EPE112

A muddled understanding of U=U: a perspective from PLHIV in Malawi and Zimbabwe

S. Sharma[1], N. Hasen[2], M. Levy[1], T. Ngaragari[3], N. Taruberekera[4], P. Mkandawire[5]

[1]Ipsos, London, United Kingdom, [2]Population Services International, Washington DC, United States, [3]Population Services International, Nairobi, Kenya, [4]Population Services International, Harare, Zimbabwe, [5]Population Services International, Lilongwe, Malawi

Background: As viral load testing has scaled, healthcare workers (HCW) have been giving people living with HIV (PLHIV) information about viral load suppression (VLS) and its benefits. We wanted to know what PLHIV understand about VLS and whether its benefits feel pertinent to them.

Methods: We interviewed a total of n=786 adult PLHIV across Malawi and Zimbabwe using a 20 minute Computer Aided Telephone Interview (CATI) technique.

Results: 92% of PLHIV in Malawi and95% in Zimbabwe understand that viral load is the term used to describe the amount of HIV in the blood. 76% of PLHIV in Malawi and 90% in Zimbabwe understand that viral load can also determine how sick or healthy one feels.

When asked what factors PLHIV would consider as important when taking ARVs, 86% of PLHIV in Malawi and 79% in Zimbabwefeel that it is either important or extremely important that they won't pass on the HIV virus to a sexual partner. However only 32% of PLHIV in Malawi and 12% in Zimbabwe believe that PLHIV who take treatment every day will not pass on HIV to other people who they have sex with without a condom.

Concerningly, 17% of PLHIV in Malawi and 18% in Zimbabwe believe that once you have achieved viral load then it is not required to take ARVs anymore and 34% of PLHIV in Malawi and 47% in Zimbabwe believe that taking treatment everyday will lead to a cure.

Conclusions: PLHIV in Malawi and Zimbabwe are not yet receiving complete information about the benefits of ART and VLS, and an important minority hold misconceptions about VLS, including about its ability to prevent transmission, an important benefit to them. ART programs may be able to improve adherence by emphasizing these benefits in their patient communication.

EPE113

Impact of innovative patient- centred two-way digital communication and community-based proactive cohort management on improving retention of ART clients in Zambia

G. Marchand[1], C. Moyo[2], P. Chipanta[1], C. Zyambo[1]

[1]Avencion, Client Services, Lusaka, Zambia, [2]Zambian Medical Association, President, Lusaka, Zambia

Background: Zambia has high HIV prevalence; and Luapula Province had highest Interruption in Treatment (IIT) rate at 16%.

Description: Zambia Ministry of Health launched digital community-retention program, utilizing implementing partner Avencion, in Luapula Province across six districts. Objective; maintain ART patients on treatment and recover "lost patients" who had IIT. Of 45,745 ART patients in Luapula Province; intervention supported 15,810 ART patients at 17 sites (96% coverage): 64% female, 89% within 20-60 age range and 56% had mobile phones.

Methods: *Proactive community management:* Engaged ART patients in community before appointment, verified patient-locator data and reminded patients of appointments.

Improved patient-locator data: Of intervention ART patients; 58% had verified mobile number and 54% had new physical address recorded.

Digital communication and appointment monitoring: Digital attendance tracking, appointment SMS reminders, two-way communication enablers for patients and facility hotline.

Oral abstracts

Late-breaker abstracts

Author Index

Improved customer care: Customer care training for health providers; weekly refresher trainings and customer service awards.

Lessons learned: Intervention supported patients experienced 771 IIT; reduction from 4,153 before intervention. Recovered 984 patients who had IIT and been "lost" before intervention started. 12 of 14 intervention sites posted decreased % IIT by Q4 FY21 while non-supported sites remained with high % IIT.

Reduced % IIT in all the sites supported by intervention.

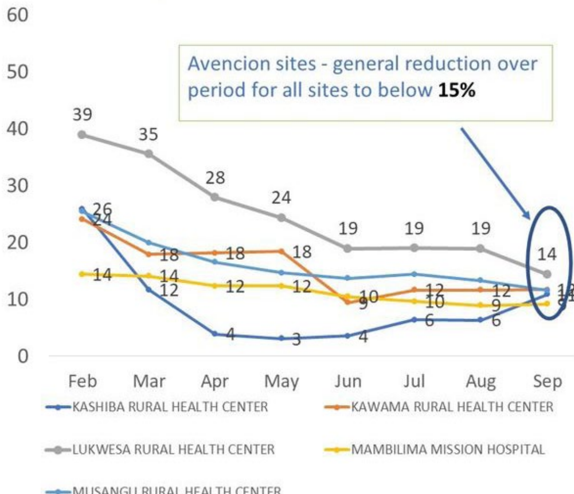

Figure. Analysis of intervention sites.

Non-supported sites remained with high % IIT; high of 67% and 22% average in province.

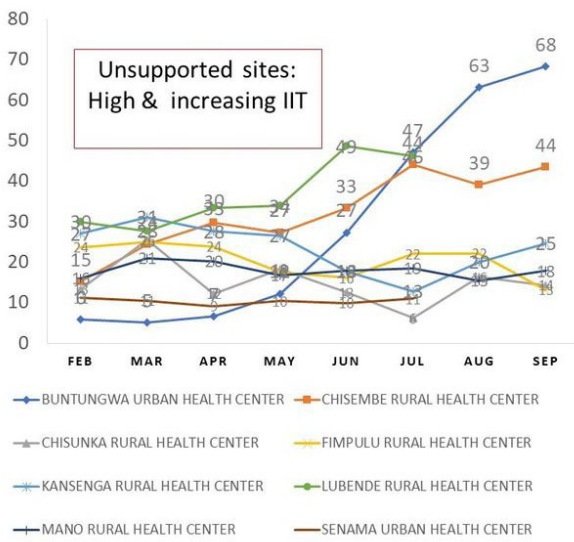

Figure. Analysis of non-supported sites.

Conclusions/Next steps: Intervention reduced % IIT in 12 of 14 supported sites analyzed and can be scaled to other facilities experiencing high % IIT; recommend scaling intervention.

EPE114
Following the science? Hesitation amongst healthcare workers to embrace U=U communication

S. Sharma[1], M. Levy[1], N. Hasen[2], T. Ngaragari[3], N. Taruberekera[4], P. Mkandawire[5]

[1]Ipsos, London, United Kingdom, [2]Population Services International, Washington DC, United States, [3]Population Services International, Nairobi, Kenya, [4]Population Services International, Harare, Zimbabwe, [5]Population Services International, Lilongwe, Malawi

Background: Awareness that an undetectable viral load renders a person living with HIV (PLHIV) untransmittable (U=U) has the potential to revolutionize how PLHIV feel about treatment, liberating them from fear and providing the opportunity for condomless sex. Healthcare workers are trusted and critical communicators of U=U information.

Research was conducted in Malawi and Zimbabwe to understand how HCWs feel about the U=U message and their confidence with communicating it to PLHIV.

Methods: We talked to HCWS in Malawi and Zimbabwe, using a mixed method approach, including n=24 x 60 minute in-depth qualitative interviews and n=504 x 30 minute quantitative interviews with SRH/ HIV care Nurses & Nurse/ peer Counsellors. Survey responses were analysed to determine level of comfort with U=U and confidence with delivering the message.

Results: 99% of HCWs in Zimbabwe/ 96% in Malawi understand that viral load is the term used to describe the amount of HIV present blood. 96% of HCWs in Zimbabwe/ 91% in Malawi state that it is possible for a PLHIV to have an undetectable viral load.

However, only 11% of HCWs in Zimbabwe and 21% of HCWs in Malawi believe that it is possible for PLHIV to have condomless sex when they are virally suppressed and 13% of HCWs in Zimbabwe/ 18% in Malawi do not believe that it is possible for a virally suppressed PLHIV to be untransmittable.

When asked to rank the importance of delivering a set of messages to PLHIV at diagnosis, HCWs ranked U=U as the least essential message to convey, after daily pill taking, accepting status, always using a condom and the importance of disclosure.

Through qualitative interrogation, the reasons for feeling discomfort with passing the message that a virally suppressed person can have sex without a condom included the idea that it would 'give a PLHIV a license to conduct mischief' and concern over other STIs.

Conclusions: A key benefit of U=U is the ability to have condomless sex. However, HCWs feel uncomfortable to give this message to PLHIV. If U=U is to reach its full potential, health programmers need to ensure HCWs feel confident to deliver the full U=U message.

EPE115

U=U conversations in busy clinical practice: why and how to have them

M. Wilberg[1], C. Treston[2], M. Penner[1], J. Kwong[3], J. Parisot[4]
[1]Prevention Access Campaign, Washington DC, United States, [2]Association of Nurses in AIDS Care, Uniontown OH, United States, [3]University of New Jersey/Association of Nurses in AIDS Care, School of Nursing, Newark, United States, [4]Michael Reese Research & Education Foundation/Association of Nurses in AIDS Care, Chicago, United States

Background: Overwhelming evidence shows that viral suppression prevents sexual transmission of HIV, a concept commonly known as U=U due to a global messaging campaign. Despite scientific consensus and endorsement from leading public health, medical and nursing organizations, many providers are still selective or reluctant to discuss U=U with all patients.

Various community-led initiatives confirm knowledge of U=U can have profound positive impacts on a person's mental health and clinical outcomes.

Description: ANAC and the Prevention Action Campaign have joined forces to present a series of educational offerings to facilitate provider understanding of the role of U=U in patient's lives, how to integrate simple but tailored U=U messages in a busy clinical practice, and how to educate and engage all staff in this effort.

This skill building includes an understanding of the science, a review of providers' responsibilities, how to craft short, effective messages using supportive language. Participants explore motivators for engagement in care and common misperceptions and hesitations amongst providers.

Lessons learned: Providers underestimate the positive impacts on a person's mental health, quality of life and clinical outcomes impact of U=U

Short messages that can be delivered by various members of the healthcare team, across all disciplines and roles can be incorporated into on-going care.

The first-person descriptions of the value of U=U in people's experience by U=U champions are powerful messages and communication tools.

Conclusions/Next steps: Continue national & global webinars that feature partnerships between providers and U=U champions.

Support and expand the partnerships between local U=U campaigns, U=U champions and nursing/provider organizations.

Develop pocket tools on supportive language and sample messaging.

Implementation of HIV status-neutral approach to enhance HIV testing, HIV prevention and HIV treatment services

EPE116

DREAMS cascade in Botswana: findings and lessons learned

G. Gokatweng[1], L. Marie-Claude[2], F. Mabona[1], C. Baumhart[2], N.H. Blanco[2], L. Okui[1], M. Montebatsi[1], R. Marima[1], G. Gaealafswe[3], N. Ndwapi[1]
[1]Bummhi, HIV, Gaborone, Botswana, [2]Center for International Health, Education, and Biosecurity (Ciheb), University of Maryland School of Medicine, HIV, Baltimore, United States, [3]Ministry of Health and Wellness, Adolescent Sexual Reproductive Health, Gaborone, Botswana

Background: In 2020, adolescent girls and young women (AGYW) in sub-Saharan Africa accounted for 25% of all new HIV infections, more than three times higher than adolescent boys and young men. In Botswana, 2,200 AGYW acquired HIV in 2020. PEPFAR launched the Determined Resilient Empowered AIDS-free Mentored and Safe (DREAMS) partnership to reduce HIV risk for AGYW. We describe the implementation strategies and outcomes of the DREAMS initiative in Botswana and share lessons learned.

Description: DREAMS was scaled from two to eight districts (from four to 36 facilities) between October 2020 and September 2021. Each facility completed a readiness assessment and had a team of trained service providers (standardized training curriculum).

The program used various platforms (e.g., radio, TV, Facebook, and newspaper) for demand creation for DREAMS and PrEP. Community dialogues with stakeholders and beneficiaries were conducted to increase demand creation and reduce stigma associated with PrEP. DREAMS enrollment increased from 585 in October-December 2020 to 7,101 from July-September 2021.

During this period, 8,270 AGYW were eligible for DREAMS; 7,101 (86%) were enrolled. Among them, 5,979 (84%) were linked to safe spaces for psychosocial support and socio-economic empowerment. PrEP uptake increased from 13 AGYW in October-December 2020 to 1,258 in July-September 2021. More than 484 AGYW received support for gender-based violence, including 201/829 (24%) for sexual violence and 283/2,483(11%) for physical and emotional violence.

Lessons learned: In Botswana, DREAMS enrolment increased by more than 10-fold within one year. Strategies deployed during this period include integrating DREAM screening at every service point (e.g., PMTCT), streamlining data collection to reduce the burden on the client, training lay health workers to integrate DREAMS screening with other services. We also developed and implemented supportive, individualized case management services for AGYWs who declined or were not eligible for DREAMS. Case managers discuss barriers and play a role in linking AGYWs to additional services.

Oral abstracts

Poster exhibition

E-posters

Late-breaker abstracts

Author Index

Conclusions/Next steps: DREAMS reached thousands of AGYW in Botswana within one year. The inclusion of various demand creation activities, a structured approach to provision of DREAMS services, and the use of data to identify and solve implementation challenges were central to the scale up of DREAMS.

EPE117

The Impact of Community Centered Approach on HIV indicators in Samburu County, Kenya

S. Ajuoga[1], W. Opudo[2], A. Nyambaka[3], B. Lemarkat[4], D. Juma[5], A. Kahiga[6], L. Matu[7], M. Kitheka[8]

[1]*Family Health International (FHI 360), Senior Technical Officer, Clinical Community Services, Nakuru, Kenya,* [2]*GoldStar Kenya, HIV Prevention, Care and Treatment, Nairobi, Kenya,* [3]*GoldStar Kenya, HIV Prevention, Care and Treatment, Nakuru, Kenya,* [4]*Department of Health , Samburu County, County AIDs and STI Control Officer, Maralal, Kenya,* [5]*Family Health International (FHI 360), Senior Data Management, Nakuru, Kenya,* [6]*Family Health International (FHI 360), Senior Technical Advisor, HIV Care and Treatment, Nakuru, Kenya,* [7]*Family Health International (FHI 360), Deputy Chief of Party, Nakuru, Kenya,* [8]*Family Health International (FHI 360), Chief of Party, Nakuru, Kenya*

Background: Samburu County supported through Afya Nyota ya Bonde project is one of the ASAL regions, not performing well and subjected to internal performance improvement to improve uptake *of HIV Prevention*sub optimal indicators.

ANYB and Ministry of health initiated a Community centered approach as a component of rapid results interventions to improve on 4 indicators to allow increased access and ease availability of prevention, care and treatment services to the rural population at risk.

Description: The Community Centered Approach (CCAH) entailed CHVs supported by NEPHAK in Samburu mobilized through CHV Led pre-SURGE for sensitization and training on four indicators;

1. HTS-INDEX targeting household members with children below 18yrs,
2. HTS-SELF targeting all community members involved in high-risk behavior,
3. PREP-NEW and
4. CX-CA SCRN targeting HIV Positive women 15-49 years.

CHVs were allocated households for both family index testing and CA-CX Screening and an integrated outreach mobilization template was shared with the CHVs to support holistic mobilization for services in a household visit addressing fatigue and duplication of work.

Lessons learned: Comparing a ten-week periodpre-surge as the baseline and during surge for four sub-optimal performing indicators, there was a significant improvement in the % achievement against weekly targets for HTS INDEX testing growing from 21% to 87%, HTS SELF with a growth from 3% to above 100%, PREP NEW increasing 2.5 times to 249% of the expected target and CA-CX screening improving from 2% to 215% by March 2021.

Conclusions/Next steps: CCAH towards improving/upscaling of HIV Prevention and Care services in ASAL region using local HIV positive CHVs not only to upscale the uptake of services but provide solutions to long withstanding household and self-stigma. Good coverage on CA-CX Screening, PREP New, HTS Self Testing and Index Testing with sustained performance across the surge period.

Approaches to viral load monitoring at scale

EPE118

Enhanced adherence counselling (EAC) enrollment via phone: a strategy to improve timeliness of enrollment and completion of EAC among HIV-infected patients with high viral load at Nkwen Baptist Hospital, Cameroon

E. Chiabi[1], E. Mboh[2], D. Marmo[1], K. Nshimba[1], S. Abongwa[1], W. Yawah[1], E. Nkwenti[1], J. Berenyuy[1], N. Ijang[1], A. Bakor Beteck[3], P. Tih Muffih[1]

[1]*Cameroon Baptist Convention Health Services, HIV-Free Project, Nkwen, Bamenda, Cameroon,* [2]*Cameroon Baptist Convention Health Services, HIV-Free Project, Mutengene, Cameroon,* [3]*Cameroon Baptist Convention Health Services, HIV-Free Project, Yaounde, Cameroon*

Background: National guidelines for antiretroviral therapy (ART) in Cameroon recommend enhanced adherence counselling be provided for patients with high viral load before making a decision whether to switch ART regimens. Significant gaps exist in the timeliness of this intervention. We present EAC enrollment via phone as a strategy to improve timeliness of EAC, including its effect on viral re-suppression in the context of the covid-19 pandemic.

Description: The national HIV programme in Cameroon since 2019 has reinforced the implementation of EAC in all HIV care and treatment centres in the country. NBH has the second largest HIV clinic in the North West Region of Cameroon with 4500 patients.

This was a comparative retrospective observational study that involved patients with high viral load (HVL) enrolled in care and treatment at Nkwen Baptist Hospital (NBH)as at June 2021. The electronic patient register (DAMA) was used to extract information on the timeliness, completion of EAC, outcome of repeat results, while information on modality of EAC enrollment by phone or face-face was extracted from patient files.

Lessons learned: Of the 103 clients eligible for EAC only 93 completed 3 EAC sessions. Of these, 56 received EAC1 physically (54%) whereas 47 (46%) had EAC1 via phone. Overall 68 viral load (VL) results were received (91%) and out of this 53 were suppressed (78%).

Out of those enrolled physically 48 (86%) completed 3 EAC sessions, 38 (79%) had repeat VL sample collection, 35 (92%) results were received with 26 suppressed (74%).Of the 47 enrolled via phone, 45 (96%) completed 3 EAC sessions, 37 (82%) had repeat VL sample collection, 33 (89%) results were received, 27(82%) had suppressed VL.

Average time to completion for patients enrolled physically was 123 days, average time of completion for patients enrolled by phone was 92 days.

Conclusions/Next steps: Enrollment of patients with high viral load on EAC by phone is an effective strategy and has the potential of scale up to improve the uptake, timeliness and completion rates of EAC especially in the context of covid-19 where reduction of face-face contact is important in infection prevention control.

EPE119

Applying a seven-step approach to rapidly improve viral load testing coverage: lessons from Burundi, Nigeria and Togo

E.A. Oladele[1], M. Bateganya[2], P. Imohi[3], P. Sadate-Ngatchou[4], N. Nkurunziza[5], N. Persaud[2], J.P. Tchupo[6], M.D. Ndung'u[4], E. Omoregbe[3], O. Anika[7], J. Mukundu[8], A. Oduola[1], M. Abass[1], C. Akolo[2], H. Mahler[9], FHI 360 Viral Load Action Group

[1]FHI 360, HIV Division, Abuja, Nigeria, [2]FHI 360, HIV Division, Durham, United States, [3]Achieving Health Nigeria Initiative, Calabar, Nigeria, [4]FHI 360, Durham, United States, [5]FHI 360, Gitega, Burundi, [6]FHI 360, Lome, Togo, [7]Achieving Health Nigeria Initiative, Uyo, Nigeria, [8]FHI 360, Chipata, Zambia, [9]FHI 360, HIV Division, Washington DC, United States

Background: Viral load (VL) monitoring is the preferred approach for monitoring treatment outcomes for people living with HIV on antiretroviral therapy. Globally, VL testing coverage falls short of the 95% benchmark and in 2021 was only 73%, 69%, and 35% in Burundi, Nigeria, and Togo, respectively.

The FHI 360 Viral Load Action Group worked with three FHI-360-supported projects (RAFG Burundi, #EAWA Togo/Burkina Faso, SIDHAS Nigeria) to implement a seven-step approach to examine barriers to VL testing coverage, develop and implement tailored plans to address barriers, and track progress to achieve optimal VL coverage.

Description: We implemented the following steps:

1. Developed the VL testing service chain framework to guide identification of and address gaps.
2. Developed a 31-item VL testing coverage gap diagnostic tool in MS Forms™ to identify barriers at each step in the VL service chain.
3. Developed an interactive analytic and visualization tool in Excel™ using PowerQuery™ and PowerPivot™ to generate graphs and tables.
4. Applied the VL diagnostic tool in 10 provinces in Burundi, three regions in Togo, and two states in Nigeria.
5. Used the data analytics and visualization tool to map gaps, decide which sites to prioritize, and develop VL testing surge plans tailored to the largest gaps
6. Implemented the VL testing surge plans
7. Tracked progress and provided feedback

We conducted a pre- and post-intervention analysis using routine data from the three projects to determine the impact of these interventions.

Lessons learned: On the Burunid project, VL testing coverage increased post-intervention from 34% in March 2021 to 83% in August 2021 at an average of 9.0% per month compared to 5.8% per month pre-intervention (p–value=0.01). In Togo, coverage increased from 6% in October 2020 to 93% in August 2021, with an average growth of 9.9% per month post-intervention (p–value=0.34).

On the Nigeria project, coverage increased from 61% in October 2020 to a peak of 94% but dropped to 78% at the end of August 2021.

Conclusions/Next steps: The multi-step, structured approach tailored to country context improved VL testing coverage significantly. When scaled up, this approach could help close global VL testing coverage gaps.

EPE120

HIV drug resistance testing gap in Malawi's HIV programme advocates for increased local genotyping capacity

J. van Oosterhout[1,2], L. Nkhoma[3], B. Chiwandira[4], E. Rambiki[4], B. Matola[4], C. Chipungu[1], S. Phiri[1,5], T. Heller[3], R. Nyirenda[4], A. Jahn[4,6]

[1]Partners in Hope, Lilongwe, Malawi, [2]University of California Los Angeles, Division of Infectious Diseases, David Geffen School of Medicine, Los Angeles, United States, [3]The Lighthouse Trust, Lilongwe, Malawi, [4]Ministry of Health, Department of HIV-AIDS, Lilongwe, Malawi, [5]Kamuzu University of Health Sciences, Department of Public Health and Family Medicine, Blantyre, Malawi, [6]University of Washington, i-Tech, Washington, United States

Background: Between 2019-2021, full transition to dolutegravir-based regimens took place in Malawi's HIV program. National guidelines were adjusted to require confirmation of HIV drug resistance (HIVDR) for patients on dolutegravir and protease inhibitor-based therapy before switching to next-line regimens.

Description: Malawi implements routine viral load (VL) monitoring at 6 months after ART initiation and yearly thereafter. Confirmed virological failure is defined as: VL result >1,000 copies/mL followed by second VL result >1,000 copies/mL after 3 months adherence support.

For patients with confirmed virological failure, guidelines require submission of a standardized case form to the national HIVDR committee to determine eligibility for HIVDR testing. Eligible samples are currently genotyped in South Africa as capacity at the national reference laboratory is not yet available.

Oral abstracts

Poster exhibition

E-posters

Late-breaker abstracts

Author Index

Lessons learned: Using data from quarterly Ministry of Health reports and laboratory information management system (LIMS), we estimated that VL coverage (routine VL results/patients on ART, mid-period) during October 2020-September 2021 was 64%. Comparing VL data from LIMS with submissions to the national HIVDR committee in the same observation period, we observed a large unmet need of HIVDR testing among patients with confirmed virological failure (Figure).
While >3,500 patients were eligible, only 174 (5%) applications for HIVDR testing were received. Contributing to this gap are clinician-related factors (insufficient guidelines knowledge, low motivation to complete HIVDR testing applications) and systems-related factors (long VL result turn-around times). Only 52% of submissions resulted in HIVDR testing, mainly through rejections (poor adherence to ART; incomplete documentation) or suspension of sample transport to South Africa during Covid-19 waves.

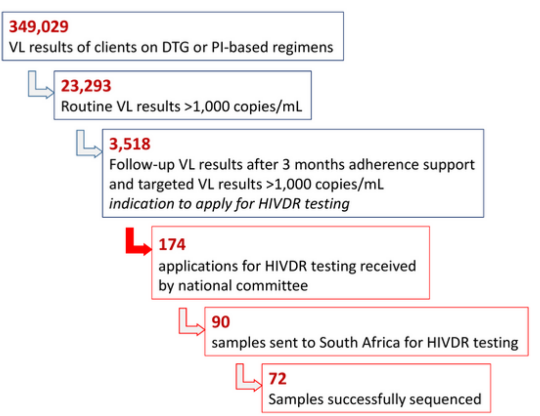

Figure. HIVDR testing gap in Malawi's HIV program, October 2020 - September 2021.

Conclusions/Next steps: Malawi's current HIVDR policy does not meet the high need for genotyping after transition to dolutegravir-based regimens and increased VL testing coverage.
Sufficient in-country HIVDR testing capacity, rapid communication of VL results and capacity building among ART providers may contribute to closing Malawi's HIVDR testing gap.

EPE121

Comparison of phone based and in-person adherence counseling for non suppressed PLHIV on anti retroviral therapy (ART) in military facilities in Uganda.

A. Nyanzi[1], D. Bwayo[1], M. Semanda[1], T. Rwegyema[1], R. Zavuga[2], J. Akao[3], E. Turesson[4], M. Laverntz[4]
[1]DoD Uganda URC Project, Kampala, Uganda, [2]UPDF, Kampala, Uganda, [3]US Embassy, Kampala, Uganda, [4]University Research Co. LLC, Maryland, United States

Background: Military personnel on anti retroviral therapy (ART) are often deployed in hard to reach areas with limited access to routine in person clinical encounters including adherence counseling. Intensified adherence counseling (IAC) has been recommended as the first intervention for people living with HIV (PLHIV) on treatment with non suppressing HIV viral load (VL). The COVID-19 pandemic created challenges of travel and need to avoid crowding within hospitals.
In this study we compared outcomes of IAC sessions conducted in-person and through phone among PLHIV not suppressing while on ART at Military managed health facilities.

Methods: This was a retrospective comparative study that used data from chart reviews and adherence counseling records from January to December 2021. In total 62 PLHIV with a non suppresed HIV VL were randomly sampled from four military ART clinics.
Descriptive statistics and chi square test were done to compare proportions of those who achieved viral suppression after 4 to 6 months of IAC, each session conducted about one month apart. HIV VL suppression was defined as a VL of <1000 copies/ml.

Results: Of the 62 participants, 17(27%) were female, average of 39 years(SD 9.76), on treatment for an average of 5 years. 50% were on a 1st lime regimen of TLD, 20% were on TLE based regimen while 33% were on a second line regimen that included a protease inhibitor.
The CD4 counts, ART regimens, HIV VL levels and adherence ratings were not significantly different between the groups at baseline.
The follow up HIV VL tests showed no statistical difference in proportion achieving a suppressed VL among the in-person compared to phone IAC. (55% among in-person group compared to 50.4% among phone based groups [p<0.61]).

Conclusions: Among PLHIV with non suppresed VL, those receiving IAC through telephone did not have significant difference in suppression compared with those who had in-person IAC. A trend towards better outcomes with in-person IAC was noted.
Phone based counselling is an option to deliver IAC for non suppressing PLHIV in hard to reach areas and to reduce crowding at health facilities, though caution needs to be taken. A larger study is recommended.

EPE122

Promising association between caregiver and pediatric viral load outcomes. Key Interventions to Develop Systems and Services (KIDSS) - Orphans and Vulnerable Children Project - Cameroon

C. Anoje[1], J. Kuria[1], L. Chingang[1], F. Soh[1], B. Beke[1], V. Nzima[2], Z. Zeh[2]

[1]Catholic Relief Services, Yaounde, Cameroon, [2]United States Agency for International Development, Yaounde, Cameroon

Background: Viral suppression among HIV positive individuals remains a key focus for PEPFAR in line with UNAIDS 95-95-95 goal. Using a case management approach, the KIDSS OVC projects supports C/ALHIV and HIV positive caregivers to ensure treatment adherence, continuity of ART and attainment of viral load suppression. Given central role of caregivers for C/ALHIV's adherence and suppression, we sought to understand the association between caregivers' and C/ALHIV's viral suppression.

Methods: Retrospective cohort study reviewed electronic program data from C/ALHIV enrolled in the KIDSS program and their adult caregiver living with HIV.

The study population included all C/ALHIVwith a valid viral load test result and whose HIV positive caregivers also have a valid viral load test result.

The primary outcome measure was viral non-suppression among children, defined as viral load of ≥1000 copies/mL. The independent variable was caregiver viral load suppression.

Results: Based on sampled 664 C/ALHIV whose caregivers had VL results, 638 children were living with CG with suppressed VL out of which 547 (86%) CLHIV were suppressed and 91 (14%) CLHIV unsuppressed. On the other hand, 26 C/ALHIV were living with caregiver who had unsuppressed VL resulting 14 (54%) of C/ALHIV had suppressed VL while 12 (46%) were unsuppressed see table 1.

Children mean age was 9 years and majority of caregivers were female. These findings demonstrate a statistically significant association between caregiver viral load outcome and those of C/ALHIV VL outcome with a P value <0.001.

Conclusions: Among caregiver–child pairs in which both members were living with HIV, children were more likely to not be virally suppressed if their caregivers were not virally suppressed, compared to children with suppressed caregivers.

Addressing barriers to caregivers' viral load suppression (socioeconomic, food insecurity, disclosure status etc)may benefit C/ALHIV's viral load suppression, while also ensuring C/ALHIV has support of a healthy caregiver. OVC projects should be deliberate in supporting HIV+ CG in adherence to attain VL suppression which is associated with better VL suppression in C/ALHIV.

OVC programs should advocate for health facility family centered service delivery models such as synchronized clinical appointments that promote continuity of treatment.

Innovations and lessons for supporting HIV prevention effective use and treatment adherence

EPE123

Review of Antiretroviral Therapy (ART) coverage in 10 highest burden HIV countries in Africa: 2015-2021

A.O. Babatunde[1,2], O. Akin-Ajani[1], R. Abdullateef[1]

[1]University of Ibadan, Medicine and Surgery, Ibadan, Nigeria, [2]Nigerian Institute of Medical Research, Lagos, Nigeria

Background: Africa is responsible for two-thirds of the global total of new HIV infections. South Africa, Nigeria, Mozambique, Uganda, Tanzania, Zambia, Zimbabwe, Kenya, Malawi and Ethiopia were responsible for 80% of HIV cases in Africa in 2014 according to the Joint United Nations Programme on HIV/AIDS (UNAIDS).

This study assesses antiretroviral coverage strategies implemented by these countries after the initiation of the 'Fast-Track strategy to end the AIDS epidemic by 2030'.

Methods: Data reported in this review were obtained from different e-bibliographic including PubMed, Google Scholar, and Research Gate. Key terms were 'Antiretroviral therapy', 'Antiretroviral treatment', HIV treatment, 'HIV medication, HIV/AIDS therapy. HIV/AIDS treatment + each of the countries listed earlier. We also extracted data on ART coverage from the UNAIDS database (https://api.worldbank.org/v2/en/indicator/SH.HIV.ARTC.ZS?downloadformat=excel). About 50 papers published from 2015 till 2021 met the inclusion criteria.

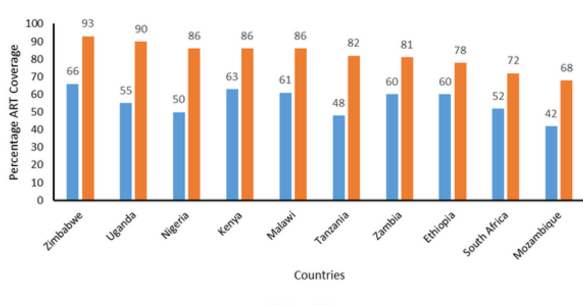

Figure.

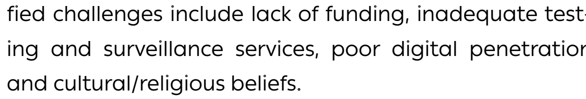
Results: All ten countries have experienced an increase in ART coverage from 2015 to 2020 with an average of 47.6% increment. Nigeria recorded the highest increase in the rate of ART coverage (72% increase) while Ethiopia had the least (30%). New strategies adopted to increase ART coverage and retention in most countries were community-based models and use of mobile health technology (mHealth) rather than clinic-based. These strategies focus on promoting task shifting, door-to-door access to HIV services and long term supply of antiretroviral medications. Most of these strategies are still in piloting stage.

However, some new strategies and frameworks have been adopted nationwide in countries like Mozambique, Tanzania, Zambia, Zimbabwe, Kenya and Malawi. Identi-



fied challenges include lack of funding, inadequate testing and surveillance services, poor digital penetration and cultural/religious beliefs.

Conclusions: Adoption of community-based and digital health strategies could have contributed to the increased ART coverage and retention. African countries should facilitate nationwide scaling of ART coverage strategies to attain the 95-95-95 goal by 2030.

EPE124

Raising HIV awareness, fighting stigma and improving ART adherence using Recycled ARV bottles. Lessons learned

A.A. Kasigeire[1], A. Bagarukayo[1], B. Kemigisa[1], R. Kikonyogo[1], J. Omagu[1]

[1]*Pill Power Uganda, Hoima, Uganda*

Background: Adherence to ART is still low in Uganda. A study among adolescents receiving ART at the Joint Clinical Research Centre found that23% of patients hadan adherence of greater than 95%. The greatest challenge was identified as stigma partly because anti-stigma and adherence campaign messages have with time become monotonous. Pill Power Uganda (PPU) realized the urgent need to innovate unique ways of fighting stigma and improving adherence using cost effective approaches. PPU embarked on raising HIV awareness, fighting stigma and encouraging adherence through recycling of empty ARV bottles into household artefacts and souvenirs.

Description: In 2017, PPU formed three peer support groups of ten HIV positive young people at each parish in Hoima district. The young people were trained in recycling empty ARV bottles. The artefacts include flower vases, baskets, dust bins, lamp shades and wind chimes. The products are branded with HIV adherence messages and sold for an income to support the adolescents. While at it, their leaders share the importance of adherence and encourage the young people to share their successes and challenges so that they can learn from each other.

Additionally, PPU reserves trading stalls at weekly markets where the young people exhibit and hold ART adherence campaigns on busy market days.

Lessons learned: As a result of the campaigns, seven more peer groups were formed reaching 82 adolescents with adherence peer support and income advancement. The peer support, adherence meetings and unique income generating activity motivated the youths to shun stigma and collaboratively adhere to their mediation. The youths have registered 83% adherence.

Conclusions/Next steps: It is evident that innovative, unique, collaborative and cost effective approaches play a big role in raising HIV awareness, reducing stigma and promoting ART adherence among HIV positive young people. PPU plans to replicate the peer support groups to two more districts.

EPE125

Gaps and opportunities for strengthening HIV support in schools for youth living with HIV

I. Njuguna[1], C. Mugo[1], F. Nyapara[1], C. Aballa[1], A. Wagner[2], A. Mbwayo[3], L. Oyiengo[4], S. Gimbel[5], D. Wamalwa[6], G. John-Stewart[7], I. Inwani[1]

[1]*Kenyatta National Hospital, Research and Programs, Nairobi, Kenya,* [2]*University of Washington, Global Health, Seattle, United States,* [3]*University of Nairobi, Psychiatry, Nairobi, Kenya,* [4]*Ministry of Health, Neonatal and Child Health Services, Nairobi, Kenya,* [5]*University of Washington, Child, Family, and Population Health Nursing, Seattle, United States,* [6]*University of Nairobi, Pediatrics and Child Health, Nairobi, Kenya,* [7]*University of Washington, Epidemiology, Global Health, Pediatrics and Medicine, Seattle, United States*

Background: As a result of optimized HIV treatment, youth living with HIV (YLHIV) have improved survival and are enrolled in schools. YLHIV spend most of their time in schools, making schools an important venue to optimize health and social outcomes.

Methods: We conducted surveys with secondary/high schools in Kenya to determine policies/practices and staff training on HIV. Selected schools were in counties with varying adult HIV prevalence (Homa Bay 21%, Nairobi 6%, Kajiado 4%). Chi-squared tests and logistic regression were used to compare policy availability and staff training by HIV prevalence and school type (day or boarding).

Results: Of 506 schools, we surveyed 97 (19%); (35, 37 and 25 in Homa Bay, Nairobi, and Kajiado, respectively). Many schools had boarding facilities (58 [60%]). Median student population was 400 (IQR: 200, 750]) and student:staff ratio 13 (IQR: 9, 16).

While 85% of schools required disclosure of chronic illnesses, only half (49%) had confidentiality policies with significantly higher frequency of policy availability in higher HIV prevalence regions (Homa Bay [91%], Nairobi [57%], Kajiado [32%], p=0.004). Similarly, while a majority (81%)

had clinic attendance policies; and policy availability was higher in higher HIV prevalence regions (Homa Bay [100%], Nairobi [81%], Kajiado [56%], p<0.001). Only 48 (49%) schools had medication use policies; significantly more in boarding than day schools (64% versus 28%, p=0.001).

Eighty percent of schools had staff trained in counseling, 32%, in HIV prevention 22%, mental health 31% stigma reduction, 36% psychosocial support, and 35% confidentiality.

Overall, 24 (25%) schools had staff dedicated to health, 11 (46%) of which had staff trained in HIV care/treatment. Boarding schools were more likely to have staff trained in HIV prevention/care/treatment compared to day schools (75% vs 25%, p=0.03).

There were significant regional differences in student populations, staff:student ratio and HIV training (all highest in Nairobi).

Conclusions: In this survey of Kenyan schools, there were notable gaps in HIV care policies and training, despite high HIV burden. Implementation of national policies on confidentiality, medication use, and clinic attendance as well as HIV training in schools may improve outcomes for YLHIV.

EPE126

Scaling up risk differentiated microplanning of female sex workers in varying geographic and socioeconomic contexts in Zimbabwe

P. Matambanadzo[1], A. Takaruza[1], R. Makandwa[1], F. Mutevedzi[1], S. Zitha[1], L. Chinyanganya[1], S. Musemburi[1], J. Hargreaves[2], F.M. Cowan[3,1], R. Steen[4]

[1]Centre for Sexual Health and HIV/AIDS Research Zimbabwe, Key Populations, Harare, Zimbabwe, [2]London School of Hygiene and Tropical Medicine, London, United Kingdom, [3]Liverpool School of Tropical Medicine, Liverpool, United Kingdom, [4]Erasmus Medical Centre, Department of Public Health, Rotterdam, Netherlands, the

Background: HIV prevalence among female sex workers (FSW) in Zimbabwe is 57.5%. Microplanning has been successfully implemented in India and Kenya for intensive coverage of identified hotspots with frequent contacts to reinforce prevention and promote clinical services. We incorporated a simple risk assessment to better target services for improved engagement in the prevention and care cascades.

Description: We rapidly scaled up microplanning with FSW across 11 sites between June 2019 and August 2021. Programmatic mapping provided population size estimates (PSEs) for a mix of urban, semi-rural, mining, fishing, farming and university towns, some with high mobility. Risk was assessed using a 6 criteria matrix with frequency of outreach contacts for high risk 1/week, low risk seen 1/month.

Lessons learned: Accuracy and completeness of data collected for PSEs improved over time with new hotspots and individual sex workers identified. PSE for the 11 sites rose from programme attendance baseline of 3831, to 4667 in June 2020 and 5879 in June 2021. Engagement of FSW in microplanning increased almost 4-fold from 1951 (51% of baseline PSE) in June 2019 to 7394 (126% of larger updated PSE) by August 2021. First-time clinic attendance increased 6-fold from 877 (45% of 1951) to 5657 (77% of 7394) from June 2019 through August 2021. Frequency of outreach contacts was almost twice monthly overall, nearly three times monthly for high risk FSW.

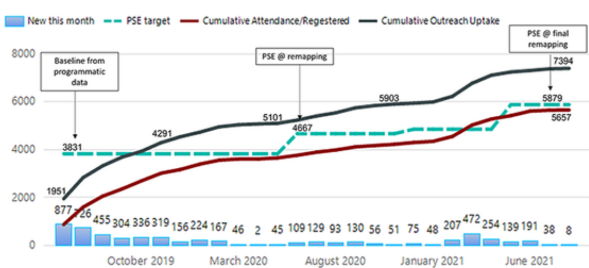


Figure 1. Clinic attendance and outreach uptake against population size estimate (PSE)

Conclusions/Next steps: Six-monthly programmatic mapping and data collection for PSE improved over time as microplanners gained knowledge of their hotspots. PSE updates together with quarterly assessments enabled better targetingp. Simple risk assessment proved feasible with those assessed as higher risk seen more often than lower-risk sex workers. Clinic attendance, both first time and repeat visits increased despite Covid-19 and funding disruptions. Microplanning is being scaled across 40 sites nationally with added focus on improving PrEP and ART uptake and adherence.

EPE127

Improving peer outreach through the engagement of people living with HIV in Nepal

M. Cassell[1], K. Bam[2], N. Sedhain[2], R. Khanal[2], B. Shrestha[2], R. Wilcher[3], I. Lohar[4], T. Weldegebreal[4]

[1]FHI 360, Hanoi, Viet Nam, [2]FHI 360, Kathmandu, Nepal, [3]FHI 360, Durham, United States, [4]USAID, Kathmandu, Nepal

Background: With funding from the U.S. President's Emergency Plan for AIDS Relief (PEPFAR) and the United States Agency for International Development (USAID), the Meeting Targets and Maintaining Epidemic Control (EpiC) project supports community partners in Nepal to close HIV service access gaps through an enhanced peer outreach approach (EPOA) involving incentivized peer referrals.

However, partners in Nepal have historically experienced lower than expected rates of new HIV case detection through EPOA—possibly because some of the key population peer mobilizers and network members engaged through this approach had already adopted preventive behaviors against HIV.

Description: By helping partners engage people living with HIV (PLHIV) in EPOA, the EpiC Nepal team saw an opportunity to complement index testing with expanded

options for PLHIV to make safe and voluntary peer referrals, improving the focus of outreach in networks with higher risk of HIV infection. At the beginning of FY20, the team ramped up efforts to identify PLHIV who were willing to serve as peer mobilizers such that in supported districts, most newly engaged peer mobilizers were PLHIV.

Lessons learned: With the expanded strategic engagement of PLHIV as peer mobilizers, participating partners experienced a tenfold increase in HIV case-finding rates through EPOA, from a baseline average of 2% of individuals tested, to a post-implementation average of 25% of individuals tested. From October 1, 2020 through September 30, 2021, 1,642 individuals were successfully referred to HIV testing services through EPOA, 457 (28%) of whom received a confirmed HIV diagnosis.

Among those diagnosed, 427 (93%) had already initiated HIV treatment services by mid-October 2021. Similarly, out of those screened negative, 650 individuals were referred for HIV pre-exposure prophylaxis (PrEP) services, and 370 (57%) of those referred initiated PrEP services through EpiC Nepal partners.

Conclusions/Next steps: The EpiC team has helped establish EPOA as a feature of Nepal's National HIV Strategic Plan (NHSP) 2021–26 and is now working with community organizations and a broader set of partners and stakeholders—including those receiving Global Fund support—to expand voluntary engagement of PLHIV as allies to help close gaps in service access.

EPE128

Improving male partners' involvement in HIV+ women's care in Malawi (WeMen study): a prospective, controlled before-and-after study

I. Triulzi[1], F. Ciccacci[2], I. Palla[1], B. Mthiko[3], D. Thole[3], M.C. Marazzi[4], L. Palombi[5], G. Turchetti[1], S. Orlando[5]
[1]Scuola Superiore Sant'Anna, Department of Management, Pisa, Italy, [2]Unicamillus, Saint Camillus International University of Health Sciences, Roma, Italy, [3]Community of Sant'Egidio, DREAM Programme, Balaka, Malawi, [4]Libera Università degli Studi Maria Ss Assunta, Roma, Italy, [5]University of Tor Vergata, Department of Biomedicine, Roma, Italy

Background: Several strategies and interventions have been implemented to improve male support or male partner involvement (MI) in Sub-Saharan Africa, but evidence on successful interventions is scarce. This controlled before-and-after intervention study aims to evaluate the impact of three different interventions on male partners' involvement in HIV+ women's care in Malawi.

Methods: Both before-and after-intervention periods, we enrolled HIV+ women with a stable partner and older than 18 years. We asked women to invite their male partners to the health centre for HIV testing and counselling and we administered an ad-hoc questionnaire to the woman at the subsequent visit to evaluate the following outcomes:

i. The number of women accompanied by male partners after invitation,

ii. Number of men accepting to be tested for HIV,

iii. Perceived partner involvement, and;

iv. Presence of gender-based violence in the family.

These data were collected in the pre-and post-analysis. Three interventions were implemented in three different clinics: the organization of a special day for men, the deployment of male champions in communities to increase awareness on MI and the use of a food package as an incentive for improving MI. A fourth clinic was considered the control center. We adopted a two-sample test of proportions to test the difference between outcomes and Kruskal-Wallis test to test the difference in the distribution of responses to indicator (iii) expressed with a Likert scale

Results: Overall, 461 women were included at the baseline and 483 in the post-intervention evaluation. Where the special day intervention was implemented, we observed an increase of 32.8 % in the number of women accompanied by their partners (from 48.5 to 81.4%), and 32.1% in the number of women feeling safe at home (from 63.5% to 95.2%) after the intervention.

This outcome increased after the deployment of male champions in communities (from 44.0% to 75.0%). In the site where the incentive was delivered to couples, we did not observe significant improvement in any outcomes.

Conclusions: Our findings showed that the special day for men and the use of male champions may be effective strategies to enhance male involvement in the health of their female partners.

EPE129

Acceptability of a motivational adherence intervention and point-of-care monitoring for perinatal women on ART with unsuppressed HIV viral load

M. Jacob[1], L. Mungate[1], O. Munaiwa[1], L. Chitibura[1], C.C. Maponga[2], R. Amico[3], L. Stranix-Chibanda[1]
[1]University of Zimbabwe Clinical Trials Research Centre, Harare, Zimbabwe, [2]University of Zimbabwe, Department of Pharmacy, Harare, Zimbabwe, [3]University of Michigan, School of Public Health, Ann Arbor, United States

Background: The Promoting Adherence through Counselling and Testing (PACT) study sought to modify the standard Enhanced Adherence Counselling (EAC) approach for perinatal women experiencing elevated HIV viral loads (VL) by:

1. Reducing the VL threshold for action to 200copies/mL,
2. Providing point-of-care (POC) VL testing, and
3. Adopting a motivational EAC approach.

We report on the acceptability of this novel behavioural intervention (PACT) among service providers and clients using the Theoretical Framework of Acceptability (TFA).

Description: Women whose long-term HIV outcomes were being followed in the PEPFAR-PROMOTE observational study in Zimbabwe who had VL above 200copies/

mL were invited to enroll in the PACT study. Participants were randomized to standard EAC vs PACT intervention. In-depth interviews were conducted with service providers and clients at exit to assess acceptability, then transcribed, coded by two independent researchers and emergent themes identified.

Lessons learned: From the seven TFA constructs, *affective attitude* was positive with limited perceived *burden* of implementing PACT procedures on a large scale, as long as POC machines are within reach. The intervention was perceived as *effective* and was a good fit (*ethicality*), as most providers and clients preferred to wait for the POC results than to return later. *Intervention cohesion*, *opportunity cost* and *self-efficacy* were balanced out with some providers feeling they needed more training while it was adequate for others, or feeling time spent waiting for VL results was valuable time wasted.

In summary, service providers had relevant skills and experience to implement PACT intervention. The main challenge perceived by providers was time pressure due to higher numbers qualifying for EAC and longer sessions for the PACT approach. Advantages were potential for earlier action following sample collection and full client participation in motivational sessions. Clients were willing to wait to receive the POC VL result.

Conclusions/Next steps: Service providers valued the PACT intervention, in conflict with their concerns about added workload of conducting more VL tests and individualized adherence support.

Current human resources and lack of POC devices limit opportunities to improve the EAC process. Policy makers should consider adopting elements of the PACT intervention to promote sustained viral suppression among perinatal women with HIV.

EPE130

Assessing the feasibility and acceptability of dried blood spot tenofovir diphosphate-based adherence feedback: results from a pilot study of a cohort of South Africans on ART

C.M. Ferraris[1], L. Jennings[2], R.N. Robbins[1], N. Nguyen[1], C.-S. Leu[3], C. Dolezal[1], N.-y. Hsiao[4], O. Mgbako[3], J. Joska[5], J.R. Castillo-Mancilla[6], L. Myer[7], P.L. Anderson[6], C.A. Mellins[1], R.H. Remien[1], C. Orrell[2]

[1]HIV Center for Clinical and Behavioral Studies at New York State Psychiatric Institute and Columbia University, New York, United States, [2]Desmond Tutu Health Foundation, Cape Town, South Africa, [3]Columbia University Irving Medical Center, New York, United States, [4]National Health Laboratory Service, Cape Town, South Africa, [5]University of Cape Town, Cape Town, South Africa, [6]University of Colorado, Aurora, United States, [7]University of Cape Town, Division of Epidemiology & Biostatistics, Cape Town, South Africa

Background: Tenofovir diphosphate (TFV-DP) concentrations in dried blood spots (DBS) are an objective measure of adherence to antiretroviral therapy (ART) that predict future viral breakthrough. Research is needed to examine how people living with HIV (PLWH) understand, accept, and respond to concentration-based adherence and how this might affect adherence.

This pilot study of concentration-based feedback to PLWH examined feasibility, acceptability and preliminary impact on adherence.

Methods: The study sample consisted of 60 PLWH from four primary health clinics in Cape Town who attended study visits once a month for 5 months. At first visit, 30 participants were randomly assigned to receive concentration-based feedback at 4 subsequent visits, and 30 to no feedback. Descriptive statistics were used to characterize the study sample and determine feasibility and acceptability of concentration-based feedback. Feasibility was operationalized as the number of drug concentration results available to participants at subsequent visits. An exit interview assessed comprehension and acceptability of concentration-based feedback using a 5-point Likert scale with Strongly Agree and Agree combined into one category.

Results: Mean (SD) age was 40 (10.51), mean duration on ART at study entry was 6 (3.5) years, 85% were women. Of 112 total concentration-feedback visits, 109 (97%) results were available to participants at their next monthly visit. Exit interview data among 29 participants receiving concentration-based feedback showed that all participants thought that these results and the associated education they received was helpful to their adherence (pill-taking behaviors).

Among these participants, 88% reported changes to pill-taking behaviors (e.g., participants stating they became more aware of daily pill-taking behavior because they were receiving drug-level feedback). In the concentration-based feedback group, there was only one instance

of a concentration result being <400 fmol/punch (a value range predictive of future viral breakthrough) compared to 9 instances in the control group.

Conclusions: A TFV-DP concentration-based feedback adherence pilot study in Cape Town among PLWH showed high feasibility and high acceptability with most participants indicating they improved their pill-taking behavior in relation to receiving the feedback. Larger scale trials are needed to assess the effects of concentration-based feedback using TFV-DP on subsequent adherence and clinical outcomes.

EPE131

Effects of a multimedia campaign on HIV self-testing and PrEP outcomes among young people in South Africa: a mixed-methods impact evaluation of 'MTV Shuga Down South'

I. Birdthistle[1], S. Mulwa[1], S. Sarrassat[2], V. Baker[1], D. Khanyile[3], D. O'Donnell[3], C. Cawood[3], S. Cousens[2]

[1]London School of Hygiene & Tropical Medicine, Department of Population Health, London, United Kingdom, [2]London School of Hygiene & Tropical Medicine, Department of Infectious Disease Epidemiology, London, United Kingdom, [3]Epicentre Health Research, Durban, South Africa

Background: Innovative HIV technologies can help to reduce HIV incidence, yet uptake of such tools is relatively low among young people. To create awareness and demand among adolescents and young adults, a new MTV Shuga campaign entitled "Down South 2" (DS2), featured storylines and messages about HIV self-testing (HIVST) and pre-exposure prophylaxis (PrEP) through television, radio and accompanying multimedia activities in 2019-2020.

Methods: We conducted a mixed-methods evaluation to investigate whether and how the DS2 campaign works among 15-24 year-olds in Eastern Cape, South Africa, in 2020. A web-based survey, promoted via social media platforms of schools, universities, and communities, assessed MTV Shuga exposure and knowledge of HIV status; secondary outcomes included awareness and uptake of HIVST and PrEP. We used multivariable logistic regression to estimate associations between DS2 exposure and each outcome, adjusting for confounding factors. An embedded qualitative evaluation explored mechanisms of DS2 impact through deductive and inductive thematic analysis of in-depth individual and group interviews.

Results: Among 3,431 online survey participants, 43% engaged with MTV Shuga and 24% with DS2. Knowledge of HIV status was higher among those exposed to DS2 (71%) versus the non-exposed (39%; adjustedOR=2.26 [95%CI:1.78-2.87]) (See Figure 1).

Exposure was also associated with increased awareness of HIVST (60% vs 28%; aOR=1.99[1.61-2.47]), use of HIVST (29% vs 10%; aOR=2.49[1.95-3.19]), and awareness of PrEP (52% vs 27%; aOR=1.90[1.53-2.35]). Qualitative insights offered evidence of DS2's influence on awareness, confidence and motivation to use HIVST and PrEP, but limited influence on service access.

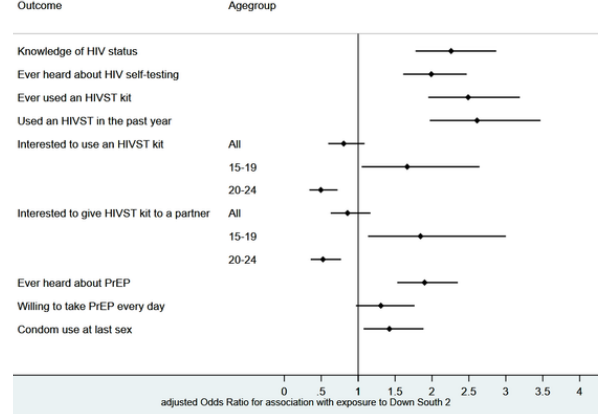

Figure 1.

Conclusions: We found evidence consistent with a positive causal impact of the MTV Shuga DS2 campaign on HIV prevention outcomes among young people in a high-prevalence setting. As diverse testing and PrEP technologies become accessible, an immersive edutainment campaign can expand HIV prevention choices and narrow the age and gender gaps in HIV testing and prevention goals.

EPE132

Who decides? Understanding patient and provider perspectives on decision-making related to HIV treatment to inform shared decision-making tools for long-acting injectable ART

C. Barrington[1], C. Ruiz[1], B.J. Uhrig Castonguay[2], H. Gonzalez Rodriguez[1], J.G. Fleming[3], S.L. Barker[4], E.A. Lipstein[5,6], W.B. Brinkman[6,5], D. Kerrigan[7], D. Wohl[2]

[1]University of North Carolina Gillings School of Global Public Health, Health Behavior, Chapel Hill, United States, [2]University of North Carolina at Chapel Hill School of Medicine, Chapel Hill, United States, [3]The Fenway Institute, Boston, United States, [4]La Clinica del Pueblo, Washington, United States, [5]University of Cincinnati College of Medicine, Cincinnati, United States, [6]Cincinnati Children's Hospital Medical Center, Cincinnati, United States, [7]George Washington University Milken Institute School of Public Health, Department of Prevention and Community Health, Washington, United States

Background: As the HIV treatment landscape expands with new options for frequency and mode of delivery, people living with HIV (PLWH) and their providers are faced with multiple therapeutic choices. Recently approved long-acting injectable antiretroviral therapy (LAI-ART) will require decision making to determine "ideal candidates" and tailor implementation strategies.

We explored how patients and providers approach decisions about HIV treatment to inform shared decision-making tools for LAI-ART.

Methods: From November 2019 to April 2021, we conducted qualitative in-depth interviews with PLWH (n=71) and HIV care providers (n=32) recruited from three clinics in the eastern US as part of the Shared Decisions when Choosing between Long-Acting Injecting or Oral Therapy (SELIGO) study. Interviews were conducted in Spanish or English based on participant preference. Using a semi-structured guide, we elicited narratives of experiences with HIV treatment decision making and probed on preferences regarding LAI-ART. We analyzed data using narrative analysis and thematic coding with Dedoose software.

Results: Nearly all patients had changed their HIV treatment since initiating. Most viewed these changes as the result of their provider's recommendation rather than their own decision.Patients deferred to providers' recommendations because they trusted them as experts and considered it the provider's role to make decisions with their patients' best interest in mind. To decide about LAI-ART, patients would want to discuss LAI-ART effectiveness, side effects, logistical considerations, and fears about changing from a pill to an injection.

Providers perceived their role in decision making as providing information, facilitating buy-in, and offering advice. Some viewed patients as the "ultimate decision makers" while recognizing the tension between persuading versus informing patients. Providers emphasized the importance of providing information on LAI-ART effectiveness and "managing expectations" around the burden of injection schedules and oral lead-in, while considering patients' unique circumstances.

Conclusions: Accompanying introduction of LAI-ART with shared decision-making tools could facilitate a shift from patient deference to greater collaboration between PLWH and their providers. Findings highlight that shared decision-making approaches for LAI-ART need to provide information along with facilitating discussion of patient preferences and concerns, grounded in the context of their lives, to maximize the benefits of this treatment innovation.

EPE133

Lessons learned from the development and implementation of MARVIN: a bilingual artificial intelligence Chatbot for people living with HIV

I. Frih[1,2], G. Tu[2,3], Y. Ma[2,4,5,6], S. Achiche[6], M.A. Laymouna[2,7], M. Chehab[2,4], L. Thériault[8], B. Lemire[5,9], M. Nait El Haj[2,10], B. Lebouché[2,4,5,7]

[1]McGill University, Faculty of Medicine and Health Sciences, Montreal, Canada, [2]Canadian Institutes of Health Research Strategy for Patient-Oriented Research Mentorship Chair in Innovative Clinical Trials in HIV, Montreal, Canada, [3]Université Laval, Faculty of Medicine, Quebec, Canada, [4]Centre for Outcomes Research and Evaluation, Research Institute of the McGill University Health Centre, Montreal, Canada, [5]McGill University Health Centre, Chronic and Viral Illness Service, Division of Infectious Disease, Montreal, Canada, [6]Polytechnique Montréal, Department of Mechanical Engineering, Montreal, Canada, [7]McGill University, Department of Family Medicine, Montreal, Canada, [8]Polytechnique Montréal, Department of Computer Engineering and Software Engineering, Montreal, Canada, [9]McGill University Health Centre, Department of Pharmacy, Montreal, Canada, [10]Université de Montréal, Faculty of Pharmacy, Montreal, Canada

Background: People living with HIV find it challenging to access reliable information to actively self-manage their care, an accessibility issue exacerbated by the COVID-19 pandemic. Aiming to respond to this need, we have developed an artificial intelligence Chatbot (AIC) named MARVIN (for **M**inimal **A**nti**R**etro**V**iral **IN**terference) to provide remote access to streamlined and verified information on HIV care.

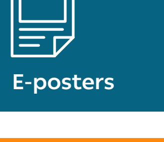
Description: MARVIN, an AIC available 24/7 in both English and French on Facebook Messenger**,** stemmed from a McGill University and Polytechnique Montréal (Canada) collaboration in January 2020. A multidisciplinary team of people living with HIV, developers, healthcare professionals, community organizations and researchers developed MARVIN following a participatory design approach.

Then, a usability pilot study took place, between April and November 2021, with 28 participants who could ask MARVIN about antiretroviral therapy (ART), vaccination/travel recommendations and general HIV-related knowledge. Finally, MARVIN was launched in Canada in December 2021.

Lessons learned:

1. Participatory design methods and patient engagement are paramount to project success. Continuous communication with MARVIN's users, from expert patients to focus groups participants, is key to align the project with their needs. The involvement of other stakeholders ensures the reliability of the project's delivery.

2. To ensure MARVIN's accessibility, ease of use and simplicity of implementation, we chose Facebook Messenger, a well-known platform to users and developers alike.



3. Confidentiality, privacy and data security are also major concerns. Considering the unique context of MARVIN, adapted privacy and usage policies regarding the processing of collected personal data are needed.
4) Pilot testing was essential to assess MARVIN's usability and acceptability while making iterative improvements based on participants' feedback.
Conclusions/Next steps: MARVIN is seen as a reliable virtual tool for verified information about HIV care. Women represented only 14.3% of pilot participants. Further evaluation is needed to identify any gender gap in the use of MARVIN and its associated factors. Next steps include to:
1. Orient future developments based on users' opinions,
2. Connect MARVIN with an up-to-date database on medication interactions and side effects,
3. Create triage tools to assess the needs of people living with HIV and offer guidance, accordingly.

EPE134

Advocacy for strengthening psychosocial intervention models to increase use and adherence of ARVs for MSM living with HIV in Indonesia

E. Sindunata[1], A. Puri Handayani[1], R.M. Alharbi[2], W. Akwa Reswana[2], I. Praptoraharjo[1]
[1]*PUI-PT PPH Pusat Unggulan Kebijakan Kesehatan dan Inovasi Sosial, Universitas Katolik Indonesia Atma Jaya, Jakarta Selatan, Indonesia,* [2]*Jaringan Gaya Warna Lentera Indonesia (GWL-INA), Jakarta Selatan, Indonesia*

Background: Before deciding to start and adhere to ARV treatment, MSM performs a risk calculation. Which mainly include the acceptance of sexual behavior and HIV before deciding to take ARV. Therefore, providing psychosocial interventions that involve a person's life journey when facing dilemmas related to sexual behavior, HIV positive status, and other challenges when starting or maintaining treatment is very important.
Description: This project used the Institute of Medicine's (2015) framework to generate evidence-based standards for psychosocial interventions. The intervention design consisted of 5 times direct group meetings with counselor and providing information without meeting. The goal is to improve self-acceptance and strengthening relationships with those closest to them.
These needs form 5 mandatory materials for the Support-RETENTION Group, namely:
1. Self-acceptance of sexual behavior;
2. Self-acceptance of HIV;
3. Living with ARV treatment;
4. Healthy romantic relationships;
5. Social support.
The provision of information through reading materials is still carried out to accommodate the needs of MSM in calculating the risk for ARV access as well as building trust within the group.
Lessons learned: Some lessons from the services needed by MSM in Indonesia.
1. The process of self-acceptance in MSM behavior and HIV is an important factor that requires special assistance and time before starting ARV;
2. The readiness of health services is an important factor for treatment adherence;
3. Mental health of MSM with HIV needs to be considered;
4. Peer support affects adherence to ARV treatment;
5. The provision of HIV services in Indonesia is not yet client-centered and still sees compliance issues as a one-dimensional problem.
Conclusions/Next steps: Recommendations for Ministry of Health:
1. Integrate mental health services in the HIV services;
2. Include the model into the current program;
3. Maximize the role and function of peer support groups to provide support and motivation for its members.

EPE135

Factors associated with viral load suppression after Enhanced Adherence Counseling in HIV seropositive clients with an initial high viral load in RISE facilities

B. Obasa[1], M. Ijaiya[1], B. Dare[1], P. Anyawu[2], E. Atuma[1], M. Strachan[3], I. Iyortim[4], R. Fayorsey[5]
[1]*Jhpiego - Johns Hopkins Program for International Education in Gynecology and Obstetrics, Monitoring, Evaluation and Research, Abuja, Nigeria,* [2]*ICAP-International Centre for AIDS Care and Treatment Program, Care and Treatment, Abuja, Nigeria,* [3]*Jhpiego - Johns Hopkins Program for International Education in Gynecology and Obstetrics, Monitoring and Evaluation, Baltimore, United States,* [4]*United States Agency for International Development, Abuja, Nigeria,* [5]*ICAP-International Centre for AIDS Care and Treatment Program, New York, United States*

Background: Enhanced adherence counseling (EAC) is recommended by WHO for people living with HIV (PLHIV) with unsuppressed viral load (VL) >1000 copies/ml after prescribed antiretroviral treatment (ART) for > 6 months. The Reaching Impact, Saturation, and Epidemic Control (RISE) project funded by the U.S. President's Emergency Plan for AIDS Relief through the U.S. Agency for International Development supports 103 health facilities in Akwa Ibom, Niger, Adamawa, Cross River and Taraba states, Nigeria.
This analysis aims to determine factors associated with VL suppression (VLS) for PLHIV who enrolled and completed EAC session between July 2020 –June 2021.
Methods: This was a retrospective analysis of de-identified client level dataset of unsuppressed VL clients who were current on treatment at the end of July 2021 and subsequently enrolled to EAC program. A log binomial regression model was used to report crude and adjusted risk ratio with 95% Confidence Intervals (95% CI) and a

p-value of 0.05 to determine association between clinical characteristics and suppression of VL post EAC in RISE program (July 2020 –June 2021).

Results: A total of 1080 clients with initial high VL who completed EAC were included in this analysis out of which 987 (91%) were virally suppressed.The median time to completion of EAC was 12 weeks and the median time for post EAC VL test was 10 weeks.

Following EAC, males were 1.1 times more likely to have VLS compared to females (ARR = 1.0893, 95% CI: 1.0194-1.1639), and PLHIV enrolled in facility settings were 1.2 times more likely to have VLS compared to community settings (ARR=1.2145, 95% CI: 1.1031-1.3371).

Similarly, PLHIV who were not TB-co-infected were 1.2 times more likely to have VLS compared to PLHIV who had TB-coinfection (ARR=1.1774, 95% CI: 0.6477 -2.1402).

Conclusions: VL suppression after EAC completion on the RISE project surpasses the WHO 70% target. Findings shows that sex, ART enrollment setting, TB co-infection, and duration on ART were significant predictors of VLS. More targeted outreach of EAC amongst females, community clients and those with TB co-infection is necessary to ensure better VLS within these groups.

EPE136

Increasing men's access to HIV prevention, care and treatment services in Nampula, Mozambique

T. Ferreira[1], E. Pimentel de Gusmão[1], H. Mutemba[1], D. Manuel[2], A. Caetano[2], S. Chiale[1], M. Afonso[3], C. Wells[4], S. Kun[4], M. Vitale[1]

[1]*ICAP at Columbia University, Maputo, Mozambique,* [2]*ICAP at Columbia University, Nampula, Mozambique,* [3]*Nampula Provincial Health Services, Nampula, Mozambique,* [4]*ICAP at Columbia University, New York, United States*

Background: Mozambique has a generalized HIV epidemic, with 13.2% overall prevalence among adults aged 15-49 and 10.1% among men. Men lag behind in the 95-95-95 global targets and recognizing this challenge, the Ministry of Health (MOH) developed male engagement guidelines to improve demand and access for health services. ICAP worked in collaboration with Nampula Provincial Health Authorities (DPS/SPS) to contextualize national guidelines and develop a comprehensive package of targeted interventions, aiming to engage more men in health services at select health facilities (HF) and their surrounding communities in Nampula province.

Description: In October 2020, ICAP, Nampula DPS/SPS and HF leadership designed and implemented a combined package of male engagement interventions in 10 HF. Male engagement interventions included: identification and training of male champions to create demand among their peers for health services uptake at HF and community levels; identification and training of community and religious leaders to disseminate key messages within the community and religious institutions; expansion of HIV prevention, care and treatment services through mobile brigades at the community level and within workplaces to reach men with school or work commitments during the day. ICAP also partnered with the Social Communications Institute to disseminate key messages in local languages on community radios.

Lessons learned: At the selected HF, there was an increase in 40% (24,166/17,241) in HIV testing, 13% (1,560/1,385) in HIV case identification, 19% (106%/89%) in the proxy linkage, 7% (10,003/7,043) in viral load (VL) samples collected and 4% (92%/88%) in viral suppression (VS) among adult men between pre implementation (October-December 2020) and post-implementation (July-September 2021) period.

Conclusions/Next steps: Targeted demand creation and health literacy strategies using peers and key community actors, coupled with differentiated service delivery, including decentralization of services to communities and workspaces and extended hours at HF, has resulted in an increased number of men receiving HIV testing services and increased HIV case identification and linkage to ART services among men. As the MOH bolsters efforts to reach the 95:95:95 global targets, contextualized interventions to reach men are essential. ICAP will continue to expand male engagement strategies to other HF and communities within Nampula.

EPE137

Does intensity of exposure to an edutainment programme matter for HIV prevention? Findings from an evaluation of MTV Shuga in Eastern Cape, South Africa

S. Mulwa[1], S. Sarrassat[1], V. Baker[1], D. Khanyile[2], D. O'Donnell[2], C. Cawood[2], S. Cousens[1], I. Birdthistle[1]

[1]*London School of Hygiene & Tropical Medicine, London, United Kingdom,* [2]*Epicentre Health Research, Durban, South Africa*

Background: MTV Shuga is an edutainment campaign designed to equip young people with skills and motivation to protect themselves from HIV. In 2019-2020, 10 episodes of a new series "Down South 2" (DS2) were broadcast via television and internet, alongside complementary media activities. We investigated whether intensity of exposure to DS2 was linked with positive HIV prevention outcomes in a high-prevalence HIV setting.

Methods: We analysed data from a web-based survey with 15-24 year-olds in Eastern Cape, South Africa, in 2020. The survey was promoted via social media platforms of schools, universities and communities. Intensity of exposure was based on number of Shuga DS2 episodes watched. Individuals with no DS2 exposure were further re-grouped according to other Shuga content accessed (Figure 1). We estimated associations between intensity of DS2 and outcomes including knowledge of HIV status, awareness, and uptake of HIV self-testing (HIVST) and PrEP, adjusting for confounders with multivariable logistic regression.

Results: Among 3,431 survey participants, 24% (n=827) accessed at least one component of DS2, with the majority (18%) viewing one episode only. Fewer participants accessed multiple episodes: 2.4%, 1.7%, and 1.8% viewed 2-4 episodes, 5-7, and 8-10 episodes, respectively. For most outcomes, frequency increased with increasing exposure to DS2. Viewing multiple episodes (2-4; 5-7; 8-10) was associated with successively higher odds of knowing one's HIV status, awareness of PrEP and HIVST, and uptake of HIVST, compared to no Shuga exposure, with considerable uncertainty around some estimates. Interest in using HIVST or PrEP was high overall (>80%), with no differences by DS2 intensity (Figure 1).

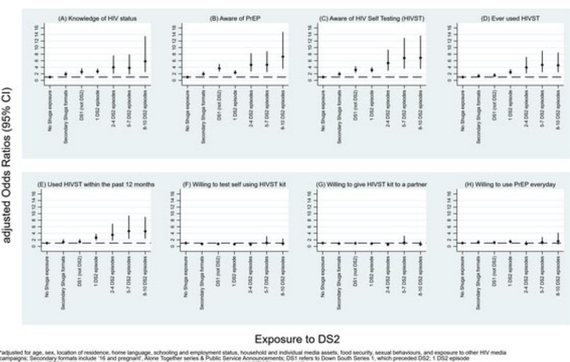


Figure 1. Adjusted associations between DS2 intensity and HIV prevention outcomes*

Conclusions: We found evidence consistent with a dose-response relationship between MTV Shuga DS2 and multiple HIV prevention outcomes among young people in South Africa. Few individuals viewed all episodes, suggesting that increasing access to the show can have beneficial effects for more young people.

EPE138

Low PrEP knowledge and high interest among men living with HIV in rural South Africa

X. Ntinga[1], O. Isehunwa[2], L. Msimango[3], P. Smith[2], L. Matthews[2], A. Van Heerden[1]

[1]Human Sciences Research Council, Centre for Community Based Research, Pietermaritzburg, South Africa, [2]University of Alabama at Birmingham, Division of Infectious Diseases, Department of Medicine, Birmingham, Alabama, United States, [3]University of KwaZulu-Natal, Centre for the AIDS Programme of Research in South Africa, Durban, South Africa

Background: Young African women have among the highest HIV incidence rates globally. Due to gender norms, women are often more successful when their partners support their prevention efforts. The number of South African men with HIV (MWH) without viral suppression continues to be a public health concern and their partners may benefit from PrEP. We explored PrEP knowledge, experience, and opportunities for implementation among MWH in rural South Africa.

Methods: Twenty-five MWH participated in in-depth telephonic interviews, between April and September 2021, in rural and peri-urban KwaZulu-Natal, South Africa. MWH ages 18 years and older who participated in prior research and consented to be contacted for future projects were recruited. Interviews were audio-recorded, transcribed, translated, and analyzed using thematic analysis.

Results: Participants' median age was 44 years old. Thirteen (52%) knew their HIV status for at least 14 years and all were accessing ART. Eighteen (72%) reported a partner with HIV, 7 (28%) reported an uninfected partner. Knowledge of PrEP was low; some had heard about PrEP from clinics, radio, and friends.

Few knew where to access PrEP and none were aware of having a partner who had accessed PrEP.Interest in PrEP was high.Men reported that, at the individual-level, PrEP use could promote HIV testing. For couples, they noted that PrEP use by an uninfected partner could support the partnership, safely support reproductive goals, and decrease stigma.

At the community-level, men were eager to share PrEP information with partners, family, and peers.Men suggested that PrEP education and dissemination expand to community settings, addressing people of all ages with and without HIV.Men also voiced PrEP concerns including challenges of routinely accessing the clinic, taking a daily medication when not sick, and potential for risk compensation.

Conclusions: In this population of research-experienced, adult MWH, many diagnosed for more than a decade, PrEP knowledge was low in 2021, five years after the start of South Africa's PrEP programme. Men were optimistic towards PrEP as an important prevention strategy for their partners and others in their community. Engaging MWH to support their partners to access PrEP may be a novel implementation strategy.

EPE139

Acceptability of at-home blood sampling using volumetric absorptive microsamplers among young Black and Latinx sexual and gender minorities assigned male sex at birth in the United States

D. Watson[1], K. Muessig[2], L. Hightow-Weidman[3], S. Hirshfield[4], J. Bauermeister[5]

[1]University of Pennsylvania Perelman School of Medicine, Medicine, Philadelphia, United States, [2]University of North Carolina at Chapel Hill, Department of Health Behavior, Chapel Hill, United States, [3]University of North Carolina at Chapel Hill School of Medicine, Division of Infectious Diseases, Chapel Hill, United States, [4]SUNY Downstate Health Sciences University, Medicine, Brooklyn, United States, [5]University of Pennsylvania School of Nursing, Department of Family and Community Health, Philadelphia, United States

Background: At-home specimen collection using volumetric absorptive microsamplers may be an option to monitor HIV preexposure prophylaxis (PrEP) adherence. We examined the acceptability of at-home blood collection to measure tenofovir-based PrEP metabolite concentrations among young Black and Latinx sexual and gender minorities (SGM).

Methods: Between January and December 2021, PrEP users enrolled in an ongoing intersectional stigma intervention (HealthMpowerment 2.0) focused on U.S. Black and Latinx SGM (ages 15-29) were invited to collect an at-home blood specimen (20 µL) using the Mitra® microsampler kit. Participants completed an online survey on the acceptability of at-home collection. Kruskal-Wallis tests were used to analyze 4-point Likert scale scores for acceptability of first sample collection and differences in medians and interquartile ranges (IQR) among different demographic groups.

Characteristic	Comfort with self-collection using lancet†				Comprehension of provided instructions‡				Overall experience using kit§				Willingness to use at-home blood collection kit again¶

# Kruskal-Wallis test; $\alpha \leq 0.05$
†† Includes vocational school and technical school
‡‡ Includes American Indian, Alaska Native, Asian/Pacific Islander, and other race/ethnicity categories
§§ Includes transgender and gender diverse identities
Likert scores: †Comfort with self-collection: 1="Very uncomfortable"; 2="Somewhat uncomfortable"; 3="Somewhat comfortable"; 4="Very comfortable". ‡Comprehension: 1="Very hard to understand"; 2="Hard to understand"; 3="Easy to understand"; 4="Very easy to understand". §Overall experience: 1="Very hard"; 2="Hard"; 3="Easy"; 4="Very Easy". ¶Willingness to use again: 1="Very unlikely"; 2="Unlikely"; 3="Likely"; 4="Very likely".

Table 1. Acceptability of first at-home blood sampling using volumetric absorptive microsamplers among young Black and Latinx sexual and gender minorities assigned male sex at birth, by age, educational level and race/ethnicity; United States - January-December 2021.

Results: 239 participants reported taking PrEP over the study period. Of these, 73 (30.5%) responded to the invitation requesting ≥1 kit. Sixty participants (82%) attempted to collect ≥1 sample. All participants were assigned male sex at birth; three were transgender (5%); most were college graduates (60%); half were Latinx (50%); and median age of 26 years (IQR: 24-28.5). Nearly all participants reported the overall self-collection experience as easy or very easy (95%; 53 out of 56).

Most reported being somewhat comfortable or very comfortable with self-collection (79%; 44 out of 56); perceiving the written instructions as easy or very easy to understand (94%; 50 out of 53); and being willing to use the at-home kit again (88%; 53 out of 60). There were no differences between median scores in acceptability by age, educational, or race/ethnicity (p-values >0.05).

Conclusions: At-home blood collection for PrEP adherence analysis was acceptable in a diverse online cohort of young Black and Latinx SGM adults. Future larger scale studies should consider including at-home blood collection for objective PrEP adherence measurement rather than relying on self-report alone.

EPE140

Implementation strategies responsible for the success of iCARE Nigeria: a combination HIV treatment intervention integrating text message medication reminders and peernavigation for youth living with HIV in Nigeria

A. Ahonkhai[1], K.M. Kuti[2], R. Garofalo[3], A.K. Johnson[3], A. Adetunji[3], B. Berzins[4], O. Okonkwor[4], L.M. Kuhns[3], O. Awolude[2], L.R. Hirschhorn[4]

[1]Vanderbilt University Medical Center, Nashville, United States, [2]University of Ibadan, Ibadan, Nigeria, [3]Ann and Robert H. Lurie Children's Hospital of Chicago, Chicago, United States, [4]Northwestern University, Chicago, United States

Background: To address poor outcomes among youth living with HIV (YLWH), the iCARE Nigeria study successfully piloted two-way text message medication reminders in combination with peer navigation. Study participants (n=40) had significant improvement in ART adherence and viral suppression at 48 weeks. Understanding factors associated with implementation success is critical for further scale-up of this pilot intervention.

Methods: We used an explanatory, mixed-methods design to identify:

1. Facilitators and barriers to implementation outcomes (feasibility, acceptability, and adoption), and
2. Implementation strategies used and/or adapted to address barriers.

Qualitative data were collected from key informant and focus group discussions with program staff, and summarized using directed content analysis. Quantitative data included participant surveys and program records, and were summarized using descriptive statistics.

Results: iCARE Nigeria was feasible as evidenced by seamless recruitment and high retention (88%) of peer navigators. In addition, after early technical challenges, text message reminders were sent with 100% success. The intervention was acceptable and showed high adoption

Oral abstracts

Poster exhibition

E-posters

Late-breaker abstracts

Author Index

by patients and peer navigators (PN). Most patients found the text message reminders (95%) and PN (90%) were not bothersome or intrusive. Implementation strategies employed to facilitate intervention success included:

1. Training, selection, supervision and matching of PN (based on age, sex, and education level etc.),
2. Flexibility in the frequency (daily to weekly) and mode of patient communication according to patient need (text/ WhatsApp message convenience vs. phone calls/in-person interaction needed to gauge well-being),
3. Early recognition and intervention on adherence issues, and
4. Customization of medication reminders.

Implementation barriers included infrastructure issues with mobile devices, power availability, and rapid overuse of airtime provided for mobile phones. Strategies employed to address these challenges included: systematic identification and troubleshooting of telecommunication constraints (eg provision of inexpensive mobile phones, to approximately 40%, chargers as needed, and revision of phone airtime stipends from monthly to weekly).

Conclusions: The iCARE Nigeria treatment intervention was feasible and acceptable with high adoption from both patients and PN. Logistical and financial challenges posed by telecommunication infrastructure were identified as important barriers, but PN/program staff were key to selecting and adapting implementation strategies to optimize implementation outcomes.

EPE141
The contributions of community-based orphans and vulnerable children projects to optimal pediatric HIV treatment outcomes: lessons from Mozambique and South Africa

T. Medrano[1], B. Sousa[2], C. Magezi[3]
[1]FHI 360, HIV, Durham, United States, [2]FHI 360, HIV, Maputo, Mozambique, [3]FHI 360, HIV, Pretoria, South Africa

Background: FHI 360 supports two PEPFAR-funded orphans and vulnerable children (OVC) projects to improve pediatric and adolescent HIV treatment outcomes- COVida in Mozambique, and Capacity Development and Support (CDS) in South Africa. By December 2020, COVida had achieved 50% viral load (VL) coverage and 61% viral suppression (VS), while rates for CDS were 55% and 82%, respectively.

We examined the association between community-based interventions and HIV treatment outcomes among children and adolescents living with HIV (C&ALHIV).

Description: In 2021, both projects implemented interventions to improve adherence to antiretroviral therapy (ART), and VL testing and VS among C&ALHIV under 18 years. They strengthened coordination with HIV clinical partners and health facilities (HFs), provided differentiated socio-economic services, collected VL data from HFs, created new clinical staff positions to monitor and support unsuppressed C&ALHIV, and offered remote case management during COVID-19. In addition, COVida trained case workers on pediatric HIV care and treatment, implemented case management in HFs (when preferred by C&ALHIV/ caregivers), and triangulated program and HF data to confirm treatment status and eligibility for VL testing. CDS delivered ART to C&ALHIV homes, as needed, participated in multidisciplinary case conferences at HFs, and trained case workers as VL champions to improve VL literacy and testing.

Lessons learned: By September 2021,VL coverage among COVida and CDS clients had increased from 50% to 86% and from 55% to 90% respectively, and VS increased from 61% to 82% and from 82% to 87%, respectively.Z-test analysis comparing VL coverage between the two periods-October-December 2020 and July -September 2021 from both projects showed a statistically significant increase [COVida- n1=13144, p1=0.5; n2=24099, p2=0.91, (Z=89.218, P<0.0001), and CDS-n1 7,400, p1=0.55; n2 21,670, p2=0.90 (Z=66.38, p<0.00001]. Likewise, VS increased significantly for both projects [COVida-n1= 6,589, p1= 0.61; n2=21918, p2= 0.82 (Z=35.5973, P<0.0001), and CDS-ni=6,081, p1=0.82; n2=18912, p2=0.87 (Z=9.7122, p<0.0001].

Conclusions/Next steps: COVida and CDS' achievements demonstrate that strong coordination with HIV clinical partners and HFs, engagement of OVC staff with HIV clinical expertise, and triangulating program data with HF data are invaluable in improving HIV treatment outcomes among C&ALHIV and should be standard practices in OVC programs.

EPE142
Treatment adherence and retention in HIV care among Mexican nationals and migrants in Mexico

D. Rojas[1], E. Rodriguez Nolasco[2], A. Gonzalez Rodriguez[2], J. Saavedra[3]
[1]University of Miami, Public Health Sciences, Miami, United States, [2]Clinica Especializada Condesa, Mexico City, Mexico, [3]University of Miami, AHF Global Public Health Institute, Miami, United States

Background: Public health policy for people living with HIV in Mexico is challenging due to migration. Migrants living with HIV (MLWH) require diagnostic and treatment services that stimulate medication adherence and lead to viral suppression.

The aim of this study was to compare differences in characteristics of MLWH in Mexico with Mexican nationals living with HIV (NLWH).

Methods: This descriptive study compared MLWH in Mexico (1,362) to Mexican NLWH (26,466) until December 31st, 2021 using Student's t-distribution and Chi-squared tests. The de-identified dataset was obtained from Clinica Condesa in Mexico City and contained information on demographics, patient status, and first and last viral load.

Results: On average, patients were 39 years old and mostly male (89.0%). Mexican NLWH had been diagnosed, on average, 8.3 years, while MLWH had been diagnosed

for 7.2 years (p<0.0001). Results showed that 82.6% of MLWH were on ARV treatment, as compared to 89.1% of Mexican NLWH. By December 31st, 2021, 38.2% of MLWH were considered inactive, while only 32.2% of Mexican NLWH were inactive (p<0.0001).

Among the inactive patients, 45.2% of the MLWH were classified as having abandoned care, while the largest percentage of inactive Mexican NLWH (26.1%) were inactive due to a change in health insurance.

Additionally, on average, the first viral load was significantly higher (p<0.0001) among the MLWH, while the last viral load was significantly higher (p<0.001) among the Mexican NLWH. In terms of viral suppression status, all patients were virally unsuppressed at their first viral load test.

However, at the last viral load, there was a statistically significant difference in viral suppression status between MLWH and Mexican NLWH; 85.3% of MLWH were virally suppressed, as compared to 82.8% of Mexican NLWH.

Conclusions: MLWH are demographically like Mexican NLWH, but due to their migratory status, MLWH in Mexico City tend to abandon care at a higher rate and have lower rates of people on ARV treatment than Mexican NLWH. However, MLWH do have a higher percentage viral suppression, which may suggest that policy for access to HIV care for MLWH in Mexico has been successful in terms of adherence, but not in terms of retention.

EPE143

Effect of TLD on suppression of clients on ART: an exploratory analysis of scaled-up TLE toTLD transition during the COVID-19 pandemic in USAID ACTION HIV supported provinces

F. Chirowa[1], I. Chibanda[2], B. Chirwa[3], S. Kanyika[4], C. Chasela[5], C. Wose Kinge[5]

[1]Right To Care Zambia, Monitoring & Evaluation, Lusaka, Zambia, [2]Right To Care Zambia, Pharmacy, Lusaka, Zambia, [3]Right To Care Zambia, Technical, Lusaka, Zambia, [4]Right To Care Zambia, Laboratory, Lusaka, Zambia, [5]Right To Care, Implementation Science, Johannesburg, South Africa

Background: HIV treatment has made strides in the introduction of more efficacious medicines. Dolutegravir-based regimen (TLD) was recommended by WHO as the best medicine for first-line in 2018, as it demonstrated a higher viral suppression rate. Right To Care Zambia is working with the Ministry of Health, through Pepfar USAID funding, to attain the ambitious 95-95-95 UNAIDS objectives in the Muchinga, Northern, and Luapula provinces of Zambia.

The purpose of this paper was to analyze the relationship between TLD scale-up and viral load outcomes.

Description: Right To Care Zambia, with funding from USAID, collected programmatic data on TLE to TLD transitioning and viral load suppression from October 2020 to December 2021, from the three province and analyzed using the Microsoft Excel package. Excel Pivot tables were used to analyze and run a trend analysis for current treatment, TLE-TLD transitioning, the proportion of clients on TLD, and Viral Suppression.

Lessons learned: In October 2020, RTCZ had only 36% of clients on TLD. A larger proportion of clients were on TLE as the first-line regimen. The suppression rate was 86% in October 2020. TLD scale-up improved to 75% in April 2021. Increased long-duration expiry TLD was received in the provinces at the end of September 2020, which saw the transition to TLD increase. As of December 2021, 93% (117,433) of the clients (126,762) were on TLD and the suppression rate improved from 86% in October 2019 to 95% in December 2021. TLD transition helped improve viral load suppression among the ART clients in Muchinga, Northern, and Luapula provinces.

Conclusions/Next steps: Having more clients on TLD was associated with a higher suppression rate. USAID Action HIV program is working hard to have 95% of clients on treatment on a TLD regimen, this is being done to improve treatment outcomes of clients current on treatment in the supported provinces.

EPE144

Building up quality of PrEP services offered by key population-led clinics through a continuous quality improvement approach: A case study of Glink Hanoi clinic in Vietnam

H.A. Doan[1], H.D. Nguyen[2], T.M. Le[3], K.Q. Do[4], B.H. Nguyen[5], P.A. Nguyen[6], Z. Humeau[1], L.K. Tran[1], B.V. Nguyen[1], N.T. Ngo[1], L.T. Doan[7], H.T. Phan[7], T.M. Ngo[8], B.N. Vu[1], K.E. Green[1]

[1]PATH, Hanoi, Viet Nam, [2]Glink Hanoi, Hanoi, Viet Nam, [3]Glink Vietnam, Ho Chi Minh City, Viet Nam, [4]Galant Clinic, Ho Chi Minh City, Viet Nam, [5]Bien Viet Clinic, Hanoi, Viet Nam, [6]My Home Clinic, Ho Chi Minh City, Viet Nam, [7]Vietnam Authority for HIV/AIDS Control, Hanoi, Viet Nam, [8]United States Agency for International Development, Office of Health, Hanoi, Viet Nam

Background: HIV pre-exposure prophylaxis (PrEP) has been scaled-up in Vietnam through public, private and key population (KP)-led clinics. With this expansion, it is vital to ensure PrEP services are of quality and meet national standards and client expectations.

Description: The USAID/PATH Healthy Markets project and Ministry of Health (MOH) piloted PrEP in 2017 and defined collaborative continuous quality improvement (CQI) system in PrEP clinics.

Standardized forms and checklists were developed and vetted by clinic, community and MOH stakeholders to help CQI teams (consisting of PrEP providers, community representatives and provincial CQI coordinators) pause-and-reflect on PrEP service quality. CQI teams conduct Plan-Do-Study-Act (PDSA) cycles every quarter to pinpoint quality challenges, implement solutions and measure their effect. We provide a case study of Glink-Hanoi, a KP-clinic delivering PrEP since 2020.

Oral abstracts

Poster exhibition

E-posters

Late-breaker abstracts

Author Index

Lessons learned: Glink's first CQI session was conducted by clinic staff, technical program officers and community workers in September 2020 who identified three areas for improvement:
i. Sufficiently completing client medical records;
ii. Properly documenting reasons for drop-out; and,
iii. Establishing client feedback channels.
These were reflected in Glink's action plan, with staff assigned to oversee each follow-up action. Subsequent CQI visits were conducted in January, June and October 2021 to review progress and identify priorities for continuously improving services.
From September 2020-October 2021, Glink-Hanoi demonstrated a systematic medical record system, enhanced documentation of drop-out reasons and staff capacity to counsel clients, and established client feedback channels.
Client feedback was increasingly positive: from January-June 2021, 84%, 90%, and 89% clients reported high satisfaction and 0%, 1%, and 1% reported dissatisfaction with waiting time, staff attitudes, and service quality, respectively; from July 2021-January 2022, 91%, 94%, and 92% reported high satisfaction with these same quality indicators and 1% reported dissatisfaction with service quality (n=387). From October 2020-September 2021, Glink-Hanoi recruited 713 new PrEP clients, with 99% continuing on PrEP after three months despite severe COVID-19 social distancing.
Conclusions/Next steps: Our results demonstrate that applying regular collaborative CQI-PDSA cycles can help clinics identify gaps in PrEP services and actively improve quality. Strong CQI systems enable KP-clinics like Glink to play a leading role in Vietnam's PrEP program.

EPE145
Should a pill a day keep the doctor away? Re-examining assumptions about frequency of sex and continuity of PrEP use

J. Reed[1], P. Chatterjee[2], D. Were[3], I. Osuka[3], A. Musau[3], K. Curran[1], D. Mohan[2]
[1]Jhpiego, HIV-Infectious Diseases, Baltimore, United States, [2]Johns Hopkins University, Bloomberg School of Public Health, International Health, Baltimore, United States, [3]Jhpiego, Nairobi, Kenya

Background: Programs typically dispense oral PrEP in 30-pill increments, and appointment schedules assume HIV risk is sufficiently frequent to exhaust clients' supply by the time of follow-up. Refill delays are thus interpreted as unprotected days of risk. However, based upon updated starting and stopping time recommendations by WHO, men and women free of risk for at least 4 or 16 continuous days, respectively, could safely stop and later resume dosing, when sex resumes.
Methods: Clients starting daily oral PrEP and participating in a longitudinal cohort study conducted by Jilinde in Kenya completed a baseline survey of demographic, behavioral, and social factors and month-long paper-based diary, indicating whether they had sex daily. All received 30 PrEP pills. We characterized abstinence from sex from a temporal perspective.
The outcomes were the total number of days (during the follow up period) and maximum contiguous days of abstinence at the individual level. We report median, 25th and 75th percentile values.
The risk factors associated with maximum reported contiguous days of abstinence were modeled using quantile regression (median, 25th and 75th percentiles). The study was approved by the Johns Hopkins University and Kenya Medical Research Institute IRBs.
Results: Daily log patterns were reported for $\geq$ 28 days by 762 individuals. The median total days without sex was 14 days (IQR 7-22 days, range 0-30 days), and median contiguous days was 4 days (25th- 75th: 2-8 days) and 7 days (4-12 days) for women and men, respectively.
Among men, 61 (84.7%) reported no sex on 4+ contiguous days; among women, 122 (17.7%) reported no sex on 16+ contiguous days. Perceived stigma score was the most significant association, particularly at the higher quantile (75th percentile) of the abstinence period (b=-2.34, p= 0.014, 95%CI -4.22 - -0.47).
Conclusions: Delayed PrEP refills should not automatically be interpreted as problematic missed doses, as abstinence periods may allow for effective cyclical use, especially among men. One-size-fits-all adherence counseling supporting habitual daily use may be programmatically preferred but may not fit all clients' needs.
Client-centered care necessitates tailored support for safely stopping and restarting aligned to fluctuating risk, complemented by more nuanced measures of both.

EPE146
TAFU Community intervention model, the magic bullet to reaching the last child living with HIV in communities, a case of Kyenjojo District

E. Mutete[1]
[1]Community Health Alliance Uganda, Programs, Wakiso, Uganda

Background: Of the estimated 96,000 children under the age of 14 years living with HIV in Uganda, 37% are not on treatment. Many enrolled into care become lost to follow up and others in HIV care have non-suppressed viral loads. The need for interventions to reduce new HIV infections, linking of identified HIV+ children and sustaining them on ART treatment as per the 95-95-95 UNAIDs cascade is still wanting.
Community Health Alliance Uganda (CHAU) with funding from Aidsfonds is implementing Towards an AIDS Free generation in Uganda (TAFU) project in Kyenjojo, Mubende and Mityana Districts which uses a "TAFU community intervention model to reach all children. TAFU model cherishes the need to Strengthen Community Systems especially using Community Resource Persons (CoRPs) such as Village Health Teams (VHT), expert clients, peer mothers,

and institutions including networks of people living with HIV, village savings and loan associations (VSLAs), District Health Team among others.

Description: Through a multi-sectoral approach, the TAFU Model address barriers to paediatric HIV services access through; Socio-economic empowerment of families and community structures,. Strengthening linkage & referral and Lobby & advocacy.

In 4 years, 102 CLHIV were identified, enrolled and retained in care i.e. from 217 at baseline in January 2018 to 319 by December 2021 (32% increment) at four target facilities.

Lessons learned: TAFU model greatly improves identification of children and women living with HIV; link and retain them in care. CoRPs and VHTs who doubled as expert clients are preferred to reach children and women living with HIV. These draw on personal experiences to support others especially the newly identified HIV positive clients.

Conclusions/Next steps: Within 4 years of implementation, there has been an increase in the number of children in HIV care from 217 to 319 (32%), hence the need lobby other stakeholders to increase buy-in, funding and scale-up the TAFU model.

EPE147

Structural barriers to ART adherence: lapses in healthcare coverage by health insurance status among MSM living with HIV

M. Valenzuela-Lara[1], T.H. Sanchez[1], J.L. Guest[1], C. Kelley[2], G. Millet[3], C. Del Rio[2], P.S. Sullivan[1]

[1]*Emory University, Department of Epidemiology, Atlanta, United States,* [2]*Emory University, Department of Medicine, Atlanta, United States,* [3]*American Foundation for AIDS Research, Washington, United States*

Background: Adherence to antiretroviral therapy (ART) is essential for maintaining long-term HIV viral suppression. Interventions to improve adherence are largely designed from the individual's behavior perspective. Considering potential structural barriers to ART adherence and to the continuity of healthcare coverage may help improve health outcomes and reduce transmission.

Methods: Secondary data analysis of the Engage[men]t study was performed to examine the association between lapses in healthcare coverage for ART and insurance status. Engage[men]t study is a prospective cohort designed to analyze racial disparities in HIV care and prevention in Atlanta, Georgia that includes 200 non-Hispanic Black and 200 White men who have sex with men (MSM) living with HIV from June 2016 to May 2017. Lapses in healthcare coverage were determined by the self-reported number of months participants were without insurance or healthcare coverage during the first year of follow-up. Insurance status was determined at baseline as insured (covered by health insurance, Medicare, or Medicaid), underinsured (health insurance and Ryan White program (RWP)), uninsured (RWP/ADAP/Drug company program (DCP)), none.

Results: Overall, 10.3% (36/349) of participants reported experiencing lapses in healthcare coverage for ART during the first year of follow-up, 6.1% (7/115) among insured MSM, 11.5% (16/139) among underinsured MSM, and 14.1% (10/71) among uninsured MSM using RWP/ADAP/DCP.

Younger MSM (cPR= 4.36, 95% CI:[1.38, 13.78]) and Black MSM were more likely to experience lapses (cPR= 2.32, 95% CI:[0.99, 3.72]).

After adjusting by race, age, and income in a multivariable log-binomial model, we found that underinsured MSM at baseline were more than twice as likely (aPR= 2.34, 95% CI:[0.95, 5.77]) to experience lapses in healthcare coverage for ART compared to insured MSM. After adjustment, no significant difference was found for uninsured MSM.

Conclusions: MSM in Atlanta who were young, Black, or underinsured were more likely to experience lapses in health coverage than men insured by private health insurance or Medicaid.

Continuous coverage with the RWP is crucial for ART adherence and care of uninsured and underinsured MSM. Simplifying RWP renewal procedures and Medicaid expansion would likely reduce lapses in coverage for MSM living with HIV and improve continuous access to care.

Moving from biomedical HIV prevention to "V ineka that, that, that!": early insights from implementing "V" in Zimbabwe

T. Sisimayi[1], D. Nhamo[2], G. Chapwanya[2], K. Chatora[3], T. Mawoyo[3], E.L. Harris[4], K.D. Shelley[5]

[1]Independent Consultant, Harare, Zimbabwe, [2]Pangaea Zimbabwe AIDS Trust (PZAT), Harare, Zimbabwe, [3]Population Services International (PSI), Harare, Zimbabwe, [4]United States Agency for International Development (USAID), Office of HIV/AIDS, Washington DC, United States, [5]PATH, Health Systems, Seattle, United States

Background: Adolescent Girls and Young Women (AGYW) remain disproportionately affected by HIV in Zimbabwe where new infections are more than double those among young men. HIV prevention options are available, including oral pre-exposure prophylaxis (PrEP), however AGYW face significant barriers to PrEP uptake and continuation. In 2021, PSI and PZAT launched "V" in four districts with the aim of reframing PrEP as an empowering self-care product that young women desire. "V" consists of fashionable branding (including "starter kit"—pill case, FAQ guide, makeup bag, reminder sticker), service integration, and peer education/support through online fora. Our objective was to characterize early learnings to inform implementation and scale up.

Methods: Observations and interviews explored "V"'s acceptability and relevance to target users, and feasibility of integrating "V" into existing service delivery. In-depth interviews (n=46) were conducted with healthcare workers, Brand Ambassadors (PrEP champions), and young women (18-24) sampled from four sites. Interview data was analyzed thematically using the framework method for qualitative data management and analysis. Project budgets and invoices were reviewed to compile unit cost data and procurement quantities for all "V" materials.

Results: Interviews indicated "V" is highly acceptable due to attractive branding coupled with factual and thought provoking messaging, establishing "a girl code" for talking about PrEP, and addressing a gap in communications materials. One young woman described "V" as "V ineka that, that, that!" which translates to "in a class of its own!" "V" was also feasible and efficient to integrate into routine service provision, including with adolescent health services and through outreach events.

Interest in "V" beyond AGYW was substantial. Minor adaptations to "V" materials (color, size) were identified to better suit the context and to address possible unwanted disclosure issues.

Conclusions: Early learnings indicate V is an acceptable and feasible innovation to help support demand creation for PrEP and continuation among AGYW in a variety of settings. National scale up discussions are ongoing pending impact analyses and sustainability considerations. Plans for scale up could explore savings through higher volume procurement and by adopting a customized lighter package of the most essential "V" materials, while still retaining "V"'s core approach.

EPE149

Applying the HIV prevention cascade to a large-scale combination HIV prevention programme for adolescent girls and young women in South Africa

K. Bergh[1,2], K. Jonas[2], C. Mathews[2], E. Toska[3]

[1]University of Cape Town, Psychology, Cape Town, South Africa, [2]South African Medical Research Council, Health Systems Research Unit, Cape Town, South Africa, [3]University of Cape Town, Centre for Social Science Research, Department of Sociology, Cape Town, South Africa

Background: Measuring uptake and adherence to HIV prevention interventions is important for setting targets and scaling interventions but challenging to conduct at scale. The HIV prevention cascade is a novel framework for measuring and understanding gaps in intervention coverage which describes how a participant must be motivated to use and have access to a prevention method to effectively use it.

The aim of this study is to identify the barriers to each stage of the cascade for male condoms and PrEP among adolescent girls and young women (AGYW).

Methods: We analyzed data from the HERStory2 process evaluation of a large-scale combination HIV prevention programme for AGYW (15-24 years) in South Africa. Due to COVID-19 restrictions, a descriptive telephonic survey was conducted with AGYW from six of the 12 programme districts. Bivariate and multivariate logistic regression were used to identify barriers at each stage of the cascade.

Results: The analytic sample consists of 515 AGYW (sample realization=23.8%). Most participants were 15–19 years old (56.6%). Motivation, access and effective use of condoms was 92.1%, 81.2 and 15.5%, respectively. Participants were less likely to be motivated to use condoms and have access to condoms if they disliked using condoms (OR=0.22; 95% CI: 0.10-0.48, N=301) and if the place where they accessed condoms was far away (OR=0.33; 95% CI: 0.15-0.76, N = 260) respectively. AGYW who had a sex partner five or more years older (OR=0.40; 95% CI: 0.16-1.01) or whose partners refused condoms (Adjusted OR=0.13; 95% CI: 0.02-1.01) were less likely to effectively use condoms (N=223). Motivation and access to PrEP was 75.7% and 40.0%. AGYW were less likely to be motivated to use PrEP if they did not believe PrEP was efficacious (OR=0.30; 95% CI: 0.17-0.54; N = 260) and more likely to have access to PrEP if they had been offered PrEP (OR=2.94; 95% CI: 1.19-7.22, N=205).

Conclusions: These findings suggest that interventions need to approach condom and PrEP uptake differently. Risk reduction counselling for boys and older men could in-

crease condom use while educational campaigns among AGYW may be more pertinent to PrEP. Addressing structural barriers to condoms and PrEP remains essential.

EPE150

Making a case for adolescents and young people HIV programming Nigeria: an assessment of returns on investment

A.O. Ajiboye[1], T. Oladele[2], D.D. Ndukwe[1], D.B. Olakunde[1], Y. Olaifa[1], K. Essomeonu[1], V. Isiramen[3], M. Haske Sani[1]
[1]*National Agency for the Control of AIDS (NACA), Community Prevention and Care Services, Abuja, Nigeria,* [2]*National Agency for the Control of AIDS (NACA), Performance and Resource Mobilization, Abuja, Nigeria,* [3]*UNICEF, AYP-HIV Expert, Abuja, Nigeria*

Background: Adolescent and young people (AYP) aged 10-24years constitute approximately a third (70 Million) of Nigeria's population. AYP possess a significant risk of HIV infection, with adolescent girls and young women (AGYW) having higher levels of vulnerabilities. Some major contributors to their higher vulnerability include gender inequalities, harmful traditional practices, sexual and gender-based violence. Over the years, this population has not been prioritized with inadequate HIV programming and limited funding. Hence, the need to develop an investment case to serve as an advocacy tool for increased funding and adequate programming for AYP to help achieve the UNAIDS 95-95-95 goals among youths in Nigeria.

Methods: Three principles guided the development of the investment case - investment in high risk areas with limited resources; opportunistic investments in low and medium risk areas; and intervention packages to meet the demographic and epidemiological needs of the target population. A desk review of programmatic data, surveillance reports and epidemiological data was done. Key informant interviews and focus group discussions were conducted to provide further insights into the findings from the desk review. Three scenarios were developed and cost modeled for each scenarios.

Results: The table below show the different investment scenarios, their cost implications and return on investment.

Scenario	Geographical spread	Service package	AYP coverage	Cost (USD)	Return on investment (%Coverage /USD)
Scenario 1	All AYP in all LGAs in the 36 states + FCT	Relevant basic or comprehensive package	100%	4.7 billion	21
Scenario 2	All AYP in all LGAs of the 10 high burden states.	Relevant basic or comprehensive package	55.3%	1.7 billion	32
Scenario 3	All AYP in the 80 high risk LGAs	Comprehensive service package.	10.6%	964 million	11

Table 1. Investment scenarios and Cost implications.

Based on the model, scenario 2 is the most efficient strategy with a unit cost of $88.3 and a return on investment of 32.

Conclusions: Scenario 2 offers the highest return on investment, reducing the burden of HIV amongst the AYP by 55% in a period of 5 years and this will be the most expedient investment for the government and her partners towards the attainment of the 95-95-95 target among AYP.

EPE151

Examining the barriers to and facilitators of implementing Friendship Bench delivered by peers for adolescents living with HIV in Botswana

C. Ahmed[1], A. Buttenheim[1], M. Brooks[2]
[1]*University of Pennsylvania School of Nursing, Philadelphia, United States,* [2]*University of Pennsylvania Perelman School of Medicine, Department of Pediatrics, Philadelphia, United States*

Background: The burden of mental health illness is of particular concern among adolescents living with HIV (ALHIV) in sub-Saharan Africa. Hence, the evidence-based Friendship Bench intervention was adapted and piloted among ALHIV in Gaborone, Botswana. The purpose of this study was to qualitatively describe the barriers and facilitators that influence the implementation of Friendship Bench from the perspective of peer counselors delivering the intervention to ALHIV in Gaborone, Botswana.

Methods: We used qualitative data from a five-phase Friendship Bench pilot study to evaluate Friendship Bench among ALHIV in Botswana. Nine peer counselors participated in semi-structured interviews to determine their experiences with implementing Friendship Bench during the pilot. To guide our directed content analysis, we used the five domains of the Consolidated Framework for Implementation Research (CFIR) framework (i.e., intervention characteristics, outer setting, inner setting, characteristics of individuals, and process).

Results: We organized our findings based on the five CFIR domains:

1. Intervention Characteristics: Several counselors stated the need for the intervention to be adapted in hard-to-reach settings (e.g., rural areas, schools) since the cost of transportation is a barrier to accessing the intervention.
2. Outer setting: The peer-based Friendship Bench model acknowledges that age is a factor in terms of how well counselors are able to relate to their clients and engage in conversations about sensitive topics such as sex and substance use.
3. Inner Setting: Although counselors consistently reported that they are not adequately compensated for their work, there was a shared perception regarding the importance of implementing Friendship Bench among ALHIV.
4. Characteristics of Individuals: Counselors have varying degrees of self-efficacy regarding their level of preparedness to handle difficult scenarios during counseling sessions.

Oral abstracts

Poster exhibition

E-posters

Late-breaker abstracts

Author Index

5. Process: Some counselors thought that clients were not being screened fast enough which was preventing them from getting more clients.

Conclusions: Unlike the original Friendship Bench model delivered by elders, there are several benefits to peer delivery of Friendship Bench among ALHIV in Botswana. Despite the benefits of peer-based implementation of Friendship Bench, there are several barriers to implementation that need to be addressed such as limited resources, insufficient skills and training, and inefficient client recruitment methods.

EPE152
Barriers to HIV and STI services access among Adolescent Girls and Young Women in Nigeria: A Cross-sectional Study

R. Aguolu[1], T. Zachariah[1], J. Anenih[1], M. Morka[2], G. Ashefor[1]
[1]National Agency for the Control of AIDS, Abuja, Nigeria, [2]National AIDS and STI Control Programme, Abuja, Nigeria

Background: Adolescent Girls and Young Women (AGYW) account for a disproportionately higher number of new HIV infections in Nigeria. AGYW have low levels of comprehensive knowledge of HIV, low HIV risk perception, and access to appropriate sexual and reproductive health services (UNAIDS 2019).

This study aimed at identifying barriers to HIV and STI services access among AGYW in Nigeria.

Methods: This was a cross-sectional study, conducted in six states across the country in November 2021. States were selected based on existing AGYW interventions, geographical representation by HIV prevalence. A convenience sampling technique was used to recruit respondents (AGYW). Quantitative data was collected through client exit interviews, conducted for 2520 AGYW receiving services at selected service delivery points using a structured questionnaire. Information on locations where clients accessed HIV and STI services, and barriers to services was collected. Stata was used for data analysis.

Results: A total of 2520 AGYW with a mean age of 18.9 years (SD=3.7) were interviewed. 36.7% of them had completed secondary education, 17.9% were employed, 57.7% were students while 81.2% were single. Majority of AGYW accessed HIV Testing Services (66.4%) and ARV refill (88.3%) from health facilities. The major barrier faced by AGYW was distance to the health facility, OSS and drop-in-centers as alluded by 23.4%. This was followed by stigma and discrimination, and fear of harassment as alluded by 17.9% and 12.1% of the AGYW respectively. Among the least mentioned barriers were lack of transportation fare, and fear of the outcome of results as alluded by 0.5% and 0.4% of AGYW respectively.

Conclusions: The findings showed that HIV and STI services being accessed by AGYW were majorly facility-based but had distance as a major challenge. Designing strategies that would bring these HIV and STI services closer to the reach of AGYW is very critical in order to close this gap in service delivery. Also, addressing barriers like stigma and discrimination, and fear of harassments may require interventions targeting both AGYW and the service providers.

Differentiated service delivery for HIV testing, prevention and treatment

EPE153
Social network strategy improves access to HIV services for key populations in a legally restrictive environment: findings from Lusaka Zambia

J. Okuku[1], O. Chituwo[1], A. Mwila[1], B. Kaliki[1], B. Musonda[2]
[1]US Centres for Disease Control and Prevention, Lusaka, Zambia, [2]Ministry of Health, Zambia, Infectious Diseases/ HIV Prevention, Lusaka, Zambia

Background: Sex work and same-sex relationships are illegal in Zambia. Key populations(KP), including men who have sex with men (MSM), female sex workers (FSW), Persons Who inject Drugs (PWID), and transgender persons(TG), face discrimination and stigma, which negatively affects their access to health services.

We report findings and lessons from using a social network strategy (SNS)to identify and reach KP with HIV service in Zambia.

Description: From October 2019 to September 2021, the Centre of Infectious Disease Research in Zambia implemented SNS - a peer-driven, incentive-based, chain referral method to reach and provide HIV testing, treatment, and prevention services to KP in three urban districts of Lusaka.

SNS was used for immediate linkage of high-risk HIV-negative or HIV-positive KP to HIV prevention and treatment services respectively. Services were provided in collaboration with public health facilities, and at community safe spaces identified in consultation with KP groups

Lessons learned: We tested 4,411 FSW, MSM, PWID, and TG who did not know their HIV status. Over time, HIV testing yields ranged between 30-71% among FSW; 10-34% among MSM; 6-41% among PWID; and 8-38% among TG. Linkage to care ranged between 95-100%, while viral load coverage and suppression were 91% and 93% at the end of September 2021, respectively. For all HIV-negative, uptake of pre-exposure prophylaxis (PrEP) ranged between 88-100% during the period.

Lessons learned from the SNS implementation included:
1. The SNS is an effective strategy for reaching previously undiagnosed, hard-to-reach, and highly stigmatized groups;
2. Use of unique participant codes and real-time data monitoring prevented repeat participation by KP;
3. Engagement of KP civil society groups helped to identify persons who were already receiving ART;

4. Scheduling of appointments prevented over-crowding of safe spaces;
5. Continuous planning and risk mitigation ensured safety and confidentiality of KP.

Conclusions/Next steps: The SNS and use of safe spaces are effective ways of achieving high HIV yield and providing ART, PrEP, and other services to KP in a legally and socially conservative environment.
The use of safe spaces increased trust with KP, ensured safety, security, and confidentiality, thereby improving uptake of services and retention in care.

EPE154

"We used to fear going to clinics but now health services have been brought close to us" Perceptions and experiences of key populations in Zambian with access to community-based delivered PrEP

C. Bwalya[1,2], K. Stoebenau[3], S. St-Onge Ahmad[3], G. Muchanga[1], M. Simuyaba[1], L. Gwanu[1], M. Mwamba[1], M. Mwale[1], C. Mambo[1], C. Peters[3], S. Toussaint[3], I. Kafunda[4], L. K Mwango[2], S. Shiyanda[2], H. Sakala[2], S. Nsanganya[2], J. Mukuka[2], A. Chilambe[2], S. Malupande[2], N. Mugwira[2], M.-C. Lavoie[5], R. Sheneberger[3,5], C. Claassen[3,5]
[1]Maryland Global Initiatives Corporation, Lusaka, Zambia, [2]Ciheb Zambia, Lusaka, Zambia, [3]University of Maryland College Park, Baltimore, United States, [4]Maryland Global Initiatives Corporation Zambia, Research, Lusaka, Zambia, [5]Center for International Health, Education and Biosecurity, University of Maryland School of Medicine, Baltimore, United States

Background: Pre-exposure prophylaxis (PrEP) is an essential HIV prevention tool for persons at increased risk of HIV. In Zambia, key populations (KPs) face substantial psychosocial and structural barriers to access PrEP, especially female sex workers (FSWs) and men who have sex with men (MSM). Alternative community-based PrEP delivery strategies can improve and sustain PrEP uptake.
This study explored KPs' experiences and perceptions of accessing PrEP outside the clinic

Methods: From 2016-2021, the University of Maryland Baltimore and its partners implemented the *Zambia Community HIV Epidemic Control for Key Populations* (Z-CHECK) program to reduce HIV transmission particularly among KPs. Z-CHECK community health workers (CHWs) conducted PrEP education, HIV testing services, and PrEP initiation and persistence support, in conjunction with facility healthcare workers (HCWs). KPs could access PrEP at the health facility or have it delivered to them by CHWs in the community. We conducted interviews with CHWs and mobilisers (n=5) and with purposively selected KPs accessing PrEP in focus group discussions (n=4) and interviews (n= 41). Interviews and discussions were transcribed and analyzed thematically

Results: Clinic-based PrEP distribution was the main source of PrEP for KPs but included a few challenges such as stigma, distance, and long waiting time, which discouraged uptake. Most participants perceived community PrEP distribution via CHW delivery in homes and safe spaces as a way to overcame barriers to PrEP uptake and encourage persistence. KPs receiving PrEP in the community described this approach as being patient-centered, safe, convenient, confidential, and a more efficient means of accessing PrEP. CHWs could reach KPs in places where HCWs could not, and community delivery was said to have promoted further patient-provider dialogue. Disclosure of PrEP use positively influenced acceptability of community distribution.
However, fears of involuntary disclosure for those that did not disclose PrEP use was common, thus CHWs often adopted covert and discreet delivery approaches to ensure confidentiality for KP clients.

Conclusions: Community distribution of PrEP is well regarded by KPs in Zambia and was perceived by KPs to improve PrEP access, uptake, and persistence. Future PrEP programs should consider integrating community-based delivery approaches to promote uptake among KPs.

EPE155

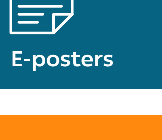
Pivoting differentiated distribution to improve access to medicines for PLHIV in South Africa during COVID-19

P. Roberts[1]
[1]Project Last Mile, Johannesburg, South Africa

Background: South Africa has approximately 7.7 million people living with HIV (PLHIV) and supports the world's largest antiretroviral therapy program. The high numbers of people requiring routine access to HIV medicines lead to congested health facilities, overburdened health staff, and challenges in quality of care.
The COVID-19 pandemic exacerbated these problems: closed health facilities, national and provincial lockdowns, and restrictions on patient transport limited access to medication.

Description: Since 2016, Project Last Mile (PLM) has supported the National Department of Health (NDoH) to expand and improve the Central Chronic Medicine Dispensing and Distribution (CCMDD) program by applying private-sector best practices. CCMDD decongests public health facilities by creating community-based and private-sector pick-up points (PuPs) where people living with HIV and other chronic diseases can conveniently collect medications.
COVID-19 increased the need to reduce the burden on public health facilities. CCMDD became pivotal to decongest facilities. PLM supported NDoH with geospatial analytics to identify optimal public and private PuPs, operationalizing innovations like smart lockers and modular containers for vaccinations and medication pick-up, and led engagements to enrol additional external PuPs.
PLM supported NDoH in rapidly pivoting operations to limit disruptions on medication access by identifying alternate facilities and PuPs for patients affected by facility

Oral abstracts

Poster exhibition


E-posters

Late-breaker abstracts

Author Index

closures, enabling multi-month dispensing, and changing enrollment criteria to allow more eligible patients to join.

Lessons learned: During COVID-19, the number of registered patients grew 107% to over 4.72 million registered on CCMDD by October 2021. PLM supported NDoH in adapting methods for rapid decanting, resulting in 45% more patients collecting their medication through CCMDD PuPs.

The number of active patients collecting at external PuPs increased by 55%, with an average waiting time of less than 10 minutes. Most new patients opt to collect from external PuPs, supporting increased patient benefits.

Conclusions/Next steps: The methods adopted by PLM demonstrate how expanding access to medication through differentiated service delivery can increase patient benefits, with implications during and beyond COVID-19.

EPE156

In-use stability studies show safety of implementation of larger bottles to support multi month dispensing initiatives

C.Y. Malati[1], D. Kiesa[1], M.L. Belayneh[1], L.E. Bailey[2]
[1]*United States Agency for International Development, Bureau for Global Health / Office of HIV/AIDS / Division of Supply Chain for Health, Washington, United States,* [2]*United States Agency for International Development, Bureau for Global Health / Office of HIV/AIDS / Division of Prevention, Care, and Treatment, Washington, United States*

Background: The 2016 WHO Consolidated HIV Guidelines include a recommendation for less frequent medication pickup for people living with HIV (PLHIV) on stable antiretroviral therapy (ART). Multi-month dispensing (MMD) of ART allows PLHIV to receive 90 and 180-day supplies of antiretrovirals (ARVs) rather than returning to the clinic or pharmacy on a monthly basis for medication. MMD has been shown to improve treatment outcomes and client satisfaction and reduce clinic congestion.

To accommodate the shift to MMD of ART, ARV manufacturers offered ARVs packaged in more convenient 90- and 180-day bottles in addition to traditional 30-day bottles.

However, due to the temperature and humidity trends in countries where the President's Emergency Plan for AIDS Relief (PEPFAR) operates, concerns grew regarding ARV stability during the span of the dosing period for the larger bottle sizes. In-use stability studies were conducted by ARV manufacturers to determine risk of degradation of product.

Description: Four ARV manufacturers conducted in-use stability studies on dolutegravir/lamivudine/tenofovir disoproxil fumarate (TLD) containing tablets to measure the concentration of active pharmaceutical ingredients at various time points.

Procedures for in-use stability studies are as follows - The investigator:

1. Conducts a full monograph test to determine physical and chemical attributes of tablets at baseline, and;
2. Places an opened bottle of ARVs in chamber and;
3. Conducts pharmaceutical analyses at various time points, removing tablets from the bottle at each time point and replacing the bottle in the chamber.

PEPFAR country work plan guidance recommends rapid optimization of ART by offering TLD to all PLHIV weighing > 30kg.

Lessons learned: The following parameters were accessed: water content, tenofovir disoproxil fumarate dissolution, lamivudine dissolution, dolutegravir dissolution, TDF assay, 3TC assay, DTG assay, impurity. Upon review of in-use stability data from four ARV manufacturers, all samples tested remained within the manufacturer-defined limits.

Conclusions/Next steps: Data indicate larger pack sizes can be safely dispensed without risk of accelerated degradation of TLD. The research pipeline for ARVs with a potential treatment indication is robust.

Stakeholders intimately involved with product development and procurement of ARVs should coordinate regarding the potential pack sizes for consideration early in the research and development process.

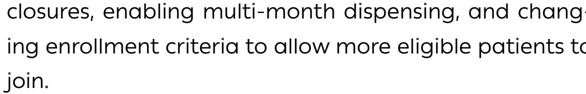
EPE157

No differences in recipients of care perceived quality of care between differentiated service delivery models and conventional care in South Africa

I. Mokhele[1], A. Huber[1], J. Kaiser[2], N. Lekodeba[1], V. Ntjikelane[1], C. Hendrickson[1,3], N. Scott[2], S. Rosen[2], S. Pascoe[1]
[1]*Health Economics and Epidemiology Research Office, Department of Internal Medicine, School of Clinical Medicine, Faculty of Health Sciences, University of the Witwatersrand, Johannesburg, South Africa,* [2]*Boston University School of Public Health, Department of Global Health, Boston, United States,* [3]*Amsterdam University Medical Center, Department of Medical Microbiology, Amsterdam, Netherlands, the*

Background: Differentiated service delivery (DSD) models aim to increase the responsiveness of HIV treatment programs to individual needs of recipients of care (RoC) to improve treatment outcomes and quality of life. Little is known about how care experiences in DSD models differ from conventional care.

Methods: From May-November 2021 we interviewed adult RoC at 12 primary clinics in four districts of South Africa. Participants, selected consecutively at routine visits and stratified by DSD model, were asked about perceived quality of care (QOC) including provider attitudes, trust in provider, and time spent with the provider using questions with Likert-scale responses (Cronbach's alpha =



0.70). Mean scores were categorized as "low" QOC (score <=3) or "high" QOC (score>3). We used logistic regression to assess differences and report crude and adjusted odds ratios (AORs). Qualitatively, participants explained their overall satisfaction; themes were identified through content analysis.

Results: 767 RoC (70.4% female, median age 39) were surveyed: 23.9% enrolled in facility pick-up-points; 26.2% in out-of-facility pick-up-points; the remainder in conventional care. Participants reported high QOC regardless of model. (Figure 1).

Those in facility-based models perceived no differences in QOC compared to those in conventional care; fewer RoC in out-of-facility models reported low QOC. Participants who missed more visits, had more expected healthcare interactions and/or more out-of-facility interactions perceived lower QOC, as did those receiving longer dispensing intervals (non-significant differences).

Qualitatively, participants receiving conventional care perceived providers as helpful, respectful, and friendly; they were satisfied with care despite long queues. Those in DSD models frequently spoke about ease and convenience, particularly not having to queue.

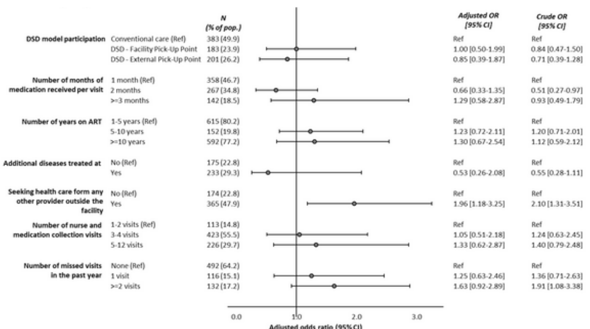


Figure 1. Crude and adjusted odds ratios for recipients of care low perceived quality of care for differentiated service delivery models and conventional care in South Africa (n=767)

Conclusions: RoC enrolled in DSD models in South Africa did not perceive differences in QOC compared to those in conventional care. Existing DSD models (facility and external pick-up-points) and dispensing intervals do not appear to affect self-reported QOC but are perceived as more convenient.

EPE158

Does differentiated service delivery for HIV treatment change healthcare providers workload? Provider views from Malawi, South Africa and Zambia

B. Phiri[1], A. Huber[2], V. Ntjikelane[3], T. Tchereni[4], J. Kaiser[5], P. Lumano Mulenga[6], M. M Mwenechanya[7], P. Haimbe[1], H. Shakwelele[1], R. Nyirenda[8], S. Ngoma[8], A. Gunde[4], B. Nichols[5], S. Rosen[5]

[1]Clinton Health Access Initiaitve, Lusaka, Zambia, [2]Health Economics and Epidemiology Research Office (HE2RO), Department of Internal Medicine, School of Clinical Medicine, Faculty of Health Sciences, University of the Witwatersrand, Johannesburg, South Africa, [3]Health Economics and Epidemiology Research Office, Department of Internal Medicine, School of Clinical Medicine, Faculty of Health Sciences, University of the Witwatersrand, Johannesburg, South Africa, [4]Clinton Health Access Initiative, Lilongwe, Malawi, [5]Boston University, Department of Global Health, Boston, United States, [6]Ministry of Health, Lusaka, Zambia, [7]Centre for Infectious Disease Research In Zambia, Lusaka, Zambia, [8]Ministry of Health, Lilongwe, Malawi

Background: Differentiated service delivery (DSD) models aim to make delivery of HIV treatment more efficient, reduce the burden on healthcare providers, decongest clinics, and improve quality of care and/or increase clinic capacity. Although many countries are implementing DSD models, there is limited evidence on how they affect providers' workloads.

Methods: We surveyed providers (April-November 2021) at 43 public facilities in Malawi (12), South Africa (19), and Zambia (12). A convenience sample of ≤10 clinical (doctors, nurses etc.) and non-clinical (lay counsellors, data capturer etc.) providers per facility who had direct or indirect involvement in DSD implementation were invited to participate. Quantitative and qualitative questions examined changes in providers' work schedules and workloads associated with the advent of DSD models.

Results: 444 providers were interviewed (n=142 Malawi, n=182 South Africa, n=120 Zambia). Most providers reported that DSD models freed up their time (74% Malawi, 71% South Africa, 93% Zambia) and made their jobs easier (90% Malawi, 73% South Africa, 98% Zambia). Freed-up time may have stemmed from seeing fewer patients/day (75% Malawi, 73% South Africa, 98% Zambia), and most respondents stated that DSD models led to changes in how their clinic was managed (80% Malawi, 67% South Africa, 90% Zambia). This change in management may have manifested in multiple ways: about a third reported spending more time with each patient, 11% reported working shorter hours; 11% said that DSD models led to more time for administrative duties. Qualitatively, providers described fewer patients seen daily due to DSD models, reducing their workloads and allowing more time for each patient for administrative tasks and for personal affairs due to shorter hours, resulting in lower stress overall.

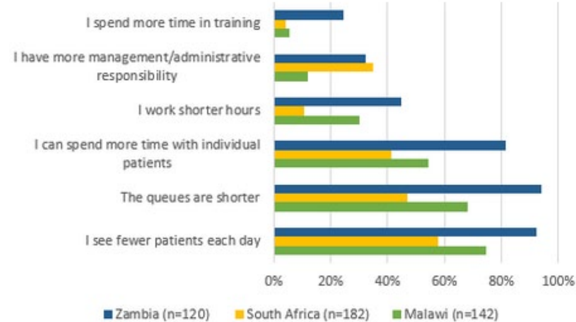

Figure 1. Provider-reported changes to their jobs post-DSD implementation, by country.

Conclusions: A diverse sample of southern African providers reported that DSD introduction freed up time, made their jobs easier, and led to changes in patient and clinic management.

EPE159

Peer-driven approaches to increase uptake of HIV testing services among Fetish Priests who are men who have sex with men (MSM) in the Western Region of Ghana

A. Wosornu[1], S.K. Wosornu[1], S.E. Owusu[1]

[1]*Maritime Life Precious Foundation, Programs Department, Takoradi, Ghana*

Background: Key populations such as MSM are classified as major drivers of the HIV epidemic in Ghana. There are different subgroups of high-risk MSM who do not avail themselves for HIV services. In Ghana, fetish priests who are MSM engage in risky sexual behaviours but reaching them with HTS is difficult because of some superstitious beliefs and the notion that HIV is a spiritual disease and cannot infect fetish priests. Reaching this subgroup of MSM who are fetish priests require using peer-driven approaches to uncover them.

Description: Using the snowball approach, an MSM who was reached, tested, and diagnosed with HIV was encouraged to link his sexual partners within the past year to a trained counselor to provide HTS. The referral chain linked the outreach team to a fetish priest at his shrine. Constant visitation and HIV education were provided to the Priest and was counseled on the need for an HIV test. With confidentiality assurance by the trained counselor, the Priest accepted HTS and was encouraged to link other fetish priests who are MSM for testing services.

Lessons learned: The peer-driven approach using the referral chain of HIV-positive fetish priest reached out to more fetish priests who are MSM in the Prestea district. A total of 20 shrines headed by MSM fetish priests were identified. 15 out of the 20 Priests agreed to test for HIV after constant education and visitation.12 fetish priests who received HTS were diagnosed HIV positive; 3 did not accept their test results and refused to be initiated on ART; 9 accepted their test results and were linked to ART using differentiated service delivery at their various shrines.

Conclusions/Next steps: Targeted approaches to HTS through effective snowball and referral chain strategy is an effective way of reaching out to closeted MSM and should be extended to other districts in the country.
Confidential and accessible differentiated service delivery encourages hidden MSM to seek HIV services themselves. As a next step, continuous education and monitoring should be ensured among the Fetish priests to encourage acceptability of ART among those who refused treatment; and support achievement of viral suppression among those who accepted treatment.

EPE160

Eswatini's Differentiated Service Delivery (DSD) models: adaptation, scale-up and monitoring

N. Kisyeri[1,2], S. Gulwako[1], H. Kamiru[2], M. Rabkin[3,4], W. Reidy[3,4], P. Preko[2], A. Dlamini[1]

[1]*Eswatini National AIDS Program, Ministry of Health, National AIDS Program, Mbabane, Eswatini,* [2]*ICAP Columbia University, Global Health, Mbabane, Eswatini,* [3]*ICAP Columbia University, Epidemiology, New York, United States,* [4]*Mailman School of Public Health, Epidemiology, New York, United States*

Background: Since 2016, the Eswatini Ministry of Health (MOH) has prioritized the expansion of HIV differentiated service delivery (DSD), including scale-up of differentiated treatment (DT) models. Because routine monitoring and evaluation (M&E) systems did not capture key DT data, MOH invested in adaptations to the national electronic Client Management Information System (CMIS) to enable tracking of DSD-relevant data, collected *ad hoc* data on DT scale-up, and conducted annual DSD system self-assessments supported by the multi-country CQUIN learning network.

Description: We triangulated scale-up of DT in Eswatini using national HIV annual program reports (2016-2020), CMIS quarterly reports (2020-2021), results from DT client satisfaction study, and Eswatini's CQUIN annual meeting reports and capability maturity model dashboard staging (2018-2021).

Lessons learned: The proportion of health facilities (HF) implementing DT grew from 22/176 (29%) in 2016 to 193/202 (96%) in 2020. The proportion of ART clients enrolled in DT rose from 13,791/174,103 (7.9%) in 2017 to 164,336/204,286 (80.4%) in 2020. The diversity of DT models also increased over time; the eight current models include 5 facility-based, (Mainstream, Fast Track, Family Centered Care, Treatment Clubs, Teen Clubs) and 3 community-based models (Outreach, Community Drug Distribution, and Community Antiretroviral Therapy (ART) groups).
Tailored DT models are available for adults, adolescents, people with HIV and co-morbidities, advanced HIV disease, men, pregnant and breast-feeding women, high viremic, and key and vulnerable populations. All DT models offer 3-multimonth dispensing (MMD) or 6MMD. *Ad*

hoc studies indicate high levels of client satisfaction. National systems cannot yet compare viral load suppression (VLS) for clients in different models, but VLS for all PLHIV on ART increased from 90% (males) and 91% (females) in 2017 to 96% and 97% respectively in 2020.

Conclusions/Next steps: Eswatini has markedly scaled up DT coverage and diversity, ensuring that HIV treatment is responsive to the needs of different groups and sub-populations. An increasing proportion of PLHIV are virally suppressed, receiving their HIV treatment through DSD models with extended ART refills and less frequent clinical visits.

Moving forward, ongoing investments in CMIS will allow MOH to use routine program data for in-depth monitoring of DT model uptake and outcomes.

EPE161

Effect of peer-delivered community-based tracing support on survival in people living with HIV in China: a propensity-score matched analysis

X. Meng[1], H. Yin[1], H. Zou[2]

[1]*Wuxi Municipal Center for Disease Control and Prevention, Wuxi, China,* [2]*Sun Yat-sen University, School of Public Health, Shenzhen, China*

Background: Despite wide-spread access to antiretroviral therapy (ART), mortality among People Living with HIV (PLHIV) in China remains higher than the general population. Community-based organizations (CBOs) can deliver peer-tracing support to PLHIV to increase access to care and optimize health outcomes. Tracing support was a novel community-based model of health care support for PLHIV.

After taking part in the only CBO for PLHIV in Wuxi, China, patients would be traced by peer health workers to improving their retention in care, ART adherence and survival.

Methods: Data on PLHIV in Wuxi, China from January 2006 until December 2021 was retrieved from the Chinese HIV/AIDS Comprehensive Information Management System. The intervention group included PLWH who received peer-delivered community-based tracing support.

Controls were matched 1:1 using propensity score matching to ensure that their characteristics were comparable to the intervention group. Competing risk model and cox proportional hazards model were used to analyse differences and correlates in AIDS-related mortality (ARM) and all-cause mortality, respectively.

Results: A total of 860 individuals were included in our analysis. The 430 PLHIV in the intervention group were likely to perform better ART adherence (92.1% vs. 83.7%, χ^2=14.176, P<0.001) and more likely to keep retention in care (93.5% vs. 76.1%, χ^2=50.655, P<0.001) compared to the 430 matched controls.

Significantly lower rates of AIDS-related mortality (ARM) (1.8 vs. 7.0 per 1000 person-years, P=0.011) and all-cause mortality (2.3 vs. 9.3 per 1000 person-years, P=0.002) were observed among PLWH in the intervention group. Survival analysis also showed that PLHIV in the intervention group had higher cumulative survival rates compared to those who in the control group (χ^2=9.147, P=0.002).

Competing risk model found peer-delivered community-based tracing support reduced ARM by 72% (SHR=0.28, 95%CI: 0.09-0.95) and all-cause mortality by 70% (HR=0.30, 95%CI: 0.11-0.82). The average cost of preventing 1 death is about USD 30,000 if employing full-time community health workers (CHWs) compared to USD 7,143 through voluntary CHWs.

Conclusions: PLHIV who received peer-delivered community-based tracing support were likely to have significantly improved survival. This model of intervention for PLHIV presented potential cost-effectively and prospective well-powered studies are needed to confirm this perspective.

EPE162

Expanding three-month drug distribution eligibility in Mozambique: impacts on viral load suppression and long-term retention

M. Prieto[1], F. Fabozzi[2], J. Moaine[1], A Candeiro[1], F. Moi[2], J. Pacca[3]

[1]*ThinkWell, ECHO Project, Maputo, Mozambique,* [2]*ThinkWell, Maputo, Mozambique,* [3]*Abt Associates, ECHO Project, Beira, Mozambique*

Background: In response to the COVID-19 pandemic, Mozambique changed multi-month dispensing guidelines to expand eligibility for providing people living with HIV with 3 months of medication and reduce clinic visits (3MMD). Access to 3MMD was expanded by reducing the time on antiretroviral therapy (ART) required for eligibility and eliminating the need for laboratory tests to verify eligibility (CD4 or viral load (VL)). This study assesses the impact of these changes on patients' viral load suppression (VLS) and long-term retention (LTR) in care (>12 months on ART).

Methods: This is a retrospective cohort study of routine data collected from electronic medical records of patients included in 3MMD on/after 30th March 2020. Data was extracted from 20 high-volume health facilities in four provinces, representing 48% of all patients active on ART in those provinces. Patients were divided into 2 cohorts: cohort 1 (C1) included patients who met 3MMD eligibility criteria before the change in policy; and cohort 2 (C2) included patients who started ART on/after 1st November 2019 and became eligible for 3MMD due to the change in policy. All patients were followed until September 2020 to assess VLS (VL<1,000 copies/ml after at least 6-months on ART), and until May 2021 to assess LTR.

Results: 13,041 patients were included (8,009 in C1, 5,032 in C2); 70% were female in C1 and 53% in C2, and 5.6% were children in C1 (ages 0-14 years) vs 2.6% in C2. Distribution of patients in an optimized ART regimen was equivalent across the two cohorts, with 98% in C1 vs 99% in C2. The distribution of patients by time on ART in C1 was: 11.5% ≤1 year; 14.5% 1-2 years, and 73.6% ≥2 years.

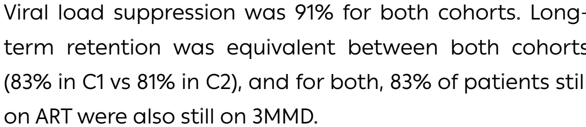
Oral abstracts

Poster exhibition

E-posters

Late-breaker abstracts

Author Index



Viral load suppression was 91% for both cohorts. Long-term retention was equivalent between both cohorts (83% in C1 vs 81% in C2), and for both, 83% of patients still on ART were also still on 3MMD.

Conclusions: Expanded access to 3MMD for HIV treatment had no negative impact on patients' viral load suppression and on long-term retention. These results support the implementation of the expanded 3MMD policy beyond COVID-19 response.

EPE163

Formation of designated weekend clinics for children and adolescents in HIV care at Mayuge HCIV, East Central Uganda improved their viral load suppression rates

K. Joel[1], E. Kalanzi[2], M. Arinaitwe[3], M. Muddu[4], P. Lwevola[1], A. Muhwezi[5], R. Iriso[6], K. Baleeta[2], L. McGough[7], M. Laverentz[8]

LLC, USAID Regional Health Integration to Enhance Services in East Central Uganda ,Jinja, Chief of Party, Jinja, Uganda, [6]University Research Co. LLC, USAID Regional Health Integration to Enhance Services in East Central Uganda ,Jinja, Deputy Chief of Party, HIV Care and Treatment, Jinja, Uganda, [7]University Research Co., LLC (URC) & Center for Human Services (CHS), Global Health Professional: Reproductive, Maternal, Newborn, Child and Adolescent Health; Health Systems Strengthening, Washington, DC, United States, [8]University Research Co., LLC (URC) & Center for Human Services (CHS), Technical Directorate, Washington, District of Columbia, United States

Background: The World Health Organization(WHO) aims to achieve HIV epidemic control worldwide with 95% of adults as well as children and adolescents living with HIV (CALHIV) on ART attaining suppressed HIV viral loads. Data from national population health impact assessments show that children need extra support to live with HIV and achieve viral load suppression (VLS); their VLS rates lag behind adults. In Uganda, for example, VLS for children was 39% compared to 84% for adults by 2020.

The WHO recommends differentiated service delivery as a person-centered approach to improve delivery of HIV services and outcomes for people living with HIV (PLHIV). We sought to pilot dedicated clinic and clinic days for CALHIVs Care at Mayuge HCIV East Central Uganda to evaluate if they would improve their HIV viral load suppression rates.

Description: To address this challenge, the USAID Regional Health Integration to Enhance Services in East Central Uganda (RHITES-EC) project provided technical support to Mayuge HCIV to pilot a dedicated weekend clinic day for children and adolescents in addition to the routine daily HIV clinic days. The designated weekend clinic offered CALHIVs comprehensive healthcare and adequate time with health service providers on a day that did not interfere with school schedules.

Lessons learned: There has been significant improvement in CALHIVs appointment keeping to clinic visits from 69% in August 2020 to 94% in September 2021; similarly in the same time period viral load suppression rates at Mayuge HCIV increased from 38% at baseline in August 2020 to 90% 12 months later, despite the challenges of COVID-19.

Conclusions/Next steps: Running the dedicated weekend clinic days for CALHIVs at Mayuge HCIV improved CALHIV appointment keeping, ensuring adequate contact time for the provision of comprehensive HIV care and treatment package hence contributed to increasing the suppression rate. Technical support to Mayuge HCIV and scaleup to 131 other government facilities in East Central Uganda continues and, since October 2021, occurs under the USAID Local Partner Health Services East Central Activity.

EPE165

High acceptability of a direct-to-pharmacy PrEP delivery model in public health HIV clinics in Kenya: perspectives of PrEP clients and healthcare providers

E. Owidi[1], K. Ngure[2], W. Waituika[1], V. Ogello[1], N. Wairimu[1], E. Irungu[3], C. Kiptinness[1], N. Mugo[4], K. Mugwanya[5], the Efficiency Study Team

[1]Partners in Health and Research Development, Thika, Kenya, [2]Jomo Kenyatta University of Agriculture and Technology, Department of Community Health, Nairobi, Kenya, [3]Jhpiego, Nairobi, Kenya, [4]Kenya Medical Research Institute, Nairobi, Kenya, [5]University of Washington, Department of Global Health, Seattle, United States

Background: High opportunity costs and health system burdens limit oral pre-exposure prophylaxis (PrEP) delivery in Kenyan public HIV clinics. Differentiated care interventions can reduce persistent barriers, and enhance PrEP scale-up and implementation.

We conducted a qualitative study to gather insights of PrEP clients and healthcare providers regarding a PrEP differentiated care intervention aimed at improving efficiency of PrEP delivery in public HIV clinics.

Methods: From March to November 2021, we conducted in-depth interviews with 17 clients enrolled in a direct-to-pharmacy (DTP) PrEP care model with HIV self-testing (HIVST) for PrEP refill visits, and 18 healthcare providers. Participants were purposively sampled from two public HIV clinics in central Kenya.

We used semi-structured interview guides informed by the theoretical framework of acceptability. We used inductive and deductive thematic approaches to understand attitudes, experiences, opportunity costs, burden, and willingness to participate in the intervention.
Results: PrEP clients were 76% female with a median age of 40 years (interquartile range 33-50). Providers were 61% female, and included 44% HIV testing services (HTS), 28% pharmacy, and 17% clinical providers, among other cadres. Participants reported feeling satisfied with the DTP model, as it improved service efficiency and quality, motivating continuation and PrEP adherence.
Clients reported that they experienced less queues and movement between clinic rooms, which improved privacy and reduced HIV clinic-associated stigma. Clients also reported that spending less time in the clinic reduced loss of working hours and income.
Providers reported reduced workload attributed to involvement of fewer staff and improved clinic flow, saving time for other roles. Both clients and providers expressed confidence in, and willingness to continue with the DTP model.
However, participants described concerns of clients possibly missing out on other healthcare services during DTP refill visits, and of HIVST self-efficacy and accuracy. Providers further described worries over shift of workload to the pharmacy and loss of roles among HTS providers.
Conclusions: DTP refill visits with HIVST was highly acceptable as a differentiated care intervention for PrEP delivery among clients and providers.
Context-specific adaptations and scale-up of the intervention could improve efficiency of PrEP delivery in public HIV clinics in Kenya.

EPE166

How do nurses spend their time? A time and motion analysis in the context of differentiated service delivery at primary public healthcare facilities in South Africa

N. Lekodeba[1], C. Hendrickson[1,2], A. Huber[1], V. Ntjikelane[1], B. Phiri[3], I. Mokhele[1], S. Pascoe[1], B. Nichols[1,2], S. Rosen[1,4]
[1]Health Economics and Epidemiology Research Office, Department of Internal Medicine, School of Clinical Medicine, Faculty of Health Sciences, University of the Witwatersrand, Johannesburg, South Africa, [2]Amsterdam University Medical Center, Department of Medical Microbiology, Amsterdam, Netherlands, the, [3]Clinton Health Access Initiative, Lusaka, Zambia, [4]Boston University School of Public Health, Department of Global Health, Boston, United States

Background: Among other benefits, differentiated service delivery (DSD) models are expected to reduce the time that clinicians spend with established ART clients enrolled in DSD models and thus potentially increase available provider time for non-DSD ART and non-ART clients. The actual use of provider time after DSD model implementation has not been reported. We measured healthcare provider time utilization in the context of DSD model implementation in South Africa.
Methods: We conducted a time and motion study at 10 primary clinics in South Africa from August to November 2021. Nurses involved in ART delivery (n=34) were observed for a total of 61 working days; type and duration of activities were recorded. We estimated average minutes spent/nurses/day on each activity and average number of clients seen/nurse/day, stratified by proportion of a facility's ART clients enrolled in DSD models, facility setting, and facility size.
Results: Compared to facilities with DSD model uptake below the median (< 47.7% of ART clients), nurses in facilities with high DSD model uptake worked slightly shorter days (-13 minutes), had more free time/breaks (26 minutes), spent substantially more time on client-related tasks (42 minutes), general administration/meetings (18 minutes), and spent slightly less time on direct client care (11 minutes) (figure). Low or high DSD model uptake did not meaningfully affect the average number of clients seen/nurse/day (26 and 27 clients, respectively). Nurses at facilities with below-median client volumes and in rural areas saw more clients/day. Nurses at rural facilities spent more time on DSD-related tasks and had less free time.

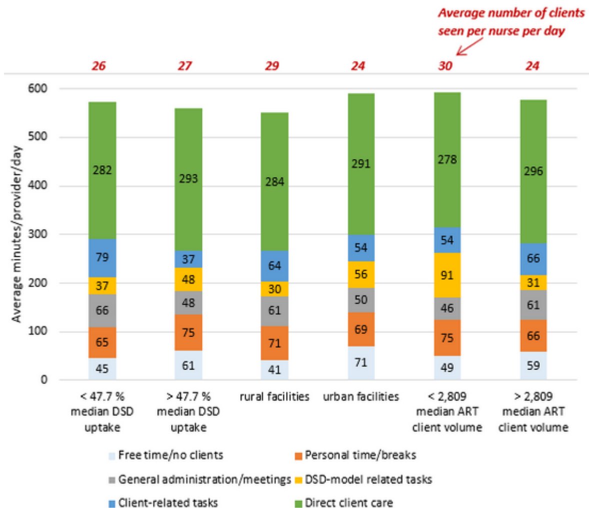


Figure. Average minutes spent per activity per day by nurses in South African clinics.

Conclusions: Nurses in facilities with high DSD uptake spent slightly less time on direct client care but more on related activities; they did not see more clients/day. As DSD model implementation expands, effective reallocation of time may enhance facility performance.

Assessment of the effect of community differentiated service delivery models on viral load suppression among children and adolescents living with HIV in Uganda

C. Mulowoza[1], D. Kalibbala[2], M. Nakanwagi[1], I. Arinaitwe[1], E. Kato[1], M. Luwunzu[1], D. Adoa[1], E. Nazziwa[3], E. Namusoke Magongo[1]

[1]Ministry of Health, Kampala, Uganda, [2]Baylor College of Medicine Children's Foundation-Baylor Uganda, Kampala, Uganda, [3]US Centers for Disease Control and Prevention-Uganda, Kampala, Uganda

Background: Viral load suppression (VLS) for Children and Adolescents Living with HIV (CALHIV) in Uganda has improved but remains low at 74% compared to that of adults (91%), DHIS2 2021. This has been due to suboptimal ARV regimens, non-adherence to treatment due to psychosocial and drug administration challenges. With support from PEPFAR, Uganda started implementing community Differentiated Services Delivery (DSD) models for children (>2 years) and adolescents (10-19 years) living with HIV in 2020. Facility models include; Facility-based individual management model (FBIM), Facility-based groups (FBGs), Fast track drug refill (FTDR) while community models include; Community Drug Distribution Point (CDDP) and Community Client Led ART Distribution (CCLAD).

A national DSD dashboard was developed to monitor VLS among clients on DSD models, by DSD type. We set to assess the effect of community DSD models on VLS among CALHIV across the country.

Description: We retrospectively analyzed data for CALHIV from the DSD dashboard for all HIV antiretroviral (ART) clinics in Uganda from July 2021 to September 2021. This dashboard pulls data from DHIS2 the national reporting system on a quarterly basis. Descriptive analysis included data on demographics and VLS for community DSD models.

Lessons learned: Among 92,562 CALHIV active on ART during July 2021 to September 2021, 56.2% were females and 43.8% were males. Of these, 74.4% were in Facility-based models, 21.0% were in community models and 4.6% un categorized; 28.9% were in FBIM, 45.5% in FBGs, 17.9% in FTDR, 1.6% in CDDP and 1.5% in CCLAD. VLS among community DSD models did not differ by sex (Males = 67.0% vs Females = 66.0%, p-value >0.05) and by community DSD type; CCLAD (62.0%) vs CDDP (61.0%), p-value>0.05). Among children, VLS (<1000 copies) was 62.0% and 75.0% among adolescents living with HIV receiving ART under a community DSD model.

Conclusions/Next steps: We observed lower viral load suppression for children and a comparable VLS for adolescents in community DSD models, compared to the national VLS., There was no significant difference in VLS among the two community DSD models. Children and adolescents living with HIV can still benefit from community DSD models, however, psychosocial support should be strengthened, especially for children.

EPE168

Effectsof multi month dispensing on viral suppression and continuity in treatment among HIV-infected children aged 2 to 9 years in selected health facilities in Western Kenya

R. Oyuga[1], E. Amadi[1], A. Ndaga[1], K. Abuya[2], D. Oneya[3], C. Ng'eno[4], E. Koech[1], N. Blanco[5], M.-c. Lavoie[5]

[1]Center for International Health, Education, and Biosecurity (CIHEB), Nairobi, Kenya, [2]Kisii County, Department of Health, Kisii, Kenya, [3]Migori County, Department of Health, Migori, Kenya, [4]CIHEB, University of Maryland, Baltimore, Nairobi, Kenya, [5]University of Maryland, Baltimore, United States

Background: WHO recommends differentiated models of care, including Multi-Month Dispensing (MMD) for stable people living with HIV. As of June 2020, MMD coverage for children in PEPFAR-supported counties was 51%. After COVID-19 epidemic began (March -2020), Kenya extended MMD to all PLHIV regardless of age and viral load.

We assessed the effects of MMD (>3 months) on clinical outcomes of children living with HIV(CLHIV) aged 2–9 years in Kisii and Migori counties, Kenya.

Methods: We conducted a retrospective cohort analysis of CLHIV on antiretroviral therapy (ART) to assess viral suppression (VS) (<400 copies/ml) and continuity in treatment (no interruption >30 days after a clinical appointment). CLHIV who made ≥1 clinic visit between March 2020 and September 2021 were included.

Those on MMD (≥ 90 days' pills) at any point during the period were classified as ever on MMD. Demographic data and clinical information from 43 facilities was abstracted from electronic medical records and generalized linear models with a log link used to assess VS and retention by MMD enrolment.

Results: Of 963 CLHIV included, 751 (78%) sought treatment in Migori, median age was seven years [Interquartile range 6-9], 488 (51%) were female, 458(48%) were on Dolutegravir (DTG)-based regimen.).

Overall, 756 (79%) of CLHIV were enrolled in MMD. VS at baseline (March, 2020) was 85% (551/649) for MMD-enrolled vs 63% (106/167) for non-MMD. At endline (September, 2021), VS for MMD-enrolled CLHIV had increased to 93% (688/736) with a retention of 91% (691/756), compared to VS of 74% (144/194) and retention of 79% (164/207) among non-MMD CLHIV. Regimen class (DTG, Non-DTG) (OR 0.47, 95% CI: 0.34 – 0.65), region (Kisii vs Migori) (OR 0.46, 95% CI: 0.30 – 0.72) and age (2-4 vs 5-9 years) (OR 2.01, 95% CI: 1.43 – 2.95) were associated with enrollment into MMD.

After adjusting for age, sex, region, and regimen, children on MMD were more likely to suppress (aRR 1.22 95% CI (1.02 – 1.46)) and continue in treatment (aRR 1.12 95% CI (1.02 – 1.19)).

Conclusions: MMD for CLHIV may contribute towards the improvement of VS and continuity in treatment. Continued MMD implementation beyond the COVID-19 pandemic may be beneficial in improving treatment outcomes.

EPE169

Mobile clinics improve HIV testing, ART initiation and treatment continuation among female sex workers in Nampula Province, Mozambique

M. Stefanutto[1], E. Pimentel de Gusmao[1], J. Selemane[2], J. Cuambe[2], T. Ferreira[1], S. Matavela[2], C. Nhampossa[2], M. Negrete[1], M. Pratapsinh[3], S. Carlos[4], C. Wells[5], S. Kung[5], M. Vitale[1]

[1]ICAP at Columbia University, Maputo, Mozambique, [2]ICAP at Columbia University, Nampula, Mozambique, [3]Nampula Provincial Health Directorate, Nampula, Mozambique, [4]Nampula Provincial Health Services, Nampula, Mozambique, [5]ICAP at Columbia University, New York, United States

Background: Reaching and engaging key populations (KP) in HIV prevention, care and treatment (C&T) services is a challenge in Mozambique. An estimated 22% of female sex workers (FSW) know their HIV serostatus (Spectrum v7.584 & Shiny 90), and only 13% are on antiretroviral treatment (ART) nationwide (PEPFAR MER FY20/Q1).

To improve access to health services in Nampula among KP, particularly FSW, ICAP implemented mobile clinic (MC) services within communities and select sex work (SW) hotspots.

Description: In July 2020, ICAP collaborated with Nampula Provincial Health Authorities (DPS/SPS) and KP community partner, Promoção Integrada de Direitos e Saúde (PASSOS), to design an integrated community-based HIV and TB prevention, C&T and general health service delivery approach for KP, utilizing MC and pop-up tents at SW hotspots and community venues in four districts, including night and weekend services. PASSOS identified hotspots and trained FSW to create demand for MC services. ICAP allocated dedicated staff to provide service delivery, including a clinical officer, lay counselor, nurse, and driver. Data from MC services were reported through seven health facilities (HF).

We reviewed data from the pre (July-September 2020) and post (July-September 2021) implementation period to assess the impact of MC on HIV case identification, ART initiation and treatment continuation (defined as patients who did not miss their drug pickup for more than 28 days from their last scheduled appointment) among FSW at the seven HF.

Lessons learned: Between pre and post implementation periods, there was a 137% (912/385) increase in HIV testing, 80% (234/130) increase in case identification, 115% (325/151) increase in ART initiation and 161% (1482/567) increase in treatment continuation among FSW. Between July-September 2021, MC contributed to 32% (290/912) of HIV testing, 30% (70/234) of case identification, 28% (92/325) of ART initiation and 34% (497/1482) of treatment continuation among FSW at seven HF.

Conclusions/Next steps: Implementing MC at community level improved health service provision for FSW in Nampula. Interventions that bring health services closer to FSW and involve KP partners are important to address gaps in access to HIV prevention, C&T. ICAP will continue to work with KP partners and DPS/SPS to strengthen and expand MC services within Nampula.

EPE170

Community health commodities distribution to address community needs during COVID-19 pandemic in Eswatini

N.A. Dlamini[1], N. Kisyeri[1,2], P. Dlamini[3], B. Sithole[3], M.N. Dlamini[1]

[1]Eswatini National AIDS Program, Ministry of Health, HIV Care and Treatment, Mbabane, Eswatini, [2]ICAP Columbia University, Global Health, Mbabane, Eswatini, [3]FHI360, HIV Prevention, Mbabane, Eswatini

Background: Community Health Commodities Distribution (CHCD) was launched in March 2020 as emergency response to COVID-19 pandemic. Eligible Human immunodeficiency (HIV) clients with suppressed viral load(VL) and patients on selected chronic medications refill at community pick up points (PUP).

Antiretroviral therapy, Tuberculosis (TB) and TB preventive therapy (TPT), pre-exposure prophylaxis (PrEP), family planning (FP) and non-communicable diseases (NCD) commodities were distributed. HIV testing and laboratory services are also provided.

Description: By October 2020, about 97 health facilities offered CHCD services during the pandemic. Community members and patients were informed about services in their catchment areas by Expert Clients (EC) during visits to health facilities. Patients were recruited and registered into the CHCD service delivery model at the public health facility. A day prior to service delivery, the CHCD facility team (nurse, EC, and data clerk) prepack the necessary commodities. On the appointment day, the facility team deliver the necessary commodities to the community PUPs where patients access the services.

Lessons learned: From April to October 2020 about 23,906 clients received CHCD services. About 70,000 medications and commodities were distributed every month and approximately 370,000 condoms distributed. Among all medications and commodities distributed, 34,288 (64%) were HIV-related: self-test kits 22,953 (67%); rapid diagnostic tests kits 5,241 (15%); VL test 5,029 (3%), TB and TPT 1,146 (6%) and PrEP refills 1,065 (3%). The non-HIV services commodities were 19,343 (36%),which included, 14,992 (78%) general outpatients' medications, refills for: hypertension 2,204 (11%); diabetes 785 (4%) and FP 216 (1%). Facilities added different curative and HIV related services based on client specific needs, and availability of commodities. However, service package and monitoring and evaluation is not standardized across the country and there is lack of some chronic disease medications.

Conclusions/Next steps: There was a rapid roll out of CHCD during the COVID-19 pandemic, increase access to commodities during COVID-driven lockdown, decongest

facilities, integrated model of care and increased service coverage. We recommend standardization of services to all PUPs. Based on uptake of CHCD and to ensure sustainability, public health facilities need to integrate CHCD in their outreach programs.

EPE171

Viral suppression levels among newly enrolled ART patients on multi-month dispensing of antiretroviral drugs

B. Oyawola[1], C. Mugo[2], M. Hakim[3], T. Adesina[4], L. Madueke[1], Z. Kpamor[1], D. Ogundehin[5], E. James[5], O. Igboelina[5], B.-w. Semo[3]

[1]*Chemonics Nigeria, Abuja, Nigeria,* [2]*Kenyatta National Hospital, Nairobi, Kenya,* [3]*Chemonics Washington, Washington, United States,* [4]*University of Maryland, Baltimore (MGIC) Nigeria, Abuja, Nigeria,* [5]*USAID Nigeria, Abuja, Nigeria*

Background: HIV programs across sub-Saharan Africa adopted multi-month dispensing (MMD) of antiretroviral treatment (ART) as a preventative measure during the COVID-19 pandemic. We evaluated the effect of MMD on viral suppression among newly enrolled adolescents and adults with HIV in northern Nigeria.

Methods: We abstracted electronic medical records for patients ages ≥10 years, newly initiated on ART and with viral load test (VL) done at 6 or 12 months after initiation, across 11 states in Northern Nigeria (April 1, 2019-June 30, 2021).

A VL performed 6-9 months after ART initiation was considered a 6-month VL, while those performed between months 9 and 15 were considered 12-month VL. A VL of <50 copies/ml was considered suppressed. Participants were categorized in the MMD group if they were issued ART for ≥84 days within 6 months of ART initiation.

The period when participants were enrolled was classified as pre-COVID-19 (before April 1, 2020) and during the COVID-19 pandemic.

We estimated the relative risk (RR) comparing proportion of virally suppressed among patients on MMD and not on MMD, and adjusted for age, gender, COVID-19 period, and ART regimen. We report 95% confidence intervals (95%CI) and p values (α=0.05).

Results: Of the 6,415 patients, 94% were >19 years, 66% were female, 73% were enrolled during the pre-COVID-19 period, 86% were on a dolutegravir-based regimen, 54% had a 6-month VL, and 57% had a 12-month VL. Of 3,474 with a 6-month VL, 2,197 (63%) were virally suppressed, while 2,280 (63%) of the 3,638 with a 12-month VL were virally suppressed.

We found that MMD was associated with viral suppression at 6 months (p=0.046). Those on MMD had a 5% higher likelihood of viral suppression compared to patients not on MMD (RR: 1.05 [95%CI: 1.00-1.11]). There is no association between MMD and viral suppression at 12 months, (RR: 1.04 [95%CI: 0.99-1.09], p=0.148).

Conclusions: Approximately two thirds of newly enrolled patients achieved VL suppression after 6 months and 12 months on ART. Multi-month ART dispensing is a plausible option for newly enrolled ART patients.

EPE172

A "One Stop" Differentiated Service Delivery Model in the Maternal and Child Health Clinics improves compliance and viral suppression among children, pregnant and breastfeeding women in Lusaka District, Zambia

S. Chirwa[1], C. Shava[2], J. Chansa[2], E. Kaemba[2], F Lipita[2], F Kunda[2], A. Mumba[2], O. Luneta[2], M Mweene[2], J Lubinda[2], C Mulenga[2], C Bwembya[2], M. Mwanza[2], Q. Bradley[1], P. Juarez[1], X. Bean[1], P. Matthews-Juarez[1]

[1]*Meharry Medical College, Nashville, United States,* [2]*Meharry Medical College Global Health and HIV Clinical Services, Lusaka, Zambia*

Background: Meharry Medical College Global Health Services implemented a PEPFAR-supported program: "One-Stop" differentiated service delivery (DSD) model to improve HIV care for moms and babies at four maternal and child health (MCH) clinics in level 2 hospitals (Chawama, Chilenje, Matero and Kanyama) in Lusaka District, Zambia.

The one-stop DSD clinic model included MCH services and a satellite pharmacy. Implementation includes collaboration with medical superintendents, facility staff, and the Lusaka Provincial Health Office.

Description: The patient-centered, team-based, DSD care model was implemented in October 2020 to establish and coordinate appointments and prevent interruption in treatment. This was accomplished by introducing five, low-cost, low-intensity interventions:

1. An electronic appointment system,
2. Patient appointment reminders with telephone calls and texting,
3. Improved signage for ease in identifying service points,
4. Sheltered waiting areas to promote and encourage clinic attendance during adverse weather conditions, and
5. A mentoring mom program to provide psychosocial support to pregnant and breastfeeding women.

Lessons learned: On average, ~1,600 pregnant women are seen at their first antenatal care (ANC1) visit in the clinics and subsequently monitored through labour and postnatally.A total of 250 (16%) mothers has HIV infections at ANC1 comprising the initial and known positives. If negative, PBFW are re-tested at 3-month intervals to check negative status for HIV infections. Using viral load suppression monitored at 12 month as an indicator of the efficacy of the model, 97% percent of pregnant women and 96% of breastfeeding women in the four clinics have exceeded the target of 95% virally suppressed.

Additionally, 80% of children under the age of 5 years are virally suppressed. Furthermore, over 90% of children under the age of 24 months (>3 kg weight, > 4 weeks age)

have been transitioned from Lopinavir/ritonavir- to Dolutegravir-based antiretroviral treatment regimen to improve viral suppression.

Conclusions/Next steps: The one-stop DSD model has resulted in improvements in prevention, linkages to care, treatment, and ART adherence for mothers and children under the age of 5 years. This model has implication for prevention of mother to child transmission of HIV (PMTCT), increased care coordination and viral suppression for the mothers and children.

EPE173

Strategies to engage men in health care services: lessons from Manica province, Mozambique

C. Augusto[1], V. Macome[1], H. Malate[2], C. Taibo[1], F Faduco[3], A Mofate[3], M. Napua[1]
[1]Pathfinder International, Maputo, Mozambique, [2]Abt Associates, ECHO Project, Beira, Mozambique, [3]DPS Mozambique, Direcção Provincial de Saúde de Manica, Manica, Mozambique

Background: Identifying and engaging men in HIV care and treatment services has been a challenge for health facilities supported by USAID's Efficiencies for Clinical HIV Outcomes (ECHO) project. The Mozambique Ministry of Health (MOH) has guided the implementation of a male engagement (ME) strategy to improve the HIV treatment cascade for men. ECHO developed a plan to implement and operationalize this national strategy with specific interventions at community and health facility levels to improve ME.

This study evaluates the effect of these interventions on ME performance along the HIV care and treatment cascade in Manica province, Mozambique.

Description: In April 2020, ECHO began supporting ME implementation in eight health facilities in Manica. By May 2021, the project developed and implemented a revision of the ME plan, which included a variety of new interventions including trainings for health providers to more consistently offer male-focused services.

This package of services comprised sexual health services, couples consultations, extended service hours, ME-focused lectures in waiting areas, health service brochures and invitations for women to share with their male partners, and community-level interventions such as community dialogues and radio spots targeting men's health.

Lessons learned: ECHO collected routine data from national registers, disaggregated by sex, to analyze male performance in HIV testing positivity rates, people active on HIV treatment, and viral load suppression, focusing specifically on progress at sites implementing the ME plan.

From April 2020 to June 2021, the project observed improvements in HIV testing (47,706 men testing and 3,540 diagnosed with HIV), men active on ART (from 44,625 to 49,007, for a 10% increase) and viral load suppression (from 81% to 88%). These results are encouraging and indicate that these interventions are helping to expand male engagement for HIV health services.

Conclusions/Next steps: A combination of interventions focusing on male interests and needs may get more men engaged in health services. Encouraging a male-friendly environment through health provider capacity building can help attract men to services and get them invested in their health.

EPE174

Multi-month dispensing and use of dolutegravir associated with better viral suppression among children in Nigeria

C. Mugo[1], L. Madueke[2], Z. Kpamor[2], D. Ogundehin[3], E. James[3], O. Igboelina[3], B.-W. Semo[4]
[1]Kenyatta National Hospital, Nairobi, Kenya, [2]Chemonics Nigeria, Abuja, Nigeria, [3]USAID Nigeria, Abuja, Nigeria, [4]Chemonics Washington, Washington, United States

Background: Few studies have investigated the effect of multi-month dispensing (MMD) of antiretroviral treatment (ART) and compared the effect of dolutegravir (DTG) to other regimen on viral suppression in program settings among children in sub-Saharan Africa.

Methods: We utilized program data (July 1, 2020-June 30, 2021) for children ages 0-15 years from 74 facilities in northern Nigeria. Definitions: MMD (ART dispensed for >84 days); viral suppression (<50 copies/ml on recent viral load [VL]); ART regimen (DTG-based, non-nucleoside reverse transcriptase inhibitor [NNRTI-based], and protease inhibitor [PI-based]); regimen-line (first or second line). Multivariate analyses using generalized linear models estimated the effect of ART regimen, MMD, and a combination of MMD and ART regimen on viral suppression.

We adjusted for duration on ART, gender, regimen-line in the three models, ART regimen in the MMD model and MMD in the ART regimen model. We report relative risks (RR), bootstrapped 95% confidence intervals (95%CI) and p values (α=0.05) to account for clustering by facility.

Results: Of 3,824 children, 1,939 (51%) were male, median age of 10 ((IQR: 6-13) years, on ART for 4 (1-6) years; 2,210 (58%) were suppressed, 3,580 (94%) on first line regimen, 2,290 (60%) on DTG, 1,095 (29%) on a PI and 386 (10%) on an NNRTI; 1,590 (42%) were on MMD and 1,159 (30%) were on both DTG and MMD.

Compared to children on DTG, those on a PI had a 16% lower likelihood of suppression (0.84 [0.71-0.99], p=0.049). The difference in suppression between those on DTG and NNRTI was not significant (0.89 [0.71-1.13], 0.306). Those on MMD had an 18% higher likelihood of suppression (1.18 [1.06-1.32], p=0.001) compared to those not on MMD. Lastly, children on DTG without MMD had a lower likelihood of suppression compared to those on DTG+MMD (0.83 [0.76-0.92], p<0.001 and 0.73 [0.63-0.85], p=0.001 respectively). The difference in suppression between those on DTG+MMD and MMD only was not significant (0.83 [0.65-1.07], p=0.162).

Conclusions: Slightly over half of the children achieved undetectable VL levels. VL suppression is higher among children on MMD and those on DTG, and even higher among children on DTG plus MMD.

EPE175

Shifting from 3-multimonth prescribing (3MMP) to 6-multimonth prescribing (6MMP) was associated with non-inferior outcomes for adults on antiretroviral therapy in Rwanda

B. Kwizera[1], G. Rwibasira[1], B. Bizimana[1], E. Remera[1], V. Mugisha[2], S. S. Malamba[3]

[1]*Rwanda Biomedical Center, Ministry of Health, Division of HIV, STIs, Viral Hepatitis and OVDC, Kigali, Rwanda,* [2]*ICAP at Columbia University, Mailman School of Public Health, Kigali, Rwanda,* [3]*Consultant, Kigali, Rwanda*

Background: In 2016, WHO endorsed multi-month prescription (MMP) of antiretroviral therapy (ART) to reduce drug refill frequency for clients established on ART and increase efficiency at both client and facility level. Rwanda started the 3-MMP initiative in 2017 and moved to 6-MMP in July 2020. People Living with HIV (PLHIV) who meet eligibility criteria (age$\geq$18, on ART for >12 months with at least 2 consecutive viral load tests [VLT]<200 copies/mL) can opt into the 6-MMP model, which includes twice-yearly clinic visits and VLT, and provision of 6-months of ART at each visit. We reviewed charts of clients who transitioned from 3-MMP to 6-MMP to compare the outcomes of the two models.

Description: We reviewed charts of all PLHIV receiving at least one year of 3-MMP followed by one year of 6-MMP at a convenience sample of 22 HFs in Kigali, Rwanda, abstracting data on VLT results, VL Target NOT Detected [TND: VL=0], undetectable VL [uVL: VL<20] and VL Suppression [VLS: VL<200 copies/ml] and retention rate defined as reporting in time (<1week) for ART pickups and VLT.

We used paired t-testing to compare VLT and retention for clients' last 12 months on 3MMP vs their first 12 months on 6MMP. VL absolute values were log-transformed and analyzed as either mean or median log VL.

Lessons learned: 10,129 PLHIV were enrolled at study health facilities. There was no significant difference in the mean-log VL values (1.32 vs 1.33) during 3-MMP vs 6-MMP (p=0.998). 28.7% of PLHIV had VL TND during 6-MMP (95%CI: 27.8-29.5) compared to 22.7% during 3-MMP (95%CI: 21.9-23.5) p<0.001.

The proportion of PLHIV with VLS during the 6-MMP period was very high 99.4% (95%CI: 99.2-99.6) but slightly lower than observed during the 3-MMP period 99.8% (95%CI: 99.7-99.9), (p<0.001). Retention improved with exposure time, 67% at 6-months and 74% after 12-months of ART exposure. Stratification showed no significant difference by sex and age group.

Conclusions/Next steps: Transitioning PLHIV established on ART from 3-MMP to 6-MMP did not majorly affect VL outcome measures. Retention improved with the establishment on ART for both periods. HIV programs should consider offering the option of 6-MMP one year after initiating ART.

EPE176

The positive impact of multi-month dispensing (MMD) of ARVs on client treatment continuity

Y.A.A. Rahman[1], H. Tagoe[1], E. Adiibokah[1], D.T. Nartey[1], T. Ayoumah[2], K. Eifler[1], M. Kowalski[1], H. Nagai[1]

[1]*JSI Research & Training Institute, Inc., USAID Ghana Strengthening the Care Continuum Project, Takoradi, Ghana,* [2]*Ghana Health Service, Effia Nkwanta Regional Hospital, Sekondi-Takoradi, Ghana*

Background: Treatment continuity is essential in achieving the second 90% of the UNAIDS 90-90-90 target. However, by the end of 2020, achieving the second 90% eluded most countries in Africa including Ghana. ARV Multi-month dispensing (MMD) is critical to successful treatment because it reduces the barriers to care at both the patient and provider levels. We assessed facility-based differentiated MMD model after Ghana adopted MMD in October 2019.

Methods: This is a longitudinal quantitative retrospective cohort study of clients initiated on ART over a three-year period (2018 to 2020). Data was collected from 58 health facilities that were grouped as district hospitals being secondary level sites (DH=20) or health centers being primary level sites (HC=38). Each facility type implemented the full bouquet of differentiated HIV services including MMD.

The differences between the groups were assessed using population-averaged generalized estimating equations (GEE), controlling for biases of facility hierarchy and available health system structures for HIV services. The primary outcome was ART retention as of May 2021.

Results: A total of 6,709 clients were enrolled, with 4,812 in DH and 1,897 in HC. Overall retention on ART significantly improved from 67% to 98% (p<0.005), with a significant difference in ART retention at HCs compared to DHs (99% and 92% respectively, p<0.001). MMD was the major contributing factor for the significant increase in client retention on ART.

There was no significant difference in MMD across the facility management types (government, faith-based, and private) at each stage of the analysis.

However, there were significant differences in MMD among men compared to women, as men were more likely (6% higher) to receive MMD compared to women.

Other variables influencing MMD were duration on ART, proximity to ART center, commodity security, and adherence to ARVs through self-reporting. Age, educational level, and marital status did not have an effect on MMD.

Conclusions: MMD improves client retention on ART. Program implementers should integrate monitoring systems that ensure proper MMD tracking and provision for

all eligible clients. Policy makers should consider adjusting MMD eligibility to commence within 12 months on ART in resource constrained settings such as Ghana.

EPE177

Providers' perspectives on barriers and facilitators for implementation of differentiated service delivery models for HIV treatment in Beira City, Mozambique

D. Moiana Uetela[1,2], S. Gimbel[2], I. Gaspar[3], C. Inguane[2], O. Uetela[2], A. Dinis[4,2], S. Chicumbe[1], A. Couto[3], E. Samo Gudo[1], S. Gaveta[1], K. Sherr[2]
[1]Instituto Nacional de Saúde, Maputo, Mozambique, [2]University of Washington, Department of Global Health, Seattle, United States, [3]Mozambique Ministry of Health, National STI-HIV/AIDS Program, Maputo, Mozambique, [4]Mozambique Ministry of Health, Maputo, Mozambique

Background: In 2018 Mozambique's Ministry of Health (MISAU) adopted eight Differentiated Service Delivery (DSD) models to optimize available infrastructure and human resources for HIV service delivery and achieve universal coverage. The models are fast flow (FF) – a semiannual visit scheduling, community ART support groups (CASG), 3-monthly antiretrovirals dispensing (3M), ART adherence clubs (AC), and four integration models: three one-stop models (for tuberculosis, maternal and child health, and adolescents) and the family-oriented approach.
We aimed to identify barriers and facilitators for DSD models implementation – both together and individually – in Mozambique.
Methods: We conducted the study in Beira city, a setting with high HIV transmission and HIV treatment demand. We conducted in-depth individual interviews with service providers from a large urban health facility (n=2), from a small rural facility (n=2), and district health managers (n=2), and two focus group discussions (n=5 in a small facility and n=8 in a large facility).
We used an iterative analytical approach to identify barriers and facilitators of successful DSD models implementation, including deductively applying constructs from the Consolidated Framework for Implementation Research (CFIR) to explore implementation determinants for DSD models, and allowing for additional themes to emerge inductively.
Results: CFIR constructs of relative advantage and patient needs and resources were facilitators, while constructs of planning, engaging, and executing were barriers across all DSD models. Specifically, less facility visits were the main facilitator for FF, 3M, and integration models and lack of training was the main barrier across all models.
Providers considered FF and 3M easier to implement and effective in reducing workload. They deemed AC and CASG complex to implement, thus less preferred. They perceived CASG as a preferred model in rural and 3M in urban settings. COVID-19 (inductively identified theme) facilitated patient eligibility for DSD that limited patient visits (FF, 3M), but temporarily interrupted implementation of community-based models (AC, CASG).
Conclusions: The relative advantage of the DSD models was the main identified facilitator. However, successful implementation requires broadly available and on-going training. COVID-19 has expedited DSD approaches that allow for less regular contact with the health system. Our findings will inform MISAU efforts to improve HIV ART delivery.

EPE178

The impact of decentralized "out-of-facility individual delivery models" in improving retention and viral suppression of people living with HIV in northeast India

R. Allam[1], L Shaiza[2], M Ralte[3], V Vero[4], A. Harshana[5], P. Kannan[5], R. Mahajan[5], C. Lalrindiki[5], B. Jamir[5], S. Todmal[5], A.P. Singh[5], A Parvez[5], R Agarwal[1], M. Nyendak[1]
[1]Centers for Disease Control and Prevention, New Delhi, India, [2]Manipur State AIDS Control Society, Manipur, India, [3]Mizoram State AIDS Control Society, Mizoram, India, [4]Nagaland State AIDS Control Society, Nagaland, India, [5]UW International Training and Education Centre for Health Private Limited, New Delhi, India

Background: Mizoram, Nagaland, and Manipur are three northeastern Indian states with the highest estimated adult HIV prevalence of 2.4%, 1.4%, and 1.2% respectively. These three states cater to approximately 32,000 People Living with HIV (PLHIV) through 24 antiretroviral therapy (ART) centres. The treatment retention rates vary between 74% to 80% in these states. Common reasons cited for treatment interruption include long-distance travel, transportation costs, difficult terrain, and loss of wages to visit the ART centre. Differentiated Service Delivery Models, such as decentralized out-of-facility strategies, are critical to prevent treatment interruption.
Description: The out-of-facility individual models are established outside of the usual ART centres and provide ART refills to PLHIV either directly at their home by community health workers or through the collection by the PLHIV at specific locations. Seventeen decentralized out-of-facility individual delivery facilities were established between March 2020 and December 2021. Stable PLHIV with CD4>350 cells/mm^3 without known opportunistic infections and on ART for more than 6 months were linked to these decentralized models. We assessed the overall retention rate, viral load testing access, and viral load suppression (<1000 copies/ml) rates.
Lessons learned: We linked 773 of 18774 stable PLHIV including key populations to these facilities. Of these, 98% (761) PLHIV remain engaged in care through December 2021; 92% (699) were retained in the out-of-facility individual model and 8% (62) were retained in the respective ART centres.

During the follow-up period, 2% (12) PLHIV died. Of the 588 PLHIV who were due for a viral load test, 59% (346) have undergone the test and out of this 92% (318) were virally suppressed.

Conclusions/Next steps: Enabling access through community engagement are pivotal to retention. The differentiated out-of-facility individual delivery model improves engagement in care and ART adherence (viral suppression) among PLHIV. The coverage of viral load testing in these remote geographies remains a challenge due to difficult terrain for access and specimen transport, however, the establishment of the decentralized service sites will allow for future viral load testing through dried blood spots in such remote settings.

EPE179

Viral load outcomes and factors associated with viral suppression among HIV-positive patients receiving multi-month dispensing of antiretroviral drugs in the context of COVID-19 pandemic: experience from 7 states in Nigeria

T. Omole[1], O. Ibiloye[1], P. Jwanle[1], I. Ahmed[1], M. Odido[1], H. Okpe[1], E. Edigah[1], R. Olaitan[1], K. Pwol[2], I. Onwuatuelo[1], J.-O. Samuels[1], P. Okonkwo[1]

[1]APIN Public Health Initiatives, FCT, Abuja, Nigeria, [2]APIN Public Health Initiatives, Makurdi, Nigeria

Background: Innovation in ART type and delivery modality/mechanism has significantly improved the treatment outcomes of people living with HIV (PLHIV). Expanded access to multi-month ARV dispensing (MMD) during the COVID-19 Pandemic helped to mitigate exposure to COVID-19 in health facilities as well as support treatment continuity and viral suppression.

We determined the viral load (VL) testing outcomes among people living with HIV (PLHIV) receiving MMD and factors associated with viral load suppression in health facilities across 7 states (Benue, Ekiti, Ogun, Ondo, Osun, Oyo, Plateau) in Nigeria.

Methods: This is a cross-sectional study of PLHIV receiving MMD in 444 health facilities who were active in care within the period of September 2019 to December 2021. These enrolled clients were categorized based on their ARV dispensing frequency – 1-2 monthly (MMD1-2), 3 monthly (MMD3), 4- 5monthly (MMD4-5) and 6-monthly (MMD6) ARV refill. We determined the VL suppression rate per MMD model and factors associated with VL suppression.

The outcome variable was VL suppression (VL<1000 copies/ml). We extracted data from the Electronic Medical Record and analysis was done using percentages, chi square, and bivariate logistic regression.

Results: As of January 26, 2022, 358,084 patients were active on ART and receiving MMD. Majority 71% (n=358,084) were female. An estimated 0.1% (n=275), 14.1% (n=44,851), 2.4% (n=7,718) and 83.4% (n=265,453) were receiving 1-2 monthly (MMD1-2), 3 monthly (MMD3), 4-5monthly (MMD4-5) and 6-monthly (MMD6) ARV refill respectively. About 89% (n=318,297) of study participants had a recent VL test result. VL coverage rates for patients on MMD1-2, MMD3, MMD4-5 and MMD6 were 74%, 67%, 76%, 95% respectively. VL suppression rates for patient cohorts on MMD1-2, MMD3, MMD4-5 and MMD6 were 76%, 89%, 92% and 96% respectively. Factors associated with VL suppression were age, sex, duration on ART, type of MMD, and ARV regimen type.

Conclusions: Although VL coverage was low, VL coverage and suppression rate among PLHIV receiving MMD-6 was optimal and higher than the third 95% UNAIDS VL target for PLHIV. VL suppression rate for those in MMD1-2 and 3 was sub-optimal. We strongly recommend scale-up of MMD-6 to improve VL outcomes in the national HIV programme in Nigeria.

EPE180

The use of vending machines for dispensing of HIV self-testing kits in Gauteng, South Africa: a pilot study

M. Majam[1], K. Hatzold[2]

[1]University of the Witwatersrand, Ezintsha, Johannesburg, South Africa, [2]PSI, Cape Town, South Africa

Background: Self-care in the age of COVID-19 has come to the fore. HIV programs have suffered major set backs as the focus of the healthcare system in many countries including South Africa has shifted towards COVID-19 prevention, testing, treatment, and vaccination. HIV Self-testing has been demonstrated through many modalities and modes of delivery.

One such delivery method that was tested during the early stages of the COVID-19 pandemic to provide access to HIV self-testing kits was contactless distribution through vending machines.

Description: Between March and May 2021, the STAR-SA team in Gauteng South Africa, partnered with HIV self-test manufacturer, OraSure, to set up three pilot sites for vending machine distribution of HIVST kits. The target population for the pilot was the same as the STAR program i.e. reaching undertested groups such as men, and adolescent girls and young women, and those that have never tested for HIV previously, or not tested in the previous 12 months.

The pilot aimed to assess feasibility, acceptability, and usage of the vending machine in de-centralised testing sites which included a workplace waiting room, a taxi rank, and a private pharmacy.

Individuals were able to access a URL, or QR code that took them to a data free web page to register their demographic information, and receive their unique access code. Thereafter, they would enter the 4 digit number onto the machine to receive their kit.

Lessons learned: Over the course of the 3 months, 900 test kits were dispensed across the three sites, with the majority of kits (91%) dispensed at the taxi rank. Of this, approximately 83% of the kits dispensed to men, were to

men in the age group of 25 - 39. 20% of females that received the test kit in the 15 - 24 age group had never previously tested for HIV. Of the clients followed up through post testing survey, the majority of individuals stated high satisfaction with overall process.

Conclusions/Next steps: Vending machines present an additional approach to distribution HIV self-tests. These outlets can be used for contactless provision of kits to relieve the burden on the system and increase access.

EPE181

Leaving no one behind: The impact of kindergarten ART clinic on HIV treatment outcomes among children enrolled in kindergarten HIV program at Lighthouse HIV care facilities

A. Sankhani[1], B. Chione[1], L. Chigaru[1], E. Ntagarume[1]
[1]*Lighthouse Trust, Clinic, Lilongwe, Malawi*

Background: Children living with HIV (CLHIV) continue to have poor viral load suppression (VL) rates especially the under 5. To address the gap, Lighthouse Trust implemented a kindergarten ART clinic in its HIV care facilities to improve retention, viral load suppression and mortality among CLHIV aged 0-5 years. Hence, the aim of study was to assess the impact of kindergarten clinic on retention, viral load suppression and mortality among children enrolled in kindergarten HIV program

Description: This was cross-sectional study of CLHIV aged 0-5 enrolled in kindergarten program in four Lighthouse trust HIV care facilities from January 2021 to December 2021. The facilities include Umodzi Family Center (UFC), Tisungane Clinic, Martin Preuss Center (MPC) and Rainbow clinic. The kindergarten clinic was conducted on Saturdays every month. The children and caregivers received client centered treatment adherence, psychosocial and nutritional counselling including ART refills. The caregivers also shared their experiences, ideas and best practices to promote treatment adherence. We calculated baseline cohort VL suppression rate using data from Electronic Medical Record system. After 1 year, we measured overall suppression rate, retention rate and mortality rate and analysis included all CLHIV regardless of ART regimen.

Lessons learned: A total of 433 CLHIV aged 0-5 were enrolled, 142 at UFC with baseline VL-37%, 51 at Tisungane with baseline VL -30%, 99 at Rainbow with baseline VL -23% and 138 at MPC with baseline VL-47%. After 1 year, overall VL suppression rate increased from 23% to 91% at Rainbow, 37% to 81% at UFC, 30% to 76% at Tisungane and 47% to 62% at MPC. The retention rate was 81% at Rainbow (81/99), 98% (139/142) at UFC, 92% (47/51) and 99% (137/138) at MPC. There were 3 deaths at UFC but no death in other facilities.

Conclusions/Next steps: Kindergarten ART clinic as a family centered differentiated care model for CLHIV has the potential to improve VL suppression and other important HIV treatment outcomes. Knowing the challenges faced by CLHIV to achieve optimal viral load suppression, scaling up this initiative in high volume HIV care facilities would accelerate progress towards attaining UNAIDS targets among CLHIV.

Strategies to increase retention and re-engagement in HIV services

EPE182

The impact of implementation strategies on PrEP persistence among female sex workers in South Africa: an interrupted time-series study

A. Rao[1], H. Mhlophe[2], A. Pretorius[3], M. Mcingana[3], J. Mcloughlin[2], S. Baral[1], H. Hausler[3], S. Schwartz[1], C. Lesko[1]
[1]*Johns Hopkins Bloomberg School of Public Health, Department of Epidemiology, Baltimore, United States,* [2]*TB HIV Care, Durban, South Africa,* [3]*TB HIV Care, Cape Town, South Africa*

Background: Female sex workers (FSW) make up a disproportionate number of people diagnosed with HIV in South Africa. Pre-Exposure Prophylaxis for HIV prevention (PrEP) is freely available to FSW in South Africa predominantly through TB HIV Care, a local NGO. Trial and real-world data suggest that half of women who initiate PrEP stop by 1-month. TB HIV Care has implemented strategies to improve PrEP persistence among South African FSW, but their impact has not been evaluated.

Methods: We used an interrupted time series design to estimate a level change in the 1-month PrEP persistence associated with rollout of various PrEP delivery implementation strategies (clinical mentoring for providers, SMS PrEP refill reminders, SMS support texts, case management, and loyalty rewards program).

We used routinely collected data from all 9 TB HIV Care FSW sites implementing PrEP between 2016-2021 and adjusted for the monthly count of COVID-19 cases. In sensitivity analyses, we tested the association between each of the strategies and 4-month persistence.

Results: Baseline persistence prior to strategy roll-out was 36% (95% CI: 31.3%-41.8%), with significant heterogeneity across sites. We found that SMS support/refill reminders (IRR: 1.35 (95% CI: 1.20-1.53)) and mentoring for providers (IRR: 1.15 (95% CI: 1.05-1.26)) were positively associated with 1-month persistence among FSW.

The loyalty rewards program was negatively associated with 1-month persistence in the same population (IRR: 0.75, 95% CI (0.67, 0.83)). The strategies that were shown to be useful at promoting persistence at 1-month had no impact on persistence at 4-months.

Conclusions: SMS support, refill reminders and provider mentoring appeared to increase 1-month persistence. Identification and subsequent utilization of these beneficial strategies may improve the utility of PrEP overall to

prevent new HIV infections among FSW. Persistence remains a critical issue, however, and strategies to build on these gains longer term are needed.

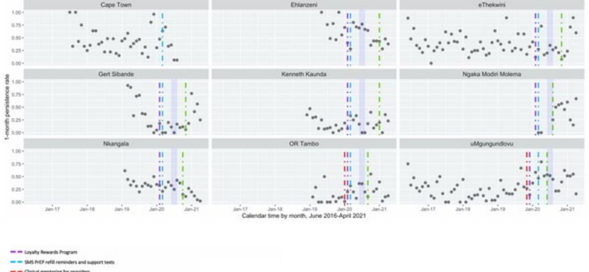

Figure 1. Monthly trends in the 1-month PrEP persistence rate (number persisting/total initiated in the prior month) by site implementing PrEP as part of the TB HIV Care program for female sex workers visualized against the introduction of several implementation strategies designed to promote PrEP persistence.

EPE183

Using Customer retention metrics to design patient-centred interventions for HIV program: a conceptual comparative analysis and lessons learnt from linkage experiences

B. Mabilane[1], K. Rees[2], H. Struthers[3], C. O'Connor[4], J. McIntyre[3]

[1]Anova Health Institute, Quality Improvement, Johannesburg, South Africa, [2]Anova Health Institute, Public Health Specialist, Johannesburg, South Africa, [3]Anova Health Institute, University of Cape Town, Johannesburg, South Africa, [4]Anova Health Institute, Strategic Information, Johannesburg, South Africa

Background: In 2019, Anova Health Institute working jointly with the South African government, rolled out an ART initiation project called 'Not-Ready' that saw ART same-day linkage rates improve from 32% to 82%. The 'Not Ready' tool was intended to engage newly diagnosed clients through six pillars, viz, their basic knowledge of HIV, social support, emotional intelligence, personal adaptive skills, mental health, and intrinsic values for themselves and/or families. The 'Not Ready' tool was innovative and provided sustainability in that two years later, linkage rates remained above 95%. Drawing from successes seen with ART Initiations, we asked if the same approaches used to engage clients to start treatment were the same to be used to retain them in care. With scarce systematic reviews that outline proven retention approaches for the HIV program, we compared retention metrics from service industries to search for synergies and possible areas to benchmark and leapfrog.

Description: We conducted a conceptual comparative analysis of the six factors in the customer retention metrics published by Ascarza and colleagues in 2018, namely,

1. Customer satisfaction;
2. Usage Behaviour;
3. Switching costs;
4. Customer characteristics;
5. Marketing and lastly
6. Social Connectivity

Lessons learned: Our conceptual comprehension is that our pillars synergize with three principles mentioned by the metrics, viz, customer characteristics, social connectivity and usage behaviour. Expanding the service quality of our counselling to include psychosocial aspects and screening for mental illness and other disorders added value and inspired confidence to start ART.

For retention to work, engagements with clients would need further layers from targeted marketing, cost-reducing economic reforms that will buffer clients from direct or indirect costs linked with staying in care, and quality-based client assessments aimed to collect patient-level satisfaction feedback.

Conclusions/Next steps: Our study found synergies between corporate customer retention principles and ART initiation approaches which may signal that half of the time, the reasons patients start ART are fundamental and can be expanded towards retention.

Futurist patient-centred HIV retention strategies should be designed to expand to other features not included in our original ART tool, which are mainly around client satisfaction, marketing and addressing costs through socialized incentives.

EPE184

Liberia's successful expansion of antiretroviral therapy refills through community pharmacies and community-based organizations

M. Odo[1], M. Kun[1], G. Kamanga[1], S. Caldwell[2], N. Lirica[3], J. Toomey[2], D. Darrow de Mora[3], P. Thakur Kumar[4], N.F. Clement[1], M. Bateganya[3]

[1]FHI 360, EpiC, Monrovia, Liberia, [2]NACP, Programs, Monrovia, Liberia, [3]FHI 360, Technical, Washington DC, United States, [4]FHI 360, Strategic Information, Nepal

Background: Provision of client-centered differentiated service delivery (DSD) for antiretroviral therapy (ART) is recommended by the World Health Organization (WHO). Liberia has about 19,000 people living with HIV (PLHIV) on ART. Treatment interruption, due to stigma and long travel distances to treatment sites, is an enduring concern. The USAID and PEPFAR-funded Meeting Targets and Maintaining Epidemic Control (EpiC) project piloted decentralized drug distribution (DDD) through private pharmacies (PPs) and one community-based organization (CBO) in Monrovia, Liberia, to address these issues.

Description: DDD was piloted in Monrovia beginning in April 2021 in one health facility, and from September 2021 in two health facilities, through a collaborative partnership with the National AIDS Control Program (NACP), Liberia Pharmacy Board, health facility management teams, and the Liberia Network of People Living with HIV (LibNeP+). Health facility and PP providers were trained on DDD. A memorandum of understanding was established

between the three collaborating health facilities, PPs, and the NACP. Clients established on treatment were offered the model and selected one ART pick-up location from 26 PPs and one CBO (a LibNeP+ office) for their next ART refill. The LibNeP+ office was added as an option in October.

Lessons learned: Between April and November 2021,1,314 clients established on treatment were offered enrollment in DDD. One Hundred and twenty-four (9.4%) clients accepted and were enrolled from three high-volume health facilities. Ninety clients (77 [85.5%] female; 13 [14.4%] male) chose PPs, and 34 clients (16 [47.1%] female and 18 [52.9%] male) chose the CBO as their preferred pick-up location.

Despite the high interest in DDD expressed by PLHIV at the health facility (52% of 58 clients established on treatment who were surveyed at baseline), the initial enrollment was slower than anticipated. Client concerns expressed during health talks included fear of confidentiality breach and losing contact with their clinicians.

Conclusions/Next steps: DDD is feasible in Liberia. However, expanded pick-up points and targeted counseling to address client fears regarding confidentiality are necessary to sustain the program in Liberia. More work is needed to understand sex-related differences in model choice.

EPE185

Smartphone ownership, preferences and patterns of use among women living with HIV in Cape Town, South Africa

S. Noholoza[1], T.K. Phillips[1], S. Madwayi[1], M. Mrubata[1], C.S. Camlin[2], L. Myer[1], K. Clouse[3,4]

[1]University of Cape Town, Division of Epidemiology and Biostatistics, School of Public Health and Family Medicine, Cape Town, South Africa, [2]University of California, San Francisco, Department of Obstetrics, Gynaecology & Reproductive Sciences, San Francisco, United States, [3]Vanderbilt University School of Nursing, Nashville, United States, [4]Vanderbilt Institute for Global Health, Nashville, United States

Background: Mobile health (mHealth) initiatives are increasingly common in low-resource settings, but the appropriateness of smartphone interventions is uncertain. To inform future mHealth interventions, we sought to describe smartphone ownership, preferences and usage patterns among women living with HIV (WLHIV) in South Africa.

Methods: As part of a smartphone intervention study, we screened pregnant WLHIV in Gugulethu, Cape Town (December 2019 - February 2021). To understand the context of smartphone ownership in this region, we described the sociodemographic characteristics and explored mobile phone ownership of all women screened (n=639), with further description of smartphone use patterns in those enrolled in the study (n=193).

Results: Median age was 31 years (IQR: 27-35), 61% were unemployed and most had completed some high school education.

91% of women screened owned a mobile phone; 87% of those owned smartphones. Among those with smartphones, 92% used Android operating system version 5.0 or above, 98% of phones had the Global Positioning System (GPS), 96% charged their phones less than twice a day, and 86% had their phones with them at the time of screening.

Among 193 women enrolled, 99% owned the smartphone themselves. Only 14% shared their smartphone with someone (71% with a romantic partner), but 96% of these possessed the phone most of the day. Median duration of smartphone ownership was 12 [IQR:5-24] months; median duration of current phone number use was 25 [IQR: 12-60] months. Participants reported a median of 2 [IQR: 1-2] phone numbers in the preceding two years.

Receiving (100%) and making (99%) phone calls were the most common smartphone uses; least used were GPS (55%) and email (47%). Messaging and social media apps such as WhatsApp (94%) and Facebook (58%) were the favourite apps reported.

Conclusions: Smartphone ownership is very common in this low-resource setting. Phone sharing was uncommon, nearly all used the Android system and phones retained sufficient battery life to support mHealth applications. These results are encouraging to the development of mHealth interventions.

Existing messaging platforms – particularly WhatsApp – are exceedingly popular and could be leveraged for interventions. Moderate smartphone and phone number turnover should be a consideration for mHealth interventions in similar settings.

EPE186

Evidence-based brief alcohol reduction intervention in clinical settings among people living with HIV and TB: an Indian perspective

G. Dhumal[1], N. Suryavanshi[1], S. Bagchi[1], P. Bogam[1], S. Bhosale[2], N. Abhivant[3], A.L. Kakrani[2], R. Borse[3], A. Gupta[4], G. Chander[4], A. Nadkarni[5], H. Hutton[4]

[1]Byramjee Jeejeebhoy Government Medical College, Johns Hopkins University Clinical Trials Unit, Pune, India, [2]Dr. D.Y. Patil Medical College, Hospital and Research Centre, Pune, India, [3]Byramjee Jeejeebhoy Government Medical College/Sassoon General Hospital, Pune, India, [4]Johns Hopkins University, School of Medicine, Baltimore, United States, [5]London School of Hygiene and Tropical Medicine, England, United Kingdom

Background: In India, alcohol use is on the rise. It triples the risk of TB among people with HIV (PWH), leads to poor treatment outcomes, and is an important risk factor for morbidity and mortality. Hence, alcohol treatment is an essential component of comprehensive care for PWH/TB.

We conducted qualitative interviews to culturally adapt an existing cognitive-behavioral therapy (CBT) and motivational enhancement therapy (MET) brief alcohol reduction intervention tailored to PWH/TB in India.

Oral abstracts

Poster exhibition

E-posters

Late-breaker abstracts

Author Index

Methods: We conducted 15 in-depth interviews (IDIs); ten with PWH/TB with unhealthy alcohol use (≥8 on the Alcohol Use Disorders Identification Test) and five IDIs with their family members in Pune, India from March to August 2021. Patients and their family members were asked to describe the motivators for alcohol reduction, barriers to cessation, and cessation strategies. Interviews were transcribed, translated, and coded using inductive and deductive coding and analyzed using rapid qualitative analysis.

Results: Participants and family members reported that the patient's self-motivation, family support, and peer narratives were important for alcohol cessation. Withdrawal symptoms, relapse and peer pressure were major barriers to quitting. Family conflict, financial crisis, mental stress, unemployment, and disease severity were reported as major triggers.

Overall, participants felt that emphasizing the negative consequences of alcohol using images and describing the direct impacts of alcohol use on TB and HIV outcomes were important. Other suggestions included avoiding people who drink alcohol, participating in yoga, eating good food, spending time with family, listening to music, and watching television. Participants also suggested gradual rather than abrupt cessation.

Family members also mentioned that therapy should include discussion of the positive impacts on life after alcohol cessation. Both participants and family members preferred intervention delivery by doctors or counsellors as participants often see them in the clinic. They also recommended involving family members in the counselling, to increase motivation at home, though they noted that the family member should be the decision-maker of the household.

Conclusions: With a contextualization of the local culture, a brief alcohol reduction intervention could be acceptable to PWH/TB patients and their family members.

EPE187

Differentiated models of care combining three-month refills and community ARV drug distribution helped keep patients on care and treatment during the COVID-19 pandemic in Tete province, Mozambique

J. Chacha[1], A. Fahamo[1], O. Canhanga[1], V. Macome[2]

[1]*Abt Associates, ECHO Project, Beira, Mozambique,* [2]*Pathfinder International, Maputo, Mozambique*

Background: To ensure patient stability and reduce antiretroviral therapy (ART) dropouts during the COVID-19 pandemic, the Efficiencies for Clinical HIV Outcomes (ECHO) project worked in Tete province to implement MOH guidelines to avoid spreading COVID-19 while keeping patients on treatment. During this period, patients were afraid to approach health facilities for risk of contracting COVID-19 and were at risk of treatment dropout.

Description: The provincial project team analyzed the number of current active patients on Anti-Retroviral Treatment to see the distribution of patients on 3-month drug distribution (3MDD) and participating in community ARV dispensation in all 33 ECHO-supported health facilities in Tete from October 2020 to September 2021. This was done by triangulating and cross-checking different sources (i.e., EPTS Open-MRS, ARV refill records, clinical chart diaries, ARV logbook, and patient prescriptions) where patient information is regularly recorded.

The project called absentee patients and/or reached them to obtain informed consent before offering them drug distribution at the combined community location, thus improving patient retention.

Lessons learned: Following this data source triangulation and analysis of patients active on ART, the project learned that 84% of 69,087 active patients were on 3MDD and 13% were utilizing community drug distribution during the year under analysis. EPTS data showed that ECHO added about 11,162 patients to treatment and managed to keep them on treatment over the same period.

Community ARV distribution comprised 8% of patient ARV access from October to December 2020 and grew to 10% for the period January to March 2021, to 13% for April to June 2021 and to 16% by the end of September 2021.

Conclusions/Next steps: These results illuminate that combining 3MDD with community ARV drug distribution reduces dropouts and increases the number of active patients on treatment. This dual strategy can be improved with longitudinal follow-up of patients using 3MDD, allowing early intervention to offer community ARV pick-up to those who have failed to receive their scheduled treatments directly from health facilities.

EPE188

Assessing the outcomes of multi-sectoral HIV and TB responses (2017-2019) to achieve UNAIDS 90-90-90 targets in Limpopo, South Africa

M.C. Raphahlelo[1], I. Hove[2], L.G. Mokoena[3], T.N. Mampheko[3], D.D. Mashego[3]

[1]*AIDS Council Secretariat, Polokwane, South Africa,* [2]*Beyond Zero, M&E, Polokwane, South Africa,* [3]*Office of the Premier, AIDS Council Secretariat, Polokwane, South Africa*

Background: The Provincial performance of Limpopo province in terms of the achievements of the UNAIDS 90-90-90 targets and reduction of mother to child transmission were assessed through the Mid-term Review of Provincial Implementation Plan on HIV, TB and STIs (2017-2022) a 5-year multi-sectoral plan addressing HIV, TB epidemics in an integrated and collaborative manner.

Methods: A consultative-participatory approach and desktop analysis of secondary data obtained from stakeholders used to review performance for period 2017-2019. Steering committee used to collate secondary data and synthesize the findings.

Monitoring and Evaluation committee provided technical support and validation. Quantitative data analysed to determine the epidemiological trends and make recommendations based on the findings.

Results: Province recorded 93%-78%-83% of UNAIDS 90-90-90 HIV targets in 2019. Clients remaining on ART increased from 72,6% in 2017 to 77,8% in 2019 and this was the highest number of clients remaining on treatment in 2018 (356915) and 2019 (373419) as compared to other provinces in the country. In 2019, three of five District municipalities reached 80% plus of PLHIV remaining on treatment and 85% plus for those virally suppressed. Involvement of community health care workers and partners is beneficial in communities.

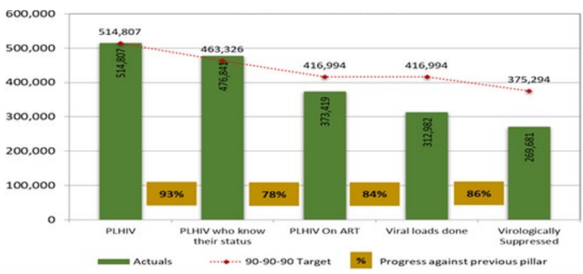

Figure. 90-90-90 Cascade - Total Population
Public sector (Sept 2019 - Limpopo)

Infant Polymerase Chain Reaction test positivity rate around 10 weeks rate declined from 0,83% (123/14768) in 2017 to 0,62% (52/8352) in September 2019. MTCT of HIV declined due to effective implementation of PMTCT interventions including intensified PCR tracking system in 2019.

Conclusions: Limpopo has achieved UNAIDS 1st 90 and is on track to achieve UNAIDS 2nd and 3rd 90 HIV targets due to effective use of community health care workers to promote HIV testing services and retaining clients in care through adherence clubs. Continue to use the multi-sectoral approach in communities to intensify prevention, care and adherence to treatment to achieve the remaining UNAIDS two 90 targets in the era of COVID-19.

EPE189

Strategies to improve Antiretroviral Therapy (ART) initiation and early retention among men in sub-Saharan Africa: a systematic review

S. Hariprasad[1], J. Hubbard[2], B. Nichols[1,3,4], M. Cornell[5], R. Hoffman[2], A. Choko[6], S. Gupta[2], R. Abbott[7], K. Phiri[8], L. Long[1], K. Dovel[2,8]

[1]Boston University, Department of Global Health, School of Public Health, Boston, United States, [2]University of California, Division of Infectious Diseases, School of Medicine, Los Angeles, United States, [3]Amsterdam Universitair Medische Centra, Medische Microbiologie & Infectiepreventie, Amsterdam, Netherlands, the, [4]University of the Witwatersrand, Department of Internal Medicine, Faculty of Health Sciences, Johannesburg, South Africa, [5]University of Cape Town, Centre for Infectious Disease Epidemiology and Research, School of Public Health and Family Medicine, Cape Town, South Africa, [6]University of Malawi, College of Medicine, Blantyre, Malawi, [7]University of California at San Francisco, Divsion of HIV Infectious Diseases and Global Medicine, School of Medicine, San Francisco, United States, [8]Partners in Hope, Lilongwe, Malawi

Background: Men are less likely to initiate antiretroviral therapy (ART) and more likely to experience early default (defined as stopped treatment within 6-months) in sub-Saharan Africa. Little is known about effective strategies to promote ART initiation and early retention among men.

Methods: We conducted a systematic review and searched MEDLINE, Cochrane Central Register of Controlled Trials, CABI Global Health databases and IAS and CROI conference archives for relevant articles. Eligibility criteria included: located in sub-Saharan Africa, quantitative data on ART initiation and/or early retention for males, intervention study, published between July 1, 2017-May 9, 2021, data collected after universal treatment policies, and English text.

Results: 4351 unique articles/abstracts were identified and 15 were included in the analyses. Of the 15 studies, 6 (40%) had a comparison group and 10/15 (67%) had verified outcomes with defined time frames. 12/15 (80%) had data on initiation and 8/15 (53%) had data on early retention. (Fig.)

ART initiation ranged from 25-97% and early retention from 47-95%. Five intervention types were identified. Studies with comparison groups provided the strongest evidence that: same-day facility ART initiation increased men's ART initiation but was inconclusive for early retention; and conditional incentives increased both initiation and early retention, although results were only significant in one study. Ongoing peer support interventions showed a high proportion of clients (>85%) initiating and being retained in care, although these studies did not have comparators. Interventions using community services and outreach only reported on initiation and had mixed results.

Figure. Reported initiation and early retention rates for men in eligible manuscripts (n=15)

Conclusions: Despite programmatic focus on men's ART initiation and early retention, evidence on effective strategies remains scarce. Additional randomized and quasi-experimental studies are urgently needed.

Current studies suggest same-day initiation in facilities may improve initiation. Ongoing peer support and conditional incentives may improve both initiation and early retention; however rigorous studies are needed to confirm potential trends.

EPE190

The use of SMS to support retention in the HIV-negative cascade: lessons learned from a key population-led health service organization in Chiang Mai, Thailand

D. Doncha-um[1], S. Sittikarn[2], S. Duangeong[3]

[1]Chiang Mai University, Social Science, Muang, Thailand, [2]Lopburee Technical College, Civil Construction, Muang, Thailand, [3]Burapha University, Sport Science, Muang, Thailand

Background: To end HIV, all HIV-diagnosed clients need to start anti-retroviral treatment (ART) as soon as possible. However, those diagnosed HIV-negative also need services to ensure that they stay HIV negative, including repeat HIV testing and access to condoms and PrEP. We present here programmatic data from a short message service (SMS) used to retain over 7,000 HIV-negative clients at Caremat, a key population-led heath service organization based in Chiang Mai, Thailand.

Methods: From October 2020 to September 2021, we sent two types of SMS, one for birthday wishes and the other for regular health check-up invitations, to 3,599 HIV negative clients. Data were collected and analyzed using Caremat's monitoring and evaluation application.

Results: 375 clients or 10% of the population contacted through SMS communications returned for HIV testing during the 1-year period. Over half (56%) of these returned more than 3 months after the initial SMS communication. These 375 tested clients accounted for 16% of annual testing numbers. For those returning, 311 or 83% were MSM, 41 (11%) MSW, 20 (5%) TGW, and 3 (1%) TGSW. 98% of all returning clients (368 clients) obtained HIV negative results. Among all HIV negative clients, 141 (38%) initiated PrEP or 66% of annual PrEP new clients. Out of the 2% (7 clients) who tested HIV positive, 6 were MSM and 1 was MSW.4 out of the 7 HIV-positive clients were initiated on treatment during the study period and 3 were in a follow up process. We further calculated that one care and support staff can call approximately 10-15 clients a day for negative retention while an SMS system can reach out to an unlimited number of clients immediately (we estimated the cost of one SMS as US$ 0.07 compared to one call at US$ 1.80 plus staff time).

Conclusions: SMS can complement in-person case management services for HIV-negative populations by offering an easy-to-use and inexpensive means for regular communications, particularly for organizations with limited human resources. These SMS appear to motivate certain key populations to seek repeat HIV testing where they can then be offered PrEP and other services.

EPE191

Promising OVC comprehensive interventions to increase retention to care for children and adolescents living with HIV in Zambia

R. Kanyinji[1], F. Chibesa[1], A. Banda[1], E. Berghammer[2]

[1]Catholic Medical Mission Board Zambia, USAID – Empowered Children and Adolescents Programl, Ndola, Zambia, [2]USAID Zambia, Social Protection, Lusaka, Zambia

Background: The USAID/Zambia funded, five years Empowered Children and Adolescent Program I (ECAP I), led by Catholic Medical Mission Board Zambia, is implementing family based comprehensive case management as a model of care to improve treatment outcomes by retaining HIV positive children and adolescents in treatment and also ensuring that they have suppressed viral loads.

The project is operating in six high HIV burden districts of Chingola, Kitwe, Luanshya, Mufulira, Ndola, and Solwezi of Zambia.

Description: The process started with training 400 Community Case Workers (CCWs) in family based comprehensive case management from 43 targeted health facilities across the six districts. The CCWs promote viral load (VL), viral load sample collection.For C/ALHIV with high VL, case conferencing is conducted involving clinical partners and other community service partners in order to understand the barriers leading to non-adherence to treatment and how these can be addressed in partnership with the family. The C/ALHIV who have been disclosed to are linked to Adolescent support groups where they learn adherence lessons. The CCW further provide enhanced adherence counselling to the C/ALHIV, they provide treatment literacy to caregivers and C/ALHIV.

Program Results:

- Improved VL coverage for C/ALHIV on ART by 2.8% from 90.1% with some health facilities coverage increased to 100.0% from as low as 40.0%
- Improved VL suppression among C/ALHIV on ART from an average of 82.6% in to 90.0 %
- Improved retention in care from 65% to 100.0%.

Lessons learned: Integration of OVC comprehensive support with HIV treatment and care activities improves retention in care and improves health out comes for C/AHIV.
Key Recommendations:

- Scale-up integration of OVC programs and HIV treatment and care programs to improve HIV retention, care, and support for C/ALHIV.
- OVC programs and HIV treatment and care clinical programs need to jointly manage C/ALHIV to achieve lasting improved health outcomes

Conclusions/Next steps: Intergration of OVC programs and HIV treatment and care programs improves HIV retention in care and treatment. Rentation in Care and treatment is improved through enhenced Case conferences and linking the C/ALHIV to support groups which are particulary for them.

EPE192
Introducing the Mentor Mothers and their impact on PMTCT indicators: a case study of Morogoro districts in Tanzania

L. Sonda[1], R. Mgawe[1], J. Kitutu[1], S. Ellis[2], K. Grubb[2], L. Makhupula[2], N. Kwendeni[2]
[1]mothers2mothers, Programmes and Technical Support, Morogoro, Tanzania, The United Republic of, [2]mothers2mothers, Programmes and Technical Support, Cape Town, South Africa

Background: The risk of mother-to-child transmission of HIV (MTCT) can be eliminated when pregnant women are able to access quality and comprehensive PMTCT services. These services include antenatal care (ANC) that offers and facilitates early maternal HIV testing in pregnancy, prompt uptake of lifelong antiretroviral therapy for women who test positive, early infant diagnosis and support services to promote maternal and infant adherence to care and treatment.
In 2019, with support from Ministry of Health, mothers2mother (m2m) introduced a mentor mother program in 10 sites of Morogoro Region to support the PMTCT efforts.
Description: A total of 725 women were enrolled across the 10 sites in Tanzania. The retention -in-care on treatment (RIC) was assessed by reviewing each woman's ART pick up history from facility records for 6 months (From May-sept 2021). RIC data was captured on DHIS 2 during the same period. Early retention was assessed on each visit on monthly basis.
Lessons learned: PMTCT cascade of mother-baby pairs in care in the 10 m2m supported sites indicators improved and increased monthly retention from 81% to over 97% by sept 2021. Resulting in improving quality of care and reduction of HIV transmission to infants following active client follow up and Retention in care. The mentor mother initiative increased adherence to treatment by 99% from an average of 84%. In May 2021, improved documentation, data quality and increased demand for PMTCT services have been attributed by the work of mentor mothers to actively follow up clients, and the provision of psychosocial support. HIV viral load(HVL) coverage increased from 46% to 93% with suppression rate of 98% by sept 2021, and early infant diagnosis (EID) increased from 80% to 93% for the <2months test and only 7% for >2moths test.
Conclusions/Next steps: Mentor mothers offer great potential to empower communities affected by HIV to catalyze positive behavior change. Through the quality improvement (QI) approach, the capacities of the health facility staff strengthened to identify performance gaps in PMTCT services delivery and develop an improvement plan. Leveraging retention and adherence to care in the facilities implementing the mentor mother model initiative.

EPE193
Implementation of telemedicine for HIV Care in the public health system of Buenos Aires, Argentina: a qualitative study based on surveys among health workers to asses acceptability of this strategy

M. Bullo[1], T. Kierszenowicz[2], M.C. Acosta[1], M.J. Rolon[3], M. Cabrini[3], D. Cecchini[4], C.G. Rodriguez[4], P.G. Scapellato[5], E.G. Bottaro[5], M.H. Losso[1]
[1]Servicio de Inmunocomprometidos, Hospital J.M. Ramos Mejía, Buenos Aires, Argentina, [2]Buenos Aires University / National Scientific and Technical Research Council, Buenos Aires, Argentina, [3]Servicio de Infectología, Hospital Dr. Juan A. Fernández, Buenos Aires, Argentina, [4]Servicio de Infectología, Hospital Dr. Cosme Argerich, Buenos Aires, Argentina, [5]Servicio de Infectología, Hospital Donación F. Santojanni, Buenos Aires, Argentina

Background: In October 2020, a research consortium by four HIV and infectious diseases units of general acute public hospitals of Buenos Aires city began an implementation study aimed to analyze obstacles and facilitators of telemedicine in the care of people living with HIV(PLHIV).
Methods: This research aims to analyze changes and continuities in the perceptions of physicians on telemedicine when caring for PLHIV after 6 months of implementation of this strategy. We prospectively collected quantitative and qualitative data through an electronic semi-structured survey delivered at and 6 months after the implementation of telemedicine. The population studied consisted of medical doctors from four public hospitals in the city of Buenos Aires involved in telemedicine care for PLHIV. Instruments collected data on perceptions about:
1. The future use of telemedicine;
2. The obstacles and benefits of this strategy.
The surveys were anonymous and self-administered. The data was stored on Redcap® platform.
Results: 30 physicians completed a questionnaire at baseline and 6 months after the implementation of the telemedicine. 20 (66.7%) were female physicians. Median age was 51 years old (IQR: 44-60).In both periods, all physicians surveyed (100%) stated that telemedicine would remain in the future as a parallel strategy to face-to-

Oral abstracts

Poster exhibition

E-posters

Late-breaker abstracts

Author Index

face consultations. 15 (50%) supported that it should be offered to specific groups of patients, such as those who are asymptomatic.

The perception on the use of computer equipment as an obstacle decreased from 15 (50%) (baseline) to 4 (13%) (month 6). Internet connection in hospitals remained as one of the main barriers (baseline: 23 (77%); month 6: 21 (70%)). Lower rates of spontaneous demand consultations were the only perceived benefit that increased after 6 months (baseline: 15 (50%); month 6: 18 (60%)). Physical examination was the most affected medical practice by tele-care (baseline: 100%; month 6: 80%).

Conclusions: The use of computer equipment and connectivity was a challenge but clearly by the end of the 6 months, still perceived as a valuable tool for physician-patient interaction. All practitioners believed that telemedicine would continue to be provided in the future. Its offer to specific groups of patients could be associated with the acceptability of this strategy.

EPE194

Community provision of ARVs in Niassa: impacts on retention for ART patients

R. de Castro[1], D. Furuma[1], P Ambasse[1]

[1]*Abt Associates, ECHO Project, Beira, Mozambique*

Background: To maintain social distancing in health units, particularly among persons living with HIV, the Mozambique Ministry of Health (MOH) provided guidance to accelerate the inclusion of clients under differentiated models of care. To support this, USAID's Efficiencies for Clinical HIV Outcomes (ECHO) project developed an alternative model of community distribution of ARVs (CDA), which the MOH then adopted. ECHO designed the CDA model to get antiretrovirals (ARVs) into the hands of those lacking resources. ECHO analyzed the CDA model's impact on increasing and retaining patients active on antiretroviral therapy (ART).

Description: CDA identifies defaulting patients through triangulation of clinical records and data from the electronic patient system (EPTS). In Niassa, this began in June 2020 at 11 health units. The CDA model incorporated patients who had difficulties accessing their local health unit, but excluded patients with no interest in treatment, children under 2 years old, pregnant and lactating women, and patients co-infected with tuberculosis.

When identifying patients, health providers organize clinical records and medication based on CDA eligibility. Through CDA, health providers use motorcycles to reach patients with ARVs. Once ARVs are distributed via CDA, providers upload information into the database and file the patient's clinical record.

Lessons learned: The CDA is popular in communities. It keeps patients on ART, improves trust between health providers and patients, and reduces crowding in health units. Between April and September 2021, 7,511 patients received from CDA, corresponding to 35% of the total number of active patients on ART in the area of implementation. Of those eligible for the CDA model, 85% participated. In the same period, CDA helped the number of patients active on ART to grow by 9%, from 20,008 to 21,729 patients. 33-day and 99-day retention remained above 90%.

Conclusions/Next steps: CDA has been a valuable strategy in Niassa and helped improve ART retention and overall access to treatment. The strategy can be used in other communities, particularly in remote areas where patients face similar challenges.

EPE195

Utilizing telework for continuous access to sexual reproductive health and HIV services among adolescent girls and young women in Zambia

K. Poho[1], L. Lockett[2], L. Spencer[2], V. Mhango[1]

[1]*Charles R. Drew University, Monitoring and Evaluation, Lusaka, Zambia,* [2]*Charles R. Drew University, Office of International Affairs, Los Angeles, United States*

Background: Between March and August 2021, the Government of Zambia enforced partial lockdowns in response to the Covid-19 pandemic, which adversely affected access of Adolescent Girls and Young Women (AGYW) to sexual reproductive health services (SRH), including HIV information. The restrictions in Zambia, which included closure of schools, contributed towards increased risk of HIV, teenage pregnancies, child marriages and sexual- and gender-based violence.

In response, Charles R. Drew University employed telework strategies through the Rise Up! Project to provide HIV and SRH information to AGYW.

Description: Using email, social media, and telephones to provide SRH and HIV information to AGYW, the Rise Up! Project ensures close communication through peer navigators who provide information and linkage to services. The peer navigators contact AGYW who are HIV-positive and make pharmacy and laboratory appointments with them. The services are then fast-tracked in order to minimize exposure to Covid-19.

Lessons learned: The use of telework strategies successfully built the capacity among the peer navigators to provide linkage and escorted referrals to AGYW reached online. This has strengthened collaboration with facilities to fast-track AGYW accessing SRH and HIV services amidst pandemic restrictions.

During the three-months lockdown from June-August 2021, the Rise Up! Project reached 14,803 AGYW through the Rise Up! Facebook page. The program subsequently linked at least 2,551 AGYW to HIV testing services, of which 262 tested positive and were all linked to care and treatment. The program was used to remind 840 positive AGYW of their clinical appointments, of which 717 (85%) adhered to their appointment while 123 (15%) didn't. Further follow up ensured that 112 (91%) of those who missed their appointment were brought back to care.

Conclusions/Next steps: Telework, including appointment reminders and virtual sessions, were used to reach and support AGYW during the COVID-19 lockdown.
Tailored virtual information dissemination should continue to be tested, refined, and strengthened. This includes the Rise Up! SRH toll free line, SRH cell phone application, podcasts, webinar series, radio, brochures, posters and video animations.

EPE196

Impact of a One-Stop model and its contribution to early retention in Tete province, Mozambique

O. Canhanga[1], J. Chacha[1], A. Fahamo[1], J. Saturnino[2]
[1]*Abt Associates, ECHO Project, Beira, Mozambique,* [2]*ThinkWell, ECHO Project, Maputo, Mozambique*

Background: Improving 33- and 120-day antiretroviral treatment (ART) retention is one of Tete province's biggest challenges. USAID's Efficiencies for Clinical HIV Outcomes (ECHO) project addressed this through a One-Stop service model, implemented during a patient's first six months on ART, whereby a patient consistently attends consultations with one individual clinician. Results show positive impacts of this One-Stop model on 33- and 120-day patient retention.

Description: ECHO began implementing the One-Stop model in August 2019 across 32 health units. The model is available to new ART patients who have been over 14 years of age for at least six months, though it excludes pregnant patients and those with tuberculosis.
As part of the model, health workers lead patients to a One-Stop appointment, where a clinician provides an ART consultation as well as psychosocial support, adherence follow-up, prophylaxis, and sample collection for clinical analyses. The clinician monitors patients by documenting the consultation and recording contact information, including the client's home address for future follow-up.
ECHO monitors the clinician's schedule both daily and five days in advance of appointments, and further contacts patients directly to schedule appointments with counselors and psychosocial support.
In the case of missed appointments, health workers contact patients and transport them to the health unit the next day. After six months of treatment, clinicians collect viral load samples and share results with patients, who are then referred to follow-up services.

Lessons learned: When patients consistently receive care from the same provider, they have improved clinician-patient relationships, feel comfortable disclosing important lifestyle details, receive individualized support, are monitored more closely, and are more likely to schedule future consultations.
In October 2019, before ECHO implemented the One-Stop model in Tete, 33- and 120-day retention were at just 67% and 79%, respectively. In August 2020, once the intervention launched, 33- and 120-day retention rose to 91% and 90%. By the end of June 2021, 33-day retention was at 97% in Tete, while 120-day retention had grown to 98%.

Conclusions/Next steps: The One-Stop model enabled better clinical follow-up, ensured stronger trust, and improved retention. The model can further be expanded to similar contexts.

EPE197

The impact of a walk-in HIV care model for people who are incompletely engaged in care: the Moderate Needs (MOD) Clinic

R. Kumbhakar[1], J.Z. Budak[1], Y. Tao[2], E. Lake[3], J. Beste[1], N. Navabi[3], E. Mose[2], J. Lee[2], K. Hara[2], S. Dhanireddy[1], J.C. Dombrowski[1,4]
[1]*University of Washington, Allergy and Infectious Diseases, Seattle, United States,* [2]*University of Washington, Seattle, United States,* [3]*University of Washington, General Internal Medicine, Seattle, United States,* [4]*Public Health-Seattle King County, Seattle, United States*

Background: The Moderate Needs (MOD) Clinic provides walk-in, team-based primary care and support services for people with HIV. Patients are referred to MOD based on incomplete engagement in care. We evaluated patients' changes in viral suppression and engagement in care during the year after MOD enrollment and compared these outcomes to eligible controls who remained enrolled in the general HIV clinic.

Methods: In this retrospective cohort study, we conducted two comparisons based on electronic medical records data:
1. Outcomes among MOD patients enrolled 1/2018-10/2020, comparing 12 months post-enrollment vs. baseline and;
2. Outcomes among "MOD-eligible" patients enrolled in MOD vs. those not ("eligible controls") 1/2018 – 10/2020, comparing outcomes 12 months post-eligibility vs. at eligibility.
We defined MOD eligibility as either ≥3 no-shows in 12 months or an 18-month gap between visits.
The primary outcome measure was *viral suppression* [VS; viral load (VL) < 200 copies/mL], defined by the last measurement during the analysis period. Secondary outcome measures were *engagement in care* (≥2 visits ≥60 days apart) and *sustained VS* (≥2 consecutive suppressed VL results ≥60 days apart).We compared pre vs. post-enrollment outcomes using a McNemar chi-squared test and post-eligibility outcomes among MOD patients vs. eligible controls using a chi-squared test.

Results: By 10/2021,213 patients enrolled in MOD. 149 patients enrolled >12 months before study end, among whom VS did not change significantly in the year post-enrollment (73% to 70%, p=0.18). 84% were engaged in care; 54% achieved sustained VS. Comparing 68 "MOD-eligible" MOD patients to 517 eligible controls, MOD patients were less likely to be virally suppressed at eligibility (70% versus 82%, p=0.02) and had lower CD4 counts (p=0.01). VS

Oral abstracts

Poster exhibition

E-posters

Late-breaker abstracts

Author Index

increased among MOD patients (70% to 75%, p=0.7), and decreased among controls (82% to 74%, p<0.001). VS in the total clinic population during the study period was unchanged. Engagement in care 12-months post eligibility was higher in MOD patients than controls (78% versus 64%, p=0.05); there was no difference in sustained VS (43% versus 49%, p=1).

Conclusions: Enrolling in a walk-in HIV clinic improved engagement in care and may have improved VS among persons incompletely engaged in HIV care.

EPE198
The role of community participation in the increase of HIV services uptake by Key Populations in the Fortportal region in Western Uganda

P. Namakula[1], WONETHA-Team
[1]*WONETHA, Kampala, Uganda*

Background: WONETHA in consortium with Baylor Uganda has been implementing ACE Forte project in the Fort portal region since July 2018.

The Project is to contributing to the Ministry of Health efforts to reduce the Incidence of HIV infections and HIV/AIDS related morbidity and mortality among children and adults in Uganda in line with the UNAIDS 95%-95%-95% targets for the epidemic control. The 5 year project commenced in July 2018, covers the 8 districts of Western Uganda(Fort Portal region) and WONETHA focuses on Key Population. The entire project covers both children and Adults but WONETHA focused on the Key Population.

Project objective:
1. Reduce HIV incidence through targeted, tailored and evidence based prevention interventions for key populations.
2. Optimize interventions that increase identification of undiagnosed KPLHIV and linkage to quality care and prevention services.
3. Intensifying interventions and innovations to provide effective linkage care and Treatment for PLHIV and TB.

Description: WONETHA's role has been mainly conducting, identification, profiling, mobilization, referral and linkage to care for KPs to access comprehensive HIV testing services. This has been done in conjunction with the public Health facilities, using the Peer to Peer Approach.

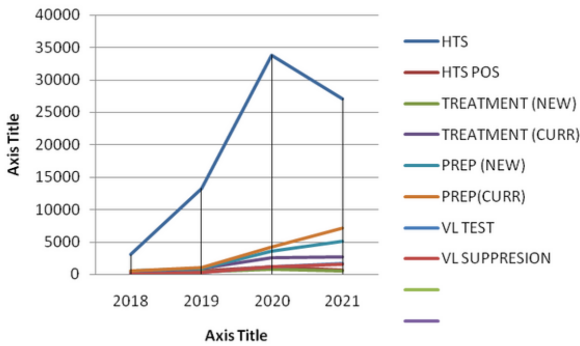

Figure. HIV Service access by KPS in the Rwenzori region 2018-2021

Lessons learned: Results reveal that there has been an increase in service uptake by Key Populations where the sex workers have been engaged in mobilizing their peers and offering some of the prevention services.

The results reveal that the community participation result in increased HIV service uptake.

Conclusions/Next steps: The results indicate that since WONETHA got involved in mobilizing KPS for HIV services, the the service uptake is steadily increasing. While the sex workers are engaged in supporting HIV service delivery, they are not trained.

The Peer Educators should be trained in counseling to effectively support adherence, and HIV treatment and Prevention Literacy such that they give correct information.

EPE199
Implementation of a ridesharing intervention to address transportation vulnerability for people living with HIV in the southern United States: qualitative findings on acceptability and feasibility

S. Harrison[1], S. Miller[1], M. Paton[1], K. Green[2], R. Rao[2], P. Hung[3], D. Ahuja[2], S. Weissman[2], T. Evans[4]
[1]*University of South Carolina, Psychology, Columbia, United States,* [2]*University of South Carolina, Internal Medicine, Columbia, United States,* [3]*University of South Carolina, Health Services Policy and Management, Columbia, United States,* [4]*ViiV Healthcare, Research Triangle Park, United States*

Background: People living with HIV (PLHIV) in the southern United States (US) are more likely to have delayed linkage to care and to fall out of care compared to individuals from other regions. Social determinants of health (e.g., poverty, poor infrastructure) are drivers of these disparities.

The current study sought to reduce transportation vulnerability among PLHIV in South Carolina—a rural southern state. Specifically, we implemented a concierge "app-based" (i.e., LYFT) ridesharing program for PLHIV with transportation vulnerability. We then completed semi-structured interviews to examine feasibility and acceptability of the program.

Methods: First, we enrolled 160 PLHIV in a randomized clinical trial to determine whether a ridesharing program improved viral suppression rates compared to standard transportation over a 12-month period.

We recruited a subset of participants (*N*=20) to complete semi-structured, in-depth interviews about their transportation experiences. All PLHIV were re-engaging with HIV care after $\geq$9 months absence or were engaged in care but not virally suppressed. Interviews were audio-recorded, transcribed, and checked for accuracy.

We used a deductive and inductive approach with two coders to identify themes abound implementation, including participants' views on feasibility and acceptability of the program.

Results: Participants largely described the concierge ride-sharing program as "quick and easy" and indicated they would recommend it to other PLHIV. The program was perceived as safe, with many PLHIV reporting past negative experiences with other forms of transportation. An important theme was concern about program maintenance.
Specifically, multiple PLHIV indicated that while they valued the free program, they could not pay for the service themselves outside of the trial. Many PLHIV also expressed a preference for having clinic staff manage logistical aspects of the program (e.g., ordering rides) due to lack of comfort, access, and/or ease with smartphone technology traditionally used for ridesharing services.
Conclusions: Addressing transportation vulnerabilities among PLHIV in the southern US is critical to reduce disparities and ensure access to HIV care.
An ongoing trial of a ridesharing program will provide insight into novel ways to address transportation vulnerability among PLHIV in the US. Qualitative findings suggest the program is perceived as a feasible approach for helping PLHIV overcome transportation-related challenges.

EPE200
Effectiveness of real-time client tracking tools in reducing Interruption in Treatment: evidence from a low resource setting, Zimbabwe

M. Munjoma[1], J. Mavudze[1], M. Pako[1], B. Ndlovu[1], A. Muropa[1], I. Moyo[1], N. Shoko[1], T. Moga[1], B. Mutede[1], N. Taruberekera[1]
[1]*Population Solutions for Health, Harare, Zimbabwe*

Background: Despite the impressive progress on achieving the UNAIDS 95-95-95 goal by 2030, Interruption in Treatment (IIT) remains one of the biggest threats in Sub-Saharan Africa especially due to COVID-19 among other challenges. UNAIDS estimates that one in five experience IIT after being on ART for at least 12 months. In Zimbabwe, IIT is equally high (estimated at 13-20%).
Population Solutions for Health (PSH) with USAID funding, invested in a client-level electronic record management system (Bahmni) that generates real-time data to improve ART retention.
Description: Between February – December 2021 PSH implemented a Continuous Quality Improvement (CQI) intervention utilizing Bahmni to generate real-time ART data from 5 Zimbabwean districts. A weekly electronic line-list of clients due for ART refills was generated to facilitate client follow-up through phone calls and home visits.
The investigators tracked 7,903 clients; Female sex workers (FSW), Men who have sex with Men (MSM), and General Population (GP) on ART from February to December 2021 implementing the CQI strategy and recording month-on-month ITT.
Lessons learned: IIT was 7.1% ((6.1% – 8.2%) 95% CI) at the onset of the intervention, and dropped almost monotonically to under 1% (0.4% (0.3%-0.5%) 95% CI) by December 2021. There were no differences in ITT rates by population type (illustrated in the graph) nor by age and gender.
Real-time data enabled a timely client-provider interaction that resolved challenges faced by the client (including COVID-19 induced travel restrictions). The CQI strategy included differentiated service delivery to improve access to ART medication.

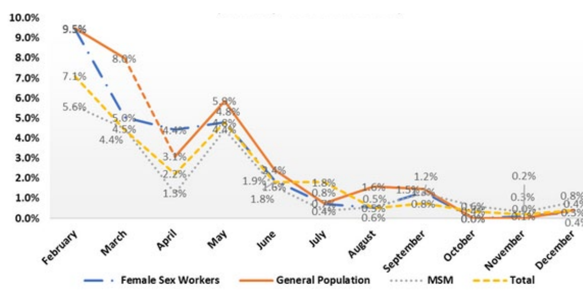

Figure. Month on interrupted in treatment by population type (February - December 2021)

Conclusions/Next steps: The EMR has shown to be an effective tool in tracking clients on ART to reduce IIT. Generating real-time data allows for a much more rapid and effective client-provider interaction that translates into improved ART cohort management.
This innovation must be scaled up especially in low-resource settings where patients face diverse challenges that result in IIT.

EPE201
Quality improvement approaches to optimize care given to children and adolescents living with HIV in Lango sub-region of northern Uganda

R. Nekaka[1], P. Donggo[2], S. Ajedra[3], R. Nansambu[2], M. Makumbi[2]
[1]*John Snow Inc., Quality Improvement, Lira, Uganda,* [2]*John Snow Inc., Lira, Uganda,* [3]*John Snow INC, Lira, Uganda*

Background: Providing quality care for children and adolescents living with HIV(CALHIV) remains a global challenge and requires development of new healthcare delivery strategies. The USAID Regional Health Integration to Enhance Services-North, Lango (RHITES-N, Lango) project, through a health system strengthening intervention, used targeted quality improvement (QI) methods to accelerate care given to CALHIV.
Description: Between March and November 2021, RHITES-N, Lango invited 59 health facilities in the region to join a 'learning network' based on prescribed HIV care and treatment services. Clinic QI teams, consisting of nurses, counsellors, community linkages facilitators, data clerks, medical and clinical officers met to establish collective and individual performance targets, analyzed facilities' care systems using 'real-time' data feedback from an excel audit tool, were trained on best practices and implemented a set of simple tailored interventions to improve the proportion of CALHIV receiving comprehensive care.

Oral abstracts

Poster exhibition

E-posters

Late-breaker abstracts

Author Index

Some of the interventions included line-listing clients due for appointment and giving them reminders. Facility data was reviewed and summarized weekly.

Lessons learned: 6,257 CALHIV were audited out of a target of 6,142 (102%) by November 2021. The proportion of CALHIV who received all the services they were eligible for increased from 30% in March 2021 to 80% (average) in November 2021. In turn, several service delivery indicators improved. 97% of the CALHIV had been screened and linked to OVC services, 100% were optimized to the optimal regimen, 91% were initiated on TB prophylaxis treatment, and 80% had an up-to-date viral load test.

Improvement was observed across 59 facilities.The proportion of CALHIV receiving all services increased by 50% in eight months.

Conclusions/Next steps:

- System improvement methods, standardized audit tools, use of real-time data, and opportunities for cross learning improve clinic processes and outcomes in a resource-constrained setting.
- The use of multiple stakeholders including health facilities and community members strengthens service integration and improves client care.
- A QI approach, using learning networks to teach simple data-driven methods for addressing system failures, with increased training, replicable best practices and resource inputs, can assist districts to quickly reach universal coverage targets.
- The use of the audit tool enabled the teams to identify and address performance gaps.

EPE202

Patient-initiated clinic appointment enhances retention and adherence to ART among adults living with HIV

N. Kalanga[1], T. Mwale[2], S. Mpinganjira[3]

[1]Kamuzu University of Health Sciences, Health Systems Management, Blantyre, Malawi, [2]Medecins San Frontiers, Blantyre, Malawi, [3]Ministry of Health, Ntcheu District Health Office, Ntcheu, Malawi

Background: Despite making significant progress in the fight against HIV and AIDS over the past decade, Malawi is yet to meet the World Health Organization (WHO) recommended target of 85% ART adherence. Due to unreceptive clinic environment some patients with HIV are scared to return to the clinic when they miss a scheduled appointment.

In June 2021, the Malawi Ministry of Health with support from Kamuzu University of Health Sciences (KUHeS) piloted a patient-initiated clinic appointment (PICA) strategy at Bwanje Health Center in Ntcheu district of Malawi to allow adult patients to participate in health care decisions and enhance patient retention in HIV care.

Description: The PICA strategy, a patient-centered innovation, empowers individuals who are stable on ART to choose their preferred next clinic appointment based on their schedules. The clinician then gives the patient enough medication to last for the specified duration (maximum of six months). Patients are advised to come earlier to the clinic if they anticipate that they may no longer be available on their scheduled appointment.

Lessons learned: Between June and December of 2021, Bwanje Health Center had 216 patients registered in the HIV program, including 17 new patients. Patient retention during the six months of PICA implementation increased from 87% to 99%. Adherence to ART (estimated by pill count) also increased from 83% to 97%. Only 8 patients missed their scheduled clinic appointments by more than two weeks. 22 patients (10%) came to the clinic earlier (between 1-14 days) before their scheduled appointment due to their anticipated busy schedules.

Feedback from the patients indicates that PICA has improved the interaction between patients and health workers to create a common shared treatment plan and discuss the patient's challenges with treatment adherence. In addition, the patients feel obliged to not miss the scheduled clinic appointment of their choosing.

Conclusions/Next steps: The patient-centered PICA strategy can improve retention and re-engagement in HIV care. When allowed to participate in health care decision-making, patients feel empowered and obliged to honor their decisions. There is need to gather more feedback from the health providers to identify areas for improvement.

Interruption in treatment and reengagement of HIV infected children and adolescents in HIV care in Benue State Nigeria: a retrospective cohort study

O. Ibiloye[1], O. Enagbare[2], H. Okpe[1], K. Ngwoke[2], U. Thomas[2], T. Omole[1], M. Odido[1], E. Edigah[1], P. Jwanle[1], I. Onwuatuelo[1], J.O. Samuel[1], P. Okonkwo[1]

[1]APIN Public Health Initiatives, Clinical Services, Abuja, Nigeria, [2]APIN Public Health Initiatives, Clinical Services, Makurdi, Nigeria

Background: The continuity of treatment is key to successful treatment of children and adolescents living with HIV (CALHIV). However, the cascade of HIV care does not account for retention and re-engagement in care.

Therefore, we described the characteristics of patients who experienced interruption in treatment (IIT) and reengaged in HIV care and estimated the factors associated with reengagement among HIV infected children and adolescents receiving HIV care in Benue State Nigeria.

Methods: A retrospective cohort study of CALHIV on antiretroviral treatment (ART) who reengaged in care between January 2021 and December 2021 in 59 health facilities in Benue state Nigeria. These patients and their caregivers were actively tracked by volunteers through mobile phone call and/or home visits. Dis-engagement in HIV care was defined as greater than 28 days of default since

the last clinical or drug refill appointment. The tracking outcomes were re-engagement in HIV care (active on ART or transferred-out to other ART site) and dis-engagement from HIV care (stopped ART or died or true LTFU). Bivariate logistic regression was conducted to determine factors associated with re-engagement in HIV care.

Results: The rate of reengagement in HIV care within 12 months was 71.8% (n=94/131). Of the 94 patients who re-engaged in HIV care, 52.1% (n=49) were male and the mean age was 11 years (SD-4.8). After active tracking for 12 months, 72% (n=94) re-engaged in HIV care.About 47% (n=61) returned to treatment, 4.6% (n=6) died, 3.8% (n=5) stopped ART, 25.2% (n=33) transferred out, and 26% (26) remained LTFU.Of the 131 patients who interrupted their treatment, 91% (116) had a mild HIV disease (WHO stage 1 and II). About 96% (n=90) of patients were tracked at least twice or thrice before they returned to treatment. None of the variables (sex, duration on ART, regimen type, and the frequency of tracking) was associated with re-engagement in HIV care.

Conclusions: Despite active patient tracking, reengagement in HIV care was poor. None of the examined factors explained reengagement in HIV care. Therefore, further research is required to understand the barriers and facilitators of re-engagement in HIV care among CALHIV.

National financing analyses and financing mechanisms for HIV, hepatitis and STI programmes and services

EPE204

HIV trust fund of Nigeria: a private sector driven sustainable domestic financing mechanism and paradigm shift in local funding

J. Kalu[1], D.G. Aliyu[2], D.J. Ozoemene[3]
[1]National Agency for the Control of AIDS, Resource Mobilisation and Performance Management, Abuja, Nigeria, [2]National Agency for the Control of AIDS, Director General, Abuja, Nigeria, [3]HIV Trust Fund of Nigeria, Chief Executive Officer, Lagos, Nigeria

Background: Following the dwindling partner support and funding, in Africa and indeed Nigeria, it became imperative for the National Agency for the Control of AIDS (NACA) to collaborate with the Nigeria Business Coalition against AIDS (NiBUCAA) to establish the HIV Trust Fund of Nigeria (HTFN).

The N62 Billion (US$150 Million) private sector led Trust Fund was established to promote domestic resource mobilization to complement existing external support from our partners for sustained HIV prevention and treatment interventions. HTFN will serve to guarantee sustainable funding from Private Sector led sources for HIV interventions, especially for the elimination of Mother-to-Child Transmission of HIV.

Description: The HTFN strategy is premised on a proven NiBUCAA structure with a Chair and notable global business icons as members of board of trustees. Also in the structure are the technical working group, and an advisory committee that makes recommendation to the board of trustees. The HTFN launch on 1st February, 2022 by the President of Nigeria, demonstrated the commitment, drive and push for implementation.

Lessons learned: HTFN has increased HIV funding and individual participation. Increase in contributions is an outcome of transparency, accountability and value for money in the private sector-led governance structure.

Conclusions/Next steps: The HTFN launch was a landmark event and the gallant step towards securing a financing mechanism to guarantee a generation of HIV free babies via these steps:

1. ALL pregnant women in Nigeria attending antenatal care services (as first visit in that pregnancy) will be provided a HIV test.
2. ALL identified HIV positive pregnant women in Nigeria will have access to lifelong ART services targeting 95% of identified positives and linking them to ART.
3. ALL identified HIV positive pregnant women will be provided partner testing and pre-exposure prophylaxis (PrEP) services where applicable.
4. ALL HIV negative pregnant women will be provided partner testing services.
5. ALL pregnant women living with HIV will have at least one Viral Load test conducted before delivery.
6. ALL HIV Exposed Infants (HEIs) will be provided enhanced Post Natal Prophylaxis at birth to prevent HIV.
7. ALL HEIs have EID services from birth till 18 months of age, identified positives infants are enrolled on paediatric ART.

EPE205

When the only intervention left to optimise is retention: Comparing the 2021 and 2016 South African HIV Investment Cases

G. Meyer-Rath[1,2], L. Jamieson[2], L. Johnson[3]
[1]Boston University, Global Health, Boston, United States, [2]University of the Witwatersrand, Johannesburg, South Africa, [3]University of Cape Town, Cape Town, South Africa

Background: Since 2016, annual updates of the HIV Investment Case have identified the optimal mix of HIV interventions in South Africa. Recommendations changed over time due to novel interventions and increasing coverage.

Methods: We updated Thembisa Optimise, a combination of an established HIV transmission model and an optimisation model incorporating diminishing returns to investment at higher coverage, with recent service coverage, survey and cost data. We assessed the cost per life year saved for each intervention-coverage option and established the optimal intervention package with and without constraining its cost to HIV budgets committed

by government and partners until 2023 (constrained and unconstrained scenario, respectively). Results were evaluated under current and maximal levels of ART coverage in those diagnosed HIV-positive (78% vs 95% by 2025).

Results: Compared to 2016 findings, condom provision continues to be most cost effective, while medical male circumcision became less cost effective at higher coverage levels especially in adolescents (Figure).

Pre-exposure prophylaxis for male adolescents/young men and early infant male circumcision are only affordable under the current budget if ART coverage remains at 78%. HIV self-testing is less cost-effective than conventional HTS but might be required to close last testing gaps.

2016 HIV IC	2021 HIV IC 78% ART coverage	2021 HIV IC 95% ART coverage
Condom provision (95%)	Condom distribution (1bn/year)	Condom distribution (1bn/year)
MMC (550k/year)	ART (95% linkage)	ART (95% linkage)
ART at current guidelines (95%)	Infant testing at birth (95%)	Infant testing at birth (95%)
PMTCT (95%)	PrEP for MSM (50%)	PrEP for MSM (50%)
ART under universal treatment (linkage) (95%)	HTS general population (18.3m/year)	HTS general population (18.3m/yea
PCR testing at 6 weeks (95%)	Medical male circumcision (600k/year)	ART (95% linkage, 95% retention)
SBCC campaign 1 (HCT, reduction MSP) (95%)	HTS adolescents (95%)	HTS adolescents (95%)
SBCC campaign 2 (condoms) (95%)	PrEP for FSW (30%)	HIVST optimized package (3m/year)
HTS General population (18m tests/year)	HIVST optimized package (3m/year)	PrEP for pregnant women (18%)
SBCC campaign 3 (condoms, HCT, MMC) (95%)	PrEP for pregnant women (18%)	PrEP for FSW (30%)
HCT for FSW (95%)	PrEP for female adolescents (18%)	Medical male circumcision (600k/ye
PCR testing at birth (70%)	PrEP for young women (18%)	PrEP for female adolescents (18)
PrEP for FSW (70%)	PrEP for young men (18%)	PrEP for young women (18%)
HTS for adolescents (95%)	PrEP for male adolescents (18%)	PrEP for young men (18%)
PrEP for young women (70%)	Early infant male circumcision (70%)	PrEP for male adolescents (18%)
Early infant male circumcision (70%)		Early infant male circumcision (70%

Unconstrained

Figure. Comparison of ranked intervention-coverage options between 2016 and 2021 HIV investment cases.

Achieving 95% ART coverage could, under the current budget, avert three times as many HIV infections and twice as many AIDS deaths over 20 years, compared to the baseline trajectory of 78% ART coverage (Table).

Baseline (2021-40)		
Total cost of the HIV programme, billions (2021 USD)	41.1	
New infections, millions	3.1	
AIDS deaths, thousands	1,093	
Life years lost to AIDS, millions	38.8	
	78% ART coverage	95% ART coverage
Incremental cost to the HIV programme, billions (2021 USD)		
Constrained scenario	n/a	8.0 (+19%)
Unconstrained scenario	4.0 (+10%)	9.6 (+23%)
HIV infection averted, millions		
Constrained scenario	n/a	2.1 (-66%)
Unconstrained scenario	0.7 (-23%)	2.1 (-66%)
AIDS deaths averted, thousands		
Constrained scenario	n/a	186 (-17%)
Unconstrained scenario	89 (-8%)	187 (-18%)
Life years saved, millions		
Constrained scenario	n/a	7.1 (-18%)
Unconstrained scenario	3.8 (-1.0%)	7.1 (-18%)
Cost per life year saved (2021 USD)		
Constrained scenario	n/a	1,132
Unconstrained scenario	1,045	1,347

Table. Summary of incremental impacts and cost-effectiveness over 20 years (2021-2040)

Conclusions: While most interventions have become affordable under the current budget, only maximizing ART retention will significantly increase the South African HIV programme's impact.

EPE206

Sustainability of community-based social services for key populations in Russia: problems and prospects of national investment programs

K. Mishenichev[1,2], O. Borodkina[1], E. Pletneva[2], J. Godunova[2]

[1]Saint Petersburg State University, Social Work, Saint Petersburg, Russian Federation, [2]E.V.A. Association, Saint Petersburg, Russian Federation

Background: According to the Governmental Analytical Center of the Russian Federation, a small share of spending on HIV prevention in total spending on HIV prevention activities is one of the key characteristics of contemporary HIV funding in Russia. According to the data of the last decade, the largest number of new HIV cases in Russia is among key populations. NGOs play a crucial role in HIV prevention among key populations. It is important to support the sustainable work of NGOs, which is driven by well-developed funding mechanisms at different government levels. One such mechanism is the government procurement system.

The aim of the study was to assess the structure of public spending on HIV prevention programs among key populations by community-based NGOs.

Methods: In 2019 and 2020 monitoring of government procurements for HIV prevention programs was conducted in the most affected HIV-infection regions of the Russian Federation

(N = 24). Key populations were the main focus of monitoring. To interpret quantitative data and obtain information about other sources of funding, interviews were conducted with the heads (N = 5) and focus groups were conducted with specialists (N = 16) of community-based NGOs in 5 regions of the Russian Federation.

Results: Information on 403 procurements in the amount of 641,143,397 rubles (approximately $8,699,367) for HIV prevention programs was analyzed. NGOs from 14 regions of Russia received 79,975,459 rubles for the preventive programs implementation. Only 21.1% of these funds were spent on HIV prevention among key populations. These funds were used to implement 18 prevention projects among key populations. In the volume of prevention goods and services for key populations, more funds are invested in people who use drugs.

Also some NGOs are not always ready to use this funding mechanism because of the bureaucratic system of state organizations that announce auctions for the procurement of goods and services.

Conclusions: It is necessary to develop national funding mechanisms that will contribute to the sustainability of NGOs providing preventive services to key populations. NGOs and the scientific community need to continue working with opinion leaders to develop the most effective methods of HIV prevention among key populations.

EPE207

An analysis of domestic funds on HIV/AIDS intervention from 2010- 2020 by the Nigerian Government

I. Ogunkola[1], Y. Adebisi[2], J. Adole[1], M. Ogbodum[1]
[1]University of Calabar, Public Health, Calabar, Nigeria, [2]University of Ibadan, Pharmacy, Ibadan, Nigeria

Background: Nigeria has the third-largest HIV epidemic globally and a relatively high incidence rate. Financing, a fundamental element of the HIV response in Nigeria, has been critical to the significant gains experienced to date. Since 2006, around US$4 billion has been expended on HIV control efforts in Nigeria.
Sadly, about 80% of these funds have been from donors—mainly the US President's Emergency Plan for AIDS Relief (PEPFAR) and the Global Fund to Fight AIDS. Our paper seeks to analyse the domestic funds (Public Source) on HIV response in Nigeria.
Methods: This study utilised secondary data on the Federal Government annual budget in Nigeria. The Federal Ministry of Health Budget were identified, the HIV/AIDS components were selected and exported to Microsoft Excel 2019 for analysis.
Results: From our results, the total domestic funds spent by the federal government on HIV/AIDS-related projects and intervention from 2010 to 2020 is $41 955 964 (Forty-one million, nine hundred and ninety-five thousand, nine hundred sixty-four USD). The average domestic funds spent by the government over the 11 years was an average of 3 million dollars.
The government disbursed the highest domestic funds for HIV/AIDS in 2012 ($8.7 million), about 15% of the national health budget for the year. In 2017, no money was budgeted for HIV/AIDS intervention in the National Health Budget. Most of the funds across the year were spent on establishing comprehensive sites to expand access to treatment and training of healthcare workers, and it appeared consecutively in 2010-2014.
None of the budget's focus through the year addresses critical populations such as people who use drugs, commercial sex workers, etc.
Conclusions: External funding remains critical to many HIV programs in the country and a more significant part of HIV expenditure is from international donors. COVID-19 has orchestrated a global economic meltdown and there has been a backdrop of donor support for HIV with attention shifted to the COVID-19 pandemic.
The Federal Government of Nigeria needs to step up the allotted funding for HIV towards the sustainability of the HIV response.

Transitional financing

EPE208

Resource estimation tool used to develop, monitor, and coordinate sustainable, integrated national and provincial sustainable HIV program financing in Vietnam

P. Nguyen[1], H. Le[1], D. Nguyen[1], K. Huu Hanh[2], T. Anh Duong[3], C.A. Thi Nguyen[4]
[1]Abt Associates, Hanoi, Viet Nam, [2]Mediconsult, Hanoi, Viet Nam, [3]Vietnam Administration for HIV/AIDS Control, Hanoi, Viet Nam, [4]USAID, Hanoi, Viet Nam

Background: Vietnam has historically relied on donors to fund the national HIV response but graduation to middle-income status led to a sharp decline in funding and increased use of local budgets to sustain HIV programs. The National HIV Strategy for the 2021–2030 sets the goal of ending HIV by 2030. To achieve this goal, the Government of Vietnam (GVN) has increased its HIV budget to cover essential medications such as ARVs and continues to advance policies, regulations, and guidelines that support HIV care and treatment. Among these, the GVN requires all provinces to develop a sustainable financing plan for HIV.
Description: USAID's Local Health System Sustainability (LHSS) project supports the Vietnam Administration of HIV/AIDS Control (VAAC) to create and use a resource estimation tool that helps provincial governments establish sustainable financing for HIV plans through 2030. To date, LHSS has supported 42 of 63 provinces to develop approved plans. Approved plans ensure that provinces allocate local budgets to cover key program areas, (e.g., care, treatment, prevention) and, importantly, include social health insurance premiums and an ARV copayment subsidy for HIV patients unable to afford them.
Lessons learned: Context-specific, evidence-based planning is critical, and the quality of planning depends on the quality of data. A clear understanding of province-specific conditions, requirements, and barriers is necessary to construct realistic and appropriate plans. Similarly, the more that VAAC knows about a province's specific funding trends, commitments, and needs, the better it can support provinces to mobilize, coordinate, and allocate available funds to address resource gaps. A comprehensive and accessible database with accurate financial and epidemiological data is vital to plan for a sustainably financed HIV response.
Conclusions/Next steps: Developing and implementing sustainable financing plans for HIV is critical to promote provincial funding and sustain Vietnam's HIV response. LHSS supports the VAAC to consistently apply a resource estimation tool to coordinate national and provincial financial resources in a timely, systematic manner for sustainable domestic HIV program financing and uninterrupted care as donor financing declines.

Strategies for the transition to sustainable public funding of HIV services in the EECA region

R. Drozd[1]

[1]*Charitable Organization "Light of Hope", Poltava, Ukraine*

Background: Over the past several years, the Global Fund has been actively supporting the countries of the EECA region in their transition to sustainable domestic funding for HIV programs. Experts of the Institute of Analysis and Advocacy during 2019-2021 were involved as consultants on technical assistance to countries in advocacy and implementation oftransitionplans.

We were able to identify strategies for countries and highlight the main gaps that impede a successful transition at this time.

Description: The experts' activities were based on a systematic approach: analyzing the situation, forming recommendations, creating an open dialogue, developing plans for implementing changes, providing technical assistance in the preparation of regulatory documents. The main focus was on the analysis of barriers inpubliccontracting mechanisms that countries used to purchase HIV services from NGOs. Another important task was to train NGOs to work on new approaches.

Representatives of the public sector, NGOs were involved in the training and discussion. This helped to establish an open dialogue on a stable basis and to initiate changes, the need for which was shown by the analysis.

Lessons learned: The experience allowed us to identify the specifics of the transition process.Countries are in the process of transforming health systems, and HIV services should not be separate from this.It is important to pay attention which of the approaches will be best for each specific country. You cannot just take the successful experience of a neighboring state and repeat it.

Adaptation and continuous improvement of the regulatory framework and the approaches are key to progress. It is also important to involve in the decision-making process not only the state, but also the civil sector and communities. Open dialogue and accountability mitigate many of the complexities at the planning.

Conclusions/Next steps: Over the past 2 years, it was possible to implement a 3-stage model of transition in Ukraine, pilot the procurement of services in Moldova and Georgia, launch the development of road maps in Kazakhstan and Kyrgyzstan, budget funds for the public contracting in Tajikistan. Further work should be aimed at ensuring that countries draw conclusions and apply this knowledge in further work.

EPE210

Information technology as an assistant in monitoring progress on transition, sustainability and co-financing of HIV in the countries of the EECA region

V. Smoliakova[1]

[1]*CF «International Budget Advocacy Hub», Kyiv, Ukraine*

Background: The countries of the EECA region are in the process of transitioning to public funding of HIV services and building sustainable HIV systems. The approach of countries may differ due to different geopolitical situations and the peculiarities of medical systems, budgetary processes, and the development of the civil sector. Donors that provide grants to support transition processes should have up-to-date information on the situation within these processes. Communities and NGOs working in the field of HIV should have the same information.

That is why the creation of a portal that has concentrated all the necessary information about the state of transition to public funding in those countries where this is happening has become a priority task for the team of the Institute for Analysis and Advocacy and the Light of Hope.

Description: The portal was created with the support of OSF and continued its development in partnership with organizations that play a key role in the region - Alliance for Public Health, 100% Life.

The structure of the portal is a portfolio of each country, which displays statistical data on key populations and the spread of HIV; key donors and projects that operate in the country; coordination mechanisms and documents regulating the sphere of HIV; transition analytics module (which shows the progress of each country from year to year in 7 key blocks that affect the sustainability of the HIV response system as a whole).

Lessons learned: During the data collection process, a situation was discovered where in many countries there is no consolidated information on some issues. This, in turn, may threaten that several donors may fund similar activities and/or not see problem areas where funding is potentially needed but not allocated.

We also saw that in countries data is collected irregularly or there is no single approach and responsible executor.

Conclusions/Next steps: The filling of the portal is provided on a regular basis annually. This allows to see the changes in the situation in each particular country and its progress or regression.

Such portals have a stimulating effect on the government and allow to attract more supporters for advocacy.

International assistance, frameworks and funding mechanisms for HIV, hepatitis and STI programmes and services

EPE211

USAID/PEPFAR local partner transition realities: salary survey highlights pay imbalance

C. Brokenshire-Scott[1], S. Mbugua[2], C. Mejia[3], D. Zongo[4]
[1]IntraHealth International, Washington, DC, United States, [2]IntraHealth International (Consultant), Nairobi, Kenya, [3]IntraHealth International, Chapel Hill, United States, [4]IntraHealth International (Consultant), Abidjan, Cote D'Ivoire

Background: In April 2018, PEPFAR announced a goal to direct 70% of USAID/PEPFAR funds to local partners through direct prime awards to achieve country ownership of the HIV response. PEPFAR's local partner transition may be at risk if organizations cannot attract and retain qualified staff to meet the performance targets.

The USAID-funded Accelerating Support to Advanced Local Partners (ASAP) project, implemented by IntraHealth International, provides rapid support to local implementing partners (LIPs) to manage USAID funds as primes.

Description: ASAP identified that LIPs have challenges in attracting and retaining key personnel in a competitive labor market. To assess whether this was linked to salary remuneration, ASAP conducted a salary survey across 24 ASAP-supported LIPs and compared salary scales and benefits against the Birches Group Salary Survey data, which provides multisector labor market information across 150 countries and is the industry benchmark for development in review of salary scales.

Lessons learned: PEPFAR-funded LIPs do not update salary scales every two years per industry standards and the vast majority of salaries are paid below the 25th percentile of Birches' metrics. The discrepancy was most pronounced among senior and technical staff. Comparatively, LIPs with multiple sources of funding paid higher salaries.

Grades	Percentage below 25th percentile	Percentage at 25th percentile or above
9-11 (senior-level)	70%	30%
5-8 (mid-level)	54%	46%
1-4 (lowest-level)	62%	38%

Table.

Conclusions/Next steps: Competitive compensation practices are essential to employee recruitment and retention efforts. It is critical that donors closely monitor LIP performance as it may be stalled while recruiting to backfill positions due to turnover. USAID/PEPFAR investments in reaching 95-95-95 through LIPs could be at risk if local organizations are continually destabilized due to their inability to afford to pay competitive salaries to retain key staff, thus limiting their capacity to deliver on PEPFAR targets. Local organizations need support to better align their current remuneration packages to market rates. Further exploration is needed to understand the impact of disparate compensation on staff engagement, retention, and productivity in PEPFAR's investment in local partners.

EPE212

The impact of shifts in PEPFAR funding policy on HIV services in Eastern Uganda (2015-2021)

H. Zakumumpa[1]
[1]Makerere University, School of Social Sciences, Kampala, Uganda

Background: Although donor transitions from HIV programs are increasingly common in low-and middle-income countries, there are limited longitudinal studies assessing medium to long-term impact on HIV services. We examined the impact of changes in PEPFAR funding policy on HIV services in Eastern Uganda between 2015 and 2021.

Methods: We conducted a longitudinal qualitative case-study of four districts in Uganda (Luuka, Bulambuli, Budadiri, Amuru) which were affected by shifts in PEPFAR funding policy. Data were collected in November 2017 (round 1) and January 2022 (round 2).

In-depth interviews were conducted with PEPFAR officials at national and sub-national levels (n=46) as well as district health officers (n=8). We conducted an embedded case-study of four facilities located in affected districts involving 24 semi-structured interviews with HIV clinic managers and eight focus groups with attending patients (68 participants). Data were analyzed by thematic approach.

Results: We identified four significant funding phases:

i. Between 2015 to 2017, PEPFAR officials reported withdrawal of site-level support in 241 facilities following categorization of case-study districts as having a 'low HIV burden'. Post-PEPFAR transition; patients perceived a decline in the quality of HIV care and more frequent commodity stock outs. Health workers reporting a narrowing in the scope of HIV services offered such as cessation of community outreaches.

ii. From 2018-2020, HIV clinic managers in transitioned districts reported a 'donor vacuum' and drastic drops in investments in HIV programming resulting in increased loss to follow-up, declining viral load suppression rates, increased reports of patient deaths and increased community transmissions.

iii. District officials reported a resumption of site-level PEPFAR support in October 2020 with stringent targets to reverse declines in HIV indicators. However, PEPFAR declared less HIV-specific funding in favour of a more integrated health services agenda.

iv. In December 2021, district health officers reported shifts by PEPFAR from routing aid through international to local implementing partners and a return to an intensified focus on HIV and Tuberculosis.

Oral abstracts

Poster exhibition

E-posters

Late-breaker abstracts

Author Index

Conclusions: Changes in PEPFAR funding policy had important impacts on HIV services. Securing the financial sustainability of HIV programming is critical to attainment of UNAIDS' 95-95-95 targets in Eastern Uganda.

Financing HIV within UHC frameworks

EPE214
Accelerate to the Finish: increasing sustainable financing for HIV responses in Asia-Pacific to achieve the 2030 targets

N. Perera[1], R. Ong[1]
[1]*Global Fund Advocates Network Asia-Pacific, Bangkok, Thailand*

Background: GFAN AP has been observing the mixed progress against HIV (TB and malaria as well) with concern, which was further compounded by the COVID-19 pandemic. It was therefore urgent to understand what the biggest needs and resource gaps are.
We also wanted to identify best practices and success stories in the AP region we could learn from and which could be replicated in order to accelerate progress in the HIV (TB and malaria) response in AP for UHC.
Methods: GFAN AP therefore commissioned India, Indonesia, Nepal, Sri Lanka and Vietnam to undertake research and analysis to understand the current situation, barriers and challenges, and the investments needed within the HIV responses to reach the goals.
It was done using desk reviews, key informant interviews, and focus group discussions, followed by analysis, with each study documented in a country investment case.
Results:
- Despite some progress against HIV, TB and malaria, countries in the Asia-Pacific are not on track to achieve targets for the three diseases, nor UHC
- Current health funding is insufficient to achieve disease-specific targets, and its sustainability is threatened by decreasing or stagnating domestic financing.
- High and increasing out-of-pocket expenditure for health care threatens the health outcomes of key and vulnerable populations in the region
- The Global Fund has played a significant role in supporting the three responses in AP countries and building effective community systems.
- Improving access to health care by vulnerable and marginalised communities requires addressing systemic, human rights, and socio-economic barriers.
- Domestic financial and political resources are not prioritising the two key solutions to ensuring that vulnerable and marginalised groups are not left behind: community systems strengthening, and a rights-based approach.

Conclusions: This document has attempted to spur us on in the spirit of partnership and with a sense of urgency to reflect on where we are, where we are going, and what we need to get there. This research will inform GFAN AP's advocacy to ensure that the Global Fund and other donors work in partnership alongside implementing country governments, communities that are affected by and/or vulnerable to the three diseases, civil society, and the private sector.

EPE215
Balancing sustainability of Community Based Health Insurance (CBHI) and full coverage of vulnerable persons living with HIV / AIDS (PLWHA): a highway to improved maternal and child welfare

R. Langsi[1], J. Sama[2], M. Njamsi[3], J. Sunday[4], I. Fonzoh[5]
[1]*University of Bamenda, Bambili, Cameroon, Health Division, Bamenda, Cameroon,* [2]*College of Technology, University of Bamenda Bambili, Department of Human Nutrition, Bamenda, Cameroon,* [3]*North West Regional Fund for Health Promotion, Bamenda, Cameroon, Mutual Health Unit, Bamenda, Cameroon,* [4]*Benue State University, Department of Chemistry, Makurdi, Nigeria,* [5]*University of Bamenda, Bambili, Department of Economics, Bamenda, Cameroon*

Background: Payment for healthcare in lower-income countries such as Cameroon is predominantly by Out-of-Pocket Payment (OPP). High cost of healthcare can be devastating to the overall family income resulting in delayed presentation of illnesses which creates a vicious cycle of poverty. Ironically, most CBHI exclude full coverage of PLWHA in order to curb rapid consumption of the pooled premium. This action adversely affects the vulnerable HIV positive mother and child more.
The aim of this study is to evaluate the health outcomes of full CBHI coverage of vulnerable PLWHA while maintaining sustainability and increased enrolment.
Methods: A cross-sectional survey done between October 2019 and September 2021 in two selected Health Facilities, consisted of a total of 250 HIV positive mothers and care givers to positive children. Half (125), were partially covered in one facility, while the other half at Boyo MUHCCOP, a CBHI scheme with donor funding received full coverage.
Sociodemographic data, assessment of OPP, health service utilization and amelioration of health outcomes were collected using a pre-tested semi structured self-administered questionnaire. Analysis was done using (SPSS) Version 20 and Microsoft Office Excel 2016.
Results: Approximately 87% were positive women, while 13% were children. 95% of fully covered participants indicated that OPP had little effect on family welfare while 35 % of partially covered thought same. In Boyo MUHCOOP, PLWHA 110 out of 125 (88.0 %) indicated prompt presentation to hospital when sick, against 47% for the partially covered. In addition 96.8 % and 48% of fully and partially covered respectively indicated overall improved health and quality of life.

At the end of this survey, Boyo MUHCOOP had increased enrolment by 20% and had a positive balance of 13,695,665 FCFA (23,291 dollars), whereas only 2,800,000 FCFA (4,761 Dollars) for non-funded schemes.

Conclusions: Early presentation of illnesses prevents chronicity and it is cheaper to manage. Improved welfare and quality of life is associated with less uptake of pooled CBHI resources.

Sustainability of CBHI schemes can be guaranteed through policy statements backed by local legislative actions imposing proof of donor funding for full coverage of PLWHA as a mandatory condition to go operational.

EPE216

Enhancing the financing of HIV epidemiological control through health insurance integration: a catalyst for sustainability

F. Ilika[1], C. Ohazurike[1], U. Ihekannandu[1]

[1]*Palladium, Health Policy Plus, Abuja, Nigeria*

Background: Nigeria is dependent on donors for its HIV control financing (83% donor, 17% government), creating a significant funding gap and a low sustainability factor. Integration of HIV into the government's health insurance schemes will help to close this gap and finance the nation's 95-95-95 targets, however little progress was made.

The USAID-funded Health Policy Plus (HP+) has a mandate to advance sustainable HIV financing methods; and provided support to actualize this integration.

Description: HP+ employed a clear strategy with multi-stakeholder involvement and consensus, mutual benefits, and risk management, between April 2019 and December 2021.

A three-pronged approach comprised of:

i. Evidence Generation and Multi-sectoral Stakeholder Consensus Building,

ii. Evidence-based Policy Formulation and

iii. Implementation and Monitoring.

Key stakeholders including government HIV, health insurance and finance agencies, CSOs, parliamentarians, health providers and private sector were galvanized using feasibility studies' evidence, and a phased approach for integration was adopted.

Secondly, The National Blueprint for HIV Integration into Health Insurance policy was developed, which outlines steps for successful integration that includes complement of HIV services, provider payments, and roles and responsibilities of stakeholders.

In early 2020, a specific roadmap for implementation was developed for Lagos state, implemented, and monitored through 2021.

Lessons learned: The integration was successful with HIV services provided and reimbursed by the health insurance scheme. Within months of implementation, 531,213 residents were enrolled in the Scheme- including 3,495 Orphans and Key populations; 216 providers empaneled, trained, providing HIV services, and receiving reimbursements from the scheme.

Over 10,000 HIV tests have been conducted and positive individuals linked to treatment: improving access to testing and treatment, reducing user fees burden for HIV services, while providing financial protection. Key lessons include the importance of evidence-based policy and multisectoral engagement, consensus building, and using a feasible phased approach.

Conclusions/Next steps: Integration of HIV services into health insurance schemes is an effective mechanism for improving financing of HIV epidemiological control.

This successful integration serves as a proof of concept that could be replicated in other LMICs, a game changer in HIV financing sustainability. HIV actors can use evidence-based engagement to achieve integration of HIV into policy reforms in similar settings.

EPE217

Can Indonesia reach sustainable response in 2030? Analysis on National AIDS Spending Assessment in Indonesia 2019-2020

D. Fidiyahfika[1], L. Wahyuniar[2], L. Agustine[2], H. Sidik[3]

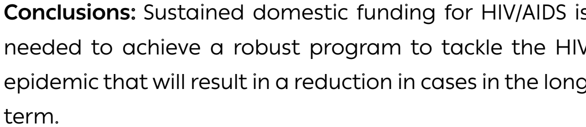
[1]*All Indonesia Public Health Services Association (ADINKES), Jakarta Selatan, Indonesia,* [2]*UNAIDS, Jakarta, Indonesia,* [3]*All Indonesia Public Health Services Association (ADINKES, Jakarta Selatan, Indonesia*

Background: Since the first cases were discovered in 1987 to December 2020, HIV AIDS has been reported in 34 provinces in Indonesia and 474 (92%) of 514 districts/cities across Indonesia. On the other hand, Indonesia has increased its status to an *upper middle-income country* that demands Indonesia to be stronger in its domestic funding.

Methods: The objective of this National Spending Assessment (NASA) 2021 to collect up information on the expenditure of HIV and AIDS programs in 2019-2020 to map out the current resources and their allocation in dealing with HIV AIDS. NASA National 2021 involves 131 international partners, ministries, and institutions from 34 provinces and 227 districts/cities in participatory manner.

Results: NASA 2021 recorded HIV AIDS expenditure of USD 158,360,511 in 2019 and USD 157,725,762 in 2020. Total public financing was USD 70,804,503 (45%) and USD 83,439,233 (53%) in 2019 and 2020. The current availability of funding for HIV AIDS is only half of the actual need as the Ministry of Health estimates that funding needs for these two years are 221,834,192 USD and 379,227,047 USD to aim the mission ending epidemic in 2030. This requirement is far from the budget availability even in 2030.

Based on the projected availability of funds from the current trend, in 2030 the availability of funds is 253 million USD. NASA 2021 also reported almost half HIV AIDS spending comes from international funding where the main areas of HIV AIDS spending were care and treatment at USD 68,011,624 (43%) and USD 91,037,581 (58%).



Conclusions: Sustained domestic funding for HIV/AIDS is needed to achieve a robust program to tackle the HIV epidemic that will result in a reduction in cases in the long term.

The high level of dependence on international funding especially on prevention means that the HIV/AIDS funding architecture needs to be reorganized to protect the sustainability of HIV funding.

Approaches to achieving sustainability, including sustainable financing for civil society

EPE218

HIV budget advocacy efforts, impact and funding: state, lessons and opportunities in South-Eastern Europe, Eastern Europe and Central Asia

R. Stuikyte[1], G. Dovbakh[2]

[1]*Freelancer, Vilnius, Lithuania,* [2]*Eurasian Harm Reduction Association, Vilnius, Lithuania*

Background: As the international donor funding for HIV is reducing, increasing domestic funding is critical. The Eurasian Harm Reduction Association together with ECOM and EWNA, using Robert Carr Network Fund support, commissioned a study to map civil society efforts, funding and impact in engaging in budget related decision and processes (budget advocacy).

Methods: The assessment reviewed the period between 2018 and 2021, with case studies of 8 diverse countries (different classification of their income level, transition out from the donor funding, geographically representative from sub-regions). The methodology and selection were informed by a multi-stakeholder advisory group. Methods included country and regional interviews, donor scanning, desk review of country and regional information.

Where possible, UN-verified data were used, especially for levels of domestic investments. The report and case studies were reviewed by country stakeholders and regional/ global partners.

Results: Since 2017, civil society capacity for HIV advocacy has grown in quantity and quality. Its annual funding in 8 countries averaged between US$27,000 and US$1.1 million. Global Fund's multi-country grant, OSF were largest contributors. Civil society is an influencer, but so are donors and government champions. Largest cumulative impact is seen in absolute numbers in funding ART (the state share was 66% in 2017 vs 80% of ART budget in 2020, while for prevention 43% vs 63% in 8 countries).

Optimisation and reduced pricing saved estimated US$73.4 million in ARV budgets. Social contracting and domestic funding of key population programming are work in progress and remains the priority. Sub-national funding was important but not systemic. In some countries, HIV activists engaged in procurement transparency work and broader health advocacy to increase prioritization of health in domestic budgets.

Conclusions: International donors should continue prioritizing advocacy for sustainability and successful transitioning of HIV response to domestic funding in its priorities, with greater coordination, geographical coverage and alignment of indicators for measuring influence.

Community groups should be given more opportunities for engaging in budget advocacy (capacity, defining its priority/role in sustainability). As countries transit, international partners should work on better quality, timeliness, consistency, and availability of financial data on domestic funding including for key population programming and civil society.

EPE219

Sustainability of opioid agonist therapy (OAT) programsin 4 Eastern European and Central Asian countries in the context of transition from Global Fund support

I. Varentsov[1], R. Stuikyte[1]

[1]*Eurasian Harm Reduction Network, Vilnius, Lithuania*

Background: OAT is part of the core interventions for preventing HIV among people who use drugs. In the last decade, sustainability of HIV response dependent on Global Fund's support have risen as a major concern. OAT remains at risk during donor transition, often underfunded and at low scale for impact. In 2019, EHRA commissioned a methodological framework and instruments specifically aimed at measuring the sustainability of OAT in countries.

Description: The purpose of the developed methodology was to generate evidence and practical steps towards establishing OAT policies and programs and strengthen the profile of OAT in the transition-related efforts.

The sustainability framework identified three issue areas (Policy & Governance; Finance & Resources; Services) and nine indicators for measuring sustainability:

Each indicator is further measured through a set of 4-6 benchmarks. Every benchmark is defined through milestones, using the normative guidance and tools. A quantified three-level scale is used to identify the level of sustainability for each benchmark. The methodology was applied in 2020 in Belarus, Moldova, Tajikistan, Ukraine.

Lessons learned: The analysis showed that Moldova received highest scores on OAT sustainability, followed by Belarus and Ukraine. Tajikistan was assessed as overall having OAT at moderate to high risk. A substantial degree of sustainability was reported at least for one indicator in three countries and for the area of Finance and Resources for Moldova.

Moderate degree of sustainability was reported for the indicators of Political Commitment, Service Accessibility and Quality and Integration in all the countries. The greatest risks across countries were recorded for the indicator of Service Availability and Coverage, which reflects low OAT

coverage below 5% in four countries, limited availability of OAT across different settings and low use of take-home dosages.

Conclusions/Next steps: OAT sustainability in four countries remains at risk. The resilience of OAT services and ability to scale up depends on multiple reasons where the political will and continued funding are one of them. There is a need for increased focus on programmatic elements - the resource inputs and service attractiveness. The assessment methodology has been effective in diverse legislative and governance models and health systems, at different stages of donor's transition.

EPE220

Sustaining the operations of Nigeria's treatment programme through the development of an ART management model

Y. Olaifa[1], D. Ndukwe[1], T. Oladele[2], B. Olakunde[1], Y. Falola-Anoemuah[1], C. Ujam[1], M. Egemba[1], K. Essomeonu[1], G. Ijaodola[3], C. Ukanwa[3], A. Ikpeazu[3], A. Ogundipe[1]

[1]National Agency for the Control of AIDS, Community Prevention and Care Services, Abuja, Nigeria, [2]National Agency for the Control of AIDS, Resource Mobilisation and Performance Management, Abuja, Nigeria, [3]Federal Ministry of Health, National AIDS and STIs Control Programme, Abuja, Nigeria

Background: Nigeria is projected to reach HIV epidemic control within the next decade. In consequence, the country would see divestment of donor resources for HIV. Nigeria's HIV treatment programme is donor dependent structurally and financially.

To prevent the collapse of interventions managed by implementing partners (IPs) with reversal of gains made in the country, there was a need to conceptualize a management model that is sustainable for the government of Nigeria.

Description: The National Agency for the Control of AIDS (NACA) led the process of reviewing the management model operated by implementing partners (IPs) to conceptualize the sustainable ART management model in 2021. Stakeholders (national, subnational, donor and implementing partners) were engaged at all levels using a participatory approach involving presentations, group discussions and plenary. A draft model was developed based on findings from consultation with stakeholders. A consultative forum was held thereafter to debate and refine the model. The key feature of the model is the identification and positioning of responsibilities shouldered by IPs within departments and agencies of the State Ministry of Health in line with their mandates. The model was presented to stakeholders in two pilot states and subsequently operationalized.

Lessons learned: Inter-agency consultations revealed the current complexities of the country's health system. Reactions to the model varied among players despite the initial consultations. Newly identified national and subnational government players embraced the model.

Previous subnational governmental and non-governmental players in the HIV space, perceived it as a threat to their current status. The expansion of the model to include community players is emerging.

Conclusions/Next steps: The process of developing a model for sustaining the management of HIV, highlights the need for continuous engagement of stakeholders, sensitivity to the power dynamics and political economy in facilitating a strong coordination mechanism amongst stakeholders.

Continuous engagement with pilot states would inform required modifications to the model. Scale up across the country would be in phases working with states and partners.

EPE221

Key population and local government-led social contracting in Vietnam: a pathway to expanding coverage of publicly-financed HIV services

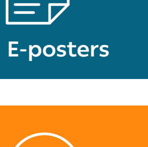
Y.H. Vu[1], Q.X. Nguyen[2], C.T. Vu[2], N.T. Vu[2], T.M. Le[3], T.K. Le[4], T.H. Do[5], C.A. Nguyen[6], K.E. Green[1], B.N. Vu[1], T.T. Tran[1], T.M. Ngo[6], L. Basu[6], Z.J. Humeau[1]

[1]PATH, Hanoi, Viet Nam, [2]Dong Nai Centers for Disease Control, Dong Nai, Viet Nam, [3]Thanh Danh Social Enterprise/Glink Vietnam, Ho Chi Minh City, Viet Nam, [4]Glink Dong Nai Clinic, Dong Nai, Viet Nam, [5]Vietnam Administration for HIV/AIDS Control, Vietnam Ministry of Health, Hanoi, Viet Nam, [6]United States Agency for International Development, Hanoi, Viet Nam

Background: Social contracting (SC) can be an effective tool for sustaining key population (KP)-organization engagement in HIV service delivery as donor funding declines and domestic financing increases. In Vietnam, a novel SC model was piloted in a high-HIV-burden province, Dong Nai (DN), by the local centers for disease control (DN-CDC) and a KP-led social enterprise (SE) with support from the USAID/PATH Healthy Markets (HM) project.

Description: DN-CDC and HM followed seven critical steps to pilot SC from April – October 2021:

1. Mapped government of Vietnam (GOV) SC regulations and developed a pilot SC model;
2. Secured endorsement from the Vietnam Administration for HIV/AIDS Control (VAAC) for the proposed model;
3. Conducted rapid scoping of KP-SE clinics in DN to determine which had sufficient capacity to implement SC;
4. Identified Glink SE clinic as the sole group matching the requirements;
5 Held co-creation meetings between Glink and DN-CDC to agree on a service package, targets, budget and final contract aligning the capabilities of Glink with DN-CDC HIV service needs;
6. DN-CDC then monitored performance and adapted targets as COVID-19 lockdowns were enforced from June – September;



7. Identified key lessons to apply to national SC policy development.

Lessons learned: Key learnings generated through the model were:

1. Securing strong VAAC and DN-CDC buy-in enabled rapid approvals and engagement;
2. Identifying the right contracting mechanism up-front minimized implementation challenges;
3. Focusing on trust generation between DN-CDC and Glink was essential for implementation;
4. Enabling an adaptive approach by DN-CDC and Glink to rapidly respond to the lockdown helped change targets to meet real local needs: increasing home/quarantine site delivery of antiretroviral treatment (ART) and reducing reach and test targets.

As a result, Glink reached 110 KP, with 8 newly diagnosed HIV positive (7.27% positivity yield) and 100% enrolled on ART, and delivered ART and adherence support to an additional 200 ART clients from the DN-CDC HIV treatment clinic.

Conclusions/Next steps: This pilot provides essential learning to inform national HIV SC policies as a pathway for public-sector domestic financing of KP-led organizations. Future efforts need to focus on securing ring-fenced domestic investment in SC and clear regulations for KP-organization SC.

EPE222

Social Contracting to promote sustainability of HIV-based Civil Society Organizations in Indonesia: readiness assessment in 10 districts

Z. Maula[1]

[1]*Indonesia AIDS Coalition, Human Rights Activist, South Jakarta, Indonesia*

Background: The Indonesia HIV Response relies heavily on the collaboration between the government and Civil Society Organizations (CSO). In the effort of synergizing the works of government and CSO and to support CSO sustainability, the government through the National Public Procurement Agency (LKPP) had issued Regulation No. 3/2021 on Social Contracting Guideline. This regulation, specifically the Type 3, also known as *Swakelola Tipe III* (ST3), allows the CSO to access government funding and contribute to the government's procurement.

As part of Indonesia AIDS Coalition (IAC)'s program to strengthen local HIV-CSO to access government funding through ST3, this initial assessment was conducted to identify districts and CSO for this intervention.

Methods: This assessment was conducted in November-December 2021 towards 10 districts (Medan, Palembang, DKI Jakarta, Bandung, Semarang, Surabaya, Denpasar, Makassar, Jayapura, and Sorong) involving 52 CSOs and aimed to identify their capability and capacity. The data collection was conducted through online surveys and in-depth interviews towards 30 CSOs that qualified through preliminary surveys of Eligibility Survey and Organization Performance Index Survey. Additionally, a Focus Group Discussion (FGD) was conducted in 7 (seven) districts, 63 CSOs, and 35 other local government institutions/agencies.

Results: This assessment signifies the capacity of CSOs (civic space) and the prospect of domestic funding in each district (fiscal space). The assessment elaborates the correlation of these two aspects with CSO's accountability, as well as presents recommendations for the CSO and denotes the fiscal space prospects, particularly on HIV. Additionally, this assessment also identifies 6 (six) most potential districts which are eligible to participate in Social Contracting Type 3 Implementation Research that will be conducted in 2022-2023. The research will be facilitated by IAC as a bridge to advocate and monitor the synergy between CSOs and local government.

Conclusions: The outcome of this research is expectedly in favor to the sustainability of CSOs by fulfilling the needs of communities regarding the procurement of HIV-related logistics, research and development concerning the study on People Living with HIV (PLHIV), and program implementation of HIV prevention for key population communities.

EPE223

Innovative seed grants: a tool for community system strengthening and sustainability at grass root level

H. Patil[1], M. Sivasubramanian[2], S. S[2], M.(. Maske[2], V. Anand[3], R. Jagtap[1]

[1]*The Humsafar Trust, Finance, Mumbai, India,* [2]*The Humsafar Trust, Capacity Building, Mumbai, India,* [3]*The Humsafar Trust, Board Member, Mumbai, India*

Background: The contributions of Community based organizations (CBOs) working with transgender populations to the community empowerment and reducing vulnerability of the community has been immense and commendable. Various funding agencies have recognized the potential of these CBOs in visibility of the community and advocating for the rights of the community.

Currently most of the funds are primarily for providing health related services and very limited support is available for the CBOs to strengthen their advocacy, governance and human rights related work that can strengthen their HIV prevention programs.

Description: The Humsafar Trust, a CBO working for LGBTQ+ health and human rights has been implementing a project TRANScend since November 2016 with an aim to enhance inclusivity and acceptance of transgender communities in India and support need-based advocacy activities aimed at enhancing transgender inclusion.

The CBOs implemented various advocacy activities such as sensitization with stakeholders, creating legal awareness among community members and designing TG friendly IEC materials on HIV/AIDS, hormone therapy, transgender bill in local languages.

Through the innovative seed grant, a total of 19 initiatives have been supported in various parts of the country. These include an International Film Festival conducted in Delhi, a workshop on gender and sexuality for parents of LGBTQ children, development of Information material on transgender issues, gender-themed poetry and speaker sessions, LBT focused film festivals and sports events etc.

Lessons learned: Advocacy seed grants have helped the smaller CBOs to strengthen their governance and programmatic implementation.CBOs have good networking with stakeholders and communities at local level. However, they lack funds and skilled human resources to sustain health and advocacy programs for community. Innovative seed grant provided them opportunity to strengthen their advocacy for health and human rights of transgender community at their district or state level.

Conclusions/Next steps: It is key that funding agencies provide small funds to CBOs for conducting advocacy activities affecting transgender community and support community system strengthening so that the CBOs can sustain their ongoing work and also strengthen their efforts to reduce vulnerability to HIV, violence, stigma and discrimination and promote well-being among the community.

EPE224
Challenges and opportunities for sustainable community responses to HIV

S.C. Choub[1], J. Tallada[2], S. Finlayson[3]
[1]Khmer HIV/AIDS NGO Alliance (KHANA), Executive Directorate, Phnom Penh, Cambodia, [2]Global Health Consultant, Analyst and Educator, Independent consultant, Barcelona, Spain, [3]Frontline AIDS, Independent Consultant, Eastbourne, United Kingdom

Background: Community responses to HIV are critical in addressing HIV/AIDS and COVID-19, particularly among key populations, however they remain on the margins of health systems in a majority of countries and are rarely funded from government budgets. With shrinking fiscal space, particularly due to the COVID-19 pandemic, and countries whose middle income status means a potential reduction in Global Fund and other international funding streams, the need to diversify funding options for community responses to HIV is urgent.

Description: Mapping of civil society and community organisations' work to obtain and sustain financing for HIV services included 22 country and seven regional/sub regional organisations. Desk review and semi-structured interviews with organisations were used to obtain data and seven case studies were developed. Key findings have been validated and piloted during proof-of-concept advocacy projects with five organisations in 2021.

Lessons learned: Although civil society and community organisations are aware of the critical and strategic need to diversify funding sources and increase domestic resource mobilisation, there are still challenges in making concrete progress on these. To support strategies for sustainable financing the following were identified as priority areas:
- Tailored (HIV – specific) on-line training and technical support on domestic resource mobilisation;
- An accessible repository of practical tools (such as service cost calculators), advice and case studies;
- Virtual conferencing that enables the exchange of insights on political and fiscal aspects that frame sustainability of HIV resources in different contexts; and,
- Catalytic flexible grants that enable foundational, innovative and risk-taking work to take place.

Key strategies	Type of Activities	Targets	Lessons learned and key challenges
Organizational strengthening	- Capacity building - Training	- Donor support to organization sustainability - Increased resource mobilization capacity	- Budget advocacy capacity strengthening may be frustrating if resources are not available to implement plans
Advocacy	- Influence policy-decision making (government, parliament, corporations providing health coverage to their employees) - Influence budget allocation	- Increased political and financial support for key populations (KPs) and HIV response, including expanded access to services and social protection policies. - Social contracting policies and mechanisms are in place.	- Better access for KPs to services may not include support for civil society organizations' operational and advocacy work. - Hard to obtain political acceptance for social contracting. - Budget contingent of fiscal space and party politics, these being particularly challenging.
Fundraising	- Sensitization and request to donate from private donors (corporation and individuals, including donations from users)	- Donations from the private sector	- Private sector cherry-picking non-controversial topics and focusses on the general population. - Private sector support volatile by nature.
Self-sustainability	- Sales of products and services, including non-HIV related.	- Strengthen income generation capacity	- Privatization of community services and negative impact on equity. - Financially, better-off populations are willing to contribute to financing services for the less well-off populations, including key populations.

Table 1. Results of the mapping and pilot projects lessons learned.

Conclusions/Next steps: The Mapping identified the most common key strategies, types of activities and targets to achieve more sustainable community response to HIV. Proof-of-concept pilots validated these findings, as well as, identified key lessons learned and challenges that civil society and community organisations encounter when working on sustainable community responses to HIV.

EPE225
Social contracting to ensure the sustainability of services and to overcome funding cuts and limitations on HIV services

M. Demchenko[1]
[1]CF «International Budget Advocacy Hub», Kyiv, Ukraine

Background: Over the last 4 years, all major types of social contracting (social services order, services procurements, financing statutory activities, providing premises etc.) have been practically tested in Ukraine.

The main task was to identify the pros and cons of each and find out which of the mechanisms best ensures the sustainability of services and cost-effectiveness. According to this, procurement of services was the best.

Description: We conducted an analysis of the legislation regarding the procurement of services and the possibility for municipal institutions, businesses, NGOs participa-

Oral abstracts

Poster exhibition

E-posters

Late-breaker abstracts

Author Index

tion. The main issue was the classification of HIV services. To consider these services as purely medical, it narrows the range of potential providers (medical education and license are required), especially for NGOs that have provided GF-funded services for many years, had expertise but could be out of the procurement process. That is why we with IAA, IRF, "100 percent life" advocate the separation of HIV services into a new category – public health services. A separate structure was established, the Public Health Center, which purchased these services and the basic package of services was determined.

Lessons learned: In 2019, the Public Health Center successfully completed procurements in all regions of Ukraine. We created a new market for services available for municipal institutions, businesses, and NGOs. As the services from basic package are covered from state budget the extended package may be financed through other social contracting mechanisms from local budgets.

Conclusions/Next steps: Procurement in 2019 has been completed and preparations for procurement of services for 2020 started. There will also be an opportunity to apply a framework procedure for signing contracts for 3 years, which will further simplify the purchase of these services. We believe this model can be successfully applied in other countries in the EECA region.

EPE226

Ukraine's model of Transition Plan as an experience that can be piloted in the EECA region

O. Denysenko[1]

[1]*Charitable Organization "Light of Hope", Poltava, Ukraine*

Background: Implementation of the Transition Plan 20-50-80 (TP) is one of objectives in the Global Fund grant for Ukraine for 2018-2020. To provide services in 2018 and implement the first phase of TP, two models of service delivery have been developed: centralized and decentralized. In 2018 20% of HIV prevention, care and support and TB support services for target groups were provided. The main tasks were to choose the optimal model and then implement it throughout the territory of Ukraine in 2019.

Description: In 2018, 2 regions were selected to pilot the models – Poltava and Sumy regions. Based on the results, our experts, together with Public Health Center and the main GF recipients, have created a model of TP for 2019-2020. In 2019, procurements of services were made through the ProZorro electronic system. The Strategic Group was set up to coordinate the process and deal with operational issues, respond to the challenges arising. About 100 million UAH has been allocated for the procurements of services in 2019. Regionals NGOs became winners of the tenders and started to provide services for state funding.

Lessons learned: We managed to create the model of TP that is the most optimal for the HIV services area. The e-procurement mechanism is transparent and competitive, so we can get the best quality at a reasonable price. Participants in the process are all potential service providers - from municipal institutions to businesses and NGOs. Governmental decision-making structures take into account the experience of NGOs (the work of the Strategic Group). This model is approved in normative acts (MoH orders, Cabinet of Ministers regulations) and can be the basis for adaptation and implementation in the EECA region.

Conclusions/Next steps: The model of services procurements for TP encourages the state to optimize its financing - to buy the necessary services at a reasonable price from quality providers. We don't discriminate representatives of communities or other participants in the newly created market, since the criteria, standards and procedures are clear and approved in normative acts.

EPE227

Key communities change national budgets

D. Sherembei[1]

[1]*All-Ukrainian Network of PLWH, Kyiv, Ukraine*

Background: The deficit of funding for social and healthcare programs remains a major problem for many countries. This is a specially urgent problem for countries in the state of military conflict. In these circumstances many communities, particularly those vulnerable to HIV, don't believe that they can change the situation.

Description: Five years ago All-Ukrainian Network of PLWH became one of the key drivers for change in budgeting the HIV related services in Ukraine. The goal of that effort was to make HIV programs in country sustainable in transition from donor to state funding.

To achieve that organization and its partners started a multilevel advocacy campaign. Representatives of PLWH community entered the National working group for Healthcare reform. They advocated for increase of the state budget for healthcare and social programs in general as well as for changes in the format the services were provided. Namely, a major focus was made on ensuring the provision of medical and social services by a wide range of organizations both Government, municipal, private and non-government.

Another important point was ensuring funding from the state budget by National Health Service of Ukraine for all those players. Organization closely cooperated with other key communities, international organizations, Government officials and Parliamentarians.

Lessons learned: Over several previous years advocacy efforts of the organization and key communities resulted in four-fold increase of healthcare funding from the budget. This, in turn, allowed for transition from donor to government funding for HIV program. Today NGOs receive funds from National Health Service for care and support services. Advocacy activities on municipal level are also implemented. Only in the second half of 2021 in 7 regions 11 advocacy initiatives were implemented and a Memo-

randum with the National Health Service of Ukraine was signed; development of a tool for collecting information on allocation of budget funds for an expanded package of services in the TB/HIV field in the context of implementing a plan to move from donor to local funding started.

Conclusions/Next steps: Cooperation of key affected communities with all stakeholders can bring systemic reforms and increase in relevant public funding and must be strengthened and supported in the future.

EPE228

Strengthening women's organizations' institutional capacity to increase their likelihoods to receive donor funding in Africa – Lessons and experiences from ICWEA

H. Mutabarura[1], L. Mworeko[2], M. Cameroon[3]
[1]ICWEA, MEAL, Kampala, Uganda, [2]ICWEA, Kampala, Uganda, [3]ICW North America, Washington, United States

Background: The International Community of Women Living with HIV Eastern Africa (ICWEA) conducted a to determine of the fraction of women's organizations that were receiving donor funding study in Uganda. The study revealed that less than 10% of the organization that were receiving donor funding were women's organization. Causes of this challenge were identified as internal capacity weaknesses in governance, financial management, procurement, project management, MEAL, human resources, resource mobilization/fund raising and leadership among others. ICW
Consortium partners came together as women's organizations to devise means of addressing the internal weaknesses as a process to access donor support.

Description: ICWEA and other ICW Consortium partners received funding from RCNF to strengthen their internal capacity as a process towards receiving donor funding. These institutions also receive core-funding to facilitate day-to-day running of the institutions. The ICW Consortium engaged services of a consultant to conduct organizational capacity assessment focusing on governance, MEAL and financial management. The assessment revealed strengthen and weaknesses in the three areas and later developed individual action plan.

Several consultants were later engaged to work with individual organizations during implement the action points. Following the internal capacity strengthening, 80% of networks have received additional funding and have grown in capacity

Lessons learned: Funding from RCNF strengthened the internal capacity of the ICW Consortium and prepared them for donor funding. 80% of the organizations in the ICW Consortium have received additional donor funding, an indication that institutional capacity strengthening is key to external funding. Core funding is critical for institutional strengthening because it allows young and/or weak organizations to remain functional despite inability to implement activities.

Facilitating the governance board to play their roles is key in organizational growth as they will ensure that the expected standards are adhered to.

Conclusions/Next steps: Development partners make their funding decisions after certifying that grantees have capacity in governance, financial management, procurement, project management, MEAL, human resources, resource mobilization/fund raising and leadership. Attainment of this status requires reasonable resources – that not all organizations can raise. Therefore, it is paramount that development partners/donors invest in organizational capacity strengthening to enable beneficiary organizations to receive external funding.

EPE229

Strengthening Internal Control Systems of Community Based Organization (CBOs)

S. Tripathi[1], M. Pande[1], S. Vishwakarma[1], S. More[1], V. Anand[2], S. Yadav[1], R. Mane[1], S. Parte[1]
[1]Institute of Chartered Accountants of India, Mumbai, India, [2]University of Mumbai, Mumbai, India

Background: The Humsafar Trust (HST) is a Community Based Organization of LGBTQ+ in Mumbai. Since inception it has faced challenges as qualified LGBTQ+ community persons did not want to work with HST owing to the stigma attached and criminalization of same sex behaviors in India. HST became a model of trial-and-error learning from its own experiences and grew manifolds in the last 28 years. With growth came the need of strengthened financial controls and an Internal Auditor was appointed with an aim to evaluate and strengthen internal control and financial systems along with capacity building on financial documentation, risk management strategies, sustainability, and providing unbiased reviews.

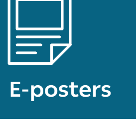
Description: HST depends upon multi-source national and international funding for health and advocacy work. It has contractual obligations, public scrutiny, liabilities/responsibilities and substantial reputational risks. Donor specific terms/conditions attached to funding are not always practicable or in the best interest of not-for-profits.

Thus, to contractually obtain indemnity from impractical financial termsand conditions that affect implementation, executing a standard form of engagement with the donor to provide legal immunity is vital. A set of standard forms was recommended for donor engagement, which strengthened internal financial mechanisms. Standard documentation includes representations and warranties made by CBOs with regard to the funding received thereby protecting the CBOs from any future liability.

Lessons learned: Given the sensitive nature of the objectives of HST and other CBOs it is imperative that they are protected and provided support to carry out work in a smooth and effective manner, with proper and standard documentation that will form the basis of such activities. Availability of finance dictates the manner in which equality is understood by CBOs.

Oral abstracts

Poster exhibition



E-posters

Late-breaker abstracts

Author Index

Conclusions/Next steps: Community-based implementation is susceptible to risks involved given the sensitivity around community-based activities and donor-led financial transparency obligations. Hence it is essential that necessary mechanisms are implemented to provide indemnity from any potential risks/obligation arising out of donor-specific requirements, particularly those that may not be practical or even detrimental to functioning/work.

EPE230
Making medicines affordable: Is the Global Fund a missed opportunity?

M. Ahmar[1], D. Peeler[1], S. Kondratyuk[1], O. Mellouk[1], W. Jallow[1]
[1]*International Treatment Preparedness Coalition, Johannesburg, South Africa*

Background: Low- and middle-income countries frequently face inaccessibility of health products due to price barriers or unavailability, as evidenced by COVID-19 vaccines. These barriers are largely related to intellectual property (IP) and patent protection; which prevent access to generics and local production of essential medicines. However, funding for necessary interventions to remove such barriers remains limited and unsustainable.

ITPC engaged in research and advocacy with the Global Fund to Fight AIDS, Tuberculosis and Malaria (GFATM), given its position as main donor in the fight against pandemics and its capacity to shape markets and influence health products' prices, to explore the potential for the Fund to become a key player in making medicines affordable.

Description: ITPC measured GFATM's IP and access to medicines funding possibilities and appetite through a review of its strategic documents and discussions with its Secretariat and Board members. The evaluation concluded that access to treatments interventions were among the GFATM's strategic priorities, however it evidenced political reluctance to fund such work.

ITPC then developed a guide providing advocates tools to integrate treatment advocacy interventions in the 2021-2023 GFATM grants. A workshop based on the guide was organized in November 2019 for 15 middle-income countries eligible to GFATM funding*.

Advocacy was pursued at country level through meetings with Country Coordination Mechanisms (CCMs) and participation in national grant-making dialogues.

**Thailand, Ukraine, Morocco, India, Vietnam, Russia, Moldova, Georgia, Armenia, Belarus, Kazakhstan, Kyrgyzstan, Guatemala, El Salvador, Honduras.*

Lessons learned: According to a survey conducted by ITPC in the 15 countries:
- 10 succeeded in including proposals on access to medicines in the national dialogue,
- 7 succeeded in including these proposals in the concept note submitted to the GFATM,
- 5 succeeded in having them approved for funding.

Conclusions/Next steps: The advocacy carried out showed results, however obstacles were encountered, in particular low prioritization access to medicines interventions at national level, insufficient funding amounts allocated, and resistance from the GFATM to fund IP. These blockages demonstrate the need to continue to advocate and mobilize donors.

EPE231
Will treatment access advocacy still be funded in the future? An analysis of funding landscape and current challenges

M. Ahmar[1], D. Peeler[1], S. Kondratyuk[1], O. Mellouk[1], W. Jallow[1]
[1]*International Treatment Preparedness Coalition, Johannesburg, South Africa*

Background: Middle-income countries (MICs) face specific access to medicines challenges related to intellectual property (IP) barriers.Very often these are excluded from voluntary mechanisms to access more affordable generic versions of life-saving medicines. In the meantime, treatment access civil society organizations (CSOs) challenging successfully patent barriers are confronted to decision-makers and donors' reluctance to support efforts to overcome IP barriers, challenging their ability to pursue their work in a sustainable manner.

Description: In 2021, ITPC conducted an analysis of the IP and access to medicines donor landscape including the political reticence around IP funding, as well as a focus on civil society recipients' experiences, lessons learned and perspectives on financial sustainability of IP funding. Reports of key funders have been reviewed and interviews with key funding institutions and civil society recipients have been conducted.

Lessons learned: The findings reveal a shrinking funding environment compromising sustainability of civil society work. There is low transparency around funding and difficulties in accessing data. The inquiry also shows variable levels of participation among some organizations and donors reticent to share information. Finally, the analysis demonstrates limited, uncoordinated and fragmented donor landscape.

On the CSOs recipients side, the analysis shows overall shrinking institutional funding and difficulties in accessing funding from established donors outside of High Income Countries based CSOs. It also highlights challenges related to short-term funding cycles making it difficult to have programmatic approaches.

Conclusions/Next steps: ITPC developed a policy paper basis on the analysis that received positive reactions and fostered increased mobilization from treatment access CSOs but also from donors. Several donors including UNITAID, Initiative Five Percent and AIDSFONDS have already given results in terms of funding commitments.

The paper will be the basis of further discussions with CSOs, traditional IP funders and other relevant stakeholders and ITPC will convene a think tank meeting in 2022 to

better understand the challenges faced, the implications of the COVID-19 crisis on the sustainability of funding, and develop strategies to overcome the identified barriers and ensure sustainable funding for IP in MICs.

Approaches and evidence from cross-sectoral programming and financing

EPE232
Health-system barriers and opportunities for integrating HIV with four selected health programs in Uganda: a qualitative study

H. Zakumumpa[1]
[1]*Makerere University, School of Social Sciences, Kampala, Uganda*

Background: Integrating HIV with other health programs is increasingly important in the context of calls for universal health coverage and the need to eliminate duplication and the health-system inefficiencies inherent in vertical programming.

Although there is evidence from clinical trials evaluating the feasibility of integrating HIV with other health programs, there is little health systems and policy research in this regard.

This WHO-commissioned study explored the perspectives of policy makers and providers in Uganda on barriers to integration of HIV with four selected health programs (malaria, immunization, maternity services and Tuberculosis) and to identify areas for cross-programmatic synergies.

Methods: Between September and December 2021 we conducted a qualitative study involving 104 participants. In-depth interviews were conducted with national-level Ministry of Health officials (n=8), representatives of bi-lateral and multi-lateral donors(*n=14*), district health team leaders (*n=26*), facility in-charges (*n=36*) and heads of HIV clinics (*n=28*) in the eight sub-regions of Uganda.

Data were analyzed by thematic approach based on WHO's 'building blocks' framework (e.g. financing, health workforce, governance, medicines).

Results: Barriers identified include;

Financing: limited domestic financing of health services which perpetuates a dependence on external donors with narrow disease-specific interests resulting in fragmented programming, donors perceive local health system actors as taking advantage of vertical funding streams for personal and sector-wide resource mobilization ends,

Workforce: workforce Mal-distribution skewed towards 'better-incentivized' (e.g. HIV) programs, limited workforce motivation and skills for integrated health services,

Medicines: parallel and disjointed commodity supply chain mechanisms within and across the five programs and;

Governance: health system governance arrangements which are structured around disease-specific 'silos'. The identified areas for improved services' integration include pooled procurement across the five programs, innovations for improving multi-disease diagnostic capacity, integrating community outreaches and on-site support supervisions.

Conclusions: Although our study unearths internal and external barriers to integrating HIV with other health programs, opportunities for improving synergies across the five programs are identified with potential for cross-programmatic efficiency gains.

EPE233
Progress in peril: impact of the UK Government's aid cuts on HIV & AIDS worldwide

N. Badran[1], J. Cole[2], M. Lewis[3], O. Golichenko[4], E. Barker[3]
[1]*SIDC (Soins Infirmiers et Développement Communautaire), Beirut, Lebanon,* [2]*STOPAIDS, London, United Kingdom,* [3]*the All Party Parliamentary Group on HIV/AIDS, London, United Kingdom,* [4]*Frontline AIDS, Brighton, United Kingdom*

Background: In 2021 the UK Government made large cuts in funding to multilateral, bilateral and R&D responses to HIV/AIDS after already significant cuts over the past decade.

Description: A desk review of data submitted from a call for evidence examining the impact of these cuts on the global HIV/AIDS response was conducted in July 2021. Data consisted of eight submissions from organisations implementing multilateral, bilateral and R&D programmes impacted by the cuts. A second round of analysis on ongoing impacts has been collected in early 2022.

Lessons learned: Cuts of over 80% to key multilateral organisations affect the international community's ability to get the HIV response back on track and advance UK government and global development priorities, including pandemic preparedness, health system strengthening, and ending preventable deaths. UK aid cuts to bilateral programmes have resulted in adverse effects, including lost opportunities to develop innovative solutions. There is a dangerous scale down of HIV services in the COVID-19 context which could lead to increased HIV transmissions. Abrupt and poorly coordinated cuts have weakened programmatic impact and operations of organisations on the ground. Analysis also highlights that funding for global health R&D has been significantly affected.

Conclusions/Next steps: Data submitted shows the withering of the UK government's commitments to the Busan Declaration principles on aid effectiveness, particularly decreases in quantity and quality of aid. Funding cuts jeopardise decades of progress in the HIV response the UK has been instrumental in delivering, risking a resurgence of the pandemic.

This evidence is a red-flag for other donors for their own spending commitments: reduced funding means more

HIV transmissions, AIDS-related deaths and a reduced ability to end inequalities that drive the AIDS epidemic.
Data supports the case that governments sustain the quantity and quality of HIV/AIDS aid by reaching the target in the 2021 Political Declaration on HIV to spend 0.7% of GNI on ODA. Data also demonstrates the UK Government's need to revaluate against the impact caused by these cuts and make sufficient provision in the spending review for the seventh Global Fund replenishment as well as the bilateral funding portfolio, considering the catastrophic impact of these cuts.

EPE234
Evaluating the Gilead COMPASS Initiative: funding and building capacity of non-profit organizations to end the HIV/AIDS epidemic in the US South

A. Mathews[1], S. Reif[2], J. Fuega[3], M. Stanton[4], I. Udoh[3], K. Colbert[5], N. Smith-Bankhead[6,5], S. Ali[4], D. Ward[7], L. Blais[8], S. Jones[9,1], Gilead COMPASS Initiative
[1]*Wake Forest University, Faith Coordinating Center, Winston-Salem, United States,* [2]*Duke University, Duke Global Health Institute, Charlotte, United States,* [3]*ETR, HIV, Sexual & Reproductive Health, Oakland, United States,* [4]*University of Houston, Graduate College of Social Work, Houston, United States,* [5]*Emory University, Coordinating Center Collaborative, Gilead COMPASS Initiative®, Atlanta, United States,* [6]*Emory University, EnCORE Center, Rollins School of Public Health, Atlanta, United States,* [7]*Southern AIDS Coalition, Birmingham, United States,* [8]*Emory University, Emory Centers for Public Health Training and Technical Assistance, Atlanta, United States,* [9]*Wake Forest University, School of Professional Studies, Winston-Salem, United States*

Background: Despite significant HIV biomedical advancements, the US South continues to be disproportionately impacted, accounting for over 50% of new HIV diagnoses. This is in part due to socio-structural barriers, including stigma, lack of resources and limited prevention capacity.
To address these issues, the Gilead COMPASS Initiative has committed $100M over 10 years in the South to:
1. Improve access to and improve quality of health care services for people living with HIV (PLWH) ;
2. Increase local leadership and advocacy; and,
3. Change public perception of HIV/AIDS.
Description: Since 2018, Gilead Sciences has funded four coordinating centers (CC), including University of Houston, Emory University, the Southern AIDS Coalition, and Wake Forest University to build the capacity of non-profit organizations to end the HIV epidemic in the South. CCs collaborated to build a standardized model to assist organizations and their communities. The CCs administered coaching, funded community partners through grants and learning opportunities, and provided training to use evidence-based strategies and evaluation.
Lessons learned: To date, collective evaluation shows that the CCs distributed $6,870,814 through 382 awards to 206 funded partners, reaching 204,862 people in the South. The majority (83.06%) of awards funded organizations led by and serving Black and Latino MSM, Black cisgender women, and people of trans experience. Training opportunities offered at each CC resulted in 93% increase in knowledge and skills, 98% increase in organization capacity, and 96% high satisfaction with COMPASS services provided. As of September 2021, the CCs awarded an additional 76 grants and learning opportunities. As COVID-19 continues to impact partners and their clients, organizations struggle through programmatic shifts, burnout, reduced staffing due to illness, and continued loss of loved ones. CCs provided online workshops to increase organizational capacity to engage audiences remotely.
Conclusions/Next steps: The COMPASS Initiative provided many organizations with their first grants, providing validation, increased local visibility, and opportunities to apply for additional HIV-related funding. Program data informs quality improvement and enhances services provided through grants, trainings, consultations, and learning opportunities.
Future evaluation will include a survey to gain insight into the impact of COVID-19 on the provision of HIV-related services.

EPE235
Catalyzing self-reliance and sustainability of HIV control efforts in Nigeria: using evidence-based policy to enhance domestic funding

F. Ilika[1], J. Nwizu[1], U. Ihekanandu[1]
[1]*Palladium, Health Policy Plus, Abuja, Nigeria*

Background: Nigeria has a very high HIV burden and is currently ranked second in the World, despite this, financing of HIV control efforts is highly dependent on international donors (over 80%). Domestic Resource Mobilization is being explored as a mechanism to close the financing gap and create a sustainable mechanism for financing HIV control needs towards the 95:95:95 targets.
Health Policy Plus Project supported the Nigerian government in 2020 to assess challenges with HIV financing and identify viable strategies for mobilizing domestic resources for HIV control.
Methods: A strategic multistage approach was used which included stakeholder mapping and key informant interviews of major stakeholders across government, donor, private, civil society, and partner organizations, and desk reviews of relevant literature to generate evidence. Key informants were selected by history of their involvement in health financing and HIV control efforts at the national, subnational and community levels.
Following this, evidence synthesis was conducted with important multisectoral stakeholders; and comprehensive strategies for addressing the gaps identified and used in formulating a national policy

Results: Challenges to HIV financing were identified as inadequate prioritization of HIV financing by government due to the perception that it is a donor's purview, low government allocations and expenditures; allocative and technical inefficiencies in fund utilization; inadequate accountability and governance; low resource mobilization capacity of HIV actors, insufficient private sector engagement, and deficient multisectoral collaboration. A multisectoral group was formed and through a collaborative process, strategies were identified to be used in mobilizing additional 662 million USD of domestic resources from 2021 to 2025; using a National Domestic Resource Mobilization (DRM) Strategy, and implementation has commenced across states.

Major strategies include improving public financing through improved government budgets; integration of HIV into health insurance; increasing private sector contributions; innovative mechanisms like diaspora bonds; local HIV commodity production; improving efficiency; strengthening governance and accountability structures; and improving CSO's accountability role.

Conclusions: Increasing self-reliance and weaning off dependence on external HIV donor funding is a global health call-to-action.

An evidence-based multisectoral approach can be used by HIV stakeholders to advance appropriate DRM mechanisms and policy that improve self-reliance and sustainability of HIV financing globally.

EPE236

Examining the translation of comprehensive intervention packages designed to reduce HIV incidence in adolescents in sub-Saharan Africa to reduce unplanned pregnancy in the same population: a literature review

A. Spensley[1]

[1]*University of Alabama Birmingham, Birmingham, United States*

Background: Rates of HIV acquisition and pregnancy among adolescent girls and young women (AGYW) in Sub-Saharan Africa (SSA) are high and lead to significant morbidity and mortality[1-6].Globally, SSA has the highest growth rate of adolescents[6]. Comprehensive evidence-based interventions for HIV and pregnancy prevention have similarities in content and delivery.Increasing the efficiency of programs to reduce HIV incidence and pregnancy in AGYW is critical as resources become limited.

Examining the translation of comprehensive HIV-prevention interventions for AGYW to reduction of pregnancy in the same population can lead to unidentified efficiencies in program cost.

Methods: The research question is: do comprehensive, evidence-based packages of interventions designed for reducing HIV incidence among AGYW in SSA also reduce incidence of pregnancy in the same population? A literature search was conducted with specific criteria designated to ensure the rigor of the review. The search identified 431 records. Abstract screening resulted in 45 records to be included in the full-text review.

Results: Records were categorized by type of article (reviews of existing evidence, policy briefs/opinion, original research not meeting review criteria, original research meeting review criteria; and content (solely pregnancy prevention, solely HIV prevention, multi-purpose prevention [both HIV and pregnancy], pregnancy prevention translated to HIV prevention, and HIV prevention translated to pregnancy prevention). No records were identified that translated HIV-prevention interventions to pregnancy prevention. Also, no records were found that translated pregnancy prevention interventions to HIV prevention.

Conclusions: There is a dearth of evidence for the translation of comprehensive HIV-prevention interventions for AGYW to pregnancy prevention in SSA. These findings shed light on the fact that there are gaps in the research and opportunities to identify areas of duplication and strategies to increase efficiency. Interventions designed to prevent acquisition of HIV in AGYW in SSA using a comprehensive package of interventions should consider including tracking pregnancy rates to generate evidence for the translation of interventions.

Findings could lead to a better understanding of potential efficiencies across HIV and MCH sectors, which currently implement separate programs to prevent either new HIV infections or pregnancy among the AGYW population in SSA.

Comparing the cost of six-month PrEP dispensing with interim HIV self-testing to the standard-of-care three-month PrEP dispensing with clinic-based testing in Kenya

D. Mangale[1], K. Ortblad[2], J. Heitner[3], P. Mogere[4], C. Kiptinness[4], N. Mugo[4], J. Baeten[1,5,6,7], K. Ngure[4,8], R. Barnabas[1,3,6]
[1]University of Washington, Global Health, Seattle, United States, [2]Fred Hutchinson Cancer Research Center, Public Health Sciences Division, Seattle, United States, [3]University of Washington, International Clinical Research Center, Seattle, United States, [4]Kenya Medical Research Institute, Center for Clinical Research, Nairobi, Kenya, [5]University of Washington, Department of Epidemiology, Seattle, United States, [6]University of Washington, Department of Medicine, Seattle, United States, [7]Gilead Sciences, Foster, United States, [8]Jomo Kenyatta University of Agriculture and Technology, Department of Community Health, Nairobi, Kenya

Background: In sub-Saharan Africa, cost remains an important barrier to HIV pre-exposure prophylaxis (PrEP) access and delivery. Novel PrEP delivery models are needed that reduce costs but maintain PrEP initiation and continuation. The JiPime-JiPrEP trial tested six-month PrEP dispensing with interim HIV self-testing (HIVST) and found non-inferior HIV testing, PrEP refills, and PrEP adherence compared to standard-of-care (SOC) clinic-based PrEP dispensing every three months. We measured the cost of this model compared to SOC dispensing.

Methods: Using activity-based micro-costing from the payer perspective, we estimated the unit cost of PrEP per person per month (PrEP month) in the intervention and SOC arms. We estimated these costs in two contexts:
1. As implemented the trial, and;
2. As projected in Kenyan public clinics.
We used data from budgets and expense reports, published documents, and key informantinterviews.
We also collected time-and-motion measures to estimate personnel effort on clinical care, HIV testing and counselling, laboratory testing, and PrEP delivery. We estimated costs in 2019 United States dollars and excluded research-related costs.

Results: From January to December 2019, trial participants accrued 644 PrEP visits (enrollment: 304, refill: 340) and were dispended 2952 months of PrEP (intervention: 2039, SOC: 913). PrEP delivery for intervention clients took a median of 152 minutes of personnel time projected over one year versus 216 minutes for SOC clients. In the trial, the unit cost per PrEP month was $27.93 for the intervention and $30.89 for the SOC. Most costs were from personnel (intervention: 25%; SOC: 31%), medication (intervention: 24%; SOC: 22%), and laboratory testing (intervention: 18%; SOC: 12%). The projected unit cost per PrEP month in public clinics was $13.50 for the intervention and $15.53 for the SOC, with higher costs of HIVST kits more than offset by personnel savings in the intervention.In both arms, the majority of costs were attributable to medication (48%) and laboratory testing (22%).

Conclusions: Six-month PrEP dispensing with interim HIVST demonstrated comparable and lower costs than SOC clinic-based dispensing every three months in Kenya, with decreased personnel time. Subsidies to lower the cost of PrEP and HIVST kits may increase the affordability of PrEP and should be considered.

EPE238
Cost versus price of key drugs to treat COVID-19, HIV, HBV and HCV

L. Ellis[1], J. Wang[2], A. Hill[3]
[1]Imperial College London, School of Public Health, London, United Kingdom, [2]Imperial College London, Faculty of Medicine, London, United Kingdom, [3]University of Liverpool, Liverpool, United Kingdom

Background: High drug prices can limit treatment access. Branded drugs can be sold for prices far higher than the costs of production. This analysis aimed to determine prices currently feasible for COVID-19, HIV, and viral hepatitis B or C treatment, assuming competitive generic manufacture.

Methods: Data on Active Pharmaceutical Ingredients (API) exported from India were collected from an online database (www.panjiva.com) and used to calculate current weighted mean cost/kg of API. Target prices were calculated based on the per-pill cost of API, plus costs of manufacture ($0.01/pill), 10% profit margin, and assumed 27% tax on profit. Current lowest global prices are from public reports and the Clinton Health Access Initiative HIV Market Report 2020. Our target prices were compared with national pricing data from a range of low, medium, and high-income countries.

Drugs	Production Cost (USD)	Minimum Price (USD)	Maximum Price (USD)
Molnupiravir (MOL)	$8.50	$20	$750
Baricitinib (BCB)	$1.96	$4.20	$2,422
Dolutegravir (DTG)	$24	$29	$25,663
Darunavir/ritonavir (DRV/r)	$264	$1,427	$36,550
Atazanavir/ritonavir (ATV/r)	$182	$155	$4,995
TDF/FTC	$45	$37	$21,402
TAF/FTC	$195	$200	$21,827
Sofosbuvir/daclatasvir (SOF/DAC)	$36	$704	$983
Sofosbuvir/velpatasvir (SOF/VEL)	$58	$565	$52,676

Table:

Results: The Table shows current prices of antiretrovirals for COVID-19 (5-14 day course), HIV or HBV (per 365-day course), and HCV treatments (per 12-week course).HIV can be treated with TDF/3TC/DTG for <$70 per year, HBV with TDF/3TC for $37 per year, COVID-19 treated with molnupiravir for $8.5 or baricitinib for $2.HCV could be cured with sofosbuvir/velpatasvir for $58 per patient.
Maximum list prices (typically from US) were up to 1000 times higher than costs of production (e.g. for dolutegravir).

Conclusions: Key viral infections can be treated or cured with generic drugs at prices far below those of branded equivalents.Use of branded drugs at high prices can limit the potential for countries to achieve the UNAIDS 95-95-95 targets.

EPE239

Estimating the costs of comprehensive HIV services for key populations in Kenya and Malawi: an analysis of the LINKAGES program

J.E. Sánchez-Morales[1], M. Opuni[2], J.L. Figueroa-Oropeza[1], A. Salas-Ortiz[3], S. Bautista-Arredondo[1]
[1]*National Institute of Public Health, Mexico, Department of Health Economics and Health Systems Innovations, Cuernavaca, Mexico,* [2]*Independent Researcher, Geneva, Switzerland,* [3]*University of York, Department of Economics and Related Studies, York, United Kingdom*

Background: Assessments of the cost of providing HIV services to key populations (KP) in low-resource settings are scarce. Most KP costing studies focus on clinical interventions. They fail to consider costs of pre-service delivery activities, actions taken below and above service level, and the structural interventions implemented alongside clinical services to reduce stigma, discrimination, and violence.
We estimated the unit costs of the following clinical services as part of a platform of services provided in the context of the LINKAGES program in Kenya and Malawi: sexually transmitted infection (STI) services, pre-exposure prophylaxis (PrEP), post-exposure prophylaxis (PEP), HIV testing services (HTS), antiretroviral therapy (ART), sexual and reproductive health (SRH) services, and management of sexual violence (MSV).

Methods: Through a combination of top-down and bottom-up approaches, we estimated the economic costs from the provider's perspective during fiscal year 2019.
Data were collected from 30 facilities in Kenya and 15 in Malawi as well as from country offices and program headquarters. Costs were disaggregated by intervention-specific costs, costs for condoms distributed throughout the program, and other program costs including KP size estimation, KP empowerment, structural interventions, peer outreach, management, monitoring and data use, and startup costs.

Results:

	n	Intervention-specific	Condoms	Other program	Total
PEP	25	25	5	16	46
On PrEP	33	89	50	213	352
HIV testing	45	6	5	22	32
On ART	45	206	48	289	542
STI screening	45	8	4	28	39
SRH	34	12	4	28	45
MSV	44	6	6	18	30

Table 1. Unit costs per service provided (USD 2019)

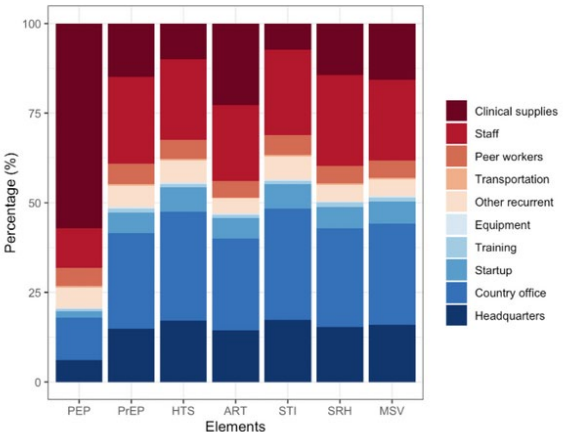

Figure 1. Contribution (%) of inputs per unit cost.

Conclusions: Costing studies that aim to estimate the full (economic) cost of HIV services for KPs need to consider costs of all program components at all levels of implementation, including below and above service level activities. Costing studies that focus on the delivery of clinical services only are likely to substantially underestimate the costs of delivering effective HIV services to KPs.

EPE240

Economic evaluation of improving HIV self-testing among men who have sex with men in China using a crowdsourced intervention: a cost-effectiveness analysis

J.J. Ong[1,2], R.D. Booton[3], J.D. Tucker[2,4,5], W. Tang[4,5], P. Vickerman[3], K.M. Mitchell[6]
[1]*Monash University, Central Clinical School, Carlton, Australia,* [2]*London School of Hygiene and Tropical Medicine, Department of Clinical Research, London, United Kingdom,* [3]*University of Bristol, Bristol, United Kingdom,* [4]*University of North Carolina at Chapel Hill, Chapel Hill, United States,* [5]*University of North Carolina, Project China, Guangzhou, China,* [6]*Imperial College London, Medical Research Council Centre for Global Infectious Disease Analysis, London, United Kingdom*

Background: HIV self-testing (HIVST) is recommended by the World Health Organization to enhance HIV testing services. Crowdsourcing, an approach that taps into the wisdom of crowds, has been successful in generating strategies to enhance HIVST uptake.

We determined the cost-effectiveness of a crowdsourced intervention (one-off or annual) compared to a control scenario (no increase in HIVST) among men who have sex with men (MSM) living in China.

Methods: We used data from our cluster randomized controlled trial of MSM (NCT02796963). We used a micro-costing approach to measure direct health costs ($USD2017) from a health provider perspective. Using outputs from a dynamic transmission model over a 20-year time horizon, we estimated the incremental cost-effectiveness ratios(ICER) using cost per quality adjusted life years(QALYs) gained with 3% discounting. The one-off intervention increased HIVST by 1.89 (95%CI:1.50-2.38) for one year, whereas we assumed an annual intervention increased HIVST throughout the 20-year time horizon. We defined an intervention as cost-effective if the ICER was <1x gross domestic product (GDP; $8823).

	Cost (USD 2017)	Incremental Cost	Total QALYs	Incremental QALY gained	ICER (Cost per QALY gained)
Guangzhou					
No crowdsourcing	127,213,915		661,837		
One-off crowdsourcing	127,036,559	-177,356	662,383	546	Dominates[1]
Annual crowdsourcing	129,039,133	2,002,574	663,268	885	2,263
Qingdao					
No crowdsourcing	45,502,682		556,347		
One-off crowdsourcing	45,409,229	-93,453	556,492	145	Dominates[1]
Annual crowdsourcing	47,550,238	2,141,009	556,840	348	6,152
Jinan					
No crowdsourcing	37,193,770		225,383		
One-off crowdsourcing	37,224,788	31,018	225,535	152	204
Annual crowdsourcing	38,913,226	1,688,438	225,828	294	5,743
Shenzhen					
No crowdsourcing	346,743,984		1,898,994		
One-off crowdsourcing	346,910,542	166,558	1,899,966	972	171
Annual crowdsourcing	350,323,180	3,412,638	1,902,905	2,939	1,161

[1] Cheaper and more effective than the next best alternative

Table 1. Cost-effectiveness of crowdsourced intervention in four cities in China with a 20-year time horizon.

Results: Table 1 summarizes the ICERs. Costs varied across the four cities with the lowest cost in Jinan, and the highest in Shenzhen. In parallel, QALYs gained was lowest in Jinan, and highest in Shenzhen. Across all cities, the crowdsourced intervention was cost-effective compared to the control scenario. The one-off intervention was cost-saving in Guangzhou and Qingdao. Deterministic univariate and probabilistic sensitivity analyses confirmed the robustness of the findings; specifically, changes in discounting, costs of the crowdsourced intervention, costs of HIV testing and cost of ART did not alter our conclusions.

Conclusions: Scaling up a one-off or annual crowdsourced HIV prevention intervention in four cities in China was very likely to be cost-effective or even cost-saving in some cities.

Further research is warranted to evaluate the feasibility of scaling up crowdsourced HIV prevention interventions in other settings and populations.

EPE241

The cost of facility-based Index testing HIV case detection in Maharashtra

S. Sriudomporn[1,2], R. Pollard[3], G. Thomas[4], A.K. Ganesh[4], A. Enugu[3], S.C. Ghosh[4], A. Singh[3], J. Thakker[3], S. Solomon[3], B. Patenaude[1,2]

[1]Johns Hopkins Bloomberg School of Public Health, International Health, Baltimore, United States, [2]Johns Hopkins Bloomberg School of Public Health, International Vaccine Access Center, Baltimore, United States, [3]Johns Hopkins University School of Medicine, Division of Infectious Diseases, Baltimore, United States, [4]YR Gaitonde Centre for AIDS Research and Education, Chennai, India

Background: Maharashtra has the highest number of PLHIV in India across states (396,000), contributing 17% of the total number of PLHIV in the country. To identify new PLHIV and support linkage to treatment, a USAID-funded program implemented facility-based index testing (FBIT) in two districts in Maharashtra. There is limited evidence assessing financial costs of FBIT implementation.

Methods: We estimated the total cost to implement FBIT in Pune and Thane over two years (October 2019-September 2021). Both start-up and recurrent costs were measured at the programmatic level, excluding HIV testing cost. Retrospective expenditure data were collected across cost categories of personnel, training, operations, supplies/equipment, and travel.

The number of contacts elicited from index clients, contacts completed HIV testing, contacts tested positive, and new PLHIV initiated on antiretroviral therapy (ART) were retrieved for each district. Per unit costs were calculated for each outcome.

Results: The total programmatic costs of implementing FBIT in year two (October 2020 – September 2021) compared to year one (October 2019 –September 2020) was 22% lower in Pune ($98,127 vs $76,963), and 18% higher in Thane ($96,172 vs $113,885). Personnel accounted for the majority of implementation costs. From year one to year two, the number of contacts elicited increased by 89% in Pune (1562 vs. 2948) and 75% in Thane (1389 vs. 2425).

The number of contacts tested positive increased by 121% in Pune (199 vs. 440) from year one to year two and increased by 108% in Thane (190 vs. 396). The cost per individual contact tested positive decreased by 65% ($493.10 vs. $174.92) and 43% ($506.17 vs. $287.59) in Pune and Thane respectively comparing year two to year one.

The number of new PLHIV initiated on ART increased by 148% in Pune (166 vs. 411) and 125% in Thane (162 vs. 365), with a decrease in unit cost of 68% ($591.12 vs. $187.26) and 47% ($593.65 vs. $312.01) accordingly.

Conclusions: FBIT implementation in HIV high-burden districts increased efficiency in identifying new PLHIV and linking them to treatment over two years.

Findings demonstrate that FBIT costs per individual are likely to decrease over time as program staff gain familiarity and efficiency.

EPE242

Cost analysis of virtual outreach model to provide HIV services to key populations in India: an implementation research

A. Shendge[1], M. Sivasubramaian[2], S. Mane[3], J. Singh[4], P. Falle Mudras[5], A. Banerjee[6], A. Royal[7]
[1]The Humsafar Trust, Programs, Mumbai, India, [2]The Humsafar Trust, Technical Directorate, Mumbai, India, [3]The Humsafar Trust, Project Director, Mumbai, India, [4]The Humsafar Trust, Monitoring & Evaluation Manager, Mumbai, India, [5]The Humsafar Trust, Finance, Mumbai, India, [6]The Humsafar Trust, Monitoring & Evaluation, Mumbai, India, [7]The Humsafar Trust, Research, New Delhi, India

Background: There is a shift in practices and avenues for risk-behavior of key populations to virtual spaces. The traditional approaches have limited success in reaching out to these hidden individuals at-risk of HIV.
This partial economic evaluation reports the costs to deliver various provider-initiated HIV services to key populations through a virtual outreach model in India.

Methods: An early implementation, retrospective analysis was conducted to estimate the service delivery costs for various HIV services through a virtual outreach model in India. The service delivery components involved were identified and validated by the implementation teams. The data on costs (infrastructure, human resource, services, technology & training) and outcomes were extracted from project reports and financial documents.
All the costs were converted into International Dollars' 2021 value using implicit price deflators for Purchasing Power Parities. Costs per service delivery outcome were calculated from Payer's perspective for the base case along with one-way sensitivity, and scenario analyses. The analysis was conducted for the time frame between October – December 2021 in MS Excel 365.

Results: A total number of 28859 individuals (belonging to key populations) were reached out on various virtual platforms and 43.8% of the clients were engaged in conversations about their sexual health, risk assessment & HIV testing. 1085 HIV tests were conducted within the timeframe of this analysis. The cost to reach out and engage one person to deliver HIV services was estimated to be 2.65 USD (INR 51) and 6.05 USD (INR 116.7) respectively.
The cost to get one client tested was reported to be 70.48 USD (INR 1360). A cost reduction of 6% was reported to provide these services through a work-from-home approach, while a rise of 32% in costs was reported in the work-from-office approach in scenario analyses. The cost-of-service delivery was reported to be sensitive to the salary of virtual navigators & e-counselors (HR costs) in this model.

Conclusions: Virtual outreach is a cost-saving approach to deliver HIV services to hard-to-reach, hidden key populations in India. Work-from-home is reported as a cost-reduction approach for this model. There is a need to conduct successive comparative analyses in further stages of implementation.

EPE243

Estimating program and patient cost-savings from multi-month ARV dispensing in Vietnam's Social Health Insurance scheme: strengthening scale up decision-making

H. Le[1], D. Nguyen[1], A.C. Thi Nguyen[2]
[1]Abt Associates, Hanoi, Viet Nam, [2]USAID, Hanoi, Viet Nam

Background: In 2019, Vietnam's Ministry of Health (MOH) extended a policy permitting multi-month dispensing (MMD) of antiretrovirals (ARVs) to a period of 84 - 90 days in accordance with WHO and PEPFAR recommendations for stable HIV patients. ARVs transitioned to Vietnam's Social Health Insurance (SHI) scheme, so evidence on the cost saving of the new MMD policy is needed to advocate for scaling-up MMD under the scheme.
The USAID funded Sustainable Financing for HIV project supported the MOH to analyze MMD's financial costs and benefits to inform MMD scale-up within the SHI scheme.

Methods: The analysis used retrospective data from a one-year costing exercise covering 103,500 patients who received ARVs through SHI in 2020. The analysis compared costs between standard 1-month dispensing versus 3-month and 6-month dispensing, using a reference of 20% copayment per visit in line with Vietnam SHI regulations. Secondary data on opportunity cost accumulated to patient time and transportation cost from most recent exit interviews were also used.

Results: The analysis found that total SHI liability costs under the MMD 3-month and MMD 6-month scenarios were lower by 13.4% and 16.4%, respectively, compared to single month dispensing due to a reduction in the number of patient visits. Each patient could save approximately $11.20 USD/year in out-of-pocket expenditures using 3-month MMD and $13.60 USD/year using 6-month MMD thanks to the reduction in visits, transport frequency and an increase in the number of working days. From the provider perspective, MMD decreases the number of visits by 55% and 67% for the 3- and 6-month options, respectively. This reduces the workload of providers overburdened by high client volume.

Conclusions: The analysis demonstrated the cost savings of implementing the MMD policy at scale across all three dimensions examined: SHI liability, HIV patient costs, and provider workload. After completing this analysis in September 2020, the MOH officially scaled up ARV MMD in all 63 provinces.
This was especially timely and impactful for people living with HIV given the financial impacts of COVID-19. By the end of December 2021, approximately 35% of Vietnam's estimated 110,000 PLHIV received ARV MMD from the SHI fund.

Use of generic ritonavir-boosted darunavir and dolutegravir for second line antiretroviral therapy is cost-effective in Zambia: a 10-year modelling analysis

J. Campbell[1], J. Estill[2], Z. Panos[3], J. Harwell[4], C. Chimhundu[5], H. Shakwelele[6], P. Haimbe[6], C. Amole[3], S. Sivile[7], L. Mulenga[7]
[1]*Clinton Health Access Initiative, Analytics and Implementation Research, Boston, United States,* [2]*Estill Epidemiology Consulting, Tallin, Estonia,* [3]*Clinton Health Access Initiative, HIV Access Program, Boston, United States,* [4]*Clinton Health Access Initiative, Clinical Sciences Team, Boston, United States,* [5]*Clinton Health Access Initiative, HIV Access Program, Harare, Zimbabwe,* [6]*Clinton Health Access Initiative, HIV Program, Lusaka, Zambia,* [7]*Ministry of Health, Lusaka, Zambia*

Background: Zambia has over one-million adults on antiretroviral therapy (ART), with almost 50 thousand accessing second-line (2L) treatment. The national HIV program recently added newly accessible generic ritonavir-boosted darunavir (DRV/r) as a best-in-class protease inhibitor (PI) alternative option to replace lopinavir-ritonavir (LPV/r) and/or atazanavir-ritonavir (ATV/r) for eligible 2L patients. This, together with use of dolutegravir (DTG) in 2L, offers opportunities to optimize 2L regimens.

Methods: We used Zambia program data as of January 2021 (with 80% of 2L patients on LPV/r and 20% on ATV/r), to populate a Markov state-transition model, coded in R. Four likely policy scenarios (Standard of Care (SOC) and three comparators) were defined to compare the cost-effectiveness of 2L ART optimization strategies:

1. SOC: uses LPV/r and ATV/r at their current breakdown in 2L;
2. C1: replaces LPV/r with DRV/r;
3. C2: replaces both LPV/r and ATV/r with DRV/r; and,
4. C3: uses DTG for all non-nucleosidereverse transcriptase inhibitor failures, and DRV/r for DTG failures.

The ART patient cohort transitions through health states including: ART status, viral load suppression status, CD4 cell count, opportunistic infections (OI). Published utility weights were applied to health states to estimate quality-adjusted-life-years (QALYs). Costs included all aspects of treatment from the health systems perspective and used public reference prices for annual treatment costs (DRV/r-$213, LPV/r-$227, ATV/r-$164, DTG-$32). Failure and retention on different regimens were parameterized using published literature, standardized to account for multiple studies. The WHO-CHOICE definition was used to determine cost-effectiveness (US$1050 per capita GDP in Zambia), 3% discounting was applied. Results exclude patients that did not migrate to 2L.

Results: Comparator scenarios C1 and C3 were cost-saving compared to the SOC, QALYs increased by 3% and 5%, respectively, while 10-year costs decreased by 2% and 5%, respectively. Comparator C2 showed increased QALYs (4.5%) with 4% increased costs; the incremental cost-effectiveness ratio (ICER) is considered highly cost-effective at US$411/QALY gained.

Conclusions: DRV/r will improve health outcomes and is cost-effective when replacing LPV/r and ATV/r. Using DTG in 2L offers additional cost savings, and combined with DRV/r presents an optimal approach for 2L optimization, allowing programs to use the best-in-class drug.

EPE245

Cost of caregiver-assisted oral HIV screening of children in Uganda and Zambia

J. Kagaayi[1], G. de Broucker[2], D. Oliver[3], M. Kaakyo[1], N. Mbona Tumwesigye[1], C. Biribawa[1], A. Nabuduwa[1], A. Mukose[1], S. Kakongwe[1], C. Namanda[1], M. Nsenga[1], C. Pounds[1], S. Mutembo[2], N. Moyo[4], J. Matoba[4], O. Chilibanyama[4], P. Ndubani[4], F. Okello[5], M.G. Alwano[5], Z. Zyambo[6], C. Chungu[6], C. Stecker[3], J. Gross[7], M. Rivadeneira[7], A.C. Awor[8], E. Nazziwa[8], M. Itoh[9], M. Boyd[9], G. Taasi[10], G. Munthali[11], M. Mwiya[11], T. Lyon[3], A. Lasry[7]
[1]*Makerere University School of Public Health (MakSPH), Kampala, Uganda,* [2]*Johns Hopkins University, Baltimore, Maryland, United States,* [3]*Catholic Relief Services, Baltimore, Maryland, United States,* [4]*Macha Research Trust (MRT), Choma, Zambia,* [5]*Catholic Relief Services, Kampala, Uganda,* [6]*Catholic Relief Services, Lusaka, Zambia,* [7]*Division of Global HIV and TB, Centers for Disease Control and Prevention, Atlanta, United States,* [8]*Centers for Disease Control and Prevention, Kampala, Uganda,* [9]*Centers for Disease Control and Prevention, Lusaka, Zambia,* [10]*HIV Testing Services, Ministry of Health, Kampala, Uganda,* [11]*Ministry of Health, Lusaka, Zambia*

Background: Caregiver-assisted pediatric oral HIV self-testing (HIVST) presents an alternative to facility-based testing which may improve testing access for children living with HIV (CLHIV) in resource-limited settings and decongest crowded health facilities. Data on cost and cost-effectiveness of this novel approach are scarce. Per person costs of facility-based HIV testing in Eastern Africa range from $3-$21 in 2020 United States Dollars (USD). This study estimated the costs of caregiver-assisted HIVST in Uganda and Zambia.

Methods: Nested in cross-sectional studies assessing the acceptability, feasibility and effectiveness of caregiver-assisted oral HIVST, we used an ingredient-based approach to estimate costs including commodities, labor, and infrastructure inputs from the perspective of the healthcare system from April to October 2021. Resources use and cost data were obtained through interviews with health workers and time-motion studies.

We present the cost per child screened using an oral test kit (OTK) and cost per child identified HIV-positive (excluding confirmatory testing). We conducted one-way sensitivity analyses to assess the robustness of the findings.

Results: HIV-positivity (screened HIVST-reactive and confirmed HIV-positive) was 0.67% among 4,766 children in Uganda (32 health facilities) and 0.43% among 2,649 children in Zambia (15 health facilities). The unit cost of caregiver-assisted oral HIV screening per child was $5.80 in Uganda and $5.12 in Zambia. In Uganda and Zambia, respectively, the largest cost component was the OTKs (44% and 41%), followed by labor (15% and 16%) and infrastructure (9% and 11%). An integrated facility-based program with community follow-up by village health teams (Uganda) or lay counselors (Zambia) where infrastructure, overhead and travel costs are eliminated, would reduce the unit cost to $4.50 and $4.93, respectively. This unit cost is sensitive to HIV prevalence among tested children and cost of OTK. The cost per CLHIV diagnosed was $869 in Uganda and $1,191 in Zambia.

Conclusions: Caregiver-assisted pediatric oral HIV screening in Uganda and Zambia can decrease the number of children needing facility-based testing and offer flexibility and convenience to parents.

Integrating caregiver-assisted oral HIV screening of high-risk children into existing community programs and negotiating lower OTK prices could further reduce the cost per HIV-positive child identified.

EPE246

Costs of pharmacy, workplace and hotspot HIV self-testing in Kenya

P. Indravudh[1], C. Kidiga[2], C. Pahe[3], E. Mutisya[3], K. Hatzold[2], H. Awsumb[2], F. Terris-Prestholt[1,4]

[1]London School of Hygeiene & Tropical Medicine, London, United Kingdom, [2]Population Services International, Washington, DC, United States, [3]PS Kenya, Nairobi, Kenya, [4]UNAIDS, Geneva, Switzerland

Background: Identifying low-cost strategies for providing HIV testing is important to expand and maintain service coverage among undertested population sub-groups. We conducted a cost analysis to estimate the costs of HIV self-testing (HIVST) implementation through pharmacy, hotspot, and workplace models in Kenya.

Methods: Financial costs of HIVST implementation were estimated from the provider perspective. Expenditure reports were collated for a 17-month time period from May 2019 to September 2020. Line-by-line expenditure analysis was supplemented with an ingredients-based approach. Price of test kits were based on the unit purchase price for community models and the unit net price (e.g., price – revenue) for pharmacy models, since kits were sold to consumers. Total and unit costs were estimated in 2019 US dollars.

Results: The cost per HIVST kit distributed was $20.70 for the pharmacy model, $10.86 for the hotspot model, and $22.69 for the workplace model. Lower unit cost for the hotspot model was likely driven by the higher volume of kits distributed. Largest contributors to costs were personnel followed by HIVST kits.

Compared with the community model, personnel costs were higher for the pharmacy model due to more intensive monitoring by project personnel. Costs of HIVST kits were also lower due to revenue generated from sales to pharmacy distributors and higher number of oral fluid-based kits, which were priced lower than blood-based kits.

Conversely, costs of HIVST kits were higher for community models, which mostly included blood-based kits. Across models, varying the volume of HIVST kits distributed yielded the largest changes in unit costs.

	Pharmacy model		Hotspot model		Workplace model	
	Cost	%	Cost	%	Cost	%
Start-up	$14,679	1.8%	$8,977	1.8%	$4,033	1.5%
Equipment	$9,304	1.1%	$4,241	0.9%	$2,696	1.0%
Recurrent	$798,055	97.1%	$473,689	97.3%	$270,205	97.6%
Total costs	$822,038		$486,908		$276,935	
Number of kits distributed	39,709		44,822		12,207	
Blood-based (unit price: $4.79)	9,975		31,655		9849	
Oral fluid-based (unit price: $2.93)	29,734		13,167		2,358	
Cost per kit distributed	$20.70		$10.86		$22.69	

Table 1. Total and unit costs by HIVST distribution model

Conclusions: Pharmacy models reliant on user initiative reached fewer clients and yielded higher unit costs compared with outreach-based hotspot models, even with recovered costs from earned revenue.

Despite the additional investment, strategies incorporating demand creation components could potentially be more efficient.

EPE247

Financial cost of a PrEP program among adolescent men who have sex with men and transgender women in Brazil

J. Nascimento Paim[1], L.E. de Souza[1], A. Grangeiro[2], N. Cerchiari[2], P. Coelho de Soarez[2], L. Magno[3,1], I. Dourado[1], A. Costa Santos[4]

[1]Universidade Federal da Bahia, Instituto de Saúde Coletiva, Salvador, Brazil, [2]Universidade de São Paulo, Faculdade de Medicina Preventiva, São Paulo, Brazil, [3]Universidade do Estado da Bahia, Departamento de Ciências da Vida, Salvador, Brazil, [4]London School of Hygiene & Tropical Medicine, London, United Kingdom

Background: PrEP is offered as a taxpayer's money program since 2017 for adults 18 years old (yo). or older. Moreover, PrEP is cost-effective in preventing HIV infections in adults.

Nevertheless, it is important to expand PrEP to youth at high risk of HIV such as adolescent men who have sex with men (aMSM) and transgender women (aTGW). We aimed to estimate the costs of scaling-up PrEP to adolescents aged 15 to 17 years in Brazil.

Oral abstracts

Late-breaker abstracts

Author Index

Methods: PrEP1519 is a demonstration cohort study of daily TDF/FTC as PrEP among aMSM and aTGW aged 15-19 yo. It is ongoing in three Brazilian capital cities (Salvador, São Paulo, and Belo Horizonte).
We used data from two cities of PrEP1519, the Brazilian National Health System (*SUS*) databases for prices of commodities, and conducted interviews with health providers to assess the use of resources.
We assessed the costs into three main categories: set-up, capital, and recurrent costs. Set-up and capital costs were annualized using a discount rate of 5%. Costs were estimated as total costs to the health system and average costs per patient.
Results: The total cost of PrEP in Salvador was estimated at US$ 272 thousand and in São Paulo at US$ 437 thousand, with an average cost per patient of US$ 860 and US$ 783, respectively. Recurrent costs responded to 87% of the total costs in Salvador, and 80% of the costs in São Paulo.
The components of demand creation of the PrEP1519 study (through social media and other networks), and peer-counseling time are the main cost categories for PrEP to be fully scaled up in the *SUS*.
Conclusions: Although the cost per patient in the two Brazilian settings is considerably high, most of these costs are already integrated into the*SUS*, and at scale, cost per patient tends to decrease substantially. Demand creation and peer counseling are the elements that would require the greatest cost increase to expand the PrEP program and to improve HIV treatment adherence as an added value. Further analysis is being conducted to estimate the cost per patient when PrEP is offered at scale.

Assessments of cost effectiveness: Provider and community perspectives

EPE248
A shift from onsite to online dissemination of new WHO treatment guidelines for HIV and TB through short interactive courses for health workers. Is it cost effective?

R. Kikonyogo[1,2], A. Bagarukayo[2]
[1]*Infectious Diseases Institute, Kampala, Uganda,* [2]*Pill Power Uganda, Hoima, Uganda*

Background: The infectious diseases institute (IDI) was mandated by the Ministry of health Uganda to provide continuous professional development for the health workforce in HIV, TB and related illnesses. Among IDI's core duties is the dissemination of new treatment guidelines. The World Health Organization (WHO) always updates and releases new treatment guidelines that are to be implemented by all health providers. The ministry of health conducts trainers of trainers (TOT) workshops for the implementing partners that include IDI. IDI then organizes teams that conduct onsite trainings per health facility. This arrangement was quite unfavourable because it was costly and time consuming. It also interrupted activities at the health centres as patient queues accumulated during the onsite trainings. In addition, the health workers' attention was divided.
Description: In 2018, IDI through its open access website piloted the online dissemination of treatment guidelines. The key content was converted into illustrative and animated sessions with narrative audio and launched as an online course. The sessions included knowledge checks and a post-test. Upon accomplishment of the pass mark of 80%, participants were able to download a certificate with 6 continuous professional development (CPD) points. A toll free number was provided for health workers to consult a doctor and eLearning specialist for any clarifications and technical challenges.
Lessons learned: To date, 304 certificates have been downloaded. The interactive sessions provided motivation for learning. One staff commented "I was glued to my phone, the audio narrations and illustrations were very catchy." The online dissemination course reached 1,007 health workers in a month compared to the average 220 through onsite trainings.
The strategy was cost effective in expenditure and time and caused minimal disruption to the health workers' schedule. The health workers appreciated the certificate and CPD points as a great motivation for completing the course. The toll free line provided a platform for consultations all which provided a good learning experience.
Conclusions/Next steps: In summary, it is essential to innovate cost effective measures that address learning needs of health workers but are at the same time favourable for the patients. IDI will cascade interactive online learning for most of its courses.

EPE249
Affordability of integrating early childhood development into PMTCT programs

C. Desmond[1], C. Mbalanga[2], E. Udedi[3], K. Dovel[4], L. Bruns[3], L. Richter[1], T. Coates[3]
[1]*University of the Witwatersrand, DSI-NRF Centre of Excellence in Human Development, Faculty of Health Sciences, Johannesburg, South Africa,* [2]*Independent Consultant, Lilongwe, Malawi,* [3]*University of California, Global Health Institute, San Francisco, United States,* [4]*University of California, Division of Infectious Diseases, David Geffen School of Medicine, Los Angeles, United States*

Background: Integrated health services can improve client experiences and maximize clinic resources, health system efficiency, and health outcomes for patients. We analyzed the incremental cost associated with including Early Childhood Development (ECD) in government and NGO clinical prevention-of-mother-to-child-transmission (PMTCT) services in Malawi.

The aim was to examine program feasibility and cost effectiveness, with a view to promoting its uptake by government and other healthcare providers in the country.

Methods: The intervention incorporated ECD training sessions into routine clinic visits for mothers enrolled in PMTCT at 6 health facilities in Malawi. Data presented previously demonstrated that mothers attended sessions regularly, with high retention of mothers and infants in ART services. We estimated the additional financial cost of delivering the intervention from the provider perspective. Cost data were collected prospectively using timesheets, staff interviews and expenditure categorization to distinguish between research and implementation costs. An ingredients approach was used to estimate the implementation cost per activity. These data were used to calibrate a costing model to investigate changes in input costs if the intervention is replicated. We analyzed the cost per ECD session across different delivery scenarios to provide a measure of relative efficiency.

Results: The incremental cost per mother per intervention session ranged from US$2.2 (delivered at government clinic) to US$6.3 (delivered at NGO run clinic). The cost implication of expanding such a service is determined by the structure of health care delivery: what level of existing cadre can implement the service, how much they are paid, and the level and cost of supervision they require. Lower wages/stipends lowers costs significantly, as would lower levels of supervision, but we have seen this compromises quality.

A key consideration is the opportunity to use staff downtime: if implementing staff can provide other clinical services while not busy with the ECD intervention, the intervention becomes more efficient.

Conclusions: We have demonstrated previously that ECD integrated into PMTCT resulted in better clinical outcomes for mothers and infants. Determining whether these clinical outcomes result in further cost savings should be investigated. Further investigation is required to determine optimal delivery design for scale-up from a demonstration project to a government program.

EPE250

Cost-benefit analysis of investments made in Morocco since the creation of the Global Fund (2002 - 2020) for HIV control

M. Ghanam[1], I. Khoudri[1], B. El Omari[1], C. Boukhalfa[2], H. El Rhilani[3], K. Alami[3], M. Youbi[1]

[1]Directorate of Epidemiology and Disease Control, Ministry of Health and Social Protection, Rabat, Morocco, [2]National School of Public Health, Ministry of Health and Social Protection, Rabat, Morocco, [3]ONUSIDA, Rabat, Morocco

Background: 2021, marks the 20th anniversary of the creation of the Global Fund. During two decades, remarkable progress in HIV control has been made in Morocco by Ministry of Health and its partners, particularly those from civil society.

This study aimed to determine the cost-benefit ratio and evaluate the costs of all investments made over the past 20 years for HIV control, as well as the advantages obtained based on the achievements in terms of reduction of new infections and AIDS-related mortality.

Description: This was a retrospective study that analyzed expenditures of interventions to control HIV at the national level from 2002 to 2020. Evolution of new infections and HIV-related deaths was also determined.

Two scenarios were compared with or without financing, the following issues were analysed:

1. Incremental cost, namely expenditure in terms of prevention, care and treatment, social protection, services and program management.

2. Advantages in terms of HIV related-deaths avoided (role of antiretrovirals) and new HIV infections avoided, taking into account the GDP rate and life expectancy at birth.

Lessons learned: Since the creation of the Global Fund in 2002, Morocco has started implementing national strategic plans for HIV control. A total of 321.796.092 US$ have been invested by the Ministry of Health and its partners for HIV control, including 130 million US$ by the Global Fund. AIDS-related deaths have fallen by 46% and new infections by 55% since 2002.

Over 20 years, these investments have averted 27 743 deaths and 51 909 new HIV infections. This has contributed to save 1.867.205.463 US$: 1.774.146.311 US$ saved thanks to deaths avoided and 93.059.152 US$ thanks to new HIV infections reduced. The return on investment (ROI) was determined at 5.80.

Conclusions/Next steps: Every dollar invested for HIV control yielded 6 US$ in benefits by saving lives. As a result, the net benefit from the health impact of HIV prevention and care programs in Morocco amounts to over 1.5 billion US$.

Economic evaluation and affordability assessments

EPE251

Decentralized drug distribution of antiretroviral therapy in Eswatini: cost-saving or cost-shifting?

R. Homan[1], N. Kisyeri[2], L. Nishimoto[3], H. Mahler[3], M. Bateganya[1], L. Muzart[2]

[1]FHI 360, Health Services Research, Durham, United States, [2]FHI 360, Mbanane, Eswatini, [3]FHI 360, Washington, United States

Background: Decentralized drug distribution (DDD) is an approach to support people living with HIV and other chronic conditions who need periodic drug refills in low- and middle-income countries. It has the potential to preserve facility-based resources (especially labor) and reduces crowding in facilities (particularly important during the COVID-19 pandemic).

Oral abstracts

Poster exhibition

E-posters

Late-breaker abstracts

Author Index

This analysis documents how the DDD approach in Eswatini changed the flow of resources during implementation and service delivery and who bore the costs/savings.
Methods: Activity-based costing of DDD was conducted todocument the resources required to support service delivery through DDD, how DDD impacted the source of resources, and how DDD impacted the cost to service clients. Resources were valued from a financial perspective for monetary transactions or as opportunity costs if no transaction took place but how an existing resource was being used changed. The latter included the value of time for facility-based staff who were redeployed, or changes in the time clients spent seeking refills (valued at the hourly equivalent of gross domestic product per capita). Antiretroviral costs were excluded, as overall use did not change.
Results: During service provision, for every US$1.00 of financial costs incurred, ~US$0.75 in opportunity costs were incurred for redeployed resources to support CDPs. These were almost equally divided between the Ministry of Health (55%) and donor-funded implementing partners (45%). Clients had a modest financial cost savings (~US$2.40/refill) but substantial opportunity cost savings (~US$47.87/refill). The ongoing financial and opportunity costs of DDD per month and refill for stakeholders are shown below (US$).

	Donor Resources		Ministry of Health Resources		Client Resources	
	Per Month	Per Refill*	Per Month	Per Refill*	Per Month	Per Refill*
Financial	$27,261	$33.25	nil	-	-$1,972	-$2.40
Opportunity	$9,085	$11.08	$11,282	$13.75	-$39,250	-$47.87
Total	**$36,346**	**$44.32**	**$11,282**	**$13.75**	**-$41,222**	**-$50.27**

**Based upon ~820 refills dispensed per month (17.7% of all ART refills)*

Conclusions: DDD of antiretroviral therapy is feasible and can reduce pressure on facility-based resources. The savings to clients largely offsets the additional costs associated with DDD for antiretroviral refills. Understanding how DDD introduction impacts the flow and source of resources required can inform scale-up and ongoing support of these programs.

EPE252

Socio-economic impact of HIV and AIDS in Ghana: a review of the out-of-pocket expenditure of people living with HIV in Ghana

D. Annang[1], P. Ayamah[2], E. Odoso[1], D. Epeh[3]
[1]Ghana AIDS Commission, Research Monitoring and Evaluation, Accra, Ghana, [2]Ghana AIDS Commission, Technical Services, Accra, Ghana, [3]Ghana AIDS Commission, Finance and Administration, Accra, Ghana

Background: The survival and health status of People Living with HIV and AIDS (PLHIV) have significantly improved over the years with the introduction of Antiretroviral Therapy (ART). ART remains a major driver of the total cost of caring for PLHIV although its introduction has substantially reduced the cost of hospitalization.
This study identified major areas of expenditure requiring funding by PLHIV as a direct result of their condition as well as ascertain the extent of out of pocket payments made by PLHIVs.
Methods: The estimation of the household out-of-pocket expenditure on HIV and AIDS was assessed within the framework of the Cost of Illness (COI) approach given as Cost of illness of HIV and AIDS in the household = direct cost of care + indirect costs associated with HIV and AIDS illness.
The study was conducted in 6 sites based on the 2016 sentinel survey and involved 600 households with at least one HIV and AIDS patient from October to December 2017. Data was analyzed using descriptive statistics.
Results: The major areas of expenditure as Out-of-Pocket (OOP) payment for PLHIVs were clinical tests, expenditure on Antiretroviral Treatment (ART) in terms of medication, medical expenditure on opportunistic infections, hospital fees, transport cost to and from the ART facilities, nutritional supplement due to ARVs, cost of hospitalization, diet/lodging expenses for caregiver and other expenditures. The highest expenditure borne by PLHIVs in Ghana are those associated with medicals on an annual basis with a mean annual expenditure of $70 as well as $12 on a monthly basis for nutritional supplement due to ARVs against the background of an average income of $344.
Conclusions: The high cost involved in ART may hinder the poor among PLHIVs from receiving quality health care and hence policy initiatives aimed at offsetting out-of-pocket payment for infected HIV persons in lower socio-economic classes must be prioritized.
Additionally, effort must be in place to court more donor funds or public/private funds to subsidize the cost of accessing ARVs and also explore building drug pick up zones closer to patients to ensure easy and low cost access to ARVs.

EPE253

Factors influencing economic stability of households affected by HIV: a case of Lea Toto Program, Kenya

J. Mwamba[1], S. Wasike[2], J. Wamboye[3], P. Mulongo[4], C. Ngave[5]

[1]Children of God Relief Institute (COGRI), Research and Resource Mobilization, Nairobi, Kenya, [2]Children of God Relief Institute (COGRI), Economic Empowerment, Nairobi, Kenya, [3]Children of God Relief Institute (COGRI), Interim Directorate, Nairobi, Kenya, [4]Children of God Relief Institute, Program Manager, Nairobi, Kenya, [5]Children of God Relief Institute (COGRI), Monitoring and Evaluation, Nairobi, Kenya

Background: Households affected by HIV are frequently more vulnerable to economic shocks than other households. This study examined the factors influencing economic stability of households affected by HIV using the case of Lea Toto Program (LTP), Nairobi City, Kenya. Specifically, the study sought to examine the effect of caregiver income, education, occupation and Household Economic Strengthening (HES) interventions on economic stability of LTP households.

Methods: The study was conducted between July-September 2021 in eight Lea Toto programs in Nairobi, Kenya. This study employed cross-sectional descriptive design. A total of 4,647 HIV affected households were sampled using census technique. Data was collected through questionnaires, coded, entered and analyzed through descriptive and inferential statistics using Statistical Package for Social Sciences (SPSS) version 25.

Results: The key finding was that caregiver income, education and occupation, as well as household economic strengthening interventions were key determinants of economic stability among HIV affected households.

The study also found that education of female caregivers (p=0.000), occupation status of male caregivers (p=0.000), occupation status of female caregivers (p<0.000), microcredit support (p=0.047) and business training (p=0.025) were significant predictors of economic stability among households affected by HIV.

Effect	Model Fitting Criteria	Likelihood Ratio Tests		
	-2 Log Likelihood of Reduced Model	Chi-Square	df	Sig.
Intercept	241.309[a]	.000	0	.
Education of female caregivers	336.561[c]	95.252	8	**.000**
Occupation of male caregivers	320.778[b]	79.468	10	**.000**
Occupation of female caregivers	287.233[b]	45.923	10	**.000**
IGA	247.410[b]	6.101	2	**.047**
Business training	248.717	7.408	2	**.025**

Table 1: Likelihood Ratio Tests

Conclusions: The study concluded that caregiver education, caregiver occupation status, microcredit support, and business training help HIV-affected households achieve economic resilience.

Thus, organizations that work with HIV-affected households should take these factors into account when promoting the economic well-being of HIV-affected households.

EPE254

Cost-effectiveness of HIV drug assistance programs in the United States: a systematic review of economic evaluations

K. McManus[1], A. Strumpf[1], J. Keim-Malpass[1]

[1]University of Virginia, Charlottesville, United States

Background: As part of the United States' Ryan White HIV/AIDs Program, the AIDS Drug Assistance Program (ADAP) is a large federally-funded, state-administered program to assist states in providing prescription drug medications, including antiretroviral therapy, for people with HIV (PWH) who lack adequate access from Medicaid or other forms of health insurance. Expenditures from ADAP are approximately $2.4 billion per year, but there has been a dearth of formal policy and economic analysis supporting the societal impact.

The objective of this study was to conduct a systematic review of economic analysis of HIV drug assistance programs in the United States to establish future research priorities based on gaps in knowledge.

Methods: Six electronic databases were searched for articles published up to Jan 15, 2022 that met inclusion criteria. The Consolidated Health Economic Evaluation Reporting Standards (CHEERS) checklist 2022 was used to assess the quality of reporting of the economic evaluations. Data were extracted into categories to assess gaps and needs for future economic evaluation.

Results: Only 6 studies met our inclusion criteria, and 2 of those studies used the same modeling approaches but were published with slightly different outcomes of interest.

The few economic analysis that focused solely on ADAP clients were conducted based on 2008 or older data. The most recent study modeled the net cost per quality-adjusted life-year (QALY) secondary to reducing new HIV cases among those that are virally suppressed, but did not include the economic or health benefits for PWH.

Author, Year	Type of economic evaluation	Perspective	Sample	Comparison	Cost data	Model Outcome	Horizon	Study Funding Source
Goyal et al., 2021 (a)*	Agent-based stochastic model	US Health Care System	Overall HIV burden in US	Simulates the 5 types of Ryan White HIV/AIDs Program	RWHAP and ADAP	Proportion of people with HIV virally suppressed, deaths, cumulative health care costs, ICER, QALY	50 years	HRSA
Goyal et al., 2021 (b)*	Agent-based stochastic model	US Health Care System	Overall HIV burden in US	Simulates the 5 types of Ryan White HIV/AIDS program	RWHAP and ADAP	HIV incidence for MSM, mortality rate, average life expectancy for low CD4, lifetime care costs	50 years	HRSA
Snider et al., 2016	Ordinary least squares regression model and simulation	State ADAPs	ADAP clients	ADAP Policies (income limit, medical requirements, enrollment cap, asset limits)	Literature Review (Staszewski et al., 1996, Freedberg et al., 2001)	ADAP clients served, survival benefits (QALYs and $), and cumulative healthcare costs	Lifetime	Bristol-Myers Squibb
Pinkerton et al., 2013	Transmission mathematical model	Societal	ADAP clients	ADAP clients	Kaiser Foundation ADAP Fact Sheet (2008 dollars)	Cost of reduction in new secondary cases each year for those who are ADAP clients (Net cost per QALY)	Lifetime	NIH; RWJF
Johri et al., 2002	State transition model with Monte Carlo Simulations	State ADAPs	ADAP clients	(1) "High efficacy", (2) "Low efficacy" ADAP policy scenarios	AIDS Cost and Services Utilization Survey	Projected life expectancy, cumulative healthcare costs, ICER, QALYs	Lifetime	CDC; NIAID; NIH; NIMH
Schackman et al., 2001	Markov state-transition and microsimulation	Government/ payer and societal	People with HIV who present for medical care with CD4 counts of 500	(1) Immediate ART, (2) ART initiated at CD4 count of 200 (3) no ART	AIDS Costs and Services Utilization Survey	Incidence of opportunistic infections, years of life, QALYs gained, lifetime costs	Lifetime	NIH

*Same modeling approach, reporting on different outcomes

Abbreviations: **ADAP** – AIDS Drug Assistance Programs; **RWHAP** – Ryan White HIV-AIDS Program; **QALY** – Quality-adjusted life-year; **ICER** – Incremental cost-effectiveness ratio; **CDC** – Centers for Disease Control and Prevention; **HRSA** – Health Resources and Services Administration; **NIH** – National Institutes of Health; **NIAID** – National Institute of Allergy and Infectious Diseases; **NIDA** – National Institute on Drug Abuse, **RWJF** – Robert Wood Johnson Foundation; **NIMH** – National Institute on Mental Health.

Conclusions: Updated person-centered cost effectiveness models assessing the ADAP program are needed on a national, regional, and state-by-state level to guide policy decisions and coverage determinations.
Some of the person-centered outcomes that should be considered for assessment include reduced complications, reduced hospitalizations, and increased health-related quality of life.

EPE255
Costs and benefits of community responses for sexual and reproductive health and the societal enablers: a scoping review

J. McHardy[1], M. Clayton[1], M. Pillinger[1], S. Lynch[1], M. Bah[1], S. Votyagov[2], M. Kavanagh[1]
[1]O'Neill Institute for National and Global Health Law, Georgetown Law, HIV Policy Lab, Washington, United States, [2]Aidsfonds, Amsterdam, Netherlands, the

Background: Evidence shows that promoting community leadership and creating rights-protective environments increases the effectiveness of other interventions aimed at ending HIV and preventing deaths from AIDS. This evidence underpinned the adoption by UNAIDS of the community-led service delivery components of the 95-95-95 targets and the 10-10-10 societal enabler targets. Although progress on these two sets of targets is fundamentally interdependent they are commonly assessed in isolation from one another.
Because of this, we have integrated the literature on the costs and benefits of these interventions and set their findings in dialogue and contestation with another.
Methods: Focused on HIV/AIDS as well as the sexual and reproductive health rights (SRHR) of key and vulnerable populations, our research is based on three interrelated scoping reviews on:
1. Benefits of policy and social environments that promote SRHR;
2. The costs of criminalisation, discrimination and stigma that run contrary to SRHR; and,
3. The costs/benefits of community services addressing SRHR.
Results: Using a mapping of the key concepts, research, and evidence gaps in literature, we have procedure a broad synthesis of the costs, benefits and resources required for community led service delivery and societal enabler policies that promote SRHR in the context of HIV/AIDS. then analyse commonalties, distinctions, and research gaps.
Preliminary findings indicate broad consensus in favour of the cost-effectiveness and other benefits of the interventions and policies under review for which there is available evaluation as well as corollary evaluations of the costs and other harms from discrimination, stigma and criminalisation. economic evaluation and assessment, to give a broad indication of the findings in the literature. Through synthesis of our findings, we are still analysing shared benefits of progress the costs and cross-cutting costs of neglecting the interrelated targets set by UNAIDS while also assessing learns for the effectiveness of siloed targets.
Conclusions: Our findings provide a novel contribution to the literature and should help inform future research on the health and societal challenges experience by key and vulnerable population as well as provide evidence in favour of increased investments in community services addressing HIV-related SRHR, societal enablers and scaled-up community leadership.

Supporting effective linkages between maternal child health and HIV services

EPE256
Ensuring timely access to Nevirapine at birth for HIV Exposed Infants (HEI) at Antiretroviral Therapy Clinics without delivery services, TASO Mbale experience

T. Mafabi[1], C. Navvuga[2], V. Wenwa[3], M. Okech[3], S. Clay[3], C. Mafabi[3]
[1]The AIDS Support Organisation (TASO) Uganda, Pediatric & Adolescent Clinic, Kampala, Uganda, [2]The AIDS Support Organisation (TASO) Uganda - Mbale, Pediatric & Adolescent Clinic, Kampala, Uganda, [3]The AIDS Support Organisation (TASO) Uganda - Mbale, Kampala, Uganda

Background: The World Health Organisation recommends all HEIs receive Nevirapine (NVP) prophylaxis as a preventive measure for HIV infection at birth. However, at TASO Mbale by March 2021 only 50% of the HEI born to mothers receiving ART care had NVP at birth; this is because TASO offers antenatal care (ANC) services but not maternity services, so our mothers deliver from public health facilities, which sometime lack supplies such as the NVP syrups.
This gap was identified and addressed through continuous quality improvement with an objective; increasing the proportion of HEI receiving NVP at birth monthly from 50% by March 2021 to 100% by Sept 2021.
Description: Pregnant HIV positive women were cohorted by age of pregnancy and expected delivery date (EDD) in 7 monthly cohorts (March to September 2021). The women were tracked and monitored during ANC visits. Their phone and physical addresses were regularly updated and NVP syrups dispensed at last ANC visits. The NVP syrup was pre-packed in the 'mama kit' and health talks on administering the prescription delivered. Follow-up phone calls made around the EDD to confirm delivery and initiation of the NVP.
Lessons learned: The facility's proportion of HEI receiving NVP at birth monthly improved from 50% by March 2021 to 100% by Sept 2021. The improved performance was majorly attributed to the, frequent data use, health talks

to mothers about the importance of giving NVP timely at birth plus administering process coupled with the actual dispensing of the syrup during last ANC visit among other changes; especially during the COVID-19 period where there were restricted travels affecting access of the ART clinic for this specific prescription.

Conclusions/Next steps: Cohorting', monitoring and tracking all pregnant mothers and follow-up phone calls helps in booking for timely 1st PCR.

Timely dispensing of necessary prescriptions (NVP in this case) coupled with enough sensitization of its benefits and demonstration of administering procedure to the end users is key in yielding positive health outcomes.

Approaches to supporting resilient health systems

EPE257
Building a well-trained and resilient health workforce to end the HIV/AIDS epidemic

J. Botha[1], K. Fisher[2], E. Geoffroy[2], J. Jere[1], N. Khozomba[1], C. Mwangonde[1], E. Schell[2]
[1]Global AIDS Interfaith Alliance (GAIA), Limbe, Malawi, [2]GAIA Global Health, Oakland, United States

Background: A well-trained nursing workforce is vital to ending the HIV/AIDS epidemic. Yet in low-income, high HIV-burden countries like Malawi, there is a chronic shortage, with only 44 nurses per 100,000 people and 62% of nursing positions in public facilities vacant. Moreover, workforce entry is hampered by deployment delays. With prevention, testing and treatment tools available, the greatest threat to continued progress in the battle against HIV is lack of skilled personnel.

Description: GAIA works with the Malawi Ministry of Health and key partners to build a competent workforce through nursing scholarships and fellowships. Since 2005, GAIA has provided scholarships,(tuition, stipends, material/psychosocial support, licensure preparation) to 574 socioeconomically disadvantaged students*(80% female; 60% lost one or more parents)*, committed to working in Malawi post-graduation.

GAIA has deployed 45 new nursing graduates as fellows (*73% female*) to work in rural health facilities in Mulanje District to bridge critical staffing gaps. Fellows received government-scale salaries, HIV-related in-service training, and support applying for permanent nursing positions nationwide.

In 2021, USAID made a five-year investment to expand these programs – funding an additional 200 scholarships and 240 fellowships. Fellows will be trained in antiretroviral therapy, maternal, newborn and child health and deployed to public health facilities, serving vulnerable high HIV-prevalence communities.

Lessons learned: By 2022, 498 scholars had graduated, of which 420 are deployed, 34 are preparing for licensure and 29 are awaiting permanent deployment. The table below shows deployed scholars' status, demonstrating that GAIA scholarships help nurses develop confidence and skills to lead, educate and serve on the frontline to end the HIV epidemic.

	Working in the public sector	Hold leadership positions	Working as educators
Deployed GAIA Scholar Graduates	82%	55%	9%

Fellowships grew Mulanje's health workforce by 11% and supported a 23% increase of people living with HIV initiated on treatment. All fellows secured permanent employment within six months of fellowship completion.

Conclusions/Next steps: Ending the HIV/AIDS epidemic demands robust investment in human resources for health. GAIA programs provide pathways out of poverty and produce competent nurses equipped to respond to global health threats.

Further, through education and economic opportunity, supported individuals and their families are able to reduce their risk of HIV transmission.

EPE258
Professionalization of lay health cadres: replacing volunteer Expert Clients with fully employed Patients Supporters in Malawi

E. Chikuse[1], T. Banda[1], A. Makwaya[1], E. Namaliya[1], A. Shaba[1], J. Lichenya[1], D. Smith[1,2], R. Hoffman[2], M. Chivwara[1], S. Phiri[1,3], J. van Oosterhout[1,2]
[1]Partners in Hope, Lilongwe, Malawi, [2]University of California Los Angeles, Division of Infectious Diseases, David Geffen School of Medicine, Los Angeles, United States, [3]Kamuzu University of Health Sciences, Department of Public Health and Family Medicine, Blantyre, Malawi

Background: Expert Clients (ECs) have played important roles in HIV treatment programs in sub-Saharan Africa, successfully providing peer support, health education and counseling at community and health facility level. However, increasing workload and complex tasks available for lay cadres in HIV services caused challenges for ECs because they are part-time volunteers and often have low education level. During the first Covid-19 wave in April 2020, ECs were suspended from work due to increased risk of severe Covid-19 disease. We describe how our program transitioned to a new lay health cadre named Patient Supporters (PS).

Description: Partners in Hope is a PEPFAR/USAID-funded Malawian non-governmental organization with Christian background, supporting HIV services for ~22% of the ART population in Malawi. In October 2020, we introduced PS as a new, formally employed lay cadre. Unlike for ECs, PS selection was independent from HIV status and required

completion of secondary school. After a one-week training, PS took over former EC tasks. In addition, PS were deployed as advanced counselors and case managers for clients with high risk of loss to follow-up. With the transition to PS, the volume of community tracing of clients who missed appointments increased: mean tracing 1,727/month by ECs vs. 5,595/month by PS, a 52% increase when corrected for available full-time equivalent of each cadre. ECs and PS achieved good tracing outcomes (percentage Alive/Back-To-Care/Transferred-Out): 79% and 85% respectively (Figure).

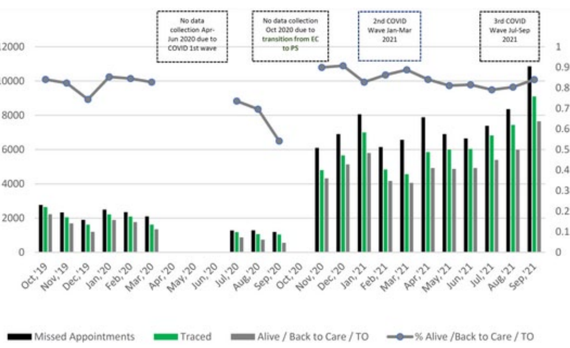

Figure. Trends in community tracing of missed appointments (October 2019-September 2021) in relation to the transition from ECs to PS and Covid-19 waves.

Lessons learned: PS have a formal contract that provides employment assurances, motivation to work and establishes adherence to specific organizational policies and performance expectations. With higher background education and full-time employment, PS expanded quantity and quality of EC tasks and added more complicated services, including advanced counseling.

Conclusions/Next steps: After successfully introducing PS, next steps will be standardization of job title and – description across PEPFAR implementing partners and ultimately, transition to employment under Ministry of Health.

EPE259

Effect of Stepwise Laboratory Quality Improvement Process Towards Accreditation (SLIPTA) implementation on laboratory management and Key HIV laboratory quality indicators in East Central Uganda

S. Bulime[1], A. Muhwezi[1], R. Iriso[1], K. Baleeta[1], N. Ruhinda[1], D. Ankunda[1], L. McGough[2], M. Laverentz[2], B. Turesson[2], M. Arinaitwe[3], M. Muddu[3], P. Lwevola[3]

[1]University Research Co. LLC, USAID RHITES-EC Project, Jinja, Uganda, [2]University Research Co. LLC, Maryland, United States, [3]Makerere Joint AIDS Program, USAID LPHS EC Project, Jinja, Uganda

Background: Quality laboratory services play a central role in the cascade of HIV prevention, testing and treatment services. However, effective laboratory service delivery is often hamstrung by deficiencies in laboratory quality management systems (LQMS). In East Central Uganda, a baseline assessment in March 2017 identified only one laboratory hub out of nine (11%) that attained LQMS three-star rating out of the maximum of five stars. The USAID Regional Health Integration to Enhance Services in East Central Uganda (USAID RHITES-EC) aimed to improve the quality of HIV related laboratory services at nine laboratory hubs and to evaluate the impact on key HIV laboratory quality indicators, including reducing HIV viral load (VL) specimen rejection rates.

Description: The USAID RHITES-EC implemented the WHO/AFRO Stepwise Laboratory Quality Improvement Process Towards Accreditation (SLIPTA) approach to improve the LQMS status of the nine laboratory hubs serving the twelve districts in East Central Uganda. We aimed to achieve a rating of at least three stars out of the maximum of five stars for all the hubs.

The technical support provided included training workshops, monthly on-site mentorships, quarterly collaborative learning meetings, monthly assessments on HIV VL specimen rejection rates, and annual assessments of LQMS star status.

Lessons learned: By December 2021, five out of the nine (55%) laboratory hubs attained the target of three- stars and above. One laboratory (Jinja Regional Referral Hospital laboratory) also attained international accreditation by the South African National Accreditation System (SANAS). The remaining four of the laboratory hubs also improved to two-stars. Staff transfers to lower-level facilities hindered achievement of the three-star target for the laboratory hubs that attained two-stars. This is being mitigated by supplementary LQMS trainings.

Alongside the improvement in LQMS status, there were improvements in key quality indicators overall, including a reduction in HIV VL specimen rejection from an average of 4.7% (March 2017) to 0.1% (December 2021) against a target of ≤1%.

Conclusions/Next steps: The SLIPTA approach significantly improved LQMS and the quality of HIV laboratory services delivered at the nine laboratory hubs serving East Central Uganda.

EPE260

Drone technology to facilitate access to medical supplies and commodities for maternal, child and HIV treatment in East and Southern Africa Region

S. Hushie[1], K. Dikgole[2]

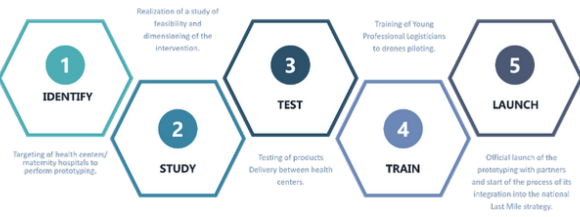
[1]UNFPA, East and Southern Africa Regional Office, Johannesburg, South Africa, [2]UNFPA, Botswana, Gaborone, Botswana

Background:

The Government of Botswana's commitment to provision of universal healthcare services in demonstrated by inter alia the wide-reaching distribution of health facility network. 84% of the population live within a 5km radius from a health facility, while a further 965 live within a 15km radius.

Botswana has however seen steady decline in its Maternal Mortality Ratio (MMR) - in 2013 Botswana's MMR was 182.6 but had dropped progressively to 133.7 in 2018 (Statistics Botswana, 2021). A worrisome development is that these apparent gains were reversed as MMR climbed back to 166.3 in 2019 (Statistics Botswana, 2021). This warrants immediate intensified intervention aimed at turning the trend back on track even as this trend is being closely watched.

Description: UNFPA ESARO is working with identified Country Programmes to pilot a medical drone delivery project in the region to prove the feasibility of using drones in the supply chain of health products to be integrated into the national Last Mile strategy. UNFPA in collaboration with the Ministry of Health and Wellbeing and the University of Science and Technology in Botswana.



Lessons learned:

1. Drones accelerate reduction of preventable maternal deaths by delivering blood and emergency obstetric care drugs and commodities and bridge the distances, reduce current transportation costs, defective products, overcome road infrastructure challenges, and contribute significantly to the timely availability of essential emergency obstetric care drugs, commodities and supplies.
2. People on lifelong medications such HIV, chronic non-communicable conditions and those seeking services such as family planning and condoms for routine refills can do this without direct human intervention and efficiently.
3. The outbreak of COVID-19 further reminds us that crisis such as communicable disease outbreaks may require innovative ways of reaching clients, suppliers and health care facilities.

Conclusions/Next steps: Drone technology although not new, is relatively novel in Africa and must be pursued.

EPE261

Using demand creation strategies to increase access to differentiated models of care

S. Hendriksz[1], B. Meyer[1], E. Arnachellam[2], L.J. Swart[3]
[1]*Right e-Pharmacy, Pretoria, South Africa,* [2]*Right e-Pharmacy, Business Development, Pretoria, South Africa,* [3]*Oxigen Communications, Pretoria, South Africa*

Background: Antiretroviral therapy (ART) services in Sub Saharan Africa are often provided in basic and inefficient ways, making long-term adherence to care challenging. Differentiated Models of Care (DMOC), provides tailored ART support and the foundation for patient-centred chronic disease wellness systems. Right e-Pharmacy provides one such solution: Collect & Go smartlocker pick up points for chronic medication. However, patient awareness of the DMOC options available to them is limited and hampered by low literacy levels and access to information.

This results in not all patients benefiting from available programs, especially newly introduced options such as the smartlockers.

Description: Using impactful, non-conventional marketing strategies, can reach more patients in different ways to effectively disseminate health information. The Collect & Go smartlocker program employed a multi-angled approach to reach different population groups within target communities. A needs assessment identified viable communication channels for reaching patients. A phased strategy was utilized by deploying live community events, radio discussions, television adverts, and targeting of public transport information sharing in local languages.

The campaign also involved distributing specially designed printed materials, use of WhatsApp, provision of free Wi-Fi, and the recruitment of taxi drivers as ambassadors. A campaign ambassador who understands the HIV/AIDS journey, stigmas, demands and message processing trends was employed to promote information sharing.

Lessons learned: A rapid uptake in Collect & Go patients was observed after each phase. Each phase targeted a specific demographic requiring a combined approach. The combined reach for the multi-channel media campaign was 13666 192. A phased approach layers messaging within the community, creating a strong information hub around health topics. In this case, more knowledge was generated within the different audiences and the audience response, in turn, guided marketing messages and future channel selection.

Conclusions/Next steps: A direct correlation was observed between demand creation activities and uptake of the Collect & Go smartlocker solution. It is critical to shape dissemination strategies to the target population for maximum impact.

Demand creation is a strong tool that can greatly benefit other DMOC programs when applied strategically and combined with specific healthcare messaging, marketing channels and demand drivers.

EPE262

PEPFAR's contribution to global health security, FY2018-FY2020: mapping expenditures that support the Joint External Evaluation capacities for preventing, detecting and responding to public health emergencies

E. Finkel[1], M. Ruffner[1], E. Reuben[1], M. Wollmers[1]

[1]*Office of the U.S. Global AIDS Coordinator and Health Diplomacy, U.S. Department of State, Washington D.C., United States*

Background: As evidenced by the response to the COVID-19 pandemic, PEPFAR supported countries have responded to global health security threats by leveraging many of the same public health and clinical platforms that have been invested in over nearly two decades to address the HIV epidemic. To assess the extent to which PEPFAR's investments have supported global health security, an analysis was conducted using the Joint External Evaluation (JEE) tool (1st ed., 2016), a globally accepted framework for measuring capacities for preventing, detecting, and responding to public health emergencies in compliance with the World Health Assembly's International Health Regulations (2005).

Methods: PEPFAR expenditures from FY2018-FY2020 were mapped to the JEE capacities based on the definitions used in PEPFAR's financial classification system. Direct support was defined as expenditures that directly benefited global health security (e.g., non-service delivery expenditures on system strengthening, training, supportive supervision, etc.). Indirect support included expenditures that had a primarily HIV-related focus but were tangentially related to the JEE capacities or could be further leveraged in the event of a public health emergency (e.g., service delivery expenditures on health care workers, laboratory services, etc.).

Results: A total of $6.4B (54%) of PEPFAR expenditures from FY2018-FY2020 were mapped to 9 of the 16 JEE capacities, including $3.4B in direct support and $3.0B in indirect support. Expenditures fell under all three goals of preventing ($264.5M), detecting ($6.0B), and responding ($133.3M) to public health emergencies. The majority (92%) of mapped expenditures supported the workforce development ($5.0B), national laboratory systems ($491.2M) and real time surveillance systems ($358.6M) capacities. $5.5B (46%) of PEPFAR expenditures remained unmapped and consisted of expenditures for commodities ($657.2M), other site-level costs ($3.5B) and indirect charges ($1.3B).

Conclusions: This analysis demonstrates that the direct and indirect spillover benefits of PEPFAR's investments in platforms to address HIV have contributed significantly to partner countries' capacities for protecting against and responding to global health security threats**.** Indeed, capacities that received the most support (workforce, laboratory, and surveillance systems), were readily adapted for COVID-19 response activities. Further improvements in these capacities will thus likely require only a marginal increase in investment.

EPE263

Understanding the impacts of climate change-related events on HIV care and prevention services: a qualitative analysis of provider perspectives across California

L. Moran[1], S. Joshi[1], K. Koester[1], S. Fuller[1], W. Steward[1], E. Arnold[1]

[1]*University of California, San Francisco, Center for AIDS Prevention Studies, San Francisco, United States*

Background: Natural disasters related to climate change (e.g., wildfires) have increased in both frequency and severity in recent years. The impacts of these events on healthcare systems and client engagement in care are not yet well understood. To understand adaptations needed to ensure continuity of HIV care and prevention efforts amid future climate-related disasters, we explored provider perspectives on HIV service disruptions during and in the wake of recent natural events in California.

Methods: From October 2021-January 2022, we conducted in-depth interviews with 15 HIV clinical and service providers in 6 California counties and one Indian Reservation. We targeted regions showing both high incidence of climate-related events over the past 5 years and high prevalence of HIV and associated epidemics, including substance use and Hepatitis C. Interviews lasted 60-90 minutes and topics included climate-related events, impacts on services, staff/client needs, and policy recommendations. We used a rapid thematic analysis to analyze findings.

Results: Among participants, 4 were clinical HIV providers, 6 were HIV program managers or staff, and 5 led HIV prevention services. All reported severe climate-related events in their service catchment areas—primarily wildfires, floods, and increasingly extreme seasonal weather patterns. Participants were most concerned about barriers related to:

1. Client isolation, trauma, and mental health;
2. The high stakes of interrupting care for clients with critical acute daily needs; and
3. The disproportionate impact of disruption on clients who have precarious social support structures and/or housing, and whose ability to remain engaged with HIV care or prevention is likely to fail if those supports are lost.

Participants described effective adaptive strategies they employed—expanding capacity for virtual services, activating community networks to maintain client contact, and developing creative mobile service delivery methods—as well as challenges for which there were not yet solutions.

Conclusions: Climate events create, exacerbate, or trigger barriers to clients' continued engagement in HIV care and prevention services. Health care and social service systems must proactively plan for climate-related disruptions. Creative strategies are beginning to emerge, but gaps remain. Further development and broader dissemination of adaptive strategies may benefit a range of HIV medical and social service providers.

Promoting approaches that enable integration and sustainability of VMMC: early learnings in Zimbabwe

A. Mondo[1], K. Chatora[1], B. Maponga[2], O. Chatsama[2]
[1]Population Solutions for Health Zimbabwe, HIV Social Marketing, Harare, Zimbabwe, [2]Population Solutions for Health, HIV Programs, Harare, Zimbabwe

Background: The first decade of Voluntary Medical Male Circumcision (VMMC) implementation was a partner-driven approach where sexually active males were prioritized to enable reduction in HIV incidence. VMMC program in Zimbabwe is transitioning to government-led "sustainability" phase aiming to move toward routine VMMC to maintain long-term impact of circumcision on HIV incidence.
With funding from the Bill and Melinda Gates Foundation, PSI through Population Solutions for Health (PSH) implemented a user-centred design approach to support the Ministry of Health and Child Care (MoHCC) and its partners to develop, test and lead processes required for districts to shift from a catch-up model towards a more sustainable, integrated model. Sustainability implementation had to be rigorous, measurable, district led, user centred and district specific.
Description: The collaborative user-centred design workshops enabled district specific planning using insights gathered from health system players and key program users and influencers including parents, boys, community leadership and educators to build a relevant transition plan as in a 5-step process shown below.

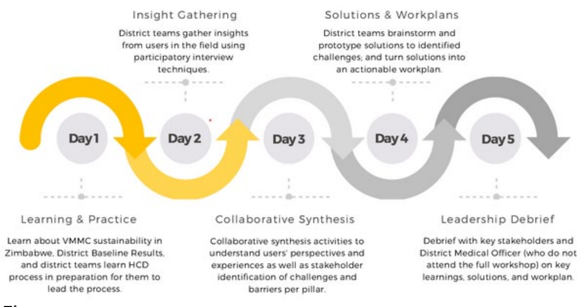

Figure.

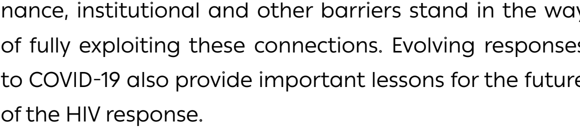
Lessons learned: The approach fostered buy-in to the phased approach for transitioning to more integrated and sustainable models of implementation, and subsequent ownership to the developed plans.The workplans followed a standard format but allowed for flexibility to address the district-specific operating environment as quoted below:
"If I'm asked to mention one thing, I enjoyed in the past four days, it's the four days. It was reflecting what we are seeing and hearing. We were producing our own. This is my workplan, not prescribed."- Kingford Chivende, District Nursing Officer, Zvimba District
Conclusions/Next steps: A toolkit was developed providing step-by-step guide for health systems and programs intending to implement user-informed processes to guide the development of sub-national implementation models. PSI and PSH supported MoHCC to extend toolkit use through developing sustainability models in PEPFAR and USAID funded districts approaching saturation.

EPE265

Advancing the HIV response and pandemic preparedness together: a policy and advocacy agenda

C. Collins[1], M.T. Isbell[2], J. Ratevosian[3], C. Beyrer[4], Q.A. Karim[5], A. Maleche[6], A. Sohn[7]
[1]Friends of the Global Fight Against AIDS, TB and Malaria, Washington, United States, [2]Independent Consultant, New York, United States, [3]Johns Hopkins University, Washington, United States, [4]Johns Hopkins University, Baltimore, United States, [5]Centre for the Aids Programme of Research in South Africa, Durban, South Africa, [6]KELIN, Nairobi, Kenya, [7]amfAR, TREAT Asia, Bangkok, Thailand

Background: COVID-19 tested the resilience of the HIV response. A growing body of literature demonstrates that the people and infrastructure involved in the HIV response made significant contributions to national COVID-19 efforts in many countries in areas such as community systems, laboratory testing, public health management, clinical trials, and surveillance capacity.
However, no roadmap has been developed to ensure that lessons learned from these critical contributions inform and are mainstreamed across efforts to prepare for future pandemics.
With policy makers now considering the architecture and financing of future pandemic preparedness systems, we developed a concrete action agenda to simultaneously strengthen pandemic preparedness and advance progress towards HIV-specific targets.
Description: We reviewed and synthesized the literature where the HIV response could potentially strengthen pandemic preparedness, including primary health care, procurement and access to essential medicines, health insurance and finance, community systems, surveillance and political mobilization. Key guidance documents were analyzed from global HIV program funders (e.g., PEPFAR, Global Fund) to understand policies that incentivize or inhibit building out from the HIV response to strengthen preparedness-relevant aspects of health systems.
Key informant interviews in six countries further informed the development of an actionable roadmap for leveraging HIV-related investments to build robust, people-centered pandemic preparedness capacity.
Lessons learned: There are multiple ways in which the infrastructure and human capacity built to support the HIV response can strengthen pandemic preparedness in low- and middle-income countries.
In addition, key principles or "values" of the HIV movement such as human rights-based services, community systems and building trust with communities are critical foundations for scaling up capacity. However, legal, policy, fi-



nance, institutional and other barriers stand in the way of fully exploiting these connections. Evolving responses to COVID-19 also provide important lessons for the future of the HIV response.

Conclusions/Next steps: The roadmap we developed identifies specific actions and an advocacy agenda to translate HIV responses and lessons learned into systems, policies and implementation science research for pandemic preparedness while advancing progress on HIV targets. Safeguards must be put in place to ensure closer integration of HIV and pandemic preparedness systems advance, rather than weaken, progress on HIV.

EPE266

Online training is effective in building the capacities of the HIV Service Providers of the National AIDS Control Program in India

A. Bose[1], A.K. Puri[2], B. Rao[2], S. Mishra[2], R.K. Singh[1], R. Ranjan[1], P.K. Pal[1], B.D. Wangkheimayum[1], M. Kumar[1], S. Choudhury[1], K. Bharathy[1], A.S. Panicker[1], L. Ramakrishnan[1], A.S. Kumar[1], L Ramakrishnan[1], S.S. Raghavan[1]

[1]Solidarity and Action Against The HIV Infection in India (SAATHII), New Delhi, India, [2]National AIDS Control Organization (NACO), New Delhi, India

Background: India tests around 30 million individuals for HIV annually through 33,320 Integrated Counselling and Testing Centres (ICTC) and treats >1.4 million PLHIV through 645 ART Centres and 1,265 Link ART Centres (LAC). GFATM funded SAATHII to support the National AIDS Control Programme in building the capacity of 16,000 health care providers (HCP) of the public health system for improving quality of services through a blended approach comprising online and in-person training.

This abstract reports on the effectiveness of online training in increasing knowledge among 6,826 doctors, nurses and laboratory personnel trained during 2019-21.

Description: The online training was delivered through the Learning Management System (LMS) platform with facilities for course authoring, management, and delivery and trainee tools for enrollment, bookmarking, progress tracking, evaluation, providing feedback, and generation of completion certificates. The LMS can be accessed at any time, place, and pace through the web, mobile, and tablets.

The project developed and uploaded the course content comprising 159 high-quality video modules in English and 10 local languages. Among these 49 were for medical officers, 39 for nurses, and the rest for lab technicians. Pre and Post scores of 6,826 trainees were downloaded from the LMS and analyzed using paired t-tests.

Lessons learned: Online training resulted in a significant ($p < 0.001$) increase in knowledge among all cadres of HCP (see Table) and the increase was higher among doctors compared to nurses and laboratory personnel. The difference may be due to prior training received by different cadres and the number of modules. Around 64-70% of the trained reported the training to be excellent and 22-26% reported to be very good. Module quality, user-friendliness of LMS, and ability to undergo training at their convenience were cited as major reasons for satisfaction.

Conclusions/Next steps: Online training of HCP is cost-effective, replicable, scalable, and sustainable.

	N	Pre-Test Mean	Pre-Test SD	Post-Test Mean	Post-Test SD	Difference in means	SD	t Statistic	P-value
ART Specialists	201	20.6	6.5	33.1	8.9	12.5	10.9	16.1	<0.001
Medical Officers of ICTC	416	16.8	7.7	29.5	9.7	12.6	11.6	22.3	<0.001
Medical Officers of STI, OST and Link ARTC	272	18.0	8.9	30.3	9.1	12.2	10.9	18.5	<0.001
Medical Officers of ARTC	647	22.6	8.5	31.9	8.0	9.3	9.1	25.8	<0.001
Nurses of ART and Link ARTC	573	11.9	4.7	16.9	3.5	5.1	5.2	23.1	<0.001
Lab Technicians of ICTC	4010	17.0	4.3	22.0	5.2	5.9	5.4	57.4	<0.001

EPE267

New Kid on the Block – integrating cholera and COVID-19 in the HIV response through the Chigubhu gear in Sanyati District

F. Dube[1], B. Madzima[1], C. Sirewu[1], T. Murimwa[2], B. Senzanje[2], R. Yekeye[1], A. Mpofu[1], M. Dube[1]

[1]National AIDS Council, Harare, Zimbabwe, [2]UNICEF, Harare, Zimbabwe

Background: Following the continued outbreak of cholera in various districts Zimbabwe over the years, the National AIDS Council with support from UNICEF introduced various interventions to build community capacity to prevent and identify early, cholera and other diarrheal outbreaks and care for people living for people with HIV who get infected.

The interventions were integrated with HIV in view of evidence that when HIV infected clients get co-infected by infectious diseases such as cholera, it further compromises their immune status and disturbs the treatment uptake absorption and even adherence to HIV treatment. COVID-19 response activities were also integrated.

Description: Interventions introduced included the chigubu gear, which is a simple mechanical instrument made of two or five litre empty plastic container filled with water and hung on supporting pieces of wood or metal near

toilets and entry into homes and or houses. A foot pedal, when pressed causes the container to tilt and let water pre-diluted with a detergent out. The project has been implemented in Sanyati district starting January 202. Its implementation is pivoted on trained community volunteers, who mobilise communities, demonstrate the concept and serve as the link between stakeholders.

Lessons learned: Although an overall effectiveness assessment has not been done yet, 25 households in Kayimbanemoyo, 28 in Kasingwindi and 13 in Mapani villages had incorporated the chigubhu gear within six months.

Over 3000 information, education and communication materials, integrating HIV prevention and treatment and cholera as well as COVID-19 were produced and distributed. In the 12 months following implementation of the intervention, no cholera and covid-19 cases were reported in the wards among people living with HIV and the general community.

Key lessons from the intervention were that integration with HIV helps to reach a captive audience and avoid parallel structures. The involvement of local leadership helped the community uptake. One of the success factors of the concept seemed to be its use of cheap locally recyclable materials.

Conclusions/Next steps: The intervention has demonstrated the importance of integration and use of local resources to tackle global pandemics at a local level. Following its success, the intervention is currently being scaled up to other districts

EPE268

Remote mentorship and assessment of medical laboratories to achieve ISO 15189 accreditation in Malawi: the UMB Malawi experience

H. Moyo[1], S. Osawe[2], P. Ndhlovu[1], C. Nyangulu[1], V. Harawa[1], T. Croxton[3], N.B. Blanco[3,3], D. Mwandama[4], M. Mkandawire[4], E. Kampira[5], M. Kaba[5], A. Maida[5], A.F. Auld[5], L. Kim[5,5], R. Mwenda[6], J. Kandulu[6], J. Bitilinyu[6], T. Kalua[1], A. Abimiku[2,3]

[1]University of Maryland, Center for International Health, Education, and Biosecurity Malawi, Lilongwe, Malawi, [2]Institute of Human Virology, Abuja, Nigeria, [3]Institute of Human Virology, School of Medicine, University of Maryland, Baltimore, United States, [4]University Research Co., Lilongwe, Malawi, [5]Centers for Disease Control and Prevention, Malawi, Lilongwe, Malawi, [6]Diagnostic Department, Ministry of Health, Malawi, Lilongwe, Malawi

Background: The University of Maryland (UMB) Center for International Health, Education, and Biosecurity (CIHEB) provides technical support to all 10 molecular laboratories in Malawi as part of the CDC-funded laboratory strengthening program referred to as AMPLIFY. AMPLIFY intended to mentor and present five laboratories for ISO 15189 accreditation in October 2020. Mentorships and assessments had to be conducted remotely using internet-based strategies due to the COVID-19 pandemic and travel restrictions. We describe the implementation of this strategy, successes, and challenges.

Description: The remote virtual strategy required laboratories to present updates during weekly Zoom calls and share supporting documents electronically with mentors. All trainings with pre- and post-test evaluations were conducted virtually. Virtual internal and mock audits were scheduled three weeks before the initial assessments to prepare for the assessments by the Southern African Development Community *Accreditation* Services (SADCAS), which were also conducted virtually as a result of the pandemic.

Lessons learned: By October 2020, AMPLIFY conducted a total of 16 virtual mentorship calls and 6 virtual trainings for a total of 24 laboratory-quality personnel. In November 2020, 4 (molecular laboratories) out of 5 (80%) laboratories were recommended for accreditation by SADCAS after a successful virtual assessment.

The support and engagement of the leadership from the hospital and laboratory is critical to reach this level of accreditation. Despite this success, major challenges encountered included poor internet connectivity and transition from an in-person to a virtual mentorship.

Identifying optimal connectivity options, engaging leadership from the hospital and laboratory, and supporting access and use of virtual learning platform can help overcome these major challenges.

Conclusions/Next steps: We demonstrated that remote mentorship and assessment is an effective strategy towards ISO accreditation. This strategy provided comparable outcomes to in-person mentorship at a significantly.

EPE269

Strengthening the TBHIV cascade with Tuberculosis Clinic-Laboratory Interface for continuous quality improvement in a secondary facility in Benue, Nigeria

J. Ekere[1], F. Ushie[1], K. Ngwoke[1], P. Jwanle[2], E. Ojo[2], O. Eke[2], J. Samuels[2], P. Okonkwo[2]

[1]APIN Public Health Initiatives, Benue, Nigeria, [2]APIN Public Health Initiatives, Abuja, Nigeria

Background: Tuberculosis (TB) remains a significant public health concern in Nigeria with attendant programmatic challenges of low TB case detection due to poor TB case finding. Despite efforts to institute a quality assurance system for intra-facility presumptive TB case identification, and prompt diagnosis, the challenge of incomplete referrals of samples for diagnostic evaluation persist.

The TB Clinic-Laboratory Interface (TB-CLICQI) strategy aims to improve sample collection and referral processes from the Direct Observed Therapy to the laboratory unit.

Description: Working in partnership with the Benue State Ministry of Health (SMOH), sites with poor TB sample referral indicators were identified and selected. The project

activities included pre-assessment of sites, 2 workshops, follow-up assessment, and active onsite mentorship of Health Care Workers (HCWs).
A 3-month retrospective data was collected, triangulated, and analyzed using National presumptive TB, Laboratory, and central TB registers in a secondary health facility with 4850 patients on antiretroviral treatment.
The diagnostic cascade evaluation (DiCE) toolkit was used in baseline assessment, Institute for Health Improvement model was used for Root-Cause Analysis, Improvement, and Performance Review, in three Plan-Do-Study-Act cycles.
The TB/HIV diagnostic cascade specific for sample collection, documentation, and linkage for diagnostic evaluation at the laboratory was evaluated, gaps identified, and specific interventions developed. Process measures were monitored weekly using runs chart, and outcomes measured monthly.
Lessons learned: TB CLICQI enhanced the clinical-laboratory interface for continuous quality improvement by focusing on deploying strategies aimed at strengthening identified gaps, building the capacity of HCWs, and improving the system of care across the TBHIV diagnostic cascade.
Modifying the presumptive TB patient clinic flow improved patient documentation, sample referral completion, and reduced patient waiting time.
The TBHIV diagnostic cascade for the collection and referral of sputum samples for diagnostic evaluation improved from 34% to 100% and 84% to 100% respectively in 4 months.
Conclusions/Next steps: The TB-CLICQI strategy contributed to a significant improvement along the TB/HIV diagnostic cascade. The project's next phase will scale-up to additional facilities in Benue State.
Deploying these CQI strategies in the management of chronic illnesses could strengthen health care systems, improve quality of care and treatment outcomes.

EPE270

Integrating mental health care into primary HIV care treatment programs in Zambia using telemedicine: Challenges and opportunities

N. Banda[1], N. Muyombwe[1], B. Siangonya[1], J. Daka[1], N. Myunda[1], A. Moonga[1], E. Mulenga[1], M. Kasonde[1], N. Toppin Dera[1], D. Mack[1], I. Kafunda[1], G. Mukanga[1]
[1]*Morehouse School of Medicine, National Center for Primary Care, Atlanta, United States*

Background: Zambia has made substantial progress towards ending the HIV epidemic due to investments in effective prevention and treatment initiatives. However, these investments will not end the HIV epidemic without addressing mental health (MH) disorders. There is compelling evidence regarding the link between MH conditions and poor health outcomes at every stage of the HIV care continuum, necessitating the inclusion of universal MH screening and linking those with identified MH conditions to specialized care.
Description: We worked with the Ministry of Health and implemented a Telemedicine program using a hub-and-spoke model in Lusaka, Zambia. We integrated MH screening and treatment into the Telemedicine workflow. We ensured continuity of care for recipients of care (RoC) on antiretroviral therapy (ART) in one tertiary and four secondary hospitals serving as hubs and eight primary healthcare clinics serving as spokes. From July 2021 to January 2022, we screened 89 adults and three adolescent girls on ART for MH services.
Of these, 23 adults and two adolescent girls received MH services via Telemedicine. The MH screening was conducted in partnership with Lusaka Provincial Health mental health specialists.
Lessons learned: There are limited human resources for mental health care in the Lusaka district and a scarcity of data to inform programmatic planning and action. Telemedicine has the potential to expand access to MH specialists for RoC in settings with limited trained MH specialists.Mental health specialists have self-reported that Telemedicine is an effective, useful, and acceptable way to deliver treatment, especially during the COVID-19 pandemic. Clients have also self-reported advantages such as privacy, convenience, and accessibility.
Conclusions/Next steps: Depression and anxiety was the primary mental health diagnosis in adults and both adolescent girls were diagnosed with substance misuse after multiple telemedicine sessions. Zambia has the potential to integrate MH services into primary HIV care programs. These opportunities include capacity building for clinicians to screen for MH and to effectively deliver care via Telemedicine.
Multiple barriers and challenges exist at the patient-, community-, and system-level, including stigma, limited human resources, policy gaps, and research gaps. Telemedicine has potential to address these gaps.

EPE271

Experience of creating LGBTQ Welcoming Space across various HIV health care systems

C. Brennan[1]
[1]*LSU Health New Orleans, School of Public Health, New Orleans, United States*

Background: Creating a safe environment is key to engaging individuals into health care. For PWH who is also a member of a sexual or gender minority (SGM) (ie Lesbian, Gay Bisexual Transgender Queer/Questioning /LGBTQ), prior health care system alienation must be countered via a welcoming health care environment. Via HRSA's SPNS funding, the STI SPNS Project tested the capacity and effect of creating an LGBTQ Welcoming Space in various HIV health care systems. The capacity of each site was

measured based on the implementation of 12 LGBTQ Welcoming Space Indicators while the effect was measured via patient and provider anonymous survey.

Methods: Over 18 months, 3 RWHAP Part C Louisiana clinics were tasked to implement 12 specific interventions to maximize its welcoming capacity for SGM PWH. Each site represented a unique healthcare organization eligible to receive Part C funds: an FQHC, an academic medical center, and an independent nonprofit community health clinic.

Ongoing monitoring documented when a specific intervention was implemented. Via an ACASI Client Satisfaction Survey (CSS), consented patients reported the impact of interventions on their clinical experience. Providers from each clinic reported their impression of the environmental and system changes on patient care.

A qualitative analysis explored the process of implementation while a Kruskal-Wallis test determined the differences in effect at the different sites as measured via the CCS and providers report.

Results: One site was able to implement all 12 LGBTQ Welcoming Space Indicators. The remaining sites experienced implementation barriers at higher organizational level. 075 CSS were completed by 566 PWH (40% female, 3% transgender, 37% SGM). Regarding environment and system changes, <1% of the CSS respondents described any as "I noticed and I did not like it" while the clinical providers reported the interventions as having a positive on patient care.

Conclusions: Despite higher-level organizational barriers, all health care systems were able to implement environmental and system changes to maximize their welcoming capacity for SGM PWH while maintaining or improving patients' over satisfaction and providers' acceptability. Though specific sites may experience unique barriers, it is within the capacity of all health care organizations to engage SGM populations into care.

EPE272

Strengthening community structures to improve service delivery for children and adolescents living with HIV

F. Musiime-Mwase[1], A. Ogei[2], A. Muhumuza[2], P. Mikago[2], D. Mporampora[2], G. Akot[2], P. Musinguzi[1], H. Kashada[2], R. Ainomujini[2], B. Nalwadda[2], H. Alima[2], J. Masiko[2]

[1]*Baylor College of Medicine Children's Foundation, Kampala, Uganda,* [2]*Uganda Protestant Medical Bureau, Kampala, Uganda*

Background: According to Ministry of Health, Uganda (2019 MoH PMTCT Report), HIV services for children and adolescents living with HIV (CALHIV) lag behind those of adults. The quality of services received by CALHIV determines their treatment outcomes, thus providing all the services they are eligible leads to improved treatment outcomes. The USAID funded Local Service Delivery for HIV/AIDS Activity (LSDA) implemented interventions to strengthen community structures in order to improve service delivery for CALHIV along the HIV continuum of care. We describe lessons learnt in improving service delivery for CALHIV.

Description: Between October 2021 through January 2022, ten health facilities were supported by LSDA to implement a community Quality Improvement (QI) collaborative. Health facilities in collaboration with Community Based Organisations, implemented a modified Community Client Led Antiretroviral Delivery model (MCCLAD) where CALHIV living in a particular village were attached to a Community Health Worker (CHW). CALHIV were scheduled to receive services in the community, followed-up and contacted by CHW's to ensure they received all the services they were eligible for.

CALHIV with a suppressed viral load were followed-up monthly while those with an unsuppressed viral load weekly. Services offered were tracked weekly using a reporting template and data entered into the national QI database.

Lessons learned: The percentage of CALHIV scheduled for contact with a CHW improved from 49% (start of October 2021) to 100% in the 3rd week of January 2022 while that of CALHIV with an unsuppressed viral load improved from 33% to 100%. The percentage of CALHIV with a suppressed viral load scheduled for contact with a CHW and attached to a CHW averaged 96% while that of CALHIV with an unsuppressed averaged 91%.

The percentage of CALHIV with a suppressed viral load scheduled for a contact, attached to a CHW and received all services averaged 92.7% while that of CALHIV with an unsuppressed viral load averaged 93% over the period.

Conclusions/Next steps: Attaching CALHIV to a CHW enabled them receive services they are eligible for in the community. Deliberate efforts should be made to strengthen health facility community collaborations so as to improve treatment outcomes for CALHIV.

EPE273

Performance assessment: an approach to achieving HIV epidemic control in Nigeria

A. Ajayi[1]

[1]*National Agency for the Control of AIDS, Performance Management and Resource Mobilisation, Wuse Zone 4, Nigeria*

Background: In Nigeria, several HIV programmes have been designed and implemented without an end-of-project assessment. The National Agency for the Control of AIDS (NACA) embraced Performance Assessment to address this gap and improve effectiveness and efficiency of HIV programmes in Nigeria.

Description: In the last quarter of 2021, Performance Assessment was carried out in 12 HIV comprehensive facilities (2 per geopolitical zone of the country). A pre-tested

Oral abstracts

Poster exhibition

E-posters

Late-breaker abstracts

Author Index

checklist with sections addressing different thematic areas was administered to the healthcare workers in each of the service delivery point (SDP) in the facilities.

Lessons learned: Across all SDPs, HIV treatment services had the highest score followed by availability of Job aids and SOPs while the least is the availability of HIV commodities. Five (5) facilities experienced stock-out of HIV commodities and consumables thereby causing critical delays in confirming HIV infection and commencing life-saving HIV treatment and care.

The findings of the assessment revealed that despite the uptake of HIV treatment services as reflected in the 100% score for all 12 facilities visited, several barriers have continued to hinder effective HIV care, adherence and support services and achievement of the 3rd 95 especially in the North West and North East zone of Nigeria.

Overall, the South East zone had the highest score and the North East zone had the least score for insecurity reasons while the North Central zone lacked adequate trained personnel.

	South East		South South		South West		Noth East		North West		North Central	
HIV Care, adherence and support services	80	100	100	80	60	80	80	40	20	0	80	100
HIV Treatment Services (ARVs)	100	100	100	100	100	100	100	100	100	100	100	100
Trained personnel across each SDP to provide services	80	80	100	60	100	100	60	40	100	60	20	80
HIV commodities (ARVs, RTKs, Condoms, consumables)	80	100	100	40	0	80	40	20	100	60	100	0
Use of national M&E tools	80	80	100	80	60	80	100	80	100	80	60	60
Job aids and SoPs across SDPs	80	100	100	100	80	100	60	80	100	60	100	60
Current HIV Guideline	100	60	60	80	20	100	0	60	80	40	80	100

Figure. Performance assessment score of HIV service delivery points.

Conclusions/Next steps: The challenges facing PLHIVs on treatment adherence require effective coordination and continuous performance assessment of HIV programme implementation to achieve optimal viral suppression rate and greater impact.

The adoption of the mechanisms put in place for strengthening identified gaps will serve as a panacea to past poor performance, limit wastage, improve service delivery and hasten progress towards achieving HIV epidemic control in Nigeria.

Making health systems work for adolescents

EPE274

Improving treatment outcomes among adolescents and young people living with HIV in the coastal region of Kenya through operation triple zero (OTZ)

S. Omariba[1], P. Odinga[2], J. Sunguti[3], S. Konah[3], C. Otwori[3], R. Tiampati[4]

[1]Pathfinder International, Kenya Country Office, Nairobi, Kenya, [2]Mombasa County Government, Department of Health, Mombasa, Kenya, [3]Pathfinder International, Nairobi, Kenya, [4]United States Agency for International Development, Nairobi, Kenya

Background: Kenya has a high HIV incidence among adolescents and young people (AYP) aged 15-24 years, contributing to 42% of all new infections annually. Sub-optimal treatment outcomes are documented among adolescents and young people living with HIV (AYPLHIV). The 2018 Kenya Population-based HIV Impact Assessment (KENPHIA) showed low viral suppression among adolescents at 61.4% (70.9% females and 52.0% males).

Between 2018 and 2021, Pathfinder International jointly with Ministries of Health and Education, implemented operation triple zero (OTZ) under the USAID Afya Pwani (AP) project in four Kenyan coastal counties (Kilifi, Kwale, Taita Taveta, and Mombasa) to improve treatment outcomes among AYPLHIV.

Description: OTZ is an asset-based approach engaging AYPLHIV as active stakeholders in their health, nurturing them to actively participate in their well-being. AYPLHIV commit to achieving "three zeroes": zero missed appointments, zero missed medications, and zero viral loads (VL).

The AP OTZ clubs comprised several approaches focusing on:

AYPLHIV (treatment literacy, periodical analysis viral load data to identify OTZ leaders, leadership empowerment, use of social media to enhance adherence and peer-peer support);

healthcare providers (training on adolescent package of care, provision of youth-friendly services, case management);

rewarding and awarding top performers; OTZ graduates (champions) mentoring the new enrollees in treatment adherence;

modification of clinics to be adolescent-friendly and caregiver support (caregiver literacy, teleconsultation).

USAID AP initially implemented 8 OTZ clubs in 2018 gradually scaling up to 84 clubs in 2021.

Lessons learned: Total adolescents enrolled in OTZ clubs increased from 379 in 2018 to 2,806 in 2021. Viral suppression among AYPLHIV improved from 76% (966/1232) in 2018 to 90% (2424/2684) in 2021; p<0.001. Similarly, retention rates among AYPLHIV enrolled in the OTZ clubs increased from 88% (1112/1256) in 2018 to 91% (2534/2782) in 2019, and 96% (2684/2806) in FY 21.

Overall, viral suppression and retention rates among AYPLHIV in OTZ clubs were higher than the national average. Adoption of innovative digital platforms and strengthened multi-month dispensing helped overcome COVID-19 challenges for sustained gains.

Conclusions/Next steps: These results substantiate the implementation of OTZ to improve HIV treatment outcomes among AYPLHIV. We recommend scale-up, with fidelity, of this model among AYPLHIV cohorts.

Community participation in systems for health, including community-led and key population-led health systems

EPE275
The final stages of an epidemic? Learning from London's community-led HIV response

I. Jackson[1], G. Brough[2], S. Worrall[3], D. Groom[4], S. Paparini[5], J. Anderson[6]
[1]NHS England, London, United Kingdom, [2]Positively UK, London, United Kingdom, [3]Positive East, London, United Kingdom, [4]Healthy London Partnerhsip, London, United Kingdom, [5]University of Oxford, Oxford, United Kingdom, [6]Queen Mary University of London, London, United Kingdom

Background: London (UK) is a world-leading city in HIV elimination efforts. To 'get to zero' HIV transmission, the multi-partners, cross-sectoral London's Fast Track City Initiative (FTCI) recognised the need to work collaboratively and embrace the success and expertise of the HIV voluntary sector. FTCI identified dedicated cross organisational funding for a novel "Improvement Collaborative" (IC).

Description: The IC of 20 partners developed 12 community-led collaborative projects in key areas of HIV service delivery, with Quality Improvement (QI) methodology and shared learning between statutory and voluntary services. The IC seeks collaborative solutions to complex problems faced by specific populations in key areas of HIV service and delivery. To support marginalised populations to test, reduce HIV viral load to undetectable levels, and have a better quality of life, FTCI commissioned and empowered a strong HIV voluntary sector with decades of expertise to lead collaborative change projects. The IC facilitates the spread and adaptation of existing and emerging knowledge in multiple settings to accomplish common aims. All projects are underpinned by the ethos of looking after *the whole person*, focusing on *people* rather than *conditions*, and avoiding simplistic separations between physical and mental health.

Lessons learned: In the past year, across all 12 projects, over 2,500 HIV tests have been carried out with and people testing positive navigated into ongoing care. Post diagnosis patient retention and peer support projects have become integrated into clinical pathways with an eight-fold increase in referrals. Over 500 care plans have been created and PLWHIV have been supported to reach U=U status. Over 75% of people have reported decreased loneliness and better quality of life. Over £750k in welfare benefits has been accessed by PLWHIV through bespoke advice and guidance. PLWHIV have been involved in the entire project selection, leadership, management and delivery process, including deliberate recruitment of members of racially minoritised communities.

Conclusions/Next steps: The experiences from the IC with regards to partnerships across sectors need not be limited to extending HIV services. Prioritising community co-production and leadership, with appropriate funding and training, strengthens the relationships between clinical and voluntary services and is applicable to multiple contexts of complex care delivery.

EPE276
Community-led integrated care outreach clinics as a capacity building strategy to expand access to sustainable, integrated healthcare in remote areas of Uganda

K. Gibbons[1,2], E. Katto[3], P. Masereka[1], R. Kinney[1], C. Nalukwago[1]
[1]Health Access Connect, Kampala, Uganda, [2]Africa Resource Centre, Cape Town, South Africa, [3]Uganda Ministry of Health, AIDS Control Program, Kampala, Uganda

Background: In Sub-Saharan Africa, transportation barriers limit care-seeking behavior and reduce access to HIV services, immunizations, malaria treatment, etc. Achieving 95-95-95 depends on health systems sustainably serving populations in remote areas. Grant-supported outreach work fails to provide continuity of care and provide for the range of needs that communities require.

Description: Remote communities (>5km from nearest health facility) can be sustainably served with ART and other primary healthcare services by establishing community-led monthly, integrated outreach clinics. Community wealth pooling improves livelihoods and access to healthcare.

In areas without access to transportation, microfinance is used as a tool to ensure reliable service. Health Access Connect (HAC) is a Ugandan NGO that has been imple-

menting the Medicycles program since August 2015, and this model has been adopted and adapted by the AIDS Control Program of the Ministry of Health in a nationwide pilot.

PROBLEM	SOLUTION
Free health services are difficult and expensive for residents of remote areas to access at the health facility.	**Set up monthly or bimonthly outreach clinics in remote communities.**
Transportation expenses of outreach clinics are cost-prohibitive and dependent on short-term grants.	**Set up community contribution system (USD 0.55/patient) to cover transport costs.** This fee is 1/2 to 1/10 of what each patient would spend to use public transportation to reach nearest health facility.
Workers at some health facilities do not have access to a reliable means of transportation. Vehicle grants are expensive and fall into disrepair.	**Use a microfinance loan for locally appropriate means of transportation** to a local entrepreneur and make health service to communities a condition of the loan.
Health campaigns (e.g., immunization, HIV, maternal and child health, neglected tropical diseases) **are expensive and reliably fail to cover residents of remote areas.**	**Integrate campaign services into a network of ongoing (bi)monthly outreach clinics.**

Lessons learned: Between August 2015 and Jan 2022:
1,038 outreach clinics
58 remote villages
40,256 total patient services (41.8 per outreach, 41.4% male)
10,587 ART refills (45.6% male)
5,990 tested for HIV
1,041 viral load tests conducted

- By using local health, transportation, and community wealth pooling, service delivery can sustainably meet patient needs and strengthen the health system.
- Learning from local innovations and adapting policy for a nationwide initiative can improve service delivery at scale in the long term.

Conclusions/Next steps: Combining community wealth pooling and reliable transportation can provide continuity of care to difficult-to-reach populations. Adaptation of model into nationwide pilot has demonstrated that the model can be adapted to many contexts.

EPE277

Improving client-centered HIV services through community-led monitoring in Nepal

A.K.R.B.P.I.T.M.C. Sharma, Bam, Khanal, Shrestha, Lohar, Weldegebreal, Cassell, Dixon, Casalini[1]
[1]*FHI 360 Nepal / EpiC Nepal, Strategic Behavioral Communication, Kathmandu, Nepal*

Background: To achieve and sustain HIV epidemic control, services must be differentiated to respond to the preferences and needs of underserved populations facing the greatest HIV infection risks. With support from the U.S. President's Emergency Plan for AIDS Relief (PEPFAR) and the United States Agency for International Development (USAID), the Meeting Targets and Maintaining Epidemic Control (EpiC) Project in Nepal supports community-led monitoring (CLM) to ensure that services are continuously accountable to clients.

Description: In October of 2020, the EpiC team introduced community scorecards and an electronic client feedback system to implement CLM in Nepal. Scorecards are generated from a structured quantitative questionnaire with rating scale and qualitative interviews. The client feedback system, called LINK, is promoted through service sites and push messaging to clients, and can be anonymously accessed by scanning posted QR codes or clicking embedded weblinks. Both the community scorecard and LINK results guide project-facilitated quality improvement consultations that engage program managers, site-level staff, and community members in the development of action plans.

Lessons learned: From October 2020 to September 2021, clients submitted feedback 3,512 times through LINK, with 90% of entries expressing service satisfaction. Complaints were registered in only 212 entries, and clients provided constructive suggestions about more convenient service operating hours; expanded availability of sexually transmitted infection services; improving the quality of counseling; ensuring client confidentiality; and clinic cleanliness. Scorecards were generated from assessments at 26 sites. Sites scored an average rating of 83 out of 100 on the quantitative assessment tool, but this average varied across sites for specific service components.
Clients gave index testing services the lowest average score (74%) and gave the highest average score (87%) to components focused on commodity access and on reducing stigma and discrimination.

Conclusions/Next steps: CLM identified specific opportunities to improve and differentiate services to be more responsive to clients while providing a platform for both community members and providers to develop and advance improvements. Virtually all sites implemented actions in response to CLM results. Going forward, sustained engagement in CLM should help to evaluate the potential impact of these improvement efforts.

EPE278

Community accountability methods improve HIV services in Gauteng province

M. Mkhatshwa[1]
[1]*Treatment Action Campaign (NGO), Community Research, Johannesburg, South Africa*

Background: The Ritshidze project was started by groups of People living with HIV and activists to address healthcare service accessibility and quality through evidence-based advocacy.In the Gauteng province, Ritshidze is implemented in 144 clinics.

Description: Ritshidze is a community led monitoring program where People Living with HIV(PLHIV) collect data at clinics on availability and quality of HIV services.

Data is used to advocate for improvement of services by holding duty bearers accountable.

The model has 5 stages:

Data collection

PLHIV sector members collect data through interviews, group discussions and observation.

Data analysis

Data is analysed and interpreted, highlighting key areas and challenges.

Solution generation

Members come up with solutions to the challenges.

Stakeholder engagement

Members present reports, with solutions generated with the community to duty bearers and advocate for improvement.

Monitoring improvement

Members seek commitment from duty bearers to resolve the challenges, note what they commit to improve and keep monitoring for the desired improvements.

Advocacy

Continued advocacy is done if the challenges are not addressed, starting from clinic to district and sometimes provincial levels, using different methods, e.g. protest marches, litigation and meetings.

Lessons learned:

Lessons

The following improvements were achieved between 2020 and 2021:

ARVs availability

- Percentage of patients receiving supply of one month or less declined from 18% to 10%
- Patients receiving 3 months' supply increased from 27% to 42%
- Patients sent home without ARVs because of stock outs declined from 39% to 18%

Confidentiality

There was an 8% increase in the number of patients with knowledge that they could refuse to give details of sex partners for index testing.

Staff attitudes

There was a 5% increase in patients reporting that healthcare workers were friendly and professional.

Conclusions/Next steps:

- Data collection needs to be a continual process, 2021 data will be instrumental in holding decision makers accountable.
- Community driven solutions are key, for example the project's recommendation for longer supply of ARVs proved fruitful as more patients received 3 months' supply increased by 15%
- It will be crucial to do more advocacy for improvement of staff attitudes to enhance adherence.

EPE279

Community-led, comprehensive service delivery models address the healthcare needs of transgender communities: implementation experience from Hyderabad, India

S. Shaikh[1], P. Mugundu[1], V. Arumugam[2], R. Mudraboyina[2], S. Reddy[2], K.K. Reddy[2], A. Singh[1], J. Bell[1], R. Pollard[1], A. Keuroghlian[3], K. Mayer[3], S. Solomon[1], K. Ard[3]

[1]The Johns Hopkins University School of Medicine, Baltimore, United States, [2]YR Gaitonde Center for AIDS Research and Education, Chennai, India, [3]Fenway Health, The Fenway Institute, Boston, United States

Background: In India, transgender communities face a disproportionate HIV burden (3.1% vs. 0.22% in general population) and structural barriers to access health care and social services. Community-led models providing access to comprehensive health care (including assistance with social entitlement schemes) are one approach to overcome these barriers.

Description: The *Mitr* Clinic, a PEPFAR/USAID funded, community-led transgender clinic, was established in Hyderabad in January 2021.Community consultations with 48 key stakeholders informed development of the clinic. Staff were recruited from the community – 91% of staff self-identify along the transgender spectrum. Services provided at the clinic include condom distribution, HIV testing/treatment, sexually transmitted infection testing/treatment, gender-affirming hormone therapy (GAHT), counselling, and support to access social entitlements. Clients are referred to community-preferred providers for laser hair removal and gender-affirming surgery (GAS).

Lessons learned: From March 1, 2021 – Jan, 20 2022, 772 clients (86% transgender women; 3% transgender men; 2% gender diverse; 9% cisgender partners) were registered. 670 (87%) had previously not been registered with government HIV programs. About 29% reported transactional sex and 41% reported inconsistent condom use. The median number of sexual partners in the prior year was 3 (interquartile range: 1-25). The clinic provided access to GAHT to 82 clients and supported 11 clients to undergo GAS. Of all registered clients, 498 clients (65%) were aware of their HIV status of whom 71 clients were positive at enrollment and 9 were newly diagnosed at the clinic. Of the 80 clients living with HIV, 91% were currently on ART. Eight percent (26/312) of clients screened positive for syphilis and underwent treatment. 289 clients (37%) were referred for laser hair removal and 508 (66%) were linked with social entitlements. 89% of clients self-reported that they were satisfied with quality and service options in a client satisfaction survey; a suggestion was to extend hours.

Conclusions/Next steps: The *Mitr* clinic reached a large proportion of the transgender community currently not registered with the targeted-interventions program of India's National AIDS Control Program. It is likely that the availability of non-HIV services served as the gateway to these populations, which highlights the importance of comprehensive integrated service models.

Community antiretroviral therapy dispensation in Cameroon associated with improved perceived service quality: a national evaluation

T. Epie[1], M. Bateganya[2], P. Sadate-Ngatchou[2], L. Nishimoto[2], M. Abass[2], M. Nsoh[1], P.-P. Ewane[1], M. Anastasie[3], N. Kamgaing[3], J.d.D. Anoubissi[3], R. Wilcher[2], H. Mahler[2], V. Nzima[4], L. Bonono[3], S. Billon[3]

[1]FHI 360, Yaounde, Cameroon, [2]FHI 360, Durham, United States, [3]Cameroon National AIDS Control Committee, Yaounde, Cameroon, [4]USAID, Washington D.C, United States

Background: The USAID- and PEPFAR-funded Meeting Targets and Maintaining Epidemic Control (EpiC) project and the Government of Cameroon developed and evaluated a model in which some health facilities providing antiretroviral therapy offered clients the option to receive antiretroviral (ARV) drug refills at community-based organizations (CBOs). We describe the impact of the model on clients' perceived quality of HIV services.

Methods: The evaluation was conducted from October to December 2020 in10 regions of Cameroon. We compared measured wait time for HIV services and perceived client satisfaction with services as proxies for service quality between clients receiving ARV refills at health facilities (n=557 clients) vs. at 50 CBO pick-up sites (n=293 clients). Wait time and satisfaction among clients were also assessed at three matched pairs of health facilities: three facilities offering the CBO pick-up option ("offering facilities") (n=170 clients) and three facilities that did not offer the CBO option ("non-offering facilities") (n=170 clients). Perceived satisfaction and wait time were collected through a client survey and a time log. Descriptive and inferential analyses were conducted.

Results: CBO dispensation was associated with shorter wait times. Mean difference in wait time for clients receiving ARV refills from CBOs was 37.5 minutes less (CI:29.05–45.95, p-value=0.000) than at health facilities.

Between the matched pairs, wait time for clients receiving refills at offering facilities was 12.9 minutes less than at non-offering facilities (CI:26.29–44.31, p-value<0.000). Clients receiving refills at CBOs were 4.5 times more likely to report satisfaction with services than those at offering facilities (97.3% vs. 89.1%, CI:2.12-9.42, p-value ≤0.000).

Similarly, clients receiving refills at offering facilities were 6.26 times more likely to report satisfaction with services than those at non-offering facilities (94.4% vs. 73.1%, CI: 3.13 - 12.54, p-value <0.000).

Conclusions: Community ARV dispensation through CBOs was associated with shorter wait times for HIV services and higher client satisfaction than in offering facilities, and higher client satisfaction in offering facilities than non-offering facilities. ARV dispensation through CBOs has the potential to improve perceived service quality both for clients who receive ARV refills at CBOs and those who continue to obtain refills at the offering facilities.

EPE281

Advancing the sustainability of key population-led organizations in Vietnam through a social enterprise approach

T.T. Tran[1], Y.H. Vu[1], T.M. Le[2], K.Q. Do[3], T.M. Nguyen[4], O.K. Pham[5], T.H. Le[5], K.E. Green[1], B.N. Vu[1], T.M. Ngo[6], Z.J. Humeau[1]

[1]PATH, Hanoi, Viet Nam, [2]Thanh Danh social enterprise/ Glink Vietnam, Ho Chi Minh City, Viet Nam, [3]Galant Clinic, Ho Chi Minh City, Viet Nam, [4]Alo Care clinic, Ho Chi Minh City, Viet Nam, [5]Centre for Social Initiatives Promotion, Hanoi, Viet Nam, [6]United States Agency for International Development, Hanoi, Viet Nam

Background: Despite Vietnam's persistent HIV epidemic among key populations (KPs), external donor financing has declined markedly over the past decade, putting at risk the long-term viability of KP-led organizations that drive community HIV service delivery. A social enterprise (SE) approach may allow KP-organizations to self-sustain and grow their impact and income.

Description: From 2014-2021, the USAID/PATH Healthy Markets project partnered with KP-organizations to support them in advancing along a continuum of business development.

A package of support was tailored to assist KP-organizations wishing to develop SE-clinic models. This included:

1. Conducting market and consumer surveys, using results to inform targeted market entry for HIV/health goods and services;
2. Collaborative assessment of KP-organization capabilities;
3. Assisting KP-organizations to develop initial business plans, register as SEs, and establish clinics;
4. Delivering technical assistance for marketing HIV/health goods and services;
5. Facilitating mentoring, coaching, and training from a local SE incubator; and,
6. Mapping financing options and supporting groups to access capital. We measured progress toward sustainability through a tailored organizational capacity assessment and investment readiness tool.

Lessons learned: A 2021 assessment evaluated the organizational capacity and financial viability of three private clinics operating under SE arms: Glink Vietnam, Galant, and Alo Care. Their mean profit and revenue increased from US$32,934 and $191,964 in 2018, to $44,677 and $442,292 in 2020, respectively. As of June 2021, the clinics' annual revenues were 35-54% lower than expected due to COVID-19 social distancing, though Glink and Galant remained in-profit. Glink, Galant, and Alo Care's total client bases (a key indicator of market growth) grew by 250%, 200%, and 173%, respectively, from 2018-2020. During this period, all groups scaled their models: Galant and Alo Care each opened two new clinics, while Glink opened six. The clinics attribute service and client diversification as most valuable for enabling increases in revenues, profits, client base, and scale.

Conclusions/Next steps: Operating private clinics is one way for SEs to generate sustained income while serving their social missions. Moving forward, it will be important to provide continued capacity-strengthening and investment-readiness support to assist KP-SEs in navigating their way toward financial independence, especially as COVID-19-related disruptions continue.

EPE282

Lifting up key populations voices and increasing quality of HIV services in Malawi: using community led monitoring to strengthen services for KPs and people living with HIV

M. Mikaya[1], S. Bulla[1], Y. Antonio[1], D. Kamkwamba[2], P.M. Juao[3], E. Phiri[4], E. Songwe[5], M. Luba[6], L. Rutter[7], E. Lankiewicz[8], N. Erondu[9]

[1]Malawi Network of AIDS Service Organization (MANASO), Lilongwe, Malawi, [2]Network of Journalists Living with HIV (JLWHA), Lilongwe, Malawi, [3]Lesbian, Intersex, Transgender and other Extensions (LITE), Lilongwe, Malawi, [4]The Child Rights Information & Documentation Centre (CRIDOC), Lilongwe, Malawi, [5]Community Health Rights Advocacy (CHeRA), Lilongwe, Malawi, [6]AIDS Vaccine Advocacy Coalition (AVAC), Lilongwe, Malawi, [7]Health Global Access Project (Health GAP), Johannesburg, South Africa, [8]amfAR, the Foundation for AIDS Research, Washington, United States, [9]The O'Neill Institute for National and Global Health Law, Georgetown University, Washington, United States

Background: Over the last 10 years, access and uptake of HIV testing services and antiretroviral therapy (ART) in Malawi has improved,though HIV incidenceamong key populations, such as men having sex with men, female sex workers, and transgender people (MSM, FSW and TGs, respectively) remains high.

Community-led monitoring (CLM) is an important evidence-informed approach to reaching key populations; it ensures that their voices are heard by duty-bearers to ensure improved HIV service delivery shifts that will increase access and utilization.

Description: Liu Lathu, 'Our Voices' in Chichewa, is the Malawi CLM Program established in 2020,currently being implemented in 29 health facilities across 6 districts in Malawi. It is led by a coalition of civil society organizations representing key populations, people living with HIV and AGYW. During the first year of implementation, six District Coordinators and 18 Community Monitors were trained in qualitative and quantitative data collection methods and have so far completed three cycles of data collection. In total, 867 PLHIV interviews were completed and 240 focus groups with KP were conducted.

Lessons learned: The interviews with PLHIV helped uncover issues that cannot be captured by routine health facility monitoring including: FSWs reporting being discriminated by medical personnel (e.g. being called prostitutes) and being denied access to ARVs.

Additionally, numerous MSM reported negative health care provider attitudes towards them once their sexual identities were revealed. KPs interviewed recommended among other health care provider training on Sexual Orientation, Gender Identity and Expression (SOGIE)as well as clinics to assign KP-specific health facility personnel as a solution to address this issue.

Conclusions/Next steps: Health Facility Managers committed to monitor and confront stigma, discrimination, and denied access to commodities and services for KP. In Year 2 of CLM implementation, Liu Lathu will follow up with facility managers and track which commitments were implemented.

EPE283

Uniting civil society to improve accountability and accessibility of HIV and TB service delivery: lessons learned from year one of community-led monitoring implementation in Uganda

B. Ajonye[1], H. Mutabarura[1], K. Mwehonge[2], A. Nsubuga[3], F. Mugisha[3], A. Rahman-Shepherd[4], N. Erondu[5]

[1]International Community of Women Living with HIV Eastern Africa (ICWEA), Kampala, Uganda, [2]Coalition for Health Promotion and Social Development (HEPS Uganda), Kampala, Uganda, [3]Sexual Minorities Uganda, Kampala, Uganda, [4]London School of Hygiene and Tropical Medicine, London, United Kingdom, [5]The O'Neill Institute for National and Global Health Law, Georgetown University, Washington, United States

Background: Community-led monitoring (CLM) is a social accountability model that aims to hold duty bearers and health facilities (HFs) accountable for improved quality of HIV and TB service delivery. In October 2020, ICWEA, HEPS, and SMUG jointly implemented CLM in Uganda, covering 108 districts (85%) and 432 HFs in total.

Using a set of standardized data collection tools, program monitors visited HFs to directly observe and collect qualitative and quantitative data.

Description: The first year of program implementation was evaluated in December 2021. The evaluation assessed timeliness and completeness of program activities, and was guided by two research questions:

1. Was the program implemented in accordance with the operational plan?
2. Did program implementation achieve any unexpected or unintended outcomes?

To answer these questions, 25 stakeholders were interviewed (including program staff, partners, advocates and duty bearers).

Lessons learned: The evaluation revealed three major areas of learning. Firstly, to optimize program governance, there is a need to improve efficiency of communication and coordination through inclusive leadership and decision-making. A key learning was the importance of continuously aligning expectations between program implementers, donors, and technical partners, to avoid scope

Oral abstracts

Poster exhibition

E-posters

Late-breaker abstracts

Author Index

changes and implementation delays, which the program experienced during set-up (e.g., in finalizing the program protocol), and which impacted resource allocation.
Secondly, greater emphasis must be placed on the quality (rather than quantity) of CLM data generated, and on building staff's analytical capabilities to provide evidence-based insights in real-time.
Thirdly, while the program's advocacy and accountability efforts are bearing fruit, establishing a system to routinely identify issues, develop solutions, and monitor progress is essential to achieve long-term impact, as is working with duty bearers to utilize program findings.
Conclusions/Next steps: Key learnings from the first year of program implementation provide valuable insights for CLM initiatives globally in terms of mobilizing civil society and affected communities; operationalizing governance and technical structures to scale-up CLM; and, orienting program activities toward national HIV/TB service delivery goals.
Moving forwards, the program will need to effectively harness CLM data to advocate and hold duty bearers accountable for sustainable improvements in HIV/TB service delivery.

EPE284
Implementation of Faith Community Initiative to engage faith leaders in HIV epidemic control interventions: experience of Institut pour la Santé, la Population et le Développement (ISPD) in Haiti

A. Apply[1], M. Leonard[1], E.J. Pericles[1], M.L. Excellent[1,2], E. Emmanuel[1], D. Lauture[1], G. Galbaud[1], B. Neptune[1], J.W. Domercant[1]
[1]*Institut pour la Santé, la Population et le Développement (ISPD), Pétion-Ville, Haiti,* [2]*University of North Carolina at Chapel Hill, Chapel Hill, North Carolina, United States*

Background: With USAID funding, ISPD implemented the Faith Community Initiative (FCI) which aimed at encouraging the involvement of faith leaders and CSOs in a joint effort to increase access to HIV services. It has been shown that Faith-based organizations can potentially play a key role in preventing the spread of HIV/AIDS. They can help model a culturally and religiously sensitive package of HIV services. From April 2020 to December 2021, ISPD worked with faith leaders of various religious denominations in selected communities of Delmas, Cap Haitian and Jérémie to sensitize them on HIV prevention, ART treatment, stigma and discrimination.
This collaboration helped design interventions that are deemed appropriate and acceptable for the faith leaders and their followers leading to an increase in access of underserved populations to HIV services.
Description: In collaboration with local faith organizations, ISPD contributed to the implementation of a Steering Committee to lead FCI activities nationwide. ISPD adapted the Messages of Hope and an HIV Educational Update training curriculum to sensitize faith leaders on HIV and improve their skills to assist those in need for HIV testing and prevention services, and those on treatment or who have interrupted their treatment. Treatment adherence in the context of Faith Healing was discussed.
Around 9,977 faith leaders and followers were trained. Afterwards they conducted sensitization campaigns in their communities. Twenty-nine peer educators were recruited to conduct sensitization sessions, conduct HIV risk assessment, assist with HIV self-testing, and link clients with reactive results to sites for follow-up. The sensitization campaign included radio broadcasts, educational brochures, flyers and diverse articles with printed Messages of Hope.
Lessons learned: With appropriate trainings addressing the taboos, various faith organizations can engage in HIV interventions. They reached over 30,607 individuals through sensitization campaigns, individual or group discussions. Due to FCI activities, 2234 individuals underwent HIV risk assessment, 817 were tested for HIV; 70 confirmed HIV-positive were referred for ART enrollment, 63 on treatment interruption have returned to care while 291 were referred for PrEP and other services.
Conclusions/Next steps: An impact evaluation will be conducted to measure changes in attitudes and practices of faith leaders toward HIV issues following the intervention.

EPE285
Feasibility and effectiveness of using an electronic client feedback tool to improve HIV service quality at six high-volume health facilities in the Democratic Republic of the Congo

C. Tendo[1], O. Lieke[2], P. Kasongo[2], P. Kibwa[1], J.-C. Kiluba[1], D. Canagasabey[3], I. Thior[3]
[1]*PATH, Lubumbashi, Congo, Democratic Republic of the,* [2]*IntraHealth, Lubumbashi, Congo, Democratic Republic of the,* [3]*PATH, Washington, DC, United States*

Background: Engaging communities in the design, implementation, and monitoring of HIV services is essential for delivering high-quality services that bring in and keep clients engaged in the HIV care continuum, ultimately leading to improved client health outcomes and progress towards epidemic control goals.
The USAID-funded Integrated HIV/AIDS Project in Haut-Katanga piloted an electronic client feedback tool to gather client feedback to improve delivery of HIV services.
Description: Through stakeholder mapping and focus groups, PATH and IntraHealth worked with facility-based providers, peer educators, civil society, and government representatives to co-design a service quality monitoring system. The group opted to use an anonymous electronic exit interview to gather client feedback, and developed an interview questionnaire, informed by an issues identification exercise. Peer educators were trained to administer an exit interview with people living with HIV or their caregivers following clinical appointments, and record responses in

the KoBo Toolbox app using project-supplied tablets. IHAP-HK shared client feedback with facility quality improvement teams and discussed remediation steps for inclusion in site-level improvement plans. We looked at the impact of this system on reducing wait time and stigma at six high-volume facilities in Haut-Katanga province.

Lessons learned: Feedback collected from 2,306 clients from May through December 2021 highlighted wait time and stigma as top issues.

Actions taken to address these issues included:

1. Pre-packaging refills prior to client appointment;
2. Using peer educators to conduct preparatory tasks (distributing refills; pulling client files) while waiting for physician or triaging and escorting clients to the consultation room or laboratory; and,
3. Coaching providers on providing services in a non-stigmatizing manner.

Due to these actions, the percentage of clients reporting stigma decreased (5.4% [May] to 1.04% [December]), and wait times were consistently shorter (between 1 to 90 mins [May] to averaging 10 minutes [December]).

Conclusions/Next steps: Our results showed the feasibility and effectiveness of using an electronic client feedback tool to collect client perspectives on and suggestions to enhance service quality, leading improved HIV service delivery at pilot facilities. IHAP-HK plans to extend this system to additional facilities in Haut-Katanga to continue engaging clients in service quality monitoring and ensure services meet client needs.

Approaches to effective paediatric HIV services

EPE286

Implementation of a pediatric and adolescent risk screening tool to improve HIV case finding: findings from selected facilities in South Africa, 2020-2021

J. Murphy[1], B. Mncwango[1], G. Kindra[1], S. Kauchali[2], N. Masike[3], E. Molai[2], J. Sikula[3], F. Tema[4], F. Mahlangu[4], B. Montoedi[5], V. Boguslavsky[2], J.M. Grund[1]

[1]*Centers for Disease Control and Prevention South Africa, Quality Improvment, Pretoria, South Africa,* [2]*University Research Co., Chevy Chase, United States,* [3]*The Aurum Institute, Parktown, South Africa,* [4]*Wits RHI, Johannesburg, South Africa,* [5]*Ekurhuleni Health District, Germiston, South Africa*

Background: South Africa (SA) had an estimated 7.9 million people living with HIV (PLHIV) in 2020, including approximately 386,000 children and adolescents living with HIV (CALHIV) aged 0-19 years. Although SA launched the Universal Test and Treat strategy in 2016 to improve HIV case finding and early linkage to treatment, identifying undiagnosed CALHIV remains a significant gap.

Description: We implemented and tested an HIV risk-based screening tool, the Pediatric and Adolescent HIV Testing Eligibility Screening Tool (PATEST), as a quality improvement intervention to improve case finding among CALHIV in 15 CDC-supported facilities in SA between October 2020 and September 2021. The tool comprises of 12 screening questions on HIV exposure and clinical/social factors.

Enrollment for screening occurred at various entry points within facilities. HIV counsellors/healthcare providers ascertained clients' status from the caregiver or adolescent to determine whether they had a known HIV-positive, negative, or unknown status.

Only clients with unknown statuses completed the full battery of screening questions. Clients who answered "Yes" to at least one of 12 questions were eligible and recommended HIV testing. Process measures were monitored throughout implementation of the tool; screening and testing outcomes are reported below.

Lessons learned: Among 190,805 clients aged ≤19 years accessing services at participating facilities, 42,739 (20%) had their status ascertained; 10,154 (24%) were excluded from further screening due to known HIV-positive (4%) or HIV-negative (20%) statuses.

We screened 28,211/32,585 (87%) clients with unknown status using the PATEST, of those 21,644/28,211 (77%) were eligible for HIV testing with 19,899/21,644 (92%) receiving testing. In total, 98 CALHIV were newly identified, translating to an HIV positivity rate of 98/19,899 (0.5%). Even in a high HIV prevalence setting, testing and identification of CALHIV attending facilities remained low, highlighting the need for innovative case finding for CALHIV.

Successful status ascertainment by counsellors/healthcare providers improved from 5% to 33% due to ongoing capacity building efforts with staff to move from universal testing towards targeted screening.

Conclusions/Next steps: The PATEST could streamline and increase efficiencies for HIV case finding among CALHIV in low-and-middle-income settings.

EPE287

Strategies for improving viral suppression among children in Akwa Ibom, Nigeria: a before and after study

scribe the implementation of an individualized viral load (VL) strategy and assess its effect on VS after six months of implementation.

Methods: The Meeting Targets and Maintaining Epidemic Control (EPIC) project's quality assurance/quality improvement team monitors quality across HIV/AIDS thematic areas. EpiC collaborated with the state pediatric task force supporting pediatric ART management to address VS.

An individualized care plan using the assess-implement-evaluate model was developed. In the assessment phase, the health needs of HIV-positive children on ART up to six months and with unsuppressed VL (≥1,000copies/ml) were reviewed across 49 facilities. Evidence-based practices were identified and implemented from January through July 2021 to address those needs.

During the evaluation phase, we assessed ART optimization in terms of regimen (dose, frequency, refills), access to appropriate care and support services (opportunistic infection [OI] prophylaxis, family/social support for disclosure and adherence), enhanced adherence counseling (EAC), and post-EAC VL monitoring.

Multivariable logistic regression was used to analyze for demographic and clinical factors associated with post-EAC VL suppression (<1,000 copies/ml) using SPSS v26 at<0.05 significance levels.

Results: Of the 312 children enrolled, median [IQR] age was seven years (IQR 4-10 years), 50.6% (156/312) males, median [IQR] duration on ART was 19 months (IQR 12-44 months), and 154 (49.4%) were on combination zidovudine-lamivudine-lopinavir/ritonavir.

We observed significant improvements from baseline in uptake of OI prophylaxis (p=<0.001)], access to family/social support for disclosure (p=<0.001) and adherence (p=<0.001), multimonth drug dispensing (p=<0.001), and transitioning to appropriate regimen (p=<0.001); 98.1%, 94.9%, and 94.1% completed one, two, and three EAC sessions, respectively. Post-EAC VL testing uptake was 92.3% (264/288), and VS among those tested was 91.3% (241/264). VS post-EAC was significantly lower among males (p=0.012) and in primary health care facilities (p=0.031).

Conclusions: Our strategies ensured viral resuppression. Implementing holistic, client-focused interventions can significantly affect virologic outcomes.

EPE288

Listening to children living with HIV and their caregivers: understanding barriers and enablers to improve care for children living with HIV in five rural Ugandan Districts

J. Rujumba[1], S. Ahumuza[2], D. Batiira[3], R. Ochen[4], I. Mwesigye[5], S. Kentusi[6], E. Vrolings[7], M. Musinguzi[8], TAFU Programme in Uganda

[1]Makerere University, Paediatrics and Child Health, Kampala, Uganda, [2]Agency for Capacity Building, Kampala, Uganda, [3]Community Health Alliance Uganda, Kampala, Uganda, [4]Health Need Uganda, Soroti, Uganda, [5]ARISE Uganda, Ntungamo, Uganda, [6]The National Forum of People Living with HIV/AIDS Networks in Uganda, Kampala, Uganda, [7]Aidsfonds, Amsterdam, Netherlands, the, [8]Aidsfonds, Kampala, Uganda

Background: Despite remarkable progress made by Uganda in the fight against HIV, Antiretroviral Treatment (ART) coverage among children living with HIV (CLHIV) still lags behind that for adults. It is estimated that 85% of adults living with HIV are on ART compared to 65% CLHIV under 15 years.

We explored barriers and enablers to access and retention of children in HIV care and generated lessons for strengthening the delivery of HIV care for children

Methods: We conducted a qualitative study in five rural Ugandan Districts of Soroti, Mubende, Mityana, Ntungamo and Kyenjojo as part of the Towards an AIDS Free Generation project.

Data were collected through 7 in-depth interviews with CLHIV and 10 caregivers; 10 focus group discussions (FGDs) with CLHIV, 24 FGDs with village health teams (VHTs), 1 FGD with a network of people living with HIV, 9 FGDs with women in a PMTCT program and 63 key informant interviews with health workers and district officials involved in HIV care. Content thematic approach was used for data analysis.

Results: Widespread stigma at home, in schools and communities perpetrated by peers and adults, limited family support due to poverty, lack of food and non-disclosure of HIV status made access to treatment and adherence to HIV care difficult for children.

Distant and understaffed health facilities and stock out of critical supplies were key structural barriers to children's initiation and continuity in care.

The key enablers of children's access and retention in HIV care were: follow-up and referral by village health teams, availability of support groups for children and caregivers at some health facilities and support to meet food and education needs of children by TAFU programme.

Conclusions: The narratives of children, caregivers and health workers in this study depict the intersectionality of vulnerabilities at family, community and health facility levels including stigma, poverty, food insecurity and constraints at health facilities as hindrances to children's access and retention in HIV care. Empowering community health workers as linking pins between families and

health facilities, expanding peer support groups for children and caregivers and strengthening the health system are critical for better outcomes for CLHIV.

Getting policies into practice

EPE289
Provider perspectives on ideal candidates for long-acting injectable antiretroviral therapy (LAI ART) for HIV treatment: a multi-site qualitative study in the United States

T. McCrimmon[1], R.M. Maggi[1], M.P. Vaughn[2], A. Perez-Brumer[3], R. McNeil[4], V.A. Shaffer[5], M.L. Alcaide[6], M.M. Philbin[1]
[1]Columbia University Mailman School of Public Health, Sociomedical Sciences, New York City, United States, [2]Columbia University and the New York State Psychiatric Institute, HIV Center for Clinical and Behavioral Studies, New York City, United States, [3]University of Toronto Dalla Lana School of Public Health, Social & Behavioural Health Sciences Division, Toronto, Canada, [4]Yale School of Medicine, Social and Behavioral Sciences, New Haven, United States, [5]University of Missouri, Department of Psychological Sciences, Columbia, United States, [6]University of Miami Miller School of Medicine, Department of Medicine, Miami, United States

Background: Since long-acting injectable antiretroviral therapy (LAI ART) was approved in the U.S. in January 2021, clinics have been developing approaches to facilitate its distribution and implementation. While highly anticipated, existing inequities in treatment access may limit LAI ART uptake, particularly among the most marginalized. Medical and social service providers play a key role in determining LAI ART access as they evaluate patients and are primary prescribers.
It is therefore necessary to understand how providers perceive and determine patients' LAI ART candidacy, and how this may influence who is offered LAI ART as it is being scaled-up.
Methods: Starting in Sept 2021, we conducted 35 in-depth interviews with HIV providers across 4 U.S cities. Providers shared how they decided which patients should be offered LAI ART and reasons why they may not offer it to patients with clinical indications. Interviews were recorded and transcribed; thematic content analysis was used to identify key findings.
Results: Provider perspectives regarding who should be offered LAI ART reflected three main themes:
1. Suppression-based eligibility: patients struggling with viral suppression on oral ART may benefit most from LAI ART but are ineligible under current guidelines. While acknowledging the risks of drug resistance, providers wanted more flexibility in prescribing to non-suppressed patients ("Anybody that's positive is the ideal candidate"). Providers also worried that some virally suppressed patients may struggle with LAI ART ("They know that what they're on works, and don't want to mess with it");
2. Patient assessment: Providers preferred to assess patients individually based on their structural barriers and co-occurring health issues ("Each provider has to know their patient to know if this would be an option for them");
3. Gender differences: Providers described female patients as more reliable ("[Men] aren't as attentive as women"), which might affect success on LAI ART, but were concerned with limited pregnancy-related data.
Conclusions: Providers utilized multiple factors in assessing patients for LAI ART. There is immediate need for standardized guidance and decision support tools that incorporate these factors to ensure consistent implementation and equitable offering of LAI ART to all patients.

EPE290
Prepping for PrEP: a readiness assessment among health facilities in Blantyre, Malawi

A. Majamanda[1], M. Enock[2], J. Tambala[2], E. Moses[2], S. Likumbo[1], D. Tinkani[3], C. Kassam[1], G. Chisamba[1], W. Fan[4], C. Ferrusi[5], D. Hoege[6], S. Allinder[6], Y. Kamgwira[7], C. Mablekisi[7], B. Agins[5], C. Holmes[6], G. Kawalazira[1]
[1]Blantyre District Health Office, Blantyre, Malawi, [2]MaiKhanda Trust, Lilongwe, Malawi, [3]Blantyre City Assembly, Blantyre, Malawi, [4]University of California San Francisco, School of Medicine, San Francisco, United States, [5]University of California San Francisco, HEALTHQUAL, New York, United States, [6]Georgetown University, Washington DC, United States, [7]National AIDS Commission, Blantyre, Malawi

Background: Malawi continues to experience a high number of new HIV infections, particularly among adolescent girls and young women (AGYW), female sex workers and men who have sex with men (MSM). PrEP was first endorsed by the Malawi Government in 2019 and but was only offered specialized drop-in centers serving key populations. Integrating PrEP into health facilities requires integration of screening in service entry points where those eligible receive services.
To prepare for PrEP scale-up in Blantyre, which has Malawi's highest HIV seroprevalence rate, a readiness assessment was conducted, led by the District Health Office (DHO), among 17 health centers and hospitals in December 2020, during which time only 3 people were documented to have been prescribed PrEP.
Methods: A formal assessment was designed to measure organizational and provider readiness to begin PrEP services, conducted by a team from DHO and MaiKhanda Trust through interview of 3 key individuals at each facility. Questions focused on training of staff cadres, ability to stock and dispense medications, documentation systems, conduct of routine sexual history taking and availability of mental health services, among others.

Oral abstracts

Poster exhibition

E-posters

Late-breaker abstracts

Author Index

Results: Of 17 facilities, only 12 had staff who had been trained on the PrEP guidelines and were prepared to package and dispense PrEP medications. Two facilities reported staff were not prepared to routinely conduct sexual histories.

Mental health services were available in 7 sites, and youth-friendly services in 13. PrEP registers had not yet been distributed but were to be located in one room in the clinic. Rapid HIV testing was available at all sites.

Conclusions: Preparing facilities to integrate PrEP in multiple service entry points is critical for scale-up and requires planning for service integration. Training of staff to assess eligibility, offer, package and dispense PrEP is necessary, including all staff who have contact with potential candidates in multiple service areas.

Available co-located mental health services to address depression and anxiety, and youth-friendly services to attract at-risk AGYW and young MSM will prepare facilities to address common co-morbidities and reach youth. Registers need to be available at multiple service entry points and include fields for assessment to determine PrEP eligibility.

EPE291

PrEP Up! A quality improvement collaborative (QIC) to scale-up PrEP in health centers in Blantyre, Malawi

M. Enock[1], A. Majamanda[2], J. Tambala[1], E. Moses[1], M. Thomas[3], C. Mablekisi[4], Y. Kamgwira[4], D. Hoege[5], S. Allinder[5], J. Murungu[6], B. Agins[7], C. Holmes[5], G. Kawalazira[2]

[1]*MaiKhanda Trust, Lilongwe, Malawi,* [2]*Blantyre District Health Office, Blantyre, Malawi,* [3]*Ministry of Health, Lilongwe, Malawi,* [4]*National AIDS Commission, Blantyre, Malawi,* [5]*Georgetown University, Washington DC, United States,* [6]*University of California San Francisco, HEALTHQUAL, Harare, Zimbabwe,* [7]*University of California San Francisco, HEALTHQUAL, New York, United States*

Background: Although Malawi continues to experience high numbers of new HIV infections, uptake of PrEP has been slow. In Blantyre, PrEP was introduced in 2020 as a pilot in drop-in centers (DICs) for key populations but was not being offered in health centers or hospitals where eligible people seek routine care.

As part of the Blantyre Prevention Strategy, under the leadership of the Ministry of Health, with technical support from a consortium of partners, QIC was launched by the District Quality Improvement (QI) unit in 21 facilities in 2021, including 3 hospitals, 14 health centers and 4 DICs.

A readiness assessment conducted in December 2020 showed that only 3 clients were on PrEP in hospitals and health centers, with 891 on PrEP in DICs.

The initial focus of facility QI activities was to identify service entry points for assessing patients who would be PrEP-eligible for formal screening according to national guidelines, including HIV testing.

Methods: Facilities apply standard QI tools for root cause analysis, process mapping and testing of team-identified changes through Plan-Do-Study-Act cycles.

Coaching provided by a team of district health officers guided by expert QI mentors (MaiKhanda Trust) occurs both in-person and virtually. Nine basic indicators are measured monthly spanning from assessment to monitoring and continuity of care.

Results: Early results from facilities show rapid increase of patients being assessed for PrEP, of eligible candidates screened. Monthly PrEP initiation jumped in hospitals and health centers from 36 in April to 249 in November 2021, with a total of 1042 people initiated over 8 months, with an additional 713 initiated in 4 drop-in centers.

Redesign of clinic flow was the most common QI intervention which centralized HIV testing as the focal point for decision-making to offer ART as either treatment or PrEP.

In larger facilities, PrEP teams were created, champions were identified to create demand in service areas, including STI, youth, ophthalmology and medical clinics. Educational talks and materials are also routinely made available in health center waiting areas.

Conclusions: Quality Improvement Collaboratives are an effective strategy to accelerate PrEP uptake in diverse facilities through integration into multiple service delivery points.

EPE292

Implementation of new Cryptococcal Meningitis screening, prevention, and treatment guidelines in Tanzania

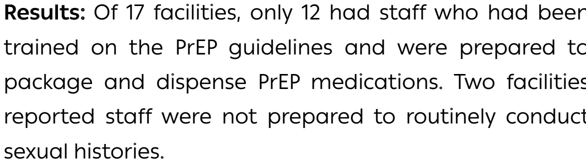
F. Freistadt[1], B. Nyakuya[2], G. Boyle[1], I. Jelly[3], J.M. Gilvydis[1], A. Nnko[2], N. Gabriel[2], A. Rwebembera[3], A. Ramadhani[3], S. Chale[2], P. Kohler[4]

[1]*University of Washington, International Training and Education Center for Health (I-TECH), Department of Global Health, Seattle, United States,* [2]*International Training and Education Center for Health (I-TECH), Dar es Salaam, Tanzania, The United Republic of,* [3]*Ministry of Health, Dar es Salaam, Tanzania, The United Republic of,* [4]*University of Washington, Department of Child, Family, and Population Health Nursing, Seattle, United States*

Background: Cryptococcal meningitis (CM) causes approximately 15% of HIV-related deaths globally, the majority in sub-Saharan Africa.

We describe findings from a technical assistance program supporting implementation of new CM screening and treatment guidelines in Tanzania.

Description: Activities included dissemination of new CMguidelines, supply chain support, and mentoring at 15 health facilities in November 2019, February 2020, and March 2021. Staff surveys assessed facility procedures, supplies, and implementation challenges. Three-months of outpatient records were abstracted at each visit to assess screening of HIV clients; inpatient records were



reviewed for CM diagnosis, treatment, and clinical disposition. Data were summarized using counts and proportions.

Lessons learned: Overall, 2,181 inpatient and outpatient clients with advanced HIV disease received cryptococcal antigen (CrAg) serum screening; 270 (12.3%) were positive. Of the 112 outpatient clients who tested positive for CrAg, 73 (65%) were screened for symptoms of meningitis. More than half (55%) of the 27 clients who were symptomatic were hospitalized for CSF testing.

Among the 46 asymptomatic clients, 43 (93%) started pre-emptive therapy with Fluconazole. More than half (53%) of facilities reported frequent fluconazole shortages in 2019, but only 1 (7%) continued to report shortages in 2021. All 15 facilities reported shortages of Amphotericin B and 5FC in 2021.

Data between inpatient and outpatient departments could not be linked due to separate records systems. A total of 268 clients were treated for CM in inpatient settings. Fifty-eight (21.6%) inpatient clients received a lumbar puncture (LP) for cerebrospinal fluid analysis and cryptococcus testing; 26 (44.8%) were positive.

Patient files did not include a reason for not performing LP diagnostic confirmation in 210 (78.3%) clients. Staff surveyed listed patient condition, lack of equipment and failure of patients to pay as reasons for not conducting LP. Inpatients were treated with Fluconazole monotherapy (76.9%), Fluconazole and Amphotericin B (7.1%), and Amphotericin B alone (0.3%).

Conclusions/Next steps: Implementation challenges following adoption of new CM guidelines in Tanzania include supply shortages, data linkage limitations, few LP procedures and inadequate management of Cryptococcal meningitis. Ongoing support is needed to address barriers and increase successful screening and treatment of clients with advanced HIV disease.

EPE293

TB preventive therapy (TPT) service delivery at HIV clinics: results from a global cross-sectional survey within the International epidemiology Databases to Evaluate AIDS (IeDEA) Consortium

K. Shearer[1], S.R. Cox[1], M. Yotebieng[2], O. Marcy[3], K. Zuercher[4], L.A. Enane[5], A. Pettit[6], A. Kinikar[7], D. Mahambou-Nsonde[8], E. Messou[9], C. Morrow[10], L. Diero[11], L. Otero[12], T. Sterling[6], J.A. Tornheim[1], N. Mbonze[13], W. Muyindike[14], F. Maruri[6], S. Pujari[15], R. Huebner[16], S. Shah[17], J.E. Golub[1], International epidemiology Databases to Evaluate AIDS (IeDEA)

[1]Johns Hopkins University, Center for Tuberculosis Research, Baltimore, United States, [2]Albert Einstein College of Medicine, Division of General Internal Medicine, Department of Medicine, Bronx, United States, [3]University of Bordeaux, Centre INSERM, IRD, Bordeaux Population Health UMR 1219, GHiGS Team, Bordeaux, France, [4]University of Bern, Institute of Social and Preventive Medicine, Bern, Switzerland, [5]Indiana University School of Medicine, The Ryan White Center for Pediatric Infectious Disease and Global Health, Department of Pediatrics, Indianapolis, United States, [6]Vanderbilt University Medical Center, Division of Infectious Diseases, Nashville, United States, [7]Byramjee Jeejeebhoy Government Medical College and Sassoon General Hospitals, Pune, India, [8]Ambulatory Treatment Center, Brazzaville, Congo, the, [9]Yopougon Attié Hospital, Centre de Prise en Charge de Recherche et de Formation (CePReF), Abidjan, Cote D'Ivoire, [10]University of Cape Town, Centre for Infectious Disease Epidemiology and Research, Cape Town, South Africa, [11]Moi University, AMPATH, School of Medicine, College of Health Sciences, Eldoret, Kenya, [12]Universidad Peruana Cayetano Heredia, Instituto de Medicina Tropical Alexander von Humboldt, Lima, Peru, [13]University of Kinshasa, School of Public Health, Kinshasa, Congo, Democratic Republic of the, [14]Mbarara University of Science and Technology, ISS Clinic, Mbarara, Uganda, [15]Institute of Infectious Diseases, Pune, India, [16]National Institutes of Health, National Institutes of Allergy and Infectious Diseases, Bethesda, United States, [17]Emory University Rollins School of Public Health, Department of Epidemiology, Atlanta, United States

Background: Tuberculosis (TB) preventive therapy (TPT) is an evidence-based, yet under-utilized, intervention to reduce risk of TB disease among people with HIV (PWH). As rifamycin-based short-course regimens for TPT are scaled up as an alternative to isoniazid monotherapy for 6 or 9 months, we sought to evaluate TPT service delivery within the International epidemiology Databases to Evaluate AIDS (IeDEA) global HIV consortium.

Methods: HIV clinics serving adults (≥20 years of age) that participated in an IeDEA-wide cross-sectional survey reflecting 2019 service delivery were eligible. We collected site-level information about TPT regimens and routine approaches for assessing TPT contraindications and adverse events. Results were summarized using proportions.

Results: Of 215 eligible clinics approached, 204 (95%) across 39 countries responded. Of these, 143 (70%) reported providing TPT to patients screening negative for TB disease. 9% (n=13) of the clinics that reported providing TPT were in North America, 3% (n=4) in Latin America, 8% (n=11) in Central/West Africa, 66% (n=95) in East/Southern Africa, and 14% (n=20) in the Asia-Pacific. Of 143 clinics, 16% offered≥1 rifamycin-based short-course regimen; 84% only offered 6-36 months of isoniazid (Figure).

Less than 10% (n=13/143) of clinics offered the 3-month regimen of isoniazid and rifapentine (3HP) as an option; though this regimen was available at 62% (n=8/13) of North American clinics.Prior to TPT prescription, 72% of clinics screened for peripheral neuropathy and 92% for jaundice/liver disease. Post-TPT initiation, the vast majority of clinics screened for adverse events, including peripheral neuropathy (88%) and hepatitis symptoms (90%).

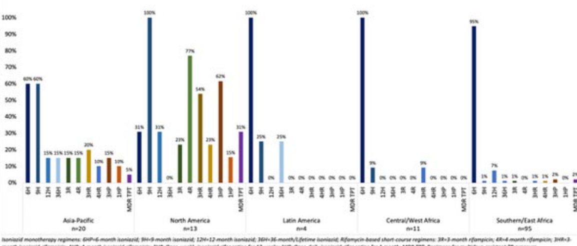


Figure. TPT regimen availability by region (n=143)

Conclusions: Across IeDEA HIV clinics serving adult PWH, we observed variability in TPT regimen availability. Access to short-course TPT regimens was uncommon, particularly in resource-constrained settings. Scaling up access to short-course regimens may improve uptake and treatment completion, leading to reductions in TB-related morbidity among PWH.

EPE294

Uptake of TLD-based regimens in South Africa: implications for national policy and HIV epidemic-control

K. Govender[1], G. Molaudi[2], M. Munsamy[3], M. Pillay[4], J. Miot[1]

[1]Wits Health Consortium - University of the Witwatersrand, Health Economics and Epidemiology Research Office, Johannesburg, South Africa, [2]Right to Care, Johannesburg, South Africa, [3]National Department of Health, Johannesburg, South Africa, [4]Project Last Mile, Johannesburg, South Africa

Background: In 2016 the World Health Organisation (WHO) recommended TLD (Tenofovir, Lamivudine, Dolutegravir) as an alternative fixed-dose combination (FDC) first-line HIV regimen to the commonly used TEE (Tenofovir, Emtricitabine, Efavirenz). The TLD-based regimen has shown more effective viral-suppression capabilities and lower-cost in comparison to TEE. As a result, South Africa revised its 2019 ART-guidelines to recommend the transition to TLD-FDC first-line regimen away from Efavirenz containing regimens with guidance on transitioning existing stable first-line clients. This study seeks to understand progress in transitioning patients to TLD regimens within South Africa's public and private healthcare-sectors.

Methods: We conducted a quantitative analysis on secondary TEE- and TLD-FDC volumes data representing total packs distributed/sold (1-pack=1-month supply) between January-2020 to December-2020 in the public and private-sector. Utilisation-patterns and proportional (%) distributions of TLD to TEE volumes at country-level was evaluated and supplemented with a 12-month provincial-level analysis. Public-sector volumes data was obtained from the NDoH's CCMDD program, this excludes the Western-Cape Province. Private-sector volumes for Anatomical-Therapeutic-Chemical (ATC) category JO5A Antiretrovirals (ARVs), representing pharmaceutical sales and distribution across South Africa, was purchased from IQVIA.

Results: Results indicate that TLD-FDC uptake gained traction more rapidly within the public-sector overtaking TEE-FDC demand by August-2020 and continuing on that trajectory to make up approximately 60% of volumes by December-2020. Kwa-Zulu Natal province showed the greatest progress in public-sector TLD uptake by December-2020 (67%). In comparison private-sector TLD uptake was lagging. TEE still made up 95% of analysed volumes at country-level by December-2020 and at least 93% of volumes across all provinces. Although the private-sector displays increasing TLD prescribing and dispensing trends, the transition remains slow, with volumes well below TEE for the analysis-period.

Conclusions: Concerted efforts are required to harmonise and strengthen policy uptake along the HIV/AIDS care-continuum, across both South African health-sectors.

To achieve HIV epidemic-control under the UNAIDS 95-95-95 goals, results suggest a need to identify and address barriers in private-sector TLD uptake which could include a lack of awareness and/or monitoring of policy changes and other existing market-dynamics. This becomes critical for coordinated contracting between the public- and private-sector as South Africa moves towards National Health Insurance.

EPE295

Unprecedented uptake and transition to generic pediatric dolutegravir in low- and middle-income countries enabled by early planning, comprehensive partner coordination, and ongoing community and national program engagement

C. Malati[1], C. Amole[2], H. Wolf[3], M. Watkins[2], Z. Panos[2], J. Samuel[1], K. Blumer[4], C. Perez Casas[4], M. Penazzato[5]
[1]U.S. Agency for International Development (USAID), Washington, D.C., United States, [2]Clinton Health Access Initiative, Boston, United States, [3]U.S. Department of State, Washington, D.C., United States, [4]Unitaid, Geneva, Switzerland, [5]World Health Organization (WHO), Geneva, Switzerland

Background: Development and introduction of novel pediatric ARVs has historically lagged behind adult ARVs and suffered from substantial delays preventing treatment innovation and rapid access for children. Dolutegravir 10 mg dispersible, scored tablets (pDTG) offer an example of accelerated timelines in stark contrast to past pediatric ARV introductions.
Understanding the factors making pDTG introduction unique is essential to ensure it sets an example for future pediatric product introduction.
Description: PADO's 2014 DTG prioritization encouraged strategic collaborations between ViiV Healthcare, IMPAACT, and PENTA, allowing rapid evidence generation and triggering WHO guidelines revision in 2018. WHO recommendation set the basis for a unified partner position shared by global donors, implementing partners, and civil society, prompting widespread guideline updates by national programs ahead of pDTG approval. In parallel, generic pDTG development progressed in record-breaking time thanks to development incentives and an innovative partnership between Unitaid, CHAI, ViiV, Viatris, and Macleods, and existing licensing from ViiV via MPP. The expeditious work of the USFDA led to ViiV's approval in June 2020, quickly followed by tentative approval of Viatris's generic version only 5 months later.
PEPFAR worked with global and local stakeholders to accelerate planning and introduction via pDTG readiness questionnaires and by offering support with stock analysis and formulary-driven procurement guidance, priming country programs for introduction. CHAI and Unitaid negotiated a pricing agreement, which allowed pDTG to be available at USD $4.50 per bottle, 75% less than the standard of care. As a result, PEPFAR-funded orders and CHAI/Unitaid catalytic procurements arrived in the first half of 2021, driving early access to pDTG across seven countries.CHAI- and AfroCAB-developed training and awareness materials were complemented by intensified action of partners including EGPAF, DNDi, and ICAP to prepare countries for rapid introduction.
Lessons learned: Political commitment, partnerships, and coordinated efforts between stakeholders resulted in rapid introduction of optimal pediatric ARVs.
Conclusions/Next steps: In just over one year after generic tentative approval, pDTG was introduced in 25 countries. The speed of introduction was driven by unprecedented coordination, continuing under GAP-f, with the hope that pDTG can set an example for accelerating future product introduction to improve virological suppression and save lives.

EPE296

Translating policy to practice: expanding differentiated service delivery for children and adolescents living with HIV in Johannesburg, South Africa

C.L. Tait[1], J. Dunlop[1,2], P. Madisha[3], K. Nukeri[3], I. Shabalala[3], N. Rumhuma[3], T. Chicktay[4], K. Rees[5,2]
[1]Anova Health Institute, Paediatric and Adolescents, Johannesburg, South Africa, [2]University of the Witwatersrand, Johannesburg, South Africa, [3]Anova Health Institute, Pharmacy, Johannesburg, South Africa, [4]Johannesburg Health District, Pharmaceutical services, Johannesburg, South Africa, [5]Anova Health Institute, Public Health, Johannesburg, South Africa

Background: Differentiated service delivery, including ART delivery modalities, improve client experience of care, retention and reduce system burdens. Children and adolescents living with HIV could experience similar benefits, however these strategies tend to be adult focused.
We describe operationalizing updated South African National Adherence Guidelines, which recently expanded access to repeat prescription collection strategies (RPCS) to children and adolescents.
Description: Updated National guidelines were released in 2020, wherein age eligibility criteria for enrolment onto RPCS was expanded to include children 5-17 years old, from the previous cut-off of 18 years. Although guidelines were available, operational uncertainties for this age-group affected implementation. District health management and implementing partners thus developed an implementation plan to operationalize the guideline, which included stakeholder and client engagement, resource assessment, approach to rollout, pharmacy and supply chain complexities and additional guidance needed for implementers. Support was ongoing between May 2020 and August 2021.
Lessons learned: Concerns raised included uncertainty over underdosing due to longer intervals between visits, maintaining psychosocial support (PSS), enrolment documentation required and the centralised chronic medication distribution formulary not including paediatric formulations. Advisors shared information on typical weight changes per age compared to dosage adjustments, which built clinicians and pharmacy teams' confidence. Implementing partners investigated supporting community-based organisations to register as pick-up points but this was challenging due to the requirements. Instead, we emphasized available community services for support be-

tween clinic visits and virtual PSS. Pharmacy teams sought clarity on age cut-offs for children to collect medication without caregivers, and documentation needed for enrolment and collection, in light of most children not holding identity cards. The provincial formulary was adjusted to include paediatric formulations in October 2021.

Finally, a standardized operating procedure and training slides were compiled to guide staff. Two trainings were held in May and October 2021. Approximately 5% of 4000 virally suppressed older children and adolescents have been enrolled.

Conclusions/Next steps: Although policy expanded differentiated models of ART delivery to children and adolescents, implementation lagged due to uncertainties, concerns and operational barriers. A multi-disciplinary stakeholder approach ensured that a broad range of factors were addressed. Further on-site support will be key to ensure quality and scale-up.

Systems serving underserved populations

EPE297

Changing time changing approaches: exploring the use of mobile libraries in the dissemination of HIV/AIDS awareness information

R. Namuddu[1,2], C. Benoni[3]

[1]Makerere University, Library and Information Science, Kampala, Uganda, [2]LGBTQI Voices Uganda, Research/information, Kampala, Uganda, [3]LGBTQI Voices Uganda, Research/ICT/MSM, Kampala, Uganda

Background: In 1983, AIDS was diagnosed in Uganda and has since reached epidemic proportions. Although the government and its partners came up with preventive education and services, patterns of sexual behavior, unless changed, threaten to thwart the success that has so far been achieved. The problem is exacerbated in rural areas given the massive information gap, heightened by poverty. With this study, we explore the mobile library approach as a necessary avenue to bring information to the people, within fishing communities in Uganda.

The objective was to find out whether this Mobile Library Information Sessions Initiative (MLISI) would help in narrowing the distance and gap (and indeed can be adopted) to getting HIV/AIDS-related information to the rural masses.

Methods: This concept of a mobile library was developed and implemented, with a van carrying health-related materials, mainly those about HIV/AIDS. The van was equipped with a public address system, had 7 library attendants, and a team of counselors. We visited three landing sites, spending a week on each site. Questionnaires were used for pre-and post-intervention assessment. The MLISI covered areas of transmission, prevention, and perceptions and attitudes held on PLWHIV. MLISI attendees were tested on the subject matter.

Results: At the end of the visits, of the (n=300) attendees' 70% revealed that they had gained some knowledge concerning HIV aids and were willing to adhere to that knowledge. 90% admitted that the knowledge gained about HIV/AIDS and attitude toward PLWHIV was useful. 90% embraced the idea of a mobile library. Librarians who guided the attendees on how to access this information got an approval rate of an average of 8 out of 10, from 80 % of the attendees on the way they conducted their work.

Conclusions: The MLISI is and may yet be an innovative and in fact a viable and reasonable approach that can be used to disseminate HIV-related info to the rural masses. This librarians-led approach proved to compel users to seek more information where they find it easy under the guidance of a professional librarian.

EPE298

Automated sign language recognition system for deaf people in need of HIV and SRH counseling and testing services in Ethiopia

G. Worku[1], H. Tesfaye[1]

[1]Haramaya University/Haramaya Institute of Technology HiT, School of Electrical and Computer Engineering, Dire Dawa, Ethiopia

Background: There are very few sign language interpreters in Ethiopia in hospitals and interpretation prices are very high, in addition to the cost of interpreters, there is a series problem related to SRH (Sexual Reproductive Health) services where a deaf patient's personal information is exposed to the interpreter which could be a family member or a friend of the patient in most cases, so the patient will not tell some of the required sensitive information specially related to HIV to the doctor due to the third-party interference.

The project was funded by ECDD (Ethiopian Center for Disabilities and Development) and Packard Foundation to be implemented in Ethiopia as a pilot project and is intended to reduce this problem by using a real-time isolated word sign language recognition system for selected SRH and HIV related words using Kinect and ML techniques.

Methods: Signer-dependent and independent recognition experiments were made by professional and local signers using KNN-DTW and Random Forest Algorithms. Microsoft Kinect was used to capture skeletal data of the signers in real-time and translations were made on the fly for selected SRH/HIV words.

Results: Among the experiments carried out, using 1NN-DTW technique we have achieved a total accuracy of 93.75 for signer-dependent scenarios and an average accuracy of 85% for signer-independent systems. The result of the experiment's made by using random forest ML algorithm for classification purposes using signers considering both

sex, body, and age variations we have achieved an average accuracy of 75%. This shows that RF algorithm is best suited for real-time application compared to DTW which is a matching algorithm causing computational complexity for an increasing number of words while RF is less susceptible to such problems.
Conclusions: We have built a system that helps underserved deaf communities in need of HIV/SRH related consultancy and testing services so that they can freely and directly communicate with the doctor helping them get the proper medication.
It's a system that works in real-time and converts the patient's signing into text/voice for the doctor so that the patient's personal information will be kept private.

EPE299

Central Dispensing Unit (Bonolo Meds) as a differentiated care model in Lesotho

S. Hendriksz[1], B. Meyer[1], T. Dube[1]
[1]*Right e-Pharmacy, Pretoria, South Africa*

Background: Lesotho is an HIV burdened country with over 340 000 people affected and about 220 000 currently enrolled for ART. The integration of ART services into primary healthcare facilities has left the healthcare workers in these facilities overburdened with the high volumes of patients. To alleviate this burden, differentiated models of care are considered and funded to decentralize patient care. One of the strategies includes the external packaging of chronic repeat medicines via a Centralized Dispensing Unit (CDU) and dispatching of these medicine parcels to alternative pick up points (PuPs) outside of facilities. PuPs can include alternative counters at facilities, private pharmacies and e-lockers.
Description: Meeting Targets and Maintaining Epidemic Control (EpiC) is a global project funded by the U.S. President's Emergency Plan for AIDS Relief (PEPFAR) and the U.S. Agency for International Development (USAID), dedicated to achieving and maintaining HIV epidemic control.
Through this program, a CDU model (Bonolo Meds) was established in Maseru, Lesotho in 2020 with a network of 21 PuPs. Bonolo Meds serves 8 health facilities, allowing the decanting of HIV and other chronic patients to the program. This means patients only return to their facilities every 6-12 months for clinical evaluation and re-scripting, alleviating the patient burden on these facilities.
As an additional leg to the project, Collect & Go Smartlockers were installed as electronic PuPs at 5 locations. This is a first of its kind project in Lesotho.
Lessons learned: Since inception Bonolo Meds enrolled 3537 patients with rapid uptake for HIV patients. Alternative PuPs allow patients to quickly collect medication outside of clinic queues. Further benefits are realized in a predictable supply chain using a 'Port 2 Patient' strategy which helps for demand planning. Previously, manual systems in the primary health clinics, often resulted in stock-outs and patients not always receiving their medication on time.
Conclusions/Next steps: The CDU as a differentiated model of medicines delivery has proved effective in increasing ease of access, adherence, and retention on treatment.
Patient & commodity tracking has improved due to use of integrated WMS & EMR systems with a centralized data repository allowing faster and efficient programme decisions.

EPE300

The current situations and the factors associated with challenges and difficulties for providing medical services for the migrants living with HIV in Japan: findings from a nationwide survey

T. Kitajima[1], T. Sawada[2], H. Miyakubi[3], H. Tran Thi[4,5]
[1]*Kyorin University, Faculty of Social Sciences, Tokyo, Japan,* [2]*Minatomachi Clinic, Yokohama, Japan,* [3]*Kyorin University, Faculty of Foreign Studies, Tokyo, Japan,* [4]*Japan Foundation of AIDS Prevention, Tokyo, Japan,* [5]*Kyorin University, Graduate School of International Cooperation Studies, Tokyo, Japan*

Background: Studies conducted in 2013 found that the number of HIV-positive migrants (HIVPM) increased in Japan as their nationality became more multifaceted. Those who spoke neither Japanese nor English tended to delay their first visit to medical facilities. The number of migrants has since further increased.
To improve HIVPM's access to medical services, we conducted a nationwide survey investigating the current situationand factors associated with challenges in providing medical services for HIVPM in Japan.
Methods: We sent a self-administered questionnaire to the person in charge of clinical services for people living with HIV at AIDS base hospitals and the medical facilities registered to provide services under the Services and Supports for Persons with Disabilities system. Three hundred ninety-one such facilities were the major medical service providers for PLHIV in Japan.
The questionnaire addressed the number and nationality of the HIVPM treated between 2013 and 2018, their experiences with HIVPM, whether they could use interpretation services, and their perceptions toward treating HIVPM. The survey was conducted from December 2019 to October 2020.
Results: Three hundred thirty-two (84.9%) facilities participated in the survey. Of these, 169 (50.9%) facilities treated 1,033 HIVPM in total. By region of origin, the largest group of HIPVM were from Southeast Asia (33.5%), followed by East Asia and Pacific (26.5%). Two hundred fifty-five (76.8%) facilities responded that they would have challenges and difficulties treating HIVPM if they spoke neither Japanese nor English.
A logistic regression analysis revealed that the facilities that had no experience of treating HIVPM who spoke neither Japanese nor English in the past six years (AOR 4.46; 95%CI 1.78-11.16), the facilities that had no access to medi-

cal interpretation services (AOR 4.29; 95%CI 1.61-11.42), and AIDS regional centers/core hospitals (AOR 7.08; 95CI 1.60-31.40) were associated with such perception.

Conclusions: More migrants from Asian countries are expected to come to Japan when the COVID-19 pandemic is over.

The study revealed a need to urgently create a multilingual system to improve the access of migrants to HIV testing and treatment in Japan.

EPE301

3-monthly ART dispensing for isolated PLWHIV in French Guiana: the results of a community-based advocacy work

C. Rouquette[1], C. Piedrafita[1], A. Nawang[1], C. Le Gouëz[1], D. Michels[1], M. Ahouah[1], S. Soltani[1], N. Vignier[2], C. Michaud[2]

[1]AIDES, Pantin, France, [2]Centre Hospitalier De Cayenne, Cayenne, France

Background: In France, antiretroviral therapy (ART) is dispensed every month. Studies show the negative impact of a monthly dispensing on retention in care for people living with HIV (PLWHIV) far from health facilities, especially in French Guiana, a French oversea department in Amazonia, where the supply of care is poor and unequally distributed. A project conducted by the French association AIDES with delocalized centers for prevention and care (CDPS), aiming at developing health autonomy on the Maroni border river, corroborated these risks.

On this basis, AIDES together with the regional HIV coordination committee (COREVIH) and prescribers launched a community-based advocacy work that resulted in experiencing a 3-monthly ART dispensing for isolated PLWHIV in French Guiana.

Methods: The advocacy methodology included gathering information on PLWHIV's needs, meeting actors working in HIV field, collectively reaching decision-makers, establishing a follow-up protocol.

AIDES brought together infectious disease specialists, French Guiana health agency, civil society organizations and the COREVIH. A flash survey addressing doctors and pharmacists' expectations regarding 3-monthly ART dispensing was conducted by the latter. It pointed out high expectations from prescribers on the basis of geographical isolation or difficulties in maintaining close consultations. A request was sent to the regional health insurance organization and led to an authorized protocol between prescribers, dispensers and the local health insurance organization.

Results: 3-monthly ART dispensing for isolated PLWHIV in French Guiana at risk of treatment interruptions is temporarily authorized since July 1rst, 2021. The dispensation protocol is based on a document drawn up by prescribers and forwarded to pharmacists through PLWHIV, then sent to the local health insurance organization by the dispensing pharmacy. Of the 92 PLWHIV, 9 people currently receive this service in this territory.

Conclusions: 3-monthly ART dispensing in French Guiana has its origins in a community based advocacy work in conjunction with the COREVIH and prescribers. COVID and previous initiatives were levers for the protocol implementation. This project questions the inadequacy of laws with PLWHIV's needs, despite existing data and recommendations. The experiment should serve as an example and lead to the generalization of a 3-monthly ART delivery in France and remote area.

EPE302

Designing for underserved patients - improving the collection of PROMs within an academic HIV outpatient clinic from an industrial design-driven perspective

S. Wolterink[1], K. Moody[2], J. Faber[1], M. Bedert[2], M. Melles[1], M. van der Valk[2]

[1]Delft University of Technology, Faculty of Industrial Design Engineering, Delft, Netherlands, the, [2]Amsterdam University Medical Centers, Department of Infectious Diseases, Amsterdam, Netherlands, the

Background: The HIV outpatient clinic of Amsterdam University Medical Centers (AUMC)is implementing digital patient-reported outcomes measures (PROMS) in routine care to improve the quality of life (QoL) for people living with HIV (PWH). We were asked to design tools to promote the participation of patient groups from Ghana and Nigeria.

Methods: Two sets of methodologies were used: qualitative research methods informed the development of a 'patient journey' and design-thinking methodologies informed the tool development. Participant observation and in-depth semi-structured interviews were conducted to gain insights into patient- and system-related characteristics. Design-thinking methodologies facilitated the transformation of qualitative data into insights that drove design concepts. Three ideation methodologies were used to create four concepts, leading to the final concept.

Results: Observations of 17 individual consultations (6 female, 11 male) at the HIV outpatient clinic resulted in six recurring themes. These themes were: Personal relationship; Disclosure; Impact of the diagnosis; Health literacy & Health involvement; Communication; No-shows. The observations and additional literature research informed the development of an interview guide. Seven interviews (5 female, 2 male) were conducted with participants from Ghana and Nigeria. The observations and interviews informed the patient journey (PJ). The PJ showed that patients experience stress and anxiety prior to and during their hospital visit but fully trust doctors and nurses. Based on the insights the design challenge was addressed, leading to the following concepts: "Peer support community"; "Wellbeing Diary"; "Waiting Room Inspiration"; "Hospital Roadmap".

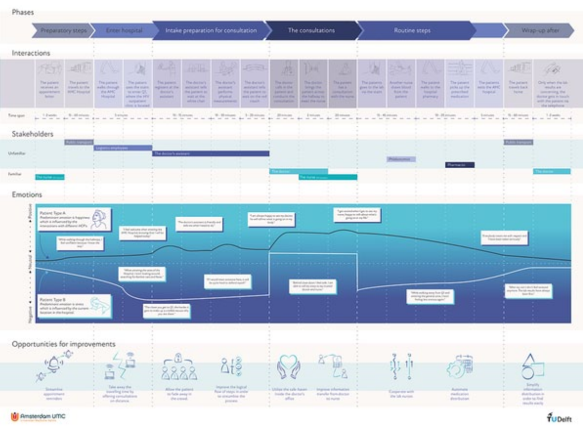

Figure. A patient-centered healthcare journey of people living with HIV. The results of an exploratory interview study with people living with HIV with a migration background originating from Nigeria or Ghana (n=7)

Conclusions: Amsterdam UMC will adopt the "Wellbeing Diary" which embodies the following characteristics: independence from relying on other organisations or infrastructure for implementation; a visual design that can be used independent of literacy level; and its affordability. The paper diary will provide a low-threshold tool for people to record PROMs-like experiences that will prepare them for their consultations at the outpatient clinic.

EPE303

Perceptions of older people living with hiv towards alcohol consumption and haart adherence in Southwestern Uganda

W. Hannington Gamukama[1]

[1]*Bishop Stuart University, Nursing, Mbarara, Uganda*

Background: While the global burden of alcohol consumption is 2.3 billion people drinking alcohol, Uganda has a heavy episodic drinking prevalence of 56.6% for age groups of 15 years and above. Alcohol consumption is associated with reduced HAART adherence. This is likely to worsen treatment outcomes among HIV/AIDs patients. However, among the older HIV/AIDs population in most LMICs, the impact of alcohol on HAART adherence is not known.

This study explored the perceptions of older persons living with HIV/AIDs towards alcohol consumption and HAART adherence in Southwestern Uganda.

Methods: A Phenomenological study design was employed among 38 purposively selected older persons living with HIV/AIDs enrolled in care in health facilities in Southwestern Uganda. A total of 6 focus group discussions were held at the selected Health Centers, Data was collected using audio recorders and notebooks for file notes, and data were then transcribed, coded, and categorized into themes. Thematic analysis was used to give meaning to the information given by the participants.

Results: All participants who consumed alcohol were men (10 of the 38). Some of the participants perceived alcohol to be beneficial in providing nutrients, increasing sexual libido, and relieving stress. Many of the participants also mentioned that alcohol increase the virulence of HIV in addition to causing other diseases like liver disease reduced the effectiveness of ART, and caused the consumers to miss taking pills.

Conclusions: Alcohol consumption is common among older patients living with HIV/AIDs and is associated with non-adherence to HAART. There is need for incorporation of counselling on effects of alcohol in the care patients receive from HIV care facilities.

EPE304

Building and implementing Le Cercle Orange: creatively responding to the needs of people living with HIV in the Montreal region without access to healthcare

P. Keeler[1]

[1]*COCQ-SIDA, Montreal, Canada*

Background: Up to one-third of people newly diagnosed with HIV in Montreal do not have a provincial health card or access to healthcare (INSPQ, 2019). It is extremely difficult for this underserved population to navigate or pay for essential medical visits, routine tests, and HIV treatment. Existing sources of support have traditionally been scattered and hard to find. In response, Le Cercle Orange brings these resources together in a vast "network of care."

Leveraging the power of this harmonized network, Le Cercle Orange can ensure that People Living with HIV (PLHIV) without access to healthcare receive cost-free health services, medication, legal resources, and community support.

Description: Sine its conception in late 2019, Le Cercle Orange supports the population in two ways: first, the project assembles and harmonizes the services of many partners who commit to offering services free of charge, currently including eight private clinics, four hospitals, treatment access programs, and several community and legal resources. Second, the project accesses individuals requiring support, connects them to this network, and ultimately supports them in fully entering the public healthcare system. Le Cercle Orange officially operates in Montreal, and has supported PLHIV farther afield.

Lessons learned: Le Cercle Orange has supported over 75 PLHIV without access to healthcare, of which 100% have received cost-free access to a healthcare provider and cost-free medication. 100% of current participants maintain an undetectable viral load (more statistics to be presented at the conference). We have addressed the challenge of knowledge gaps between institutions and the community by encouraging communication between stakeholders. We have continually developed our internal systems and community partnerships to address difficulties accessing the population.

Conclusions/Next steps: This innovative project successfully connects an underserved population to care and helps many individuals maintain an undetectable viral load. Now that our pilot phase has ended, at AIDS 2022,

Oral abstracts

we wish to provide a detailed road map of how the project was conceived and implemented, reinforcing our future goals: supporting other regions wishing to integrate components of the project, expanding Le Cercle Orange past Montreal, growing our partnerships, and improving our internal processes to better advocate for long-term change at the governmental level.

EPE305

Client satisfaction with antiretroviral treatment services in public health facilities south Ethiopia: institution based cross-sectional study

A. Badacho[1,2], A. Chama[3], T.D. Darebo[3], D.D. Woltamo[3]
[1]Wolaita Sodo University, Public Health, Addis Ababa, Ethiopia, [2]Wolaita Sodo University, College of Health Sciences and Medicine, Public Health, Addis Ababa, Ethiopia, [3]Wolaita Sodo University, Public Health, Wolaita Sodo, Ethiopia

Background: HIV/AIDS remains the leading cause of morbidity and mortality throughout the world.Moreover, Sub-Saharan countries, including Ethiopia, are highly affected by HIV/AIDS pandemic. Ethiopia's government has been working on a comprehensive HIV care and treatment program, including antiretroviral therapy. However, evaluating the client satisfaction with antiretroviral treatment services is yet not well studied.
The objective of this study was to assess client satisfaction and associated factors with antiretroviral treatment services provided at public health facilities in South Ethiopia.
Methods: A facility-based cross-sectional study involved 605 randomly selected clients using ART services at public health facilities of Southern Ethiopia. A Structured questionnaire was used to collect the data. The data were entered, cleaned using EPI Info and analyzed by SPSS 21 software package. A multivariate regression model was used to see an association between independent variables and the outcome variable. The odds ratio with 95% CI was computed to determine the presence and strength of association.
Results: Four hundred twenty eight (70.7%) clients were satisfied with an overall antiretroviral treatment service, which included significant variations ranging from 21.1% to 90.0% among health facilities. Sex [AOR= 1.91; 95% CI = 1.10 - 3.29], employement [AOR= 13.04; 95% CI = 4.34 - 39.22], clients perception on the availability of prescribed laboratory services [AOR= 2.56; 95% CI = 1.42 - 4.63], availability of prescribed drugs [AOR= 6.26; 95% CI = 1.42 - 4.63] and cleanliness of toilet in the facility [AOR= 2.83; 95% CI = 1.56 - 5.14]were factors associated with client satisfaction with antiretroviral treatment services.
Conclusions: The overall client satisfaction with antiretroviral treatment service was lower than the national target of 85%, with a marked difference among facilities. Sex (being male), occupational Status (employed), client's response on the availability of comprehensive laboratory services, standard drugs, and cleanliness toilets in the facility were factors associated with client satisfaction with antiretroviral treatment services. Sex sensitive services needed to address and sustained availability of laboratory services and medicine recommended.

EPE306

Lost to HIV care in the context of deep-rooted inequities in Winnipeg, MB, Canada

G. Hill-Carroll[1], S. Loewen[2], K. Slater[1], P. Migliardi[1], D. Martin-Heiken[1], M. Klimczak[3], P. Plourde[4], D. Girard[1], K. Templeton[5]
[1]Winnipeg Regional Health Authority, Healthy Sexuality & Harm Reduction, Winnipeg, Canada, [2]University of Manitoba, Winnipeg, Canada, [3]Winnipeg Regional Health Authority, Healthy Sexuality and Harm Reduction, Winnipeg, Canada, [4]Winnipeg Regional Health Authority/ University of Manitoba, Winnipeg, Canada, [5]Manitoba HIV Program, Winnipeg, Canada

Background: Despite public health efforts and improved treatment, HIV continues to be a major infection of concern in Manitoba, Canada. Manitoba has the second highest rate of HIV transmission in Canada. The Province's largest city, Winnipeg, holds the burden of most new transmissions.
In the past few years, exacerbated by the COVID-19 pandemic, Winnipeg has seen an influx of people recently infected with HIV who are not engaged to care.
Description: In 2021, the Healthy Sexuality and Harm Reduction (HSHR) team, Population and Public Health Program, WRHA, conducted a review of newly diagnosed cases of HIV that were not connected to care over a one-year period. The aim was to understand the social epidemiology acting as the backdrop to their (dis-)engagement in HIV care.
This review revealed that over 30 percent of cases had never presented or had attended less than two appointments for care. It was found that female and younger individuals were more likely to be "lost to care". Co-infections with other STBBIs, mental health issues, problematic drug use, homelessness, and incarceration were key aspects of the personal and social history among this cohort.
Further, many of these clients had been tested in emergency departments, suggesting that emergency departments served a primary care function for this population. A lack of access to primary and preventive care, a toxic drug supply and late presentations to acute care may have also contributed to a significant number of fatalities (19%) related to HIV.
This analysis has become the flashpoint for an enhanced collaboration across partners situated in key positions throughout the healthcare system.
Lessons learned: Over the years, the HSHR team and the Manitoba HIV Program have collaborated to address the needs of people living with HIV who are lost to care. Renewed efforts are required to reimagine what support to

and engagement of individuals and communities deeply affected by ongoing socio-economic and political inequities, facing systemic racism and drug-use stigma entails. Collaboration must include the community affected by HIV.

Conclusions/Next steps: Partnerships in addressing HIV lost to care need to revisit and renew the ways in which healthcare systems approach emerging syndemics.

EPE307

Cracking the access rock: GIS hotspot and priority population mapping to enhance targeted condom last mile distribution and accountability in Uganda

W. Mugwanya[1], R. Kindyomunda[1], I. Luswata[2], I. Nalubega[2], V. Kibirige[3], R. Kareodu[1], T. Tumusiime[4]

[1]*UNFPA, Kampala, Uganda,* [2]*Joint Medical stores, Kampala, Uganda,* [3]*Ministry of Health, Kampala, Uganda,* [4]*Aids Information Center, Kampala, Uganda*

Background: Uganda's HIV prevalence still high (6%), higher among key/priority populations. Condom use is a priority HIV prevention intervention, however, data shows declining trends at high-risk sexual encounter though slightly higher among key populations. MOH condom needs assessment revealed barriers to condom use including; social stigma linked to conservative sex and sexuality cultural and religious beliefs and values; inconvenient access points; Efficacy misbeliefs and low-risk perception. Access Inequities programmatically result from lack of; user targeting, inadequate stock Monitoring and accountability and people-centered condom programming. Currently, condom Distribution (CD) and utilization falls below the target needed for desired impact. While Uganda's annual universe of need is250 million, only 177M condoms were distributed in 2021 and utilization estimated at only 53%.

The MOH, with support from UNFPA, USAID, Global Fund and JMS, warehouse supporting alternative distribution system (ADS) explored digital solutions to improve accountability and last mile CD to priority population hotspots.

Description: A digital application was developed (jms.nftmobility.app) and used to GIS-Map hotspots collecting basic information including; hotspot type, functional status, contact person, GPS-location, estimated use, quantity distributed and dispensers. This was guided by District focal persons identifying hotspots. JMS transported condoms to regions and distributed to hot spots. Resupply is done upon call orders through a toll-free number and data is entered in the system in real-time

Lessons learned: Overall, 14,175 hotspots mapped across 120 districts covering 90% of districts and Distributed 26,373,000 condoms in one round within 60 days, with most Urban Districts (Kampala and Wakiso), taking 30% of condoms. For the first time, the country registered limited stock-out reports during 2021 end-of-year festive season.

The mapping also revealed that 8,713 (71.3%) Hotspots lacked condom dispensers. Learnings from First Roll-out phase are being utilized to improve the mechanism including; approaches to reduce resupply time, exploiting the mechanism to increase dispenser network, disseminate user information and strengthen automatic data transmission and sharing with the MOH HMIS.

Conclusions/Next steps: Digital solutions offer an opportunity for effective last mile CD, improves CD, user targeting, data availability, stock monitoring, and management, and accountability of condoms distributed through the ADS hence improving access and utilization, reducing stock-out and wastage.

EPE308

A comprehensive package of HIV interventions for transgender people in the post-soviet region

E. Orsekov[1], Y. Kirey-Sitnikova[1]

[1]*ECOM - Eurasian Coalition on Health, Rights, Gender and Sexual Diversity, Advocacy, Tallinn, Estonia*

Background: Transgender people belong to one of the five key populations recognized by UNAIDS as particularly vulnerable to HIV, HIV prevalence among transgender women can be up to 49 times higher than the prevalence in the general population. However, in the post-Soviet region, with the exception of Kyrgyzstan, transgender people are not identified as a key group, and their specific needs are not taken into account when developing HIV prevention and treatment programs. Medical professionals involved in prevention programs rarely understand how trans-specific and trans-competent services should be built.

The proposed comprehensive package of activities aims to fill these gaps.

Methods: The data collection method is a desk analysis. The first project of a comprehensive package of services created was piloted in five countries of the region: Armenia, Georgia, Kyrgyzstan, Russia, Ukraine, reaching 50 transgender people through a facilitated focus group discussion, where transgender people gave their feedback. Feedback was taken into account when finalizing the comprehensive package of services.

Results: The set of activities as a whole corresponds to the international recommendations and expertise. Among the differences, the following can be noted:

a. The classification of activities is based on the Health Impact Pyramid;

b. A wider range of gender transition activities are included, which are seen as preventive strategies and motivational activities;

c. The social and legal specifics of the countries of the post-Soviet region are taken into account.

The package presented below contains the most complete set of activities and in this sense is the "ideal" option to strive for.

Oral abstracts

Poster exhibition

E-posters

Late-breaker abstracts

Author Index

Conclusions: The created package of comprehensive services is not only designed to fill the gap associated with HIV activities for trans* people in the post-Soviet region, but also provides for the specifics of the region for subsequent implementation. The package provides recommendations for creating an environment free of discrimination and violence, provides for long-term preventive measures, which include activities that are carried out one-time or infrequently and have a long-term effect on preventing HIV infection. The package details clinical regulatory activities, the Implementation chapter with practical recommendations, and M&E chapter.

Evidence on task sharing

EPE309

Synergizing Health Interventions for Toronto GBMSM (SHIFT): clinicians' and community workers' perspectives on task shifting HIV prevention services in Toronto, Canada

D.J. Brennan[1], M. Charest[1,2], A. Turpin[1], D. Griffiths[3], J. Maxwell[4], B.D. Adam[5], R. Ahmed[6], K. McCrady[7]
[1]*University of Toronto, Factor-Inwentash Faculty of Social Work, Toronto, Canada,* [2]*University of Ottawa, Faculty of Medicine, Ottawa, Canada,* [3]*Gay Men's Sexual Health Alliance, Toronto, Canada,* [4]*AIDS Committee of Toronto, Toronto, Canada,* [5]*University of Windsor, Windsor, Canada,* [6]*Alliance for South Asian AIDS Prevention, Toronto, Canada,* [7]*2-Spirited Peoples of the First Nations, Toronto, Canada*

Background: Several factors place gay, bisexual and other men who have sex with men (GBMSM), particularly those further marginalized by other identities/experiences, at disproportionate risk for HIV in Canada. These include limited access to culturally competent HIV prevention services, including HIV/STBBI testing and PrEP. Given close ties to communities, AIDS service organizations (ASOs) could be well-positioned to provide some of these services. Task shifting has been utilized in low- and middle-income settings to provide HIV-related services but has yet to be adopted widely in high-income countries.
We investigated clinicians' and ASO community workers' (CWs') perspectives on the prospect of task shifting HIV prevention services in Toronto, Canada.
Methods: We conducted semi-structured interviews with 19 clinicians (e.g., psychologists, nurses, physicians) and 14 CWs who worked with GBMSM in Toronto and Ottawa, Canada. Participants represented a variety of sexual orientations, sex/gender identities and races/ethnicities.
Interviews were transcribed verbatim and then analyzed via NVivo, using direct content analysis and constant comparison, to answer the following question: Which HIV prevention services could be shifted from clinicians to CWs and how could this be supported? A community consultation with key stakeholders was then conducted to assess the ecological validity of our findings.
Results: There was substantial agreement between clinicians and CWs in terms of task shifting various aspects of HIV/STBBI testing and PrEP services. Most respondents indicated that ASOs could be ideal sites for community workers to perform rapid HIV testing and provide resources for GBMSM to conduct self-testing for STBBIs. Most participants were also in favour of CWs providing nearly all non-clinical services related to PrEP (e.g., pre-counselling, follow-up, case management), other than prescribing or interpreting laboratory test results.
Several respondents felt that CWs might be better equipped than clinicians to provide client-centered, culturally competent, sex-positive care to clients. Participants stated that proper supports should be in place, including adequate training, supervision, and compensation for task shifting to be successful.
Conclusions: Our results suggest that there is widespread support and varied opportunities for task shifting HIV prevention care to CWs.
These findings could serve as the foundation to implement community-based, culturally competent services to GBMSM in high-income settings.

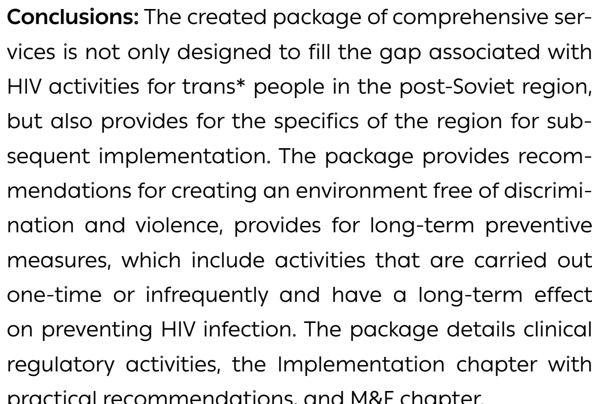
Systems to deliver effective, long-term chronic care

EPE310

Experiences of people living with both HIV and diabetes trying to access essential medications and care: a scoping review

J. Elliott[1,2], K. Sidney Annerstedt[1], E. Pfiester[2]
[1]*Karolinska Institute, Stockholm, Sweden,* [2]*T1International, Chelthenham, United Kingdom*

Background: Both diabetes and HIV are lifelong conditions requiring reliable access to essential medicines, education, and care to survive. The experiences of people living with both conditions are insufficiently understood.
This study aimed to describe the experiences of people who are living with both HIV and diabetes when trying to access essential medications and care.
Methods: A scoping review of available literature was undertaken. Studies were included if they explored the attitudes, experiences, feelings, perceptions, satisfaction, interactions with stigma or stereotyping, of people simultaneously living with diabetes and HIV in trying to obtain essential medicine or care.
Studies were included if they were published in English between January 2021 and December 2000 and a member of the study team could obtain the article in full. Studies were excluded if they solely concerned people who were



not simultaneously living with diabetes and HIV, did not address essential medicines or care, were written solely from the healthcare provider perspective. Reviews and secondary data were also excluded. Multiple databases were searched.

Results: A total of 1,426 articles were identified with 724 remaining after removing duplicates. A total of 17 studies were included after abstract and full text review. Study geographies most represented were South Africa (n=5), the United States (n=4), Malawi (n=2) and Kenya (n=2). Cambodia, Zimbabwe, Thailand and Morocco were also represented with one article each. Seven key themes were identified: uncoordinated care, female, and gender-based discrimination, stigma and disclosure, poverty, mental health. Patients reported HIV was easier to live with than diabetes, likely due to better access to care rather than a biomedical difference. Better integrated care could include better clinical scheduling, a focus on non-urgent transportation and a removal of out-of-pocket costs associated with accessing care.

Limitations of this study include a lack of literature found on this specific patient population, a lack of specificity regarding diabetes type, and potential for sampling bias.

Conclusions: Health system integration, patient burden, stigmatization and elimination of out of pocket costs associated with obtaining care are clear targets for improving the access to essential care for people living with diabetes and HIV.

EPE311

A pharmacy intervention programme for ART adherence considering UNAIDS targets in the interior provinces of Argentina: long term sustainability including COVID-19 pandemic context

Y. Sarnagiotto[1], D.M. Cecchini[2], M. Franco[1], J. Iturra Rojas[1], P. Trinidad[2], H. Visciglio[1,2], I. Cassetti[2]

[1]Helios Pharma, Buenos Aires, Argentina, [2]Helios Salud, Buenos Aires, Argentina

Background: According to official statistics approximately 70% of HIV-infected patients in Argentina reside in interior provinces (IPVs). HIV care and ART adherence constitute a challenge due to adverse geographical conditions, long distances to pharmacies/healthcare institutions and high levels of stigma/discrimination. COVID-19 pandemic lockdown increased this already complex scenario. Our institution as main provider for health insured patients in Argentina developed a pharmacy intervention programme (PIP) tailored to achieve ART adherence considering UNAIDS targets in IPVs.

Description: PIP was implemented in 2017 and consisted in:

1. *Traceability checklist* of ARVs through specific pharmacy software;
2. *Pharmabox:* all patient`s ARVs (medical electronic prescription) are monthly sent in a personalized box;
3. *Real time communication:* patients receive automatic SMS/WhatsApp messages when pharmabox is delivered from central pharmacy, when arrives to local pharmacy and when available for pick-up;
4. *Adherence reminders:* patients with no pharmacy withdrawals within 15 days after arrival of pharmabox are contacted by an adherence team. PIP was supplemented in COVID-19 pandemic (PIP+) with:
5. *Enhanced pharmacy delivery:* pharmabox delivered for >1 month;
6. *Home delivery:* delivery to patient's home when unable to circulate due COVID-19 disease, contact or lockdown measures;
7. *Telemedicine services:* when a patient was unable to contact a local physician for HIV follow up, teleconsultation with a central referral physician was provided.

Lessons learned: Since implementation of PIP a significant >10% increase in adherence (pharmacy withdrawals) was observed comparing 2016 vs 2018 (p<0.001) and was sustained during COVID pandemic with addition of PIP+. A similar pattern was observed for virologic suppression rates. Results are shown in Table 1.

	2016	2017	2018	2019	2020	2021
Patients (n)	2030	2480	2907	3367	3775	4614
ART coverage (%)	100	100	100	100	100	100
ART adherence by pharmacy withdrawals (%)	86.7	91.9	98	97.8	98.9	99.4
Viral load < 200 c/mL (%)	77	77	87	86	85.6	88
Pharmacy Intervention Programme (PIP)	None	PIP early implementation	PIP	PIP	PIP+	PIP+

Table 1.

Conclusions/Next steps: A PIP was a highly successful strategy for achieving and sustaining levels of adherence considering UNAIDS targets in IPVs, with a parallel increase in virologic suppression rates. Additional services (PIP+) included in COVID-19 pandemic lockdown logistical challenges may contributed to preserve such outcomes.

Acute Respiratory Infection Incidence and outpatient antibiotic prescription patterns in people living with or without HIV infection: a virtual cohort study

L. Sweet[1], C. Daniels[2], X. Xu[3], T. Sunil[4], S. Topal[5,6], X. Chu[6,5], A. Noiman[6,5], A. Barsoumian[7], A. Ganesan[5,6,8], B.K. Agan[5,6], J.F. Okulicz[5,7]

[1]Brooke Army Medical Center, Internal Medicine, JBSA-Fort Sam Houston, United States, [2]Texas Lutheran University, Department of Political Science, Sociology, & Geography, Seguin, United States, [3]University of Texas San Antonio, Department of Sociology, San Antonio, United States, [4]University of Tennessee, Department of Public Health, Knoxville, United States, [5]Uniformed Services University of the Health Sciences, Infectious Disease Clinical Research Program, Bethesda, United States, [6]The Henry M. Jackson Foundation for the Advancement of Military Medicine, Inc., Bethesda, United States, [7]Brooke Army Military Medical Center, Infectious Disease Service, San Antonio, United States, [8]Walter Reed National Military Medical Center, Division of Infectious Diseases, Bethesda, United States

Background: Acute respiratory infections (ARIs) account for most outpatient antibiotic prescriptions in adults. Inappropriate antibiotic use for ARIs is a major public-health concern and data in people living with HIV (PLWH) are limited. We evaluated ARI incidence and antibiotic prescribing in the Department of Defense (DoD) HIV Virtual Cohort Study (VCS).

Methods: The VCS is a retrospective cohort of adult DoD beneficiaries. Male PLWH cases (n=2,413) were matched 1:2 to controls without HIV (n=4,826) by age, gender, race/ethnicity, and beneficiary status. ARI ICD-10 diagnosis codes between 2016-2020 were captured and antibiotic use was characterized as "always", "sometimes", or "never" appropriate based on a previous study. Bivariate analyses compared ARI incidence and antibiotic appropriateness. Cases were also evaluated by CD4 count, viral load (VL) suppression on antiretroviral therapy (ART), and by "optimized" treatment status (VL<200 c/mL on ART with CD4 ≥500 cells/uL).

Results: Most subjects were non-active duty retirees or beneficiaries (66.3%) with a mean age of 45.9 (±12.8) years and were commonly Caucasian (43.8%) or African American (43.6%). Among cases, the mean CD4 count at first encounters was 651 (±330) cells/uL with 87.4% on ART. Mean ARI encounters were similar for cases and controls, however rates were higher among certain PLWH subgroups (Table). Antibiotic use was "never" appropriate in approximately 45% of encounters in both groups.

Among cases, antibiotic appropriateness did not differ by demographics, smoking history, or HIV characteristics (data not shown). Compared to controls, cases received more fluoroquinolones (14.2% vs 11.0%; p=0.033) and sulfonamides (5.5% vs 2.7%; p=0.001) and less macrolides (35.0% vs 39.5%; p=0.043).

Characteristics	Cases	Controls	p-Value
Mean ARI encounters/1,000 person-years			
All subjects	1,066 (4,285)	1,010 (8,379)	0.821
VL non-suppressed	2,018 (9,929)	--	<0.001
VL suppressed	865 (1,096)	--	--
CD4<500 cells/uL	1,878 (9,049)	--	<0.001
CD4≥500 cells/uL	847 (1,021)	--	--
Non-optimized	1,532 (7,279)	--	<0.001
Optimized	836 (1,073)	--	--
Total number of encounters	4,962	6,225	--
Encounters with antibiotics prescribed	1,298 (26.2)	2,127 (34.2)	0.951
Most frequent ARI ICD-10 codes			
Acute upper respiratory infection (J06.9)	1,018 (17.4)	1,236 (21.1)	--
Pneumonia unspecific organism (J18.9)	876 (15.0)	507 (8.6)	--
Acute pharyngitis (J02.9)	678 (11.6)	688 (11.8)	--
Antibiotic appropriateness			0.733
Always	180 (13.9)	190 (8.9)	--
Sometimes	528 (40.7)	984 (46.2)	--
Never	590 (45.5)	955 (44.9)	--
Data expressed as number (%) or mean (±SD).			

Table.

Conclusions: There was no difference in mean outpatient ARI encounters between cases and controls, however PLWH with lower CD4 counts and/or non-suppressed VLs had more frequent ARI visits. Inappropriate antibiotic use for ARIs was high in both groups and interventions promoting antibiotic stewardship should also target clinicians caring for PLWH.

EPE313

From heuristics to an evidence-based approach: allocating health workers for clinical services in Mozambique

J. Barroso Pacca[1], A. Ouenzar[2], A. Chauca[3], M. Prieto[4], D. Milagre[5]

[1]ECHO Project/Abt Associates, IDD - Mozambique, Beira, Mozambique, [2]ECHO Project/Abt Associates, IDD - Mozambique, Maputo, Mozambique, [3]ECHO Project/Pathfinder International, Beira, Mozambique, [4]ECHO Project/ThinkWell, Maputo, Mozambique, [5]ECHO Project/Pathfinder International, Maputo, Mozambique

Background: USAID's Efficiencies for Clinical HIV Outcomes (ECHO) is a multi-year project providing clinical services in four provinces in Mozambique. High quality service delivery is crucial to meet the 95-95-95 targets, and is dependent on having an adaptive health workforce. Mozambique faces high turnover, poorly trained health workers (HW), and substantive misalignment between health needs and allocation of human resources. To overcome these challenges, ECHO hires, deploys, and manages additional HWs in 148 supported health facilities (HFs).

This study shares how ECHO shifted its HW allocation model from one based on HF complexity to a data-driven model based on costs, efficiency, and target populations.

Description: Existing data in Mozambique was insufficient to inform ECHO's HW allocation decisions. Instead, we adopted several principles for deploying HWs: (1) dis-

Oral abstracts
Poster exhibition
E-posters
Late-breaker abstracts
Author Index

tribution of HWs based on evidence (HIV outcomes); (2) an adaptive management approach that considers cost-efficiency; (3) the continuum between community health systems and formal health systems; (4) ongoing calibration based on evidence. ECHO mapped HFs into quadrants where the X-axis defined the volume of each HF, and the Y-axis distributed the performance of HFs based on an index consisting of selected indicators (test; linkage; retention; PMTCT; viral load; TPT). ECHO deployed a different HW package to HFs in each quadrant.

Lessons learned: After 18 months of implementation, ECHO observed the number of some cadres (psychosocial staff and maternal-child health nurses) had more impact than others on improving health outcomes, so the project hired more of these staff to improve HFs with poor retention and preventing maternal-to-child transmission results.ECHO has since used implementation science to adapt its HW approach based on results by adding additional cadres and modifying HW distribution.

Conclusions/Next steps: ECHO's approach increased the proportion of 148 HFs with positive outcomes from 14% to 59%. Regular monitoring and use of real-time data has allowed ECHO to make informed decisions on allocating HWs and helped the project to advocate for the use of this approach with local health authorities to achieve better outcomes.ECHO's experience is relevant for similar low-income settings where the public sector plays a significant role in health service delivery.

EPE314

Hypertension management practices across 10 HIV clinics in Uganda: perceptions of health care providers and people living with HIV and hypertension

F. Ayebare[1], J.B. Kiggundu[1], J. Senfuma[1], C. Kiwala[1], M. Muddu[2], I. Ssinabulya[3], J.I. Schwartz[4], J. Kayima[5], G. Mutungi[6], M.R. Kamya[1], C.T. Longenecker[7], F.C. Semitala[3], A.R. Katahoire[3]

[1]Infectious Diseases Research Collaboration, Kampala, Uganda, [2]Makerere University Joint AIDS Program, Kampala, Uganda, [3]Makerere University College of Health Sciences, Kampala, Uganda, [4]Yale University, New Haven, United States, [5]Uganda Heart Institute, Kampala, Uganda, [6]Ministry of Health, Kampala, Uganda, [7]University of Washington, Seattle, United States

Background: Access to antiretroviral therapy (ART) and innovations in care have made HIV an example of successful care for chronic diseases. Access to quality hypertension (HTN) care among people living with HIV (PLHIV) however, remains suboptimal. This is despite available guidelines for the integration of non-communicable diseases (NCD) in HIV care.

We explored PLHIV and their health care providers' perceptions of current hypertension care and management practices at 10 HIV clinics in Kampala and Wakiso districts, Uganda.

Methods: We conducted 40 semi-structured interviews with hypertensive PLHIV and 40 with health care providers involved in patient care. Interviews were audio recorded and later transcribed. The findings generated were analyzed inductively.

Results: HTN management and control practices varied across facilities. HTN services were of low priority in HIV Clinics. HTN practices such as BP measurement, treatment and monitoring were not routinely conducted. Where these practices existed, they were conducted selectively for patients that were symptomatic and/or perceived to be at risk.

Several barriers to HTN care were highlighted by health care providers. These included lack of BP machines, existence of non-functional BP machines, limited supply and range of anti-hypertensive medications, and low prioritization of HTN in HIV clinic settings. PLHIV reported difficulties in accessing HTN care; lack of HTN medications at public health facilities, treatment interruptions due to side effects from the commonly prescribed anti-hypertensives, high costs of medications, use of herbal remedies and rationing HTN treatment when they felt better.

Conclusions: This formative assessment identified gaps in current hypertension management and control practices in HIV clinics of urban and peri-urban Uganda.

These findings will be used in a stakeholder engaged design of HIV-HTN care integration implementation strategies that will be tested in a cluster randomized clinical trial.

EPE315

Knowledge, attitudes and practices related to hypertension management and control among PLHIV with hypertension accessing care at HIV clinics in Kampala and Wakiso districts in Uganda

J.B. Kiggundu[1], F.C. Semitala[2], M. Muddu[3], F. Ayebare[1], C. Kiwala[4], J. Senfuma[4], G. Mutungi[5], J. Kayima[6], R.U. Hernández-Ramírez[7], J.I. Schwartz[7], M. R. Kamya[1], D. Spiegelman[7], A.R. Katahoire[8], I. Ssinabulya[8], C.T. Longenecker[9]

[1]Infectious Diseases Research Collaboration, Kampala, Uganda, [2]Makerere University College of Health Sciences, Kampala, Uganda, [3]Makerere University Joint AIDS Program, Kampala, Uganda, [4]Infectious Diseases Research Collaboration, Research, Kampala, Uganda, [5]Ministry of Health, Directorate of Non-Communicable Diseases, Kampala, Uganda, [6]Uganda Heart Institute, Kampala, Uganda, [7]Yale University, New Haven, United States, [8]Makerere University College of Health Sciences, Kampala, Uganda, [9]University of Washington School of Medicine, Seatle, United States

Background: Despite guidelines recommending integrated HIV and hypertension (HIV-HTN) care, several barriers hinder implementation. Understanding patient-level barriers is crucial for improved delivery of integrated HIV-HTN care. We assessed knowledge, attitudes and prac-

Oral abstracts

Poster exhibition

tices (KAP) of people living with HIV (PLHIV) with hypertension (HTN) towards HTN at PEPFAR supported HIV clinics in Uganda.

Methods: From June to November 2021, we administered a pre-tested KAP survey to PLHIV with HTN receiving care from 10 HIV clinics in Kampala and Wakiso districts. The survey assessed socio-demographic characteristics, medical history, knowledge, attitudes, and practices about HTN, including diagnosis, risk factors, complications and treatment. For each KAP survey domain, a composite score of correct answers was expressed as a percentage of the total number of items. Comparisons were made using either χ^2 or Mann-Whitney test.

Results: A total of 394 (325- Kampala; 69-Wakiso) PLHIV were enrolled. Median age was 52 years (IQR 44-59), and 76% were female. A third and a quarter of the participants correctly identified normal ranges for systolic (80-140mmHg) and diastolic (60-90 mmHg) blood pressure, respectively. Although 87% of the participants knew that HTN could be treated, only 62% knew that treatment is lifelong, and only 56% were on HTN medicines. Although only 5% were currently using herbs, nearly one third believed they could treat HTN.

Over a quarter of the participants believed they could stop medications when symptoms subside, while 39% only took medicines when they felt unwell. Two-thirds of the participants reported engaging in physical exercise lasting ≥30 minutes for a minimum of four days a week.

Across the three KAP domains, participants had a median combined score of 49% (IQR 35-59%). Respondents from Wakiso had a modestly better knowledge median score of 29% (IQR 21-36) vs 26% (IQR 21-32%) for Kampala, P=0.022, while attitude and practice scores did not differ between districts, with an overall median score of 75% (IQR 72-80%) and 50% (0-70%), respectively.

Conclusions: In Uganda's urban and periurban settings, PLHIV with HTN had insufficient knowledge about HTN and its risk factors, treatment, and complications. Strategies to improve these among PLHIV may improve uptake of integrated HIV-HTN care outcomes in similar settings.

Public-private partnerships

EPE316

Public-private sector partnerships: Contracting with private sector laboratories in Botswana to close viral load testing gaps during COVID-19 and beyond

M. Gilbert[1], W. Dikobe[1], G. Katiko[1], L. Nishimoto[2], H. Satti[3], M. Bateganya[4], T. Moyo[5]

[1]*FHI 360, HIV/ AIDS Programs, Gaborone, Botswana, [2]FHI 360, HIV/ AIDS Programs, Washington, United States, [3]FHI 360, HIV/AIDS Programs, Washington, United States, [4]FHI 360, HIV/AIDS Programs, Durham, United States, [5]FHI 360, HIV/AIDS Programs, Gaborone, Botswana*

Background: Challenges around viral load (VL) testing include equipment breakdowns, reagents stock-outs, shortages of trained staff, and long turnaround times (TAT) for results. These challenges prevent timely decision-making around client care. In Botswana, routine public sector VL testing was drastically affected at the national level by COVID-19 response measures, exacerbating existing challenges.

The USAID/PEPFAR-funded Meeting Targets and Maintaining Epidemic Control (EpiC) project piloted VL testing through private laboratories.

Description: EpiC contracted with a private laboratory to conduct VL testing at US$20 per test—comparable to public laboratory testing but less than half the usual cost in private laboratories.

From October 2020 to September 2021, health providers in 12 clinics across 10 districts in Botswana collected VL samples at the health facilities or referred clients to their choice of one of the nation's 25 private lab-operated depots for VL sample collection, which clients could schedule at convenient times, including weekends.

The private laboratory transported and processed samples, then returned the results to the referring provider through a secure electronic portal within 24 hours

Lessons learned: VL testing through private laboratories offered clients more location and scheduling options for sample collection, improving VL testing coverage among key population (KP) individuals who may not have received a VL test otherwise due to challenges in accessing services. From October 2020 to September 2021, 5,123 VL tests were conducted via private laboratories, 20% of which (1,042) were from KPs.

At the 12 participating clinics, VL testing coverage increased significantly from 83% to 90% for KPs and slightly among the general population (90% to 91%). In addition, the TAT of results decreased from one to six weeks before the intervention to 24 hours following the intervention.

Conclusions/Next steps: VL testing through private laboratories was feasible in Botswana at costs similar to public laboratory testing in the country. Countries with strong private laboratory systems should consider private-public partnerships to increase national VL testing capacity

during COVID-19 and beyond. This model could help close VL testing gaps for KPs and other groups who face challenges in accessing HIV services.

EPE317

Reaching the unreached informal labours for HIV/AIDS services: experience from the Employer Led Model under National AIDS Control Programme in India

D.S. Ephraim[1], L.S. Khariyat[1], S. Kumar[1], I. Madan[1], S.K. Purohit[1], B. Singh[1], S. Rajan[1]
[1]*National AIDS Control Organiation, Ministry of Health & Family Welfare, Government of India, New Delhi, India*

Background: Evidence suggests that HIV/AIDS affects the most productive age-group, with the industrial sector equally vulnerable to HIV/AIDS. Based on the heterogeneous nature of epidemic in India and to expand the coverage of informal labourers, NACO developed a partnership model called "Employer Led Model" (ELM) to leverage support of industries.
Description: ELM has been designed to provide HIV/AIDS prevention to care services to informal labourers including Migrants and Truckers, linked to industry directly or indirectly. Industries were engaged through a signed MOU with State AIDS Control Societies (SACS) to implement activities including HIV/AIDS awareness through mid-media, treatment of sexually transmitted infections, referral & testing, ART, condom promotion, health-camps, and creating a cadre of peer volunteers for cascading knowledge transfer.
ELM aims to help prospective employers to implement comprehensive HIV prevention to care service delivery within the existing systems which is low-cost and extends beyond geographical reach of traditional service outlets such as Targetted Intervention (TI), Link Worker Schemes (LWS) and Workplace interventions.
Since the launch of ELM in 2014 under NACP, total of 868 Industries have signed MOU in 24 states (as on March-2021) and have reached out to more than 2 million informal labourers with comprehensive HIV services. A total of 473 labourers were detected HIV positive, out of which 456 labourers were linked to ART services.
Lessons learned: Collaboration of Indian Industries by way of prioritizing the population, has led to recognition of their vulnerability to economic and social impact of the epidemic. The engagement resulted in investment by business houses to achieve efficient and effective HIV interventions. The strategy for HIV prevention and care through this model has led to adaption of similar approaches by national health programs like National Tuberculosis Elimination Programme (NTEP). While number for HIV testing is high, there is still a gap in improving ART linkages.
Conclusions/Next steps: ELM highlights the importance of engagement and collaboration with business and industries in the fight against HIV/AIDS and to attain the goal of elimination of HIV/AIDS by 2030 in India.

Combination programming on social drivers of HIV (including education, violence and workplaces)

EPE318

Confronting the infodemic and fake news to end stigma and discrimination in HIV/AIDS: the first zero discrimination Massive Open Online Course (MOOC) in Brazil

D. Canavese de Oliveira[1,2], C. Velasquez[3], A.R. Ferreira[3], M. Polidoro[4,2], Health, Environment and Development - SAD/UFRGS/IFRS
[1]*Federal University of Rio Grande do Sul (UFRGS), Public Health, Porto Alegre, Brazil,* [2]*Brazilian Association of Public Health (ABRASCO), Group of Work LGBTQIA+ Health, Rio de Janeiro, Brazil,* [3]*Unaids Brazil, Brasilia, Brazil,* [4]*Federal Institute of Rio Grande do Sul, Porto Alegre, Brazil*

Background: The UNAIDS Global Strategy 2021-26, the Sustainable Development Goals and WHO statement about infodemics point to the need to produce innovative, accurate and people-centered strategies education strategies. In Brazil, disinformation, the lack of access to evidence-based knowledge and fake news are still barriers that affect the reduction of inequalities, contribute to violent situations and hinders progress in preventing HIV and ending AIDS as an epidemic.
Description: The work comes from the partnership between UNAIDS Brazil, Brazilian Association of Public Health and Federal University of Rio Grande do Sul developed during the years 2020 and 2021. The initiative aimed to produce a tool that could translate evidence-based policies and initiatives on HIV and AIDS for a large set of health professionals across Brazil. During this period, the pedagogical concept and content definition for a Massive Open Online Course (MOOC) on Zero Discrimination and HIV/AIDS were developed using content that included scientific evidence and effective community responses for HIV and AIDS. It included information produced directly by social movements and civil society, researchers, people living with HIV and activists.
Lessons learned: The MOOC was the first to be offered in this format in Brazil. It contains 90 course hours that can be taken when convenient, without a time limit, free of charge and accessible on any tablet, smartphone or computer. The intervention expanded health professionals' access to content on HIV prevention, care and treatment, HIV-related violence, LGBTQIA+ violence, gender-based violence, racism and how to reduce inequities, especially in marginalized and key populations. The first edition of the course had 1,500 registrations. Since the launch in October 2021, more than 500 people have concluded the course.
Conclusions/Next steps: The free, massive offer to healthcare professionals across the country was important especially during the period of the COVID-19 pandemic due to a demand for an online learning strategy. A completion rate of more than 30% is above international standards.

Oral abstracts

Author Index

The possibility to use the MOOC content tailored to each health professional's necessity proved to be powerful. The next phases include expanding the dissemination of the course and analyzing the pre- and post-tests completed in the course registration.

EPE319

School-entry age and HIV risk in adulthood: evidence from Lesotho

J.-W. de Neve[1], R. Moshoeshoe[2], J. Bor[3]
[1]University of Heidelberg, Heidelberg, Germany, [2]National University of Lesotho, Roma, Lesotho, [3]Boston University, Boston, United States

Background: Children with birthdays just before school-entry cut-offs progress through school as the youngest in their grade. These students may perform worse in school and have lower educational attainment, a risk factor for HIV acquisition.

Methods: We investigated the impact of Lesotho's age-at-school-entry policy on educational attainment, HIV risk factors, and HIV status in adulthood, analyzing nationally representative data from the Demographic and Health Surveys (DHS) of 2004-05, 2009-10, and 2014 (adults 15-59) and Multiple Indicator Cluster Survey (MICS) of 2018 (all ages). In Lesotho, children are eligible to start school (in January) if they will turn six years old by June 30th.

We compare respondents with birthdays just before vs. just after the June 30th cut-off using a regression-discontinuity design (RDD). HIV biomarkers were collected as part of the DHS.

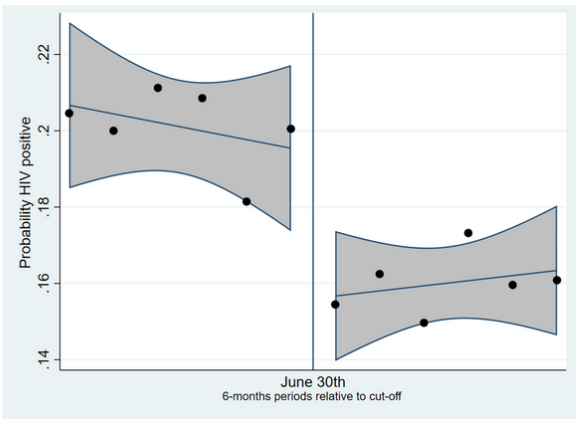

Figure. HIV prevalence among men in the DHS, by date of birth

Note: Sample includes men ages 15-59 in the DHS 2004-05, 2009-10, and 2014 with a valid HIV test result (*N*=8,082). Lines show the relationship between month of birth and probability HIV positive, with lines fit separately on either side of the June 30th cutoff. Shaded regions are 95% confidence intervals. Dots shows the unweighted observed probability of being HIV positive by month of birth. In Lesotho, children born before June 30th are eligible to start school earlier and progress through school younger.

Figure. HIV prevalence among men in the DHS, by date of birth.

Results: The sample included 18,269 (DHS) and 11,865 (MICS) respondents. Children born just before the June 30th cut-off entered school at age 5.3 years; those born just after entered school at age 5.8, a difference of 0.5 years (95% CI 0.2, 0.8). Although they started earlier, children born before the cut-off completed 0.3 fewer total years of schooling (95% CI 0.1, 0.5) by adulthood. Women born before the cut-off were 2.7 percentage points (95% CI 0.0, 5.1) more likely to have a child before age 18. Men were 3.3 percentage points (95% CI 0.2, 6.5) more likely to be HIV infected (*Figure*); however, there was no association with HIV infection for women.

There were no differences in HIV knowledge, despite differences in math and reading skills. We show that RDD assumptions hold, supporting a causal interpretation of this natural experiment.

Conclusions: Entering school early reduces educational attainment and increases men's risk of HIV acquisition in Lesotho. Policies that improve educational experiences in primary school may reduce HIV risk in HIV endemic settings.

EPE320

Grow, learn, own: empowering sex workers to reduce their HIV risk through economic empowerment programming in two districts of South Africa

L. Casey[1], R. Saker[2], T. Pillay[3]
[1]NACOSA, Pretoria, South Africa, [2]NACOSA, Cape Town, South Africa, [3]NACOSA, Durban, South Africa

Background: In South Africa, sex workers (SW) remain at high risk for HIV, with prevalence at 62.3%[1]. NACOSA piloted a SW economic empowerment programme called Grow Learn Own (GLO) in two districts during 2020-2021. GLO aimed to empower SW with skills to diversify their income, reduce reliance on sex work as the only means of earning an income, whilst reducing HIV risk.

Description: GLO implementation targeted 80 female SW between the ages of 25-35 with minimum completion of grade 9 schooling. Activities included group mentorship, financial literacy skills, savings clubs, and then streaming into either entrepreneurship or work readiness training, followed by referrals to opportunities. Qualitative information was extracted from case studies and de-identified data from a centralized programmatic database.

Lessons learned: Of the 80 recruited SW, 96% (n=77) were reached with the minimum package of services (financial literacy training + three mentorship sessions). 98% of the SW (n=78) completed 3 sessions of mentorship, 96% (n=77) of the SW participated in the savings clubs, saving 78% of the target. 88% (n=70) of the SW completed work readiness or entrepreneurship training.

Health services have been offered alongside GLO, with HIV prevalence of the GLO SW at 38% (n=30), with 90% of the HIV+ SW (n=27) on Anti Retroviral Treatment (ART). Of the SW reached, 62% (n=50) are HIV-, with 70% (n=35) on Pre-Exposure Prophylaxis (PrEP).

Case studies demonstrate that in parallel to positive health outcomes, SW have started businesses or secured employment and learnt how to save with plans through the support of the mentors, training and referrals in the GLO programme.

Conclusions/Next steps: The GLO programme pilot demonstrates that the retention of SW in a formal economic empowerment programme is possible, alongside improved uptake of HIV services. Qualitative data shows positive changes to the lives of sex workers as a result of the GLO programme, through diversified income, skills building and empowerment - ultimately reducing HIV risk.

EPE321

Implementation of Multi-Month Drug Dispensing to improve retention in care by reducing interruption in treatment among HIV-infected patients on Antiretroviral Treatment across APIN-supported States in Nigeria

O. Magnus[1], P. Jwanle[2], O. Ibiloye[1], J.O. Samuel[1], P. Okwonkwo[1], T. Omole[1]
[1]APIN Public Health Initiatives, Clinical Science, Abuja, Nigeria, [2]APIN Public Health Initiatives, Clinical Services, Abuja, Nigeria

Background: The national HIV programme has adopted Differentiated ART Service Delivery which includes multi-month drug dispensing (MMD) model for people living with HIV (PLHIV) to increase access to antiretroviral treatment (ART) and improve treatment outcomes. Therefore, we implemented MMD3-6 model to improve retention in care among PLHIV on ART in 7 APIN-supported States. MMD3-6 model refers to 3-6 months antiretroviral drug refill to treatment naïve and experienced PLHIV.
Objective: To assess interruption in treatment (IIT) rates among PLHIV on ART on MMD3-6.
Methods: We extracted data from the electronic medical records for PLHIV on ART and enrolled on MMD between October 2019 to April 2021 (18 months i.e. 6 quarters). We collected aggregate data of PLHIV eligible and enrolled on the different models of MMD and determined the average rates of IIT among these PLHIV during the period of intervention.
Results: Between October 2020 and June 2021, the IIT rates for the patient cohort in MMD 3 was between 0.2% (x/y) and 36.5% (x/y), that for MMD4-5 was 0.2% (x/y) and 4.5% (x/y) while for those in MMD6, IIT rates was between 0.1% (x/y) and 0.6% (x/y). For MMD3, MMD4-5, and MMD6, the average IIT rates were 15.6%, 2.9%, and 0.53% respectively.

Figure.

The trend of reduction in IIT rates over the review period for MMD3 was from a baseline of 8.1% to 0.2%, for MMD4-5, it was from a baseline of 4.5% to 0.2% while for MMD6, IIT rates reduced from a baseline of 0.6% to 0.1%.
Conclusions: The mean of patients who interrupted in treatment on MMD6 is lower compared to MMD4-5 and MMD3. Thus, MMD6 improved retention in care among PLHIV enrolled in the HIV programme in Nigeria. Thus HIV program implementer are encourage to move all clients who meets MMD6 eligibility criteria to MMD6.

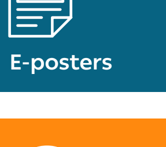
Delivering gender-transformative programmes and tackling violence against women and girls: Programmatic lessons

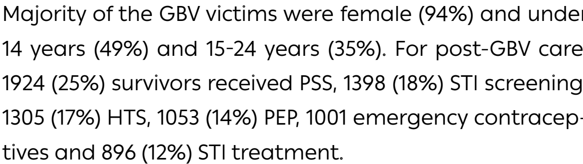
EPE322

Gender-based violence service integration in HIV/AIDS care during COVID-19; lessons learned from an HIV clinic in Malawi

C. Kiruthu-Kamamia[1,2], O. Sande[1], T. Kumwenda[1]
[1]Lighthouse Trust, Lilongwe, Malawi, [2]International Training Center for Education and Health, Lilongwe, Malawi

Background: People most vulnerable to acquiring HIV and PLHIV are stigmatized populations and at high risk of experiencing gender-based violence (GBV). GBV may also lead to HIV acquisition by being a barrier to accessing and using preventive interventions such as PrEP and condom use. To address this, the Lighthouse Trust (LH), a WHO-recognized Center of Excellence, began offering comprehensive GBV screening and care services in its COEs across Malawi. The COEs are located next to tertiary central hospitals that also have one-stop-centers (OSC) for comprehensive GBV care.
Description: Following WHO guidance, LH does not conduct universal screening, but routine screening in specific services such as active index testing/partner notification services, PrEP, and teen clubs. Clinical providers are trained to identify potential signs of GBV when providing routine ART care. Once a client is identified as a GBV survivor, they receive appropriate clinical care such as STI testing and HTS and PEP for survivors. Extreme physical and sexual violence survivors are referred to the central hospital for specific care.
Survivors are also offered psycho-social counseling and support (PSS). LH developed a GBV register in the facilities to monitor and track GBV care offered. All healthcare workers (HCW) were trained on the WHO LIVES (Listen, Inquire, Validate, Enhance Safety, Support) method for GBV care and support.
Lessons learned: From January 2020-December 2021, there were 3179 GBV cases reported, of which sexual violence (53%) was the highest reported followed by combination of physical, sexual and emotional violence at 19%.





Majority of the GBV victims were female (94%) and under 14 years (49%) and 15-24 years (35%). For post-GBV care, 1924 (25%) survivors received PSS, 1398 (18%) STI screening, 1305 (17%) HTS, 1053 (14%) PEP, 1001 emergency contraceptives and 896 (12%) STI treatment.

Conclusions/Next steps: Training HCWs on LIVES method improved identifying GBV cases. Staff attitude and sensitivity with survivors improved over time through continued mentorship. Though OSCs were closed and repurposed to COVID19 treatment rooms in mid 2020, we continued to see an increase of GBV cases. Integrating GBV services in an HIV clinic using existing staff is possible and an essential service to strengthen overall care.

Social protection: New evidence and programmatic lessons

EPE323

Impact of a conditional cash transfer on AIDS incidence, hospitalizations and mortality in Brazil: a nationwide longitudinal study

G. Sampaio Morais[1], L. Magno[2], A. Ferreira da Silva[1], N. Sernizon Guimarães[1], J.A. Ordoñez[1], L.E. Souza[1], J. Macinko[3], I. Dourado[1], D. Rasella[4,1]
[1]Federal University of Bahia, Collective Health Institute, Salvador, Brazil, [2]University of the State of Bahia, Life Science Department, Salvador, Brazil, [3]University of California at Los Angeles (UCLA), UCLA Fielding School of Public Health, Los Angeles, United States, [4]Universitat de Barcelona, ISGlobal, Hospital Clínic, Barcelona, Spain

Background: Brazil has long been recognized for its strong response to the AIDS epidemic. However, one of the biggest challenges of this response has been reaching the poorest people. The country implemented one of the world's largest Conditional Cash Transfer programmes, the *Bolsa Familia Programme* (BFP), which targeted poor individuals earning between US$18–36 per person per month. The monthly cash benefits range from US$17 to a maximum of US$41, which contributed to the improvement of their socioeconomic conditions.

The conditionalities for continuing to receive the benefit are that parents comply with health care and education requirements for their children. This study aims to evaluate the impact of BFP coverage on AIDS incidence, hospitalizations and mortality in Brazil.

Methods: This study uses panel data from 5,507 Brazilian municipalities over the period 2004 to 2018 and fixed effects multivariable negative binomial regressions to estimate the effect of BFP coverage - classified as low (0% to 29%), intermediate (30% to 69%), and high (≥70%) - on the main AIDS outcomes (i.e., incidence, hospitalizations and mortality rates) adjusting for all relevant demographic, socioeconomic and healthcare covariates.

Results: A high BFP coverage was associated with the reduction of AIDS incidence (Rate Ratio – RR:0.94; 95%CI:0.90-0.99), AIDS-related hospitalizations (RR:0.85; 95%CI:0.79-0.91) and AIDS mortality rates (RR:0.88; 95%CI:0.81-0.94). The effect on incidence was more pronounced in municipalities with higher AIDS endemicity levels (RR:0.86; 95%CI:0.80-0.94), among adult women (RR:0.85; 95%CI:0.77-0.93) and in children under 14 years old (RR:0.75; 95%CI:0.57-0.99).

Conclusions: This is the first study to comprehensively evaluate the impact of a Conditional Cash Transfer on AIDS in a LMIC over a 15-year period and have important implications on the reduction of AIDS-related indicators for countries with social protection measures such as conditional cash transfers. The effect of BFP coverage on incidence, hospitalizations and mortality rates from AIDS in Brazil could be explained by the reduction of households' poverty and by BFP health-related conditionalities. During the current dramatic rise in global poverty due to the COVID-19 pandemic, the protection of the most vulnerable populations through conditional cash transfers could avert potential changes in the trends of AIDS in LMIC.

EPE324

Delivering 'Game Changer' combination HIV prevention interventions for Adolescent Girls and Young Women (AGYW) to promote epidemic control in South Africa

C. Wagner[1], K. Mangoale[1], M. Lotvonen[2], M. De Vos[3]
[1]NACOSA, AGYW, Cape Town, South Africa, [2]NACOSA, Monitoring and Evaluation, Cape Town, South Africa, [3]NACOSA, Programmes, Cape Town, South Africa

Background: Adolescent Girls and Young Women (AGYW) bears the brunt of the HIV-epidemic in Sub-Saharan Africa, 3-5 times more than their male counterparts. Prioritising HIV prevention through a combination of biomedical prevention, behaviour change and addressing structural drivers could prove to be a game changer in South Africa (SA). SA National Strategic Plan (NSP) 2017-2022 notes that epidemic control of HIV, TB and Hepatitis is possible by 2030 if we deliver Game Changer interventions, defined as: "thoughts or ideas if implemented well, will contribute to epidemic control".

Description: NACOSA implemented a ‚My Journey' programme for 15 – 24 year-old AGYW (2019 – 2021) via The Global Fund. Game changer strategies implemented included: Focused for impact in four high-risk communities; mainstreaming of HIV, TB and STIs through inter-sectoral frameworks and partnerships with government; developed and facilitated risk assessments for AGYW (n = 127 635); offered tailored services to mitigate individual risks; universal test-and-treat for HIV; HIV self-testing; community-based provision of PrEP and adherence to ARVs; targeted distribution of condoms; Comprehensive Sexuality Education in secondary schools and piloted an economic strengthening.

Figure.

Lessons learned: NACOSA provided behavioural (598), biomedical (77931) and structural (21557) tailored, human rights-based and evidence-informed services, resulting in understanding the local epidemic and meeting the needs of AGYW. This HIV-prevention game changer approach allowed us to implement pilot projects, which could be scaled up for vulnerable AGYW, to contribute to epidemic control by 2030.

Conclusions/Next steps: Implementing Game Changer interventions are imperative if we hope to end HIV in the next generation. Next steps include

1. Focusing on AGYW feedback surveys to improve programmes offering and reward regular health-seeking behaviour.
2. Scaling up economic empowerment and human rights packages as part of tailored approaches for current communities.
3. Identifying new high-risk communities to deliver 'Game Changer' interventions, to promote epidemic control of HIV in South Africa by 2030.

EPE325

HIV-sensitive Social Protection: Qualitative evidence from Ghana, West Africa

E.O. Ankrah[1], E. Anaman[2], E. Larbi[3], J. Lamptey[3]
[1]Ghana AIDS Commission, Research, Monitoring and Evaluation, Accra, Ghana, [2]World Food Programme, Accra, Ghana, [3]Ghana AIDS Commission, Accra, Ghana

Background: In Ghana, despite accomplishments in terms of treatment access which have led to a reduction in the number of AIDS-related deaths, food insecurity and poverty remain serious concerns for many HIV-affected individuals and households. Though investments in social protection (SP) have shown to have sustainable impacts on poverty reduction, many barriers exist that prevent people living with, at risk of, or affected by HIV from accessing social protection services. These barriers could be policy or programmatic, or a combination of the two. Evidence to support decision-making in strengthening the HIV sensitivity of SP schemes to better reach PLHIV is inadequate.

Methods: A cross-sectional study design using qualitative data collection techniques was adopted to elicit respondents' perceptions of the social protection interventions available to persons living with and affected by HIV in Ghana from February through May 2021. Twenty-nine (29) semi-structured in-depth interviews were conducted with PLHIV and other key stakeholders involved in social protection interventions. National-level stakeholders' engagements were held. Audio recordings were coded and analysed using a thematic analytical framework.

Results: Respondents reported that SP interventions are somewhat HIV-sensitive but persons living with, affected by and at risk of HIV are not prioritized. "*Our organization does not single out PLHIV, the programmes implemented are designed to benefit vulnerable persons in the community" (Indicated by a respondent from an NGO).*

PLHIVs are not wholly involved in the development of social protection interventions and the identification of targeted beneficiaries. The age criterion used for Livelihood Empowerment Against Poverty does not allow an orphan above 14 years to benefit.

A substantial proportion of respondents reported that common barriers hindering vulnerable populations' access to SP interventions include inadequate knowledge on interventions, stigma and discrimination, and gender discrimination.

Conclusions: Ghana AIDS Commission and its partners agree that inclusive SP systems contribute to holistic responses to the needs of PLHIV to better address the different dimensions of poverty and vulnerability. To reduce vulnerability, the Commission will work to develop and promote HIV-sensitive SP interventions. Also, ensure the meaningful involvement of the vulnerable groups and other stakeholders in the planning, implementation, monitoring and evaluation stages at all levels.

EPE326

Ending inequalities facing people living with, at risk of or affected by HIV in accessing social protection: HIV and social protection assessments analysis results from 18 countries

D. Chipanta[1], T. Chilambe[2]
[1]Institute of Global Health, University of Geneva, Institute of Global Health, Geneva, Switzerland, [2]National AIDS Commission, Malawi, Coordination and Capacity Building, Lilongwe, Malawi

Background: The UNAIDS strategy for 2021-2026 recognizes that inequalities impede the Global efforts towards ending AIDS as a public health problem by 2030. Addressing inequalities in the AIDS responses requires HIV inclusive social protection programs.

Studies are needed to identify if existing social protection policies, programs, and schemes need modification to make them HIV inclusive.

Description: We reviewed HIV and social protection assessments reports conducted by governments with UNAIDS support in 18 countries from 2016 to 2021 to assess how HIV inclusive these programmes are and if not, what modifications are required.

Author Index

The countries included Cambodia, Dominican Republic, Ghana, Jamaica, Kenya, Latin America and the Caribbean Islands, Lesotho, Liberia, Malawi, Nigeria, Mali, Namibia, Sierra Leone, Tanzania, Togo, Uganda, Zambia, Zimbabwe.

Lessons learned: All the countries reviewed have a range of social protection programs, which do not mention HIV nor discriminate based on HIV. For instance, 85% of the programs captured by the assessment in Uganda do not discriminate against people with HIV. In practice, HIV vulnerable populations faced barriers to accessing these programmes. The populations were key and vulnerable populations, including PLHIV, Men who have sex with men, intravenous drug users, transgender people, sex workers, prisoners, adolescent girls and young women (AGYW), pregnant women and lactating women living with HIV, People 50 years and older, orphans and vulnerable children, Cross-border, Ebola Survivors (in Liberia and Sierra Leone) and, Housekeepers in Mali .

Conclusions/Next steps: The recommendations were, expansion of short-term HIV-specific cash transfer programs, case management, insurance, nutritional support, housing, education, employment, economic empowerment. Train social protection workers on ways to support people living with HIV, at-risk and affected by HIV, address stigma and discrimination, Simplify the enrolment processes, electronic national registries, moonlight services for sex workers, and improved coordination and policy.

Innovations in behavioural data collection and use

EPE327
Quality of life and stigma assessment using PROMs and PREMs in PLHIV: E-RES-HIV program

A. Cabello[1], J. Arcos[2], M. Del Olmo[2], A. Herrero[3], M. Clavero[4], J. Hernández[5], S. Nistal[6], E. Tortajada[7], R. Córdoba[8], L. Prieto-Pérez[1], I. Carrillo[1], A. Al-Hayani[1], C. Barriocanal[2], M. Górgolas[1], B. Álvarez[1]
[1]Fundación Jiménez Díaz University Hospital, Infectious Diseases, Madrid, Spain, [2]Fundación Jiménez Díaz University Hospital, UICO (Clinical and Organizational Innovation Unit) of the Quironsalud Public Hospitals Network in Madrid, Madrid, Spain, [3]Fundación Jiménez Díaz University Hospital, Department of Data Analytics of the Quironsalud Public Hospitals Network in Madrid, Madrid, Spain, [4]Infanta Leonor Teaching Hospital, Infectious Diseases, Valdemoro, Spain, [5]Villalba General Hospital, Infectious Diseases, Villalba, Spain, [6]Rey Juan Carlos University Hospital, Infectious Diseases, Móstoles, Spain, [7]Fundación Jiménez Díaz University Hospital, Pharmacy Department, Madrid, Spain, [8]Fundación Jiménez Díaz University Hospital, UICO (Clinical and Organizational Innovation Unit) of the Quironsalud Public Hospitals network in Madrid, Madrid, Spain

Background: E-RES-HIV is a healthcare outcomes measurement program implemented at 4 public hospitals in Madrid. The objective of this project is to analyze PROM and PREM in PLHIV. Understanding patient's unmet needs related to their outcomes and experiences is essential to improve PLHIV care services.

Methods: We evaluate PROMs and PREMs in PLHIV in PLHIV through E-RES-HIV program. Quality of life (QoL) and stigma were annually assessed using previously validated questionnaires (EQ-5D-5L, WHOQOL-HIV-BREF and HIV-specific Stigma validate scale), from January 9, 2020 to September 2021. Subjects answered questionnaires patient's portal [an application through which the patient has all his medical history, and through which he can interact and communicate directly with the hospital services (e-PROMs)].

Results: We attend 3990 PLHIV; most of them (91.1%) are male. The age distribution is 9.7% in people <30 years, 61.3% in patients between 31 and 50 years and 26.9% in people between 51 and 70 years. 89% of them (3552) have the patient's portal active and 33.2% (1179) answered any questionnaires. Regarding quality of life, only 7.7% considered their quality of life fair or very poor.

However, 41% described dissatisfaction with the quality of their sleep, 31% were dissatisfied with their sexual life, 38.4% felt moderate or very tired in their daily activity and 49.1% described feelings of sadness, anxiety or depression moderately, frequently or always. 42.1% of subjects had also frequent feelings of concern about the future.

Regarding stigma, 76.3% made an effort to keep their HIV status secret. 70.6% felt embarrassed when disclosing their HIV status to other people. 72.9% were afraid of rejection when describing their serological status. Despite this, 72.7% had maintained their social relationships and 81.3% reported not having suffered rejection when revealing their serological status.

Conclusions: Patient reported outcomes are crucial to provide information for the decision-making process and carry out a patient-centered care strategy in PLHIV. Aspects related to quality of life and stigma show important concerns and needs of people living with HIV for which we have to implement measures.

Innovative approaches to track individuals

EPE328
Unique identifier codes to track AGYW across service providers for DREAMS programming in Malawi and Zimbabwe

A. Sheets[1], J.M. Alcantara Acosta[1]
[1]Population Services International, Digital Health and Monitoring, DC, United States

Background: AGYW suffer disproportionate burden from HIV. PEPFAR's DREAMS program aims to empower and equip adolescents to remain HIV-free. Each partner has independent funding agreements, M&E systems, and reporting structures. This makes analyzing which services an individual girl has received difficult. While digital systems can automate unique identifier codes (UIC), DREAMS is often paper-based and paper-first making automated UICs not possible.

Description: UICs are challenging: Need to avoid duplicate entries; avoid data entry issues (misspellings or duplicates); readily available ID numbers e.g. national ID compromise privacy; need to limit the use of personally identifiable information. PSI was tasked in Zimbabwe and Malawi to track AGYW nationally across implementing partners (IPs) and agencies to ensure that those enrolled are receiving the core primary package of services as well as additional services that they should receive.

Lessons learned: Due to IPs being paper-first, PSI adopted a written UIC algorithm that had been demonstrated effective in other countries for KP programs. This is valuable in situations where national ID is avoided to protect anonymity and safety such as KP and AGYW programming. The UIC is completed by asking the AGYW details that are then concatenated.

The UIC was tested with client data and was found to have <2% collisions. In order to further ease the UIC, an app was created to help those with phones to compose the UIC correctly and consistently. The algorithm was revised and adopted when implementation began in order to create a consistent length to support data quality and cleaning. This put in place a UIC for the first time across all IPs and required collective approval and uptake among partners.

Conclusions/Next steps: Through the implementation of this UIC algorithm PSI has been able to track 1,455,797 unique profiles since FY16 in Zimbabwe across 5,382,319 service events and 307,872 unique profiles since FY18 in Malawi across 2,369,405 service events. The unified approach to UIC development and a support tool to generate UICs which reduces errors allows accurate tracking of service uptake across multiple independent partners and should be scaled up nationally.

EPE329
Development and rapid scale up of a standardized individual level client tracking system for HIV: experience from 11 countries

A. Legrand[1], K. Stankevitz[2], A. Abba Gana[3], A. Gottlieb[4]
[1]BAO Systems, Washington DC, United States, [2]FHI 360, Durham, NC, United States, [3]FHI 360, Abuja, Nigeria, [4]FHI 360, Washington DC, United States

Background: Health information systems (HIS) that enable the longitudinal follow-up of patients can improve quality of care by allowing HIV programs timely access to data. However, these systems can be costly, time consuming to deploy, and require significant technical skills to adopt. To overcome these barriers, we developed a standardized metadata package for HIV programs in DHIS2, an open source, web-based HIS platform. This metadata package is available to download for free.

Description: The metadata package supports data collection across the continuum of HIV services, comes preconfigured with over 70 standard HIV indicators, and was designed to support data use and case management. Built-in dashboards enable real-time notification of clients that may need extra support- such as clients who are out of pills, missed appointments, or need to be linked to care (Figure 1). Additional modules are available for hotspot mapping and peer worker management. The package can be installed as-is, or can be customized to meet local needs.

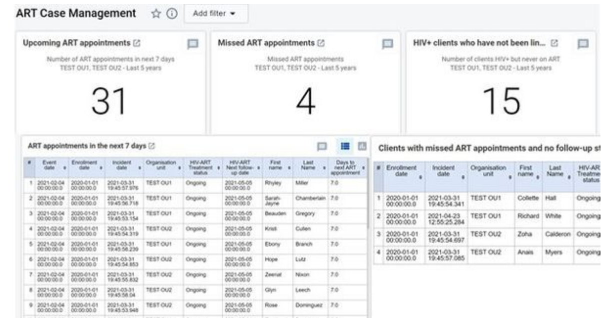


Figure 1: ART case management dashboards available in the HIV Metadata Package.

Oral abstracts

Poster exhibition

E-posters

Late-breaker abstracts

Author Index

Lessons learned: By introducing standardized metadata, we were able to rapidly customize individual-level HIS across 11 countries, tracking ~120,000 clients. Customization ranged from 3 weeks to 6 months, whereas some prior systems required over a year to develop from scratch. Customization time varied based on country requirements, availability of in-country hosting, and existing capacity. Regular access to up-to-date data and dashboards helped promote utilization.

In many countries, buy-in expanded beyond the project, promoting uptake by other partners, donors, or the national government, helping to integrate existing fragmented systems.

Conclusions/Next steps: The HIV Tracker Package is an open-source global good, available to enable rapid deployment of individual-level data collection systems for HIV. Initial use of the system has shown the package can be rapidly customized to meet local needs while maintaining the benefits of standardization.

EPE330

Recounting and returning the lost: an innovative utilization of basic data systems and tools for enhanced tracking of ART clients during COVID at 30 high-volume HIV facilities in Zimbabwe

E. Dhodho[1,2], K. Takarinda[1], K. Masiye[1], P. Chimberengwa[1], N. Nyathi[1], S. Machiva[1], L. Sibanda[1]

[1]Organization for Public Health and Development (OPHID), Harare, Zimbabwe, [2]University of California, Berkeley, Carlifonia, United States

Background: In Zimbabwe, COVID-19 lockdowns and travel restrictions disrupted HIV services resulting in reduced access to healthcare facilities by PLHIV. After the first hard lockdown, reported losses to follow-up (LTFU) among clients on ART more than doubled. To mitigate LTFUs, PLHIV were allowed to access ART at health facilities of their convenience as "visitors" limited to <28 days of ART refills, alternatively transfer-in if issued ART resupplies ≥28 days. Between April-June 2021, 6,431 LTFU clients were reported in 15 TASQC supported districts, against 315,595 clients retained on ART.

We describe a data-based remediation exercise conducted to track and establish the status of these LTFU clients.

Description: Thirty high-volume facilities contributing 80% of LTFUs were selected for the exercise. The process included in sequential order: i) line-listing in MS-Excel of all LTFUs and "visitor clients" at each facility ii) internal facility triangulation of LTFUs with the pharmacy dispensing register in case of fast-track refills followed by updating of patient ART files iii) ≥4 follow-up phone calls to outstanding LTFU clients and iv) triangulating remaining LTFUs with "visitor clients" identified at other facilities.

Lessons learned: A total of 6,431 clients were declared LTFU, with 4531 (70%) being part of the remediation exercise. They had a median age of 35 years (IQR,27-44) of whom 2,892 (64%) were females. Overall, 1,380 (30%) were identified as currently on ART care of which 780 (57%) were documented in pharmacy dispensing registers, 511 (37%) were follow-up through phone calls and 89 (6%) were visitor clients elsewhere. The remaining 170 (3.4%) had relocated to neighbouring countries.

Conclusions/Next steps: Covid-19 lockdowns and travel restrictions adversely affected client movement and facility documentation processes leading to erroneous reporting of client outcomes as LTFU whilst clients were still in care. To mitigate LTFU in the Covid-Era, the OPHID consortium will:

i. Improve documentation and routine triangulation of "visitor clients" across all 15 supported districts;

ii. Update ART resupply visits patient ART files which were abandoned due to fears of contracting COVID-19; and,

iii. Triangulate client follow-up with all pharmacies.

Innovative uses of data to strengthen systems and programmes

EPE331

The representative studies rubric: 12 steps to address underrepresentation in HIV clinical research

B. Minalga[1], R. Siskind[2]

[1]Fred Hutchinson Cancer Research Center, Office of HIV/AIDS Network Coordination, Seattle, United States, [2]National Institute of Allergy and Infectious Diseases, Division of AIDS, Bethesda, United States

Background: HIV clinical research often fails to enroll samples of participants that are representative of the HIV epidemic. Failure to include representative study populations results in compromised generalizability, misclassification of study populations, disparities in PrEP regulation and coverage, safety and efficacy uncertainties of ARV use in pregnancy and breastfeeding, and undermined efforts to address health disparities. The underrepresentation of certain participant populations in HIV research occurs as a constellation of systemic processes, many of which are institutionalized within the field of clinical research. The presenters developed a tool, the Representative Studies Rubric (RSR), consisting of a 12-item questionnaire that can be applied to study protocols to facilitate enhanced inclusion of underrepresented populations.

Description: The RSR examines individual study protocols for their representativeness in terms of age, ethnicity, gender, injection drug use, pregnancy, race, and sex assigned at birth. The presenters pilot tested the RSR in a retrospective analysis of 100% of study protocols (47) conducted by the NIH-funded HIV/AIDS clinical trials networks that were actively enrolling study participants in September 2021: AIDS Clinical Trials Group (21 studies); COVID-19 Prevention Network (1 study); HIV Prevention Trials

Network (5 studies); HIV Vaccine Trials Network (5 studies); HPTN/HVTN (3 studies); International Maternal Pediatric Adolescent AIDS Clinical Trials (10 studies); and Microbicide Trials Network (2 studies). Findings were presented to research leadership to activate process improvement.

Lessons learned: The systematic exclusion of underrepresented populations is widespread, and it most often occurs passively through ambiguous and exclusionary definitions of study populations. Too few studies prioritize representative sampling through the use of population-specific enrollment goals, and stigmatizing language is ubiquitous. However, research staff are highly committed to enrolling more representative study populations.

Conclusions/Next steps: Institutionalized barriers in HIV research perpetuate the exclusion of underrepresented populations. The RSR should be implemented proactively in the development of study protocols to help correct these institutionalized barriers, advance scientific integrity, and facilitate equitable representation of study populations. The NIH-funded HIV/AIDS clinical trials networks are currently working to implement the RSR as a protocol development tool. Research entities outside these networks should consider implementing the RSR as well.

EPE332

Under-reporting of antiretroviral treatment coverage among diagnosed HIV patients in Bangkok, Thailand

P. Chaiphosri[1], K. Nilsum[1], S. Tanpradech[1], S. Aungkulanon[2], T. Naiwatanakul[2], S. Northbrook[2]

[1]AIDS, TB and STI Control Division, Department of Health, Bangkok Metropolitan Administration, Bangkok, Thailand, [2]Division of Global HIV and TB, U.S. Centers for Disease Control and Prevention, Nonthaburi, Thailand

Background: Use of accurate data are critical to reach 95-95-95 by 2025. The ART coverage for diagnosed people living with HIV (PLHIV) in Bangkok reported through the National AIDS Program (NAP) database was 57% in 2020. We conducted a data quality assessment (DQA) to investigate data quality issues related to the number of PLHIV receiving antiretroviral treatment (ART) and developed a method to adjust ART coverage from November 2020 – January 2021 in Bangkok.

Methods: A single-stage cluster sampling technique was used to randomly select a facility from each managing authority. We randomly selected 5% or 10% of patients who picked up ART during last 30 days from hospitals with >1,000 and <1,000 ART patients, respectively. We reviewed their hospital electronic medical records and NAP database entries to verify completeness and accuracy of HIV case registration in NAP, including last ART pick-up date and next appointment date.

A multiplier method was developed to estimate the number of cases missed through under-registration in NAP, under-reporting of ART data, and delayed reporting. Multipliers disaggregated by facility type and health insurance scheme were pooled using random effect model regression to further adjust the number of HIV patients currently receiving ART.

Results: From a total of 59 facilities providing ART services and reporting ART in NAP, 11 health facilities (5 public, 5 private, and 1 research hospital) completed the assessment. All HIV infected patients in hospital databases were registered in NAP.

The pattern of ART underreporting varied by hospital type and health insurance scheme with the most significant under-reporting found in private hospitals and patients under the civil servant medical benefit scheme (CSMBS). Reasons for under-reporting included delay in data entry, insufficient understanding of reporting requirements, and no mandatory data entry requirement for PLHIV under CSMBS. We estimated 79% of diagnosed PLHIV received ART using the pool multiplier, an increase from the unadjusted 57% figure.

Conclusions: Our results demonstrate completeness of HIV registration and under-reporting of ART coverage by one-third. Data quality assurance trainings should be conducted to improve data quality, strengthen reporting systems, make informed adjustments and decision-making.

EPE333

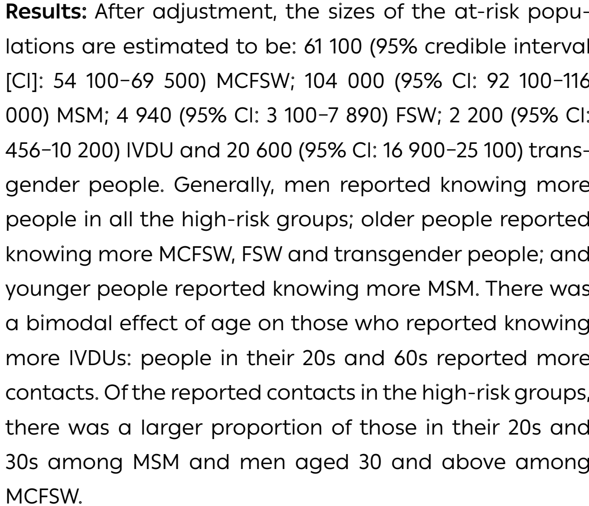
Estimating the sizes of key populations for HIV in Singapore using online surveys

S.E.D. Quaye[1], Y. Cheng[2], R.K.J. Tan[1,3], K. Prem[1,4], A.K.J. Teo[1], A.R. Cook[1]

[1]National University of Singapore, Saw Swee Hock School of Public Health, Singapore, Singapore, [2]University of Chicago, Department of Statistics, Chicago, United States, [3]University of North Carolina Project, Guangzhou, China, [4]London School of Hygiene and Tropical Medicine, London, United Kingdom

Background: Singapore lacks robust data on the sizes of the key populations that are most at risk for HIV. Using the network scale-up method for hidden or hard-to-reach populations, we estimate the sizes of five key populations—male clients of female sex workers (MCFSW), men who have sex with men (MSM), female sex workers (FSW), intravenous drug users (IVDU) and transgender people—and profile the ages and ethnicities of respondents and their high-risk contacts.

Methods: We conducted a cross-sectional online survey between March and May 2019 (n = 3068) using a network scale-up instrument previously developed for Singapore. Participants were recruited using an existing panel and online advertising, and the sample weighted by age, sex, ethnicity and education attained to represent the general adult population. We built a Bayesian hierarchical model to estimate the sizes of the five key populations for HIV in Singapore.



Results: After adjustment, the sizes of the at-risk populations are estimated to be: 61 100 (95% credible interval [CI]: 54 100–69 500) MCFSW; 104 000 (95% CI: 92 100–116 000) MSM; 4 940 (95% CI: 3 100–7 890) FSW; 2 200 (95% CI: 456–10 200) IVDU and 20 600 (95% CI: 16 900–25 100) transgender people. Generally, men reported knowing more people in all the high-risk groups; older people reported knowing more MCFSW, FSW and transgender people; and younger people reported knowing more MSM. There was a bimodal effect of age on those who reported knowing more IVDUs: people in their 20s and 60s reported more contacts. Of the reported contacts in the high-risk groups, there was a larger proportion of those in their 20s and 30s among MSM and men aged 30 and above among MCFSW.

Conclusions: This study demonstrates that a size estimation study of hidden populations is quickly and efficiently scalable through using online surveys in a socially conservative society, like Singapore, where key populations are stigmatised or criminalised. The approach may be suitable in other countries where stigma is prevalent and where barriers to surveillance and data collection are numerous.

EPE334

In-service HIV training through a mobile distance learning platform

M. Inguane[1], I. Chiposse[1], C. Taibo[1], A. Ouenzar[1]

[1]*Abt Associates, ECHO Project, Beira, Mozambique*

Background: USAID's Efficiencies for Clinical HIV Outcomes (ECHO) project, in coordination with various provincial health directorates in Mozambique, directly contracted health facility providers to strengthen the health system and improve quality of care. ECHO created a distance learning platform, accessible via simple mobile phones, to give these providers trainings, assess their technical knowledge, and provide important updates related to HIV care and treatment.

Description: Since February 2021, 148 health facilities across four provinces in Mozambique (Manica, Sofala, Niassa, and Tete) have implemented the distance learning platform. The platform targets health technicians, ranging from monitoring and evaluation specialists to lay professionals.

Since implementation, ECHO has launched seven modules on a variety of topics: viral load testing and suppression, counselling and health testing (HTC), pediatric antiretroviral treatment, prevention of mother-to-child transmission, psychosocial support, TB and HIV co-infection, and a mixed module incorporating each aforementioned module).

These modules include multiple-choice questions to test mastery of the training material presented that utilize interactive voice response messaging. Each module was "live" for four weeks, allowing providers to answer questions as they were available. The project also created a dashboard to analyze and present results, which displayed health provider participation levels, correct answer rates, and groups with the greatest need for knowledge reinforcement.

Lessons learned: Through the distance learning platform, technicians were kept informed on HIV and ART topics. In total, 89% of eligible technicians utilized the platform. These results strengthen the case for technical assistance (TA) targeted at technical groups and focus areas.

For modules such as HTC and TB/HIV co-infection, however, average scores were below the minimum acceptable score of 80%. ECHO is currently implementing actions to address these findings that the platform illuminated.

Conclusions/Next steps: The ECHO distance learning platform saw high technician uptake, helped to highlight areas where staff were struggling, and allowed the project to target activities accordingly. Similar programs are recommended to steadily monitor health professionals and understand their needs related to HIV and beyond.

EPE335

Insights from collecting health worker performance data to inform index testing service delivery in Senegal

A. Finnegan[1], E.H. Babacar Gueye[1], M. Dia[2], A. Gueye[1], J. Muriuki[3], C. Toure[4], A. Collins[1], M. Joiner[1], S. Bijou[1]

[1]*IntraHealth International, Chapel Hill, United States,* [2]*RTI, Dakar, Senegal,* [3]*IntraHealth International, Nairobi, Kenya,* [4]*IntraHealth International, Bamako, Mali*

Background: Health workers are essential to epidemic control. Projects implementing index testing, especially among key populations, often rely on staffing that spans the community and facility and cadres with differing skill levels and training. It is critical to examine how staffing configurations can help reach epidemic control.

Description: In October 2021, IntraHealth International conducted the PEPFAR HRH Inventory in 13 districts across Senegal under the USAID-funded Neema project. The PEPFAR HRH Inventory collects detailed demographic information on PEPFAR-funded health workers (clinical, ancillary (e.g. community health workers, peer navigators/educations, and social service workers), program management, and other staff). We enhanced this inventory with questions about staff training and supervision and enumerated staff funded by other donors. We analyzed the results against indicators of district-level service delivery such as achievement of targets, retention in treatment, and index testing service delivery.

Lessons learned: Neema relies on a combination of Ministry of Health (MOH) and PEPFAR-funded staff with few staff funded by other donors. The MOH supports the majority (78%) of clinical staff whereas PEPFAR supports the majority (69%) of ancillary staff. The ratio of HIV clients on treatment to ancillary staff is 38 clients to 1 ancillary staff (38:1, range: 21:1-82:1). Higher ratios of HIV clients on treat-

ment to ancillary staff were weakly associated with reduced retention of the treatment cohort (Figure 1). Supervision showed a mixed association with district outcomes measured. Health care worker level outcomes may have been more directly associated with outcomes measured than district level data alone.

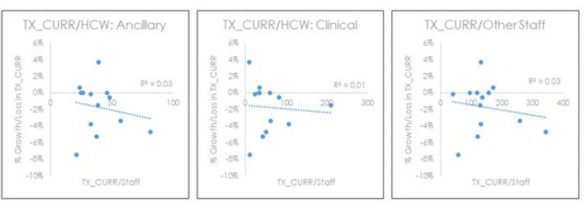


Figure 1: Ratio of clients on treatment (x-axis) to staff in each district (dots) by category (e.g. ancillary, clinical and other staff) to percent growth or loss in the treatment cohort (y-axis) between FY21/COP20 quarters 3 and 4.

Conclusions/Next steps: We found that it was feasible to collect information on supportive supervision, training, and performance monitoring along with the PEPFAR HRH Inventory. Analysis of staffing ratios, supportive supervision, and performance monitoring enhanced our understanding of PEPFAR service delivery and illuminated opportunities for optimizing implementation.

EPE336

Sustained viral suppression among HIV positive women through a robust peer approach in m2m countries during COVID-19 Pandemic

N. Kwendeni[1], L. Makhupula[1], A.M. Mbule[1], K. Schmitz[1]
[1]mothers2mothers, Programmes and Technical Support, Cape Town, South Africa

Background: The impact of Covid-19 on health services areas resulted in catastrophic impacts for the most marginalized and vulnerable people. Starting march 2020 COVID 19 was declared a pandemic across the continent with most of m2m countries announcing lockdowns and heavy restrictions. Our peer cadres known as Mentor Mothers were declared essential workers, enabling continuity of services during the full lockdown and restricted access periods imposed in response to Covid-19. Within three weeks, the m2mhybridmodelwas introduced, which included a new type of eservices: Peer via Phone (PvP) using m2m's FLWs to deliver an average of 5 structured monthly calls ranging from education, psychosocial support, adherence and self-care support and follow up/support for clinical services. In some cases, Mentor Mothers delivered pre-packed ART to defaulting clients in the community.

Description: From inception in Apr-2020 to Dec 2020, over 208, 321 m2m clients were reached through PvP eService across Ghana, Kenya, Lesotho, Malawi, Mozambique, South Africa, Uganda and Zambia. Using case based DHIS2 tracker cumulative number of clients receiving PvP disaggregated by call type, client risk profile and receiving the first, introductory Call and at least one other PVP call.

Lessons learned: The algorithms show that HIV-positive clients were prioritized **34%** pregnant, **64%** breastfeeding, and **2%** in General ART. HIV serostatus remains a key determinant in client risk profiles and PvP eService delivery algorithms with **71%** of the clients were HIV positive.

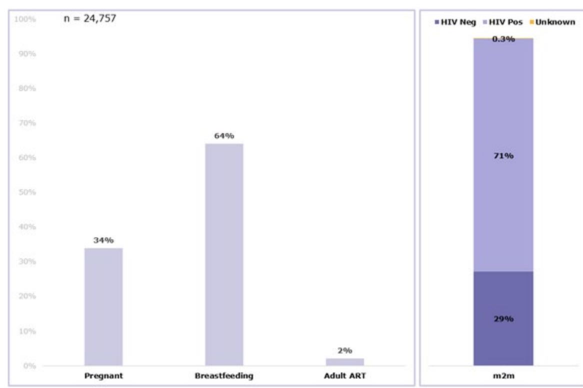

Figure 1: m2m's Total Clients Reached through Peer via Phone (PvP) eServices.

Conclusions/Next steps: m2m's PvP were effective at reaching high risk clients such as HIV pregnant and breastfeeding mothers.
The results underscore the importance of having the risk profiling variables enhanced to ensure that all vulnerable clients are provided with differentiated care by m2m peer models.

EPE337

The Uganda HIVDR Database: a data information exchange platform to improve HIV drug resistance (HIVDR) monitoring

E. Twinomujuni[1], A. Ayitewala[2], S.P. Muwanguzi[3], G. Kuboi[4], S.P. Atwiine[5], V. Nabitaka[1], P. Nambuya Mbabazi[2], C. Katureebe[6], M. Nakawuka[6], A. Ahimbisibwe[6], M.G. Alwano[7], Z. Guoqing[8], M. Steinau[8], E. Mary[8], E. Nazziwa[8], E. Namusoke Magongo[6]
[1]Clinton Health Access Initiative (CHAI), Infectious and Non-Communicable Diseases (INCD), Kampala, Uganda, [2]Uganda National Health Laboratory and Diagnostic Services (UNHLS), Kampala, Uganda, [3]Monitoring and Evaluation Support Program (METS), Kampala, Uganda, [4]Joint Clinical Research Centre (JCRC), Kampala, Uganda, [5]Uganda Virus Research Institute (UVRI), Kampala, Uganda, [6]Ministry of Health, AIDS Control Program, Kampala, Uganda, [7]Catholic Relief Services (CRS), Kampala, Uganda, [8]US Centers for Disease Control and Prevention (CDC), Atlanta, United States

Background: The Uganda HIVDR Database was commissioned by the Ministry of Health as part of a national HIVDR improvement program in 2018 and was deployed in May 2021. Before the Database, turnaround time was as high as 8 months, and it was hard to identify where the delay was. We describe implementation, immediate benefits, and a future outlook of the HIVDR Database.

Description: The Uganda HIVDR Database is a PEPFAR funded online system developed by the Ministry of Health in 2021 with support from CHAI to expedite HIVDR monitoring. In Uganda, HIVDR testing is performed after a repeat viral load (VL) > 1000 copies/ml following intensified adherence counselling. Each VL result goes through an HIVDR testing eligibility algorithm and profiles of eligible samples are exchanged with the HIVDR Database that also pushes them to the HIVDR testing laboratories' systems. After testing, laboratories automatically push the results back to the Database. Through the Database interface, clinicians can access the results in real-time, add client medical and social histories, discuss results, make ART recommendations, and monitor clients started on new regimens.Each stage is timestamped, and clinicians are notified through email.

Lessons learned: The Database received 3,575 sample profiles collected between February and September 2021 and 303 results discussions were conducted via the Database interface. Real-time data exchange with the laboratories and clinician notifications at each stage have facilitated a reduction in results handling latencies by an average of 174 days from 247 days. Timestamping every stage allows for targeted quality improvement interventions at inefficient stages. In addition, the Database provides better client data security and privacy through data encryption.

Figure. Monthly average turnaround time (TAT) from sample collection to Switch Committee decision.

Conclusions/Next steps: The HIVDR database has facilitated the use of data exchange to improve turnaround time for HIVDR results. However, continuous quality improvement is needed to further reduce the turnaround time to expedite timely switch decisions and patient management.

EPE338

Using routinely collected blood donation data for expanded HIV and syphilis surveillance in Blantyre District, Malawi

E. Singogo[1], T. Hartney[2], S. Bourdin[2], M. Chagomerana[1], S. Puerto-Meredith[1,3], B. M'baya[4], G. Kadewere[5], E. Kudowa[1], B. Rice[2], J. Hargreaves[2], S. Weir[3], M. Hosseinipour[3,1]
[1]University of North Carolina Project-Lilongwe Malawi, Epidemiology, Lilongwe, Malawi, [2]London School of Hygiene and Tropical Medicine, MeSH Consortium, London, United Kingdom, [3]University of North Carolina-Chapel Hill, Institute for Global Health and Infectious Diseases, Chapel Hill, United States, [4]Malawi Blood Transfusion Services, Transfusion Medicine, Blantyre, Malawi, [5]Ministry of Health, , Malawi, Directorate of Health Technical Support Services, Lilongwe, Malawi

Background: WHO recommends all blood donations be screened for transfusion transmissible infections. However, these data are not incorporated into national surveillance systems in Malawi. We set out to use routinely collected data from blood donors in Blantyre district, Malawi, an area of high HIV and syphilis prevalence, to explore current HIV and syphilis prevalence and identify recent sero-conversions among repeat donors.

Methods: We conducted a retrospective cohort analysis of blood donation data collected by the Malawi Blood Transfusion Service (MBTS) between October 1st 2015 and May 31st 2021. All blood donations were routinely screened for WHO-prioritized transfusion-transmissible infections, including HIV and syphilis. We characterized donor demographics as well as screening outcomes, including identifying sero-conversions among repeat donors who previously tested negative. Logistic regression was used to model the impact of individual level covariates on the probability of sero-conversion.

Results: A total of 93,199 donations from 5,054 donors were recorded, with 7 donors (0.1%) donating a maximum of 24 times. The majority of donors were male (4,294; 85%) and students (3264; 64.6%) at the time of their first donation. Of those screened for HIV and syphilis, 126 (2.5%, 126/5,049) and 245 (4.9%, 245/5,043) tested positive respectively.

Among repeat donors who previously tested negative, 87 HIV sero-conversions and 195 syphilis sero-conversions were identified over the study period, indicating an HIV incidence rate of 6.86 per 1,000 person-years and a syphilis incidence rate of 15.37 per 1,000 person-years. Donors who were female or aged 16-19 at the time of first donation had a higher risk of HIV or syphilis sero-conversion.

Conclusions: Routinely collected data from national blood donation services may be used to enhance existing population-level disease surveillance systems, particularly in high prevalence areas. While blood donors are generally considered a low-risk population for HIV and syphilis, we were able to identify and characterise blood donor populations at increased risk of sero-conversion over the study period.

This information will provide insight into priority prevention areas in Blantyre district and help to inform targeted interventions for improved prevention, testing and treatment.

EPE339

Preliminary outcomes from the Routine Electronic Mother-Infant Data (REMInD) study to support maternal retention in HIV treatment and early infant diagnosis in South Africa

T.K. Phillips[1], Y. Gomba[1], F. Phelanyane[1,2], K. Anderson[1], M.-A. Davies[1,2], E.J. Abrams[3,4], L. Myer[1]
[1]University of Cape Town, School of Public Health & Family Medicine, Cape Town, South Africa, [2]Western Cape Government Department of Health, Cape Town, South Africa, [3]Columbia University, ICAP, New York, United States, [4]Columbia University, College of Physicians and Surgeons, New York, United States

Background: HIV vertical transmission prevention (VTP) remains a priority but monitoring continuity of care through VTP programs is challenging. The REMInD study aims to validate the use of routine electronic health records to identify gaps in routine VTP and facilitate relinkage to care of mother-infant pairs (MIPs) in Cape Town, South Africa.

Methods: We followed a prospective cohort of mothers and infants (born March-Nov 2021) accessing public VTP services in Gugulethu using routine electronic reports from the Western Cape (WC) Provincial Health Data Centre. Gaps were defined per national guidelines as missing infant HIV test (delivery, 10 weeks[w]), missing maternal viral load (delivery), or >3 months without maternal ART dispensed (delivery, 10w). We validated gaps using source data and participant telephone calls. Where true gaps were identified, we initiated tracing and relinkage to care.

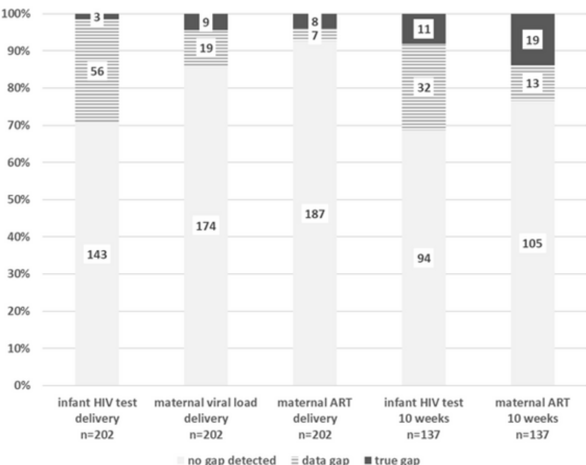

Figure. Gaps in routine HIV vertical transmission prevention among mothers and infants at delivery (n=202) and 10 weeks postpartum (n=137)

Results: 202 MIPs (137 with data through 10w) were included (median maternal age 32 years, 87% started ART before pregnancy). One infant was diagnosed with HIV at birth and initiated ART. At delivery and 10w, 84/202 (41%) and 62/137 (45%) of MIPs had gaps identified, respectively. Of 177 gaps (Figure), 127 (72%) were data gaps (services completed but not showing in routine reports), including four MIPs accessing care outside of WC. Fifty true gaps (43 MIPs) were confirmed, 21 MIPs (49%) were successfully contacted, and 16 gaps were filled. Incorrect contact details and privacy concerns presented challenges to tracing. Reasons for true gaps included patient (travel, fear of returning to the clinic) and health service (laboratory tests not done) factors.

Conclusions: The relatively low numbers of true gaps in early VTP among MIPs in this cohort is reassuring. Ongoing work is needed to strengthen the quality of routine electronic data, including patient contact details, to facilitate streamlined identification and tracing of MIPs with true gaps to care.

EPE340

Relevance of HIV prevention self-assessment tool in identifying gaps in national key population programming in Africa

M. Emmanuel[1,1], M. Khan[2], P. Bhattacharjee[3], C. Benedikt[4]
[1]Genesis Analytics, Health Practice, Guateng, South Africa, [2]Genesis Analytics, Guateng, South Africa, [3]University of Manitoba/Institute of Global Public Health, Nairobi, Kenya, [4]Global HIV Prevention Coalition, Geneva, Switzerland

Background: HIV disease burden in 2020 was 37.7 million, with key populations (KP) and their sexual partners accounting for an estimated 62% of new infections globally. The HIV Prevention Self-Assessment Tool (PSAT) was created in collaboration with global prevention stakeholders to support countries in assessing and monitoring their progress toward comprehensive key population prevention programming, and identifying program areas for strengthening.

This process facilitated by the South-to-South Learning Network aimed to identify the strengths and weaknesses of KP prevention programs in nine selected African countries.

Description: The PSAT is a self-reflection tool that provides a snapshot of the national prevention landscape through investigation of key prevention elements in the domains of program management, implementation and outcomes. Nine selected countries across south, east and west Africa nominated country champions to complete the KP PSAT. Country champions comprised a wide range of technical experts representing key constituencies within the KP prevention landscape. The PSAT scores were validated by country technical working groups (TWG). The scores for each prevention domain were analyzed using Power BI and included data visualization.

Lessons learned: Results indicated that financing of KP programs remains a gap across countries. Areas for strengthening included:

Oral abstracts

Poster exhibition

E-posters

Late-breaker abstracts

Author Index

i. Monitoring of budgets at all levels as budgets are not disaggregated to KP groups.
ii. Unit costs per KP are not well documented, leaving gaps in accurate cost estimates for service delivery to female-sex-workers and men who have sex with men.
Amongst all countries, standardization of costs between programmatic and national levels was an area for strengthening. In three countries, there was insufficient information to fully understand the financial gaps.
Conclusions/Next steps: The PSAT enables the development of action plans to address country-specific program management and implementation issues. This is evident in the cases of Uganda and Kenya, where, after identifying financing gaps through PSAT, we assisted them to identify their exact technical assistance requirements to close the gaps, as well as KP program unit costs at the country level in Kenya, resulting in an estimate of total resource needs.
These findings demonstrated that budgeting and financing of KP programs are still areas that need to be improved in Sub-Saharan Africa.

EPE341
Lack of knowledge, stigma and discrimination are key barriers for people living with HIV and key populations in accessing social protection: A 12-country study in West and Central Africa (WCA)

R. Ameur[1,2], L.-M. Le Quéré[3], H. Badini[4], M. Traore[5], H. Van Renterghem[6], S. Sehgal[7],
I. Ganhoue N'gayie Bertin[8], HIV Sensitive Social Protection Sub-group of the Regional Joint Team on AIDS for West and Central Africa
[1]International Labour Organization, Decent Work Team in Pretoria, Pretoria, South Africa, [2]International Labour Organization, Gender, Equality, Diversity and Inclusion Branch (GEDI), Geneva, Switzerland, [3]World Food Program, Regional Bureau for West Africa, Dakar, Senegal, [4]The Joint United Nations Programme on HIV/AIDS (UNAIDS), Regional support Team in West and Central Africa, Dakar, Senegal, [5]Cabinet consultant Moussa Traore, Dakar, Senegal, [6]The Joint United Nations Programme on HIV/AIDS (UNAIDS), Fast-Track Implementation Department, Geneva, Switzerland, [7]University of Cape Town, Graduate School of Business, Cape Town, South Africa, [8]Réseau Africain des Personnes vivant avec le VIH Afrique de l'Ouest, Secrétariat Permanent, Abidjan, Cote D'Ivoire

Background: Scarcity of evidence regarding HIV-sensitive social protection led the UN Regional Joint Team on AIDS's social protection sub-group to launch an initiative in 12 WCA countries.
The aim was to collect information about existing social protection programs, their sensitivity to HIV; and to better understand the knowledge of people at risk, living with or affected by HIV about social protection and access to such services.

Methods: A three-pronged approach was implemented between June and October 2021:
1. A desk review about social protection systems and programmes was conducted for Burkina Faso, Cameroon, Central African Republic, Côte d'Ivoire, Chad, Ghana, Guinea Bissau, Mali, Nigeria, Senegal, Sierra Leone, and Togo.
2. A survey was conducted among rights holders and duty bearers using online questionnaires that reached 1467 persons.
3. A workshop on "Enhancing inclusive, people-centered social protection for vulnerable PLHIV and key populations (KPs)" allowed to discuss and endorse the information collected.

Results: Nine of the twelve countries have a validated and operational social protection policy but only three have ratified ILO's Convention 102 on Minimum Standards of Social Security.
Among the *1299* rights holders surveyed (*45% women, 45%* men, 10% did not say) including 881 young and adult PLHIVs, 216 KP representatives, and 244 people affected by HIV, more than half did not know if a social security system existed in their countries and three quarters were not registered for it.
Almost *80%* did not have health insurance**,** *77%* were unaware of any existing social safety net programs in their country, and *80%* did not know if the law on social protection was inclusive or not.
The main barriers listed to accessing social protection services were the lack of knowledge and information, unemployment and poverty, and stigma and discrimination.
Conclusions: The study findings and workshop discussions confirm the huge lack of knowledge, mechanisms and access to social protection systems and services among people at risk, living with or affected by HIV in WCA. There is a need to intensify advocacy with authorities and capacity development of community partners, disaggregated data collection, and dialogues around removing barriers to existing schemes and making them more inclusive.

EPE342

Operationalizing Ethiopia's ARV Pharmaceutical Management Information System (PMIS) for rational use of ARVs and optimized supply chain decision making

T. Ewnetu[1], F. Alemu[1], S. Tewfik[1], B. Ayalneh[1], E. Geremew[1], E. Ejigu[1], T. Seifu[1], Y. Derib[1], B. Tadesse[2], M. Abdela[2], R. Bayisa[2], B. Ashagire[3]

[1]*Contractor for USAID Global Health Supply Chain Program Procurement and Supply Management, Addis Ababa, Ethiopia,* [2]*Ministry of Health of Ethiopia, Addis Ababa, Ethiopia,* [3]*U.S. Agency for International Development, Addis Ababa, Ethiopia*

Background: In Ethiopia, the antiretroviral (ARV) pharmaceuticals management information system (PMIS) has been implemented to capture information on patients and ARVs, guide patient treatment follow-up, ARV dispensing, and supply chain decisions.

However, an assessment conducted in 205 health facilities (HFs) in 2018 indicated that only 21% of the facilities generated an ARV therapy (ART) monthly report and its utilization had declined.

Description: The USAID Global Health Supply Chain Program-Procurement and Supply Management (GHSC-PSM) project collaborated with the Ethiopian Ministry of Health (MOH) to revitalize use of PMIS and address gaps in ART data visibility. GHSC-PSM conducted a baseline assessment in 389 HFs in December 2019 that indicated only 32% of facilities submit an ART monthly report and identified workload, inadequate PMIS knowledge and follow-up, and non-availability of reporting tools as factors for underutilization of PMIS.

To strengthen the system and increase visibility on ART in Ethiopia, GHSC-PSM:

1. Developed a plan of action;
2. Revised, printed and distributed PMIS tools, standard reporting procedures and job aids;
3. Reintroduced the reporting system by conducting training, supervision, advocacy, and review meetings; and,
4. Developed a long-term strategic plan that includes requirements for digitalization.

Lessons learned: These efforts revitalized PMIS at 1200 ART sites and helped avail organized ART and service data for supply chain decision making. PMIS monthly activity reporting increased from 92 facilities reporting in September 2020 to 618 facilities by September 2021, an improvement because of the project's interventions.

Newly available monthly report data from 618 high-volume facilities indicated that 272,175 adult ART clients and 9,340 pediatric ART clients were being served at the HFs.

PMIS helps monitor implementation of differentiated service delivery (DSD) models and its revitalization has helped avail dispensing and stock information. PMIS gives access to real time ARV data, that has helped improve follow up with ART clients, monitoring adverse drug interactions and transition to TLD at HFs.

Conclusions/Next steps: The revitalization of PMIS has contributed to evidence-based supply chain decisions and rational ARV dispensing and use. GHSC-PSM will continue work with the MOH to scale up, automate, and effectively use the data for decision making.

EPE343

Sparking innovation with the integration of novel data visualization and geo-mapping tools into capacity building coaching sessions

E. Leung[1], R. Murali[1], H. Yazdi[1], E. Moore[1], D. Middleton[1], L. Senter[1], W. Murphy[1], T. Jimenez[1]

[1]*CAI Global (Cicatelli Associates Inc.), New York, United States*

Background: Cicatelli Associates Inc. (CAI) operates the Technical Assistance Provider-innovation network (TAP-in) funded by the U.S. Health Resources and Services Administration HIV/AIDS Bureau, to provide tailored technical assistance to prioritized local or state health jurisdictions. We will present TAP-in's innovative use of data visualization tools and publicly available data to describe jurisdictions' HIV care systems and priority populations during technical assistance sessions.

This data-driven approach reveals gaps in the system of care and supports decision-making as jurisdictions refine strategies to implement their local work plans and strive to achieve the U.S. goal of ending the HIV epidemic by reducing newly-reported cases by 75% by 2025.

Description: Using Tableau (data visualization software), we developed system of care (SOC) geographic maps depicting data on HIV service locations, funding streams, and priority populations' demographics for select jurisdictions with identified needs for strategic planning and development.

Using two real-life case studies, we will illustrate TAP-in's capacity building approach for guiding jurisdictions through review, analysis, and uncovering of gaps in SOC, using the maps, and identifying ways to strengthen the system for greatest impact on improving linkage, retention, and viral suppression.

Lessons learned: Using data and data visualization and geomapping tools during TA was effective for jurisdictions in strategizing on how to best leverage their funding and implement their workplans to best reach their priority populations and get to next level outcomes.

For example, one "lightbulb" moment happened when we showed jurisdiction staff a map depicting the concentration of African Americans (AA) living in neighborhoods by zip code overlaid with the current SOC; the map revealed a lack of medical HIV care services available in neighborhoods where there are a greater number of AA residing.

Connecting this lack of services with data visualizations showing the high number of AA not linked to care and not virally suppressed in the jurisdiction, helped them gain a clear understanding of where EHE funding could make the greatest impact.

Conclusions/Next steps: Data and innovative data visualization techniques can be used effectively with jurisdictions in describing their service delivery network and identifying enduring disparities to inform development of more responsive systems.

EPE344

Using activity-based costing and management to better understand HIV disease control costs in East Africa

H. Pan[1], B. Lee[1], G. Ruhago[2], E. Ekirapa[3]
[1]Palladium, Washington, United States, [2]Muhimbili University of Health and Allied Sciences, Dar es Salaam, Tanzania, The United Republic of, [3]Makerere University School of Public Health, Kampala, Uganda

Background: Traditional costing studies simplistically assume homogeneity across patients and providers or only examine costs of one level at a time. Using an Activity-based Costing and Management (ABC/M) approach can generate better understanding of the true cost of a country's disease control program by:
a. Revealing what and how many resources are used in practice, and
b. Stacking costs of above-site, facility, community, and client levels.

Methods: USAID and PEPFAR's Sustainable Financing Initiative for HIV/AIDS funded the Health Policy Plus (HP+) and Uganda Health Systems Strengthening (UHSS) projects to conduct two ABC/M studies in summer 2020 in Tanzania (seven regions) and Uganda (eight districts). Using time-driven activity-based costing (TDABC), HP+ and UHSS analyzed the flow of adult clients (1,197 in Tanzania, 1,508 in Uganda) through the care cycle of HIV treatment, testing, and preventive services.
Facility-level costs were estimated by quantifying all resources consumed during the client's facility visit. Above-site costs were estimated from expenditures reported to PEPFAR's Resource Alignment Initiative and allocated to HIV program areas.
Community-level costs were estimated from implementing partner-reported expenditures and client volumes. Client-level costs were calculated from client-reported transportation, out-of-pocket costs, and estimated opportunity costs.

Results: In both countries, significant variations were observed across and within facilities for service delivery. Lower-level facilities tend to have truncated patient care processes and often deviate from clinical protocol. Clinical contact time is shorter than optimal and wait time represents 38 percent of time spent in an HIV facility visit. Personnel expenditures appear to be low in both countries, contributing to relatively low service delivery costs, but absenteeism could lead to significant inefficiencies. Stacking costs together, an individual on antiretroviral therapy costs an estimated US$237 annually in Tanzania and US $255 in Uganda. Commodities comprise over 50 percent of the total cost. Non-service delivery and program management costs comprise 30 percent. Service delivery, community and above-site program costs comprise 18 percent.

Conclusions: TDABC results reveal efficiency and quality improvement opportunities along the client care process. A fuller picture of the actual cost of disease control across patients and providers would inform more efficient and equitable resource allocation.

EPE345

Implementation and impact of a digital patient management system to deliver differentiated HIV care services in Uganda: the ARTAccess application

M. Balaba[1], E. Nakibuuka[1], M.S. Nabagala[1], J. Kigozi[2], R. Parkes-Ratanshi[1,3]
[1]Infectious Diseases Institute, Makerere University, Academy for Health Innovations, Kampala, Uganda, [2]Infectious Diseases Institute, Makerere University, Health Systems Strengthening, Kampala, Uganda, [3]University of Cambridge, Institute of Public Health, Cambridge, United Kingdom

Background: In 2016, the Infectious Diseases Institute operationalized a nurse-led paper-based differentiated service delivery (DSD) model where patients stable on HIV treatment accessed ART refills at private community pharmacies. We developed and piloted a web-based application (ARTAccess™) interoperable with existing patient management system (Uganda EMR) to document patient refills.
This study assessed the impact of the ARTAccess™ application by comparing outcomes for patients in DSD sites using ARTAccess™ to sites using paper-based system.

Methods: We undertook a non-inferiority study comparing the ARTAccess™ with the paper based system. We analyzed routine quantitative data from two health facilities using ARTAccess™ (Kiswa and Kawaala) and two health facilities using the paper based system in Kisenyi and Kitebi. Data extracted from health facility records, private pharmacy records and ARTAccess™ database was analyzed using descriptive statistics at univariate level to assess differences between study outcomes of patients on the two models using a chi-square test. All p-values were considered significant if $p<0.05$ using Stata version 16.0

Results: Baseline characteristics are similar for both models (mean age 41.3 years; 74.1% of clients on ARTAccess™ were female compared to 68.6% on the paper based system) as shown in table below.
Late attendance/ missed appointment was higher in the ARTAccess™ arm than the paper based arm but lost to follow up rates and mortality were similar in both arms. Discontinuation rates from DSD model was similar for both models, but those on the paper system had more than twice the number of high viral loads as compared to

those on ARTAccess™. Fewer clients attended to using the ARTAccess™ system opted out of the program compared to paper based model.

CHARACTERISTIC	PAPER BASED SYSTEM N=4,831	ART ACCESS SYSTEM N=5,011	TOTAL N=9,842	P Value
Age; median (inter-quartile range)	41.3 (35.3 – 48.1)	41.3 (35.3 – 48.1)	41.3 (35.3 – 48.1)	0.419
Female n(%)	3,313 (68.6)	3,715 (74.1)	7,028 (71.4)	0.000
Death; n(%)	35 (0.7)	42 (0.8)	77 (0.8)	0.522
Lost to follow up; n(%) (More than 3 months missed clinic visit after scheduled return date)	503 (10.4)	590 (11.8)	1,093 (11.1)	0.077
Late/missed appointment; n(%) (More than 2 weeks but less than 3 months missed clinic visit after scheduled return date)	594 (12.3)	1,143 (22.8)	1,737 (17.6)	0.000
Discontinuation from DSD model	1,074 (22.2)	992 (19.8)	2,066 (21.0)	0.003
High viral load	140 (13.0)	59 (6.0)	199 (9.6)	0.000
Opted out voluntarily	36 (3.3)	13 (1.3)	49 (2.4)	0.002

Table.

Conclusions: The lost to follow up and mortality outcomes in patients on the ARTAccess™ system are non-inferior to paper system showing that mHealth tools are a safe alternative for documentation of patient refills in DSD models.

EPE346

Barriers impeding care for people living with HIV: early findings from Community-Led Monitoring in Haiti

S. Policar[1], J.H. Isidor[2], A.M. Gerald[3], E. Steide[2], L. Lucien[2], V. Shubert[4], V. Toureau[5], C. Mouala[5], N. Ledan[6], A.R. Sharp[7]

[1]*Organization for Development and Fight against Poverty (ODELPA), Port-au-Prince, Haiti,* [2]*Housing Works, Port-au-Prince, Haiti,* [3]*l'Action Citoyenne pour l'Égalité Sociale en Haïti (ACESH), Port-au-Prince, Haiti,* [4]*Housing Works, New York, United States,* [5]*Joint United Nations Programme on HIV/AIDS (UNAIDS), Port-au-Prince, Haiti,* [6]*Health Global Access Project (Health GAP), Port-au-Prince, Haiti,* [7]*The O'Neill Institute for National and Global Health Law, Georgetown University, Washington, United States*

Background: Community-led monitoring (CLM) is an emerging and powerful approach to improving the quality of health care for people with HIV (PWH), and members of key populations (KP) and other affected groups. CLM consists of a routine cycle of civil society-led monitoring and advocacy with the aim of improving services for PWH and promoting accountability for the communities receiving care.

In 2020, the Community Observatory for HIV Services (OCSEVIH) launched a CLM project in Haiti to identify barriers to HIV care and to advocate for better health services.

Description: Surveys were conducted in 41 healthcare facilities in the Nord, Artibonite, and Ouest departments from April to June 2021, including 41 observation-based surveys of facilities, 41 facility manager interviews, and 980 patient surveys (including 689 PWH). Data were collected by a team of PWH and KP community monitors. Separately, 6 focus groups and 45 semi-structured individual interviews were conducted in the broader community. Qualitative data were analyzed using a thematic codebook developed by the monitors and other CLM team members.

Lessons learned: 60% of patients surveyed reported traveling long distances to clinics, despite 59% having facilities closer to home. Wanting to avoid being seen was cited by 44% of these respondents as the primary reason for traveling to remote facilities. Monitors observed at least one privacy concern in 22% of clinics, such as consulting multiple patients in one room.

Other concerns included buildings in bad condition (29% of clinics), feeling unsafe (24% of patients surveyed), and staff reprimanding patients for missed visits (11%). Qualitative data reveal violations of privacy (described in 31 out of 45 interviews) and disclosure of HIV status (21 out of 45) in clinics, mainly via separation of PWH from other patients in waiting rooms, counseling and discussions of health information in public spaces, and disclosure of HIV status by health personnel to community members.

These findings are being used in advocacy with duty bearers to address these barriers.

Conclusions/Next steps: Ensuring confidentiality and privacy is critical, particularly in settings where HIV-related stigma is high. Improving treatment initiation and retention for PWH is critically dependent on improving patient confidentiality and acceptability of healthcare services.

EPE347

Demonstrating DHIS2 tracker success in large scale longitudinal client level service data and referrals for AGYW in DREAMS service delivery

A. Sheets[1], J.M. Alcantara Acosta[1]

[1]*Population Services International, Digital Health and Monitoring, DC, United States*

Background: One of the underpinning components of a successful PEPFAR DREAMS program is ensuring adolescent girls and young women (AGYW) receive all services in the primary prevention package and clinical services that meet each AGYW's individual HIV risk. This relies on "active referrals" by DREAMS implementing partners to ensure that not only are they identifying which services the AGYW needs from another partner but to actively support and follow that referral to linkage. Paper vouchers passively provided have never managed to accomplish this task.

Description: PSI leveraged the DREAMS DHIS2 database in Malawi and Zimbabwe to manage referral workflows using a tracker program shared across partners. Partners issue referrals, indicating the service needed and receiv-

ing partner. To close referrals, the referring or receiving partner is able to confirm the outcome (whether linked or lost to follow up). Partners can view referrals received and linkage status of outgoing referrals in real-time.

While the referral program is shared, the service outcome data captured in DREAMS relies on separate DHIS2 programs for each partner to maintain confidentiality.

Lessons learned: The scale of this implementation using DHIS2 tracker has demonstrated the ability of DHIS2 to stand up to this volume of longitudinal client tracking, providing an important use case for the new feature development in analytics and referrals workflow in DHIS2.

The ability to seamlessly track data across partners allows for a deeper analysis into barriers to linkages: which services are slow to link, which geographic regions have the biggest challenge, and how community and facility partners are working together to support bringing the right care to the right clients.

Conclusions/Next steps: Despite a robust referral system the biggest lesson is that on the ground efforts by partners are still key to manage linkages. This system exposed where referrals needed strengthening and will continue to allow programs to increase layering and linkage rates across IPs in support of DREAMS programming.

Now that it's demonstrated that it is possible to leverage DHIS2 at scale for referrals and linkages, the PSI's development team shared the configuration as use cases with UiO to support the next round of DHIS2 innovations.

EPE348

Sex Workers Murder Monitoring Tool in Africa. A tool for HIV treatment and prevention among sex workers collective in Africa

C. Mukoma[1]

[1]*African Sex Workers Aliance (ASWA), NRB, Kenya*

Background: Sex workers are considered a key population for HIV. According to the 2016 UNAIDS Prevention GAP Report, HIV prevalence among sex workers is 10 times greater than among the general population. Even in very high prevalence countries, such as most countries in the African region, HIV prevalence among sex workers is much higher than among the general population.

A combination of biological, social and structural factors interact to heighten sex workers' vulnerability to HIV. According to the UNAIDS Gap Report (2014), the top four reasons why sex workers are being left behind are: violence, criminalisation, stigma and discrimination; and lack of programs and funding.

Description: Sex Workers Murder Monitoring Tool is an innovative initiative in 35 countries of sub-Saharan Africa to systematically monitor, collect and analyse reports of murders and violence against sex workers in Africa. The tool is an online platform made for sex workers who remotely uses an online open-source platform that is easily accessible on smartphone and the ASWA website. All cases of violence are reported on the tool.

The data analysts are able to monitor and track the cases reported and make reports. Updates of the preliminary results are published on sex workers' websites in Africa. Violence escalated during the COVID-19 pandemic, heightened by the loss of livelihoods among sex workers.

Lessons learned: In Kenya, 500 sex workers have faced violence cases and 135 were murdered since COVID-19. In Uganda,50 sex workers were murdered. In Cameroon, sexual violence was 44.1%,35 sex workers were murdered. In eSwatini15 Sex workers were murdered. In Angola, Sex workers murdered were 30.

Conclusions/Next steps: The data from the tool has been presented for data-driven advocacy for health and HIV/AIDS policy shift, change of punitive laws, practices, and enactments against sex work. Advocacy for decriminalisation of sex workers resulted in declassifying sex work from petty offenses statutes in Zimbabwe. The data on violence was used to advocate for the rejection of Uganda's Sexual Offence Bill, targeting sex workers.

The data was also used by human rights defenders to petition Ghana's Parliament not to pass a bill targeting the LGBTI sex workers in Ghana.

EPE349

Innovative use of supply chain data to strengthen HIV commodities management in Apac district of northern Uganda

H.J. Ogwal[1]

[1]*JSI-USAID Regional Health Ingegration to Enhance Services Project, Health Systems Strengthening (Supply Chain), Lira, Uganda*

Background: Antiretroviral (ARV) commodities supply chain management ensures optimal and uninterrupted supply of quality medicines to implement HIV care and treatment. The implementation core players include the facility staff, medicines management supervisors, the District Health Team, central warehouse and the Ministry of Health. The efforts to achieve a resilient supply chain system in the Lango sub-region of northern Uganda were affected by COVID-19 pandemic, inadequate funding, poor order fulfillment rates, poor logistics management by facilities and inadequate data use for decision making.

Description: The major interventions supported by the JSI-led USAID Regional Health Integration to Enhance Services - North, Lango (RHITES-N, Lango) project include annual procurement planning, ordering and reporting for resupply, rational medicines use, stock status monitoring, and data use to inform timely decisions. Despite the support, between January 2020 to January 2022, Apac district experienced stock-outs of ARVs among other commodities. To address this, RHITES-N, Lango supported the district to undertake the following activities and approaches:

- Review of all vital commodity data, including consumption, days stock out, losses and adjustments, stock balances, months of stock available, quantities to order,

and order fulfillment rates from sources like HMIS 105, order reports, weekly real-time ARV stock status and monthly stock evaluation

- Monthly commodity meetings to review progress, challenges and actions
- Intensify use of data to inform actions that included redistribution, emergency orders, targeted capacity building mentorship.

As a result, there was stabilized stock availability during the period of review. All five ART sites in the Apac maintained optimal stock level for all key commodities like ARVs, TB medicines, laboratory and other commodities.

Lessons learned: Data ownership enables use for decision making. Furthermore, the DHO's commitment and stewardship optimizes responses by all key players of commodity management.

Conclusions/Next steps: ARV Stock stability is a critical prerequisite to successful HIV prevention, treatment and achieving the 95-95-95 target. The best practices from Apac will be cascaded to other districts in the Lango subregion to ensure sustained stock stability.

Approaches to using data to improve programming

EPE350

Improving HIV case finding through index testing: findings from CDC-supported health facilities in South Africa, October 2019—September 2021

S. Aheron[1], S. De Anda[1], A. Ochieng[1], K. Ayalew[1], F. Basson[2], N.K. Cecilia[3], N. Dube[4], S.P. Gribble[5], M.E. Patton[1], J. Grund[1], J. Olivier[1]

[1]Centers for Disease Control & Prevention, Pretoria, South Africa, [2]Health Systems Trust, Durban, South Africa, [3]Wits Reproductive Health and HIV Institute, Johannesburg, South Africa, [4]The Aurum Institute, Johannesburg, South Africa, [5]TB HIV Care, Cape Town, South Africa

Background: Index testing, defined as offering HIV testing to biological children, needle-sharing or sexual partners of HIV-positive clients, is recommended as a targeted testing approach to increase newly diagnosed case finding to achieve the 95-95-95 goals for HIV epidemic control was introduced in South Africa in 2018. Prior to 2018, a generalized testing approach was used.

Description: We analyzed aggregate quarterly facility data reported from 784 South African facilities which offered index testing across the four CDC-supported Provinces from October–December 2019 (Q42019) to July–September 2021 (Q32021). Data included numbers of overall and index HIV tests performed and new HIV-positive tests to assess growth and contribution of index testing to the overall testing program. Chi-squared analysis was used to assess differences between Q42019 and Q32021 among provinces, sex, and age group.

Lessons learned: Index testing implementation significantly improved (0.05%) between Q42019 and Q32021, overall HIV tests increased from 1,119,101 to 1,244,296 (11.2%) and those from index from 21,238 to 50,516 (137.9%). Overall HIV-positive tests decreased from 58,351 to 41,280 (-29.3%) while positive index tests increased from 3,018 to 4,998 (65.6%). The proportion of overall HIV tests and new positive tests contributed by index testing increasing from 1.9% to 4.1% and from 5.2% to 12.1%, respectively.

Eastern Cape and Kwa-Zulu Natal were successful in testing and new case finding from index due to early government buy-in, rigorous focus on training, tools, monitoring and strong engagement with community partners for outreach/tracing/tracking index contacts. Gauteng experienced declines primarily due to outward migration because of COVID-19.

	Overall Testing Program				Index Testing			
Province & Demographics	Number & % Change of HIV tests performed	P-value	Number & % Change of new HIV-positive tests	P-value	Number & % Change of HIV tests performed	P-value	Number & % Change of new HIV-positive tests	P-value
Eastern Cape	-29.7% (n=-44,854)	0.00	-36.1% (n=2,266)	0.00	460.5% (n=5,112)	0.00	407.3% (n=2,464)	0.00
Gauteng	-0.1% (n=-300)		-46.3% (n=-11,782)		-43.5% (n=-3,135)		-38.1% (n=-1,757)	
Kwa-Zulu Natal	51.6% (n=165,199)		0.0% (n=-8)		237.2% (n=26,522)		207.4% (n=13,708)	
North West	1.9% (n=5,150)		-30.6% (n=-3,015)		44.8% (n=779)		51.7% (n=727)	
Female	14.7% (n=111,203)	0.00	-28.4% (n=-10,465)	0.012	126.0% (n=13,788)	0.00	79.4% (n=1,222)	0.00
Male	3.8% (n=13,992)		-30.8% (n=-6,606)		150.4% (n=15,490)		51.3% (n=758)	
<15	32.5% (n=31,759)	0.00	-47.3% (n=-629)	0.00	49.8% (n=3,685)	0.00	-29.5% (n=-61)	0.00
15+	9.1% (n=93,436)		-28.8% (n=-16,442)		185.0% (n=25,593)		72.6% (n=2,041)	

Table 1: HIV tests and positives overall and from index testing by province, sex, age, South Africa, Q42019 to Q32021

Conclusions/Next steps: Index testing performed better than the general testing program due to strong partner engagement and rigorous focus on the program proving to be an important case finding strategy in South Africa.

EPE351

Improving cardiovascular health for aging patients living with HIV: a Boston University Medical Center Quality Improvement Initiative

E. Jansen[1], N. Sanfratello[1], A. Asundi[2,3]

[1]Boston University School of Medicine, Continuing Medical Education Office, Boston, United States, [2]Boston University School of Medicine, Infectious Disease, Boston, United States, [3]Boston Medical Center, Center for Infectious Disease, Boston, United States

Background: The prevalence of cardiovascular comorbidities among people living with HIV (PLWH) have increased over time as the population ages. PLWH experience greater a burden of cardiovascular diseases (CVD) compared to people without HIV infection, even in the

Oral abstracts

Poster exhibition

E-posters

Late-breaker abstracts

Author Index

setting of viral suppression. Despite growing CVD morbidity in PLWH, known preventative strategies are under-implemented in the infectious disease clinic setting, including screening for risk factors, and statin utilization. The BUMC Center for Infectious Disease project team set a quality improvement (QI) aim to increase the proportion of high ASCVD risk (≥ 7.5%) PLWH prescribed a statin from 57% to 75% by May 31, 2022.

Description: From January to December 2021, the team carried out a QI project leveraging the Institute for Healthcare Improvement's Model for Improvement. The team obtained demographic and prescribing data from the health record and generated control charts. Patients aged 40-75, virally suppressed, with a recently completed appointment in the Center for Infectious Disease with their PCP were included.

The team performed a gap analysis to identify root causes of barriers to preventative interventions. Frontline clinicians identified, co-designed, and piloted practice changes using the Plan-Do-Study-Act cycle.

Lessons learned: Based on gap analysis findings, the project team implemented an automated ACC/AHA 10-year risk calculator that harvests data from the health record and trained the team on its use. This improved risk score calculation from 10% to an average of 71%.

To improve appropriate statin prescribing, we created opportunity reports, pharmacist and nurse-driven flagging of eligible patients, and developed screen capture animation patient education video in the top five languages to address prescribing disparities by preferred language found in our gap analysis. We do not yet observe a sustained increase in the percentage of high ASCVD risk* PLWH that have a prescription for statin therapy.

Conclusions/Next steps: The automated calculator reduced reliance on provider memory and increased accessibility to ASCVD risk information at point of care. Supportive workflows that facilitate shared decision-making conversations may be key to sustainably increasing appropriate statin prescribing.

Centering equity through data disaggregation uncovers important disparities, and is essential for informing culturally and linguistically tailored cardiovascular health interventions.

EPE352

Improving HIV outcomes in Nigeria using a technology-enhanced "situation room" approach

D.S. Dauda[1], E. Ondura[1], A.N. Ngusha[2]

[1]Palladium International Development, Data.FI Nigeria, Abuja, Nigeria, [2]Palladium International Development, Data.FI Nigeria, Uyo, Nigeria

Background: Despite substantial investments in systems to collect and manage HIV data, information gathered is poorly used to manage program performance due to government's inability to synthesize data across multiple information systems, the lack of access to real-time data analyses and visualizations, and poor accountability mechanisms to track implementation of prioritized actions.

The USAID-funded Data for Implementation (Data.FI) project developed an automated system for HIV program implementing partners (IPs) to report key indicators for weekly reporting, ensure data completeness and quality—particularly for clients newly testing HIV-positive, newly linked to, and currently on HIV treatment.

In Akwa Ibom, the state with the highest prevalence of HIV in Nigeria, Data.FI set up an HIV "Situation Room" (SR) with the state government to convene weekly data review meetings, allowing service providers, IPs, and decision-makers to closely monitor data in real-time, identify gaps, and agree on and triage solutions.

Description: Data.FI developed a standardized, action-oriented, technology-enabled SR methodology, leveraging the Automated Partner Performance Reporting (APPR) platform, which integrates and triangulates data from multiple sources (IPs' electronic medical records, laboratories, pharmacies, censuses, and routine PEPFAR reports) reviewed weekly for strategic planning and program improvement. The SR approach includes processes for identifying critical information needs, developing standard visualizations to facilitate problem identification, analyzing root causes of identified issues, and strengthening feedback mechanisms.

In collaboration with IPs, performance tracking and accountability tools are used to follow up on action plans, monitor performance improvements, and improve transparency, enabling continuous feedback and learning as a catalyst for ongoing program adaptation.

Lessons learned: A structured mechanism for regular and rapid review of data can help programs quickly identify HIV cascade inefficiencies, understand reasons for underperformance, and course-correct service delivery to improve HIV outcomes. Implementation of the SR approach in Akwa Ibom has led to improvement in outcomes across the HIV 95:95:95 cascade that have been well documented in published briefs disseminated in Nigeria and uploaded on USAID's Development Experience Clearinghouse to encourage learning.

Conclusions/Next steps: Building on the demonstrated success of the Akwa Ibom SR, the approach is being replicated in other states across Nigeria.

EPE353

Using the service quality assessment tool as a strategy to advance pediatric and adolescent HIV services progress towards the 95 95 95 goals for Uganda

A. Dennis[1]
[1]*Ministry of Health, AIDS Control Program, Non Communicable Diseases- NCDs, Kampala, Uganda*

Background: In Uganda, treatment cascade for children and adolescents across 95 95 95 cascade continues to lag behind adults. By 12/2020, 66% of children (0-9 years) and 57% of adolescents (10-19 years) knew their HIV status. Of these, 66% of children and 97% of adolescents were on antiretroviral treatment (ART). Viral load coverage was 74% for children, and 81% for adolescents with a viral load suppression of 37 and 67% for children and adolescents respectively, (DHIS 2020). The proportion of children and adolescents on optimal treatment was 73%.
This sub-optimal performance is partly attributed to absence of a simple tool to identify gaps. Ministry of Health (MOH) with support from Clinton Health Access Initiative developed the service quality assessment (SQA) tool and piloted it in selected regions with ≥70% of all children living with HIV.
Description: The SQA tool is modelled after six service standards for pediatric and adolescent HIV i.e., outpatient department screening and testing, same day ART initiation, optimal ARV regimens, updated viral load, adolescent responsive services, psychosocial support, and commodity ordering. Healthcare workers were trained on the tool and guided on routinely abstracting data using the tools dashboard to identify and address gaps. Mentorship and supervisions were conducted quarterly by MOH.
The tool was deployed in 603 health facilities in 27 districts in 01/ 2021 and data abstracted from 4,600 files in 03/2021. Analysis informed rapid mentorships addressing screening, linkage, retention, viral load collection and documentation gaps.
Lessons learned: By September 2021 compared to 12/2020, treatment cascade across all indicators improved within pilot regions; children 0-19 years who knew their status increased from 69% to 78%, ART initiations from 81% to 92%, ART optimization from 78% to 99%, viral load coverage from 78% to 91%, viral load suppression from 58% to 91%, and 12-month retention from 82% to 90%. SQAs allowed monitoring of paediatric and adolescent service standards to identify gaps for timely interventions.
Conclusions/Next steps: Regular SQAs that are easy to use and implement by healthcare workers can contribute to Uganda's achievement of the 95-95-95 goals.
SQAs should be scaled-up nationally for quality-of-care improvements for children and adolescents.

EPE354

Measuring what matters for COVID-19 responses: evidence on HIV related outcomes for adolescent girls

N. Said[1], M. Temin[2], S. Blake[2], T. Abularrage[2]
[1]*International Planned Parenthood Federation (IPPF) Secretariat, Medical and Technical Unit, London, United Kingdom,* [2]*Population Council, New York, United States*

Background: Adolescent girls and young women comprised an estimated 10% of the population in sub-Saharan Africa but accounted for 59% of new HIV infections (UN, 2019).
Evidence on the effectiveness of short-term and the long-term mitigation strategies for COVID-19 is still limited. To better characterize the historical evidence on interventions and outcomes for adolescent girls, we conducted a structured review to advance four goals:
- Identify high-potential interventions to be replicated to reduce girls' risk of contracting COVID-19.
- Identify short-term emergency interventions to mitigate the secondary effects of COVID-19 on girls.
- Identify longer-term interventions that hold promise for "building back better" with and for adolescent girls.
- Map and visualize the evidence gaps by assessing the concentration of evidence across interventions studied, outcomes prioritized, girl sub-populations and in contexts of instability.

Methods: To answer these questions, we conducted a structured review that resulted in the selection of 171 studies from 25,000+, including 32 reviews and 139 evaluations.
Our systematic inquiry resulted in an *Evidence Gap Map* on the amount of evidence on interventions with demonstrated outcomes for girls.
This submission is on a subset analysis of referenced HIV outcomes in these studies to identify some gaps in our responsive interventions to girls and HIV.
Results: Using 3ie EGM platform, we found that 132 publications reported outcomes on girls health, 87 have included reference to HIV outcomes for adolescent girls.
The gap was demonstrated among interventions such as economic empowerment, schools, mental health, cash transfers, safe spaces, gender empowerment, GBV, menstrual health, teen pregnancy and, harmful practices such as child marriage.
These results were surprising as these interventions could be effective for HIV prevention and response among girls during COVID-19.
Conclusions: The available evidence and gaps on HIV studied outcomes for girls demonstrate the need for evidence-informed HIV interventions and for more research to address the gaps.

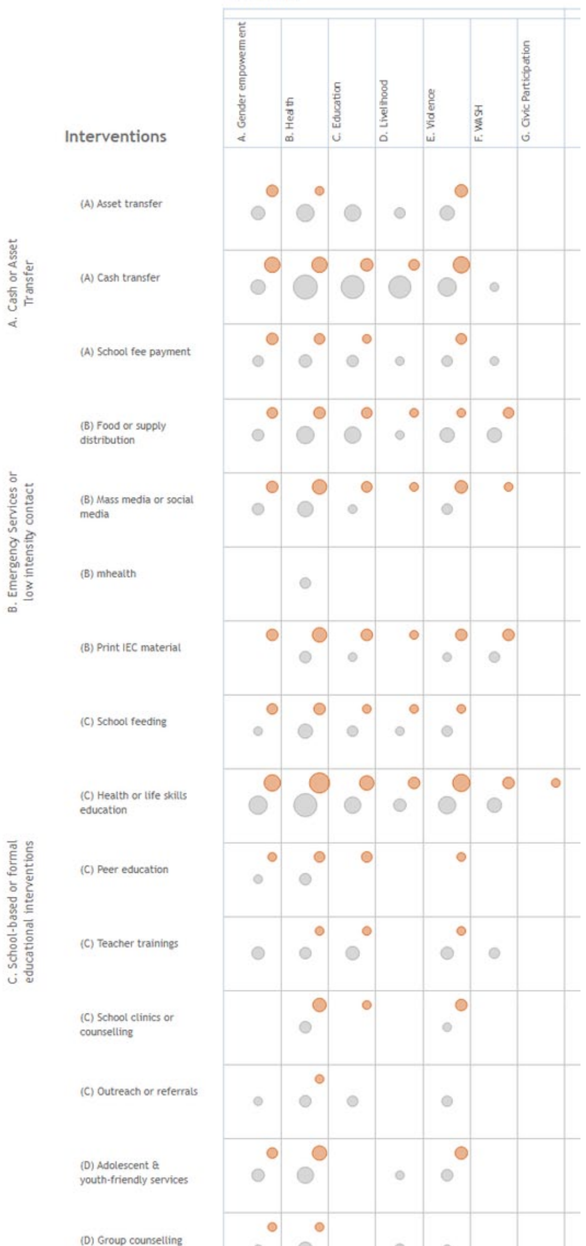

Figure. Evidence Gap Map on adolescent girls interventions and outcomes in low-resource settings in the era of COVID-19.

EPE355

The impact of human resource support on HIV care continuum indicators in four provinces in Mozambique

K. Borces[1], R Sato[2], T. Namalela[1], M. Prieto[1], J. Pacca[3], F. Moi[1]
[1]ThinkWell, Maputo, Mozambique, [2]Harvard University, T.H. Chan School of Public Health, Boston, United States, [3]Abt Associates, ECHO Project, Beira, Mozambique

Background: To support Mozambique in achieving HIV epidemic control, the Efficiencies for Clinical HIV Outcomes (ECHO) project deploys technical assistance (TA) and health providers in health facilities in four provinces. To inform the allocation of additional health staff to ECHO facilities, this analysis assessed the association between ECHO project inputs—TA visits and the clinical staff support—and performance on key HIV care continuum indicators.

Methods: A hybrid panel regression model was used to estimate the effect of ECHO human resource support on HIV key performance indicators in supported facilities from October 2019 to September 2020. The model used lagged independent variables to account for the delayed effect of project inputs on HIV continuum care indicators, and controlled for facility catchment population and HIV prevalence using proxy variables. Data for this analysis was obtained from Mozambique's DHIS2 database and ECHO project databases.

Results: Each additional TA visit provided by the ECHO project was correlated with an increase of 6 patients receiving ART, while deploying each additional clinical staffer was correlated with an increase of 135 patients receiving ART. Both TA visits and clinical staff support were correlated with a decrease in the number of ART patients lost to follow-up (LTFU), by 7 and 71 patients respectively. Additional clinical staff support was also correlated with a 3.2 pecentage point increase in the percentage of ART patients with suppressed viral load. However, TA visits were correlated with a decrease in HIV positivity yield by 0.1 percentage points, and a decrease in patients newly enrolled in ART by 2 patients. Clinical support was also found to be negatively correlated with these indicators, but the correlation was not statistically significant.

Conclusions: Our results suggests that the ECHO project was successful in increasing the number of patients receiving HIV treatment and reducing the number of patients LTFU. Decreases in HIV positivity yield and the number of people newly enrolled in ART may be related to approaching ART saturation in each facility's catchment population. Additional data to extend the analysis beyond the one-year time frame is needed to better understand underlying trends in health facility performance.

EPE356

The total package: an integrated monitoring, accountability and quality improvement (IMAQI) system to link participatory community monitoring of service delivery to quality improvement of health facilities

R. Walters[1], L. Mondry[1]
[1]Positive Vibes Trust, Cape Town, South Africa

Background: Since 2017, Positive Vibes has supported key populations in seven East/Southern Africa countries to monitor health facilities and dialogue with healthcare workers, programmers and policy makers around quality improvement. Methodologies and strategies have evolved to deepen and extend the impact of monitoring at facility level through a comprehensive system of tools that supports engagement and accountability, substantiates community advocacy with authoritative data, and links monitoring with practical quality improvement.

Description: Cooperating communities and facilities progress systematically through the IMAQI system that supports joint analysis, diagnostics, design, remedial action, and ongoing monitoring of user-satisfaction.

1. Applied annually, *"Setting The Levels"* is a process where discrete populations and healthcare workers reflect on their subjective perceptions of services, coming together to compare/contrast perspectives, and dialogue;
2. *ma'Box* is an online virtual suggestion box. Clients give real-time feedback on their user-experience and generate data;
3. Trusted, community-identified *Peer Monitors* stationed at facilities encourage and assist clients to rate their experience on the ma'Box platform;
4. Communities participate in a *Quarterly Review of ma'Box data,* preparing, analysing and interpreting data, generating findings and recommendations;
5. Communities present data to monitored facilities as the departure point for Quality Improvement. *"A Better Place"* is a tool to support priority-setting and Quality Improvement Plan and budget development.

The IMAQI system is cyclical; the effects of quality improvement recognisable in improved satisfaction levels reported in routine ma'Box data.

Lessons learned: Monitoring is a powerful practice for marginalised, disenfranchised communities. It grows confidence for expression, raising expectations for quality and dignified care. Service uptake improves as facilities respond positively to feedback. Monitoring can, however, become problematic. When accountability is too strong -- exclusively negative and critical -- monitoring based in contestation becomes counterproductive; accountability breaks the relationships necessary for cooperative solutions. Alternatively, healthcare workers, better informed by feedback, may wish to do better; they may want to improve, but not know how. Intention does not automatically confer direction.

Conclusions/Next steps: Monitoring that achieves the most effective results supplements critique with solutions. It links communities and facilities into a plan and resourcing (human, technical, programmatic, financial) to implement quality improvement within a finite timeframe.

EPE357

Optimizing Electronic Medical Record System-EMasterCard and granular data driven evidence to support program improvements in an expanded geographical area

E. Gulule[1], S. Phiri[1], J. Van Oosterhout[2], M. Chivwara[1], J. Lichenya[1], D. Smith[2], T. Masangano[1], S. Malajira[1], K. Phiri[1]
[1]*Partners in Hope, Lilongwe, Malawi,* [2]*University of Califonia, Department of Medicine, Los Angeles, United States*

Background: Electronic medical record (EMR) systems have been important in electronic granular data capture solutions for Point of care real-time program and epidemic surveillance. Granular data reporting by age and sex was observed challenging in Malawi. In September 2019, Malawi expanded EMR system from 206 to 724 (99.3%) using hybrid electronic system-EMasterCard.

We describe how Partners In Hope (PIH) transitioned from paper based data capturing and reporting on an expanded geographical area to using E-mastercard system.

Description: Malawi Health system has largely used paper based record management system. In 2006 Malawi national EMR system on HIV & AIDS programming was launched and has evolved significantly overtime. PIH is a Malawian non-governmental organization supporting HIV care and treatment supporting 123 facilities in 9 districts. In September 2019, PIH adopted, supported and expanded roll-out of E-Mastercard from 35.6% to 100%.

The transition involved hiring and deploying of 212 facility based data clerks. PIH also provided training to both data clerks, and ART providers including developing standard operating procedures. While it would take 21 days to manually collect and report data at 32 facilities on quarterly basis, it is currently taking 5 days to collect and report data at 123 facilities on monthly basis. PIH has also increase frequency of granular program data review meetings from once a quarter to monthly.

Lessons learned: Optimizing EMR usage has seen significant time saving and human resource which was initially required is now being used for other Care & Treatment activities including viral load monitoring and back to care programs. Granular data review meetings have resulted in PIH introducing other care and treatment initiatives such as Risk Stratification and Advanced HIV Disease as part of quality of improvements.

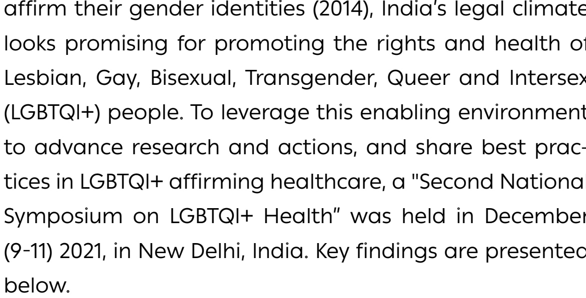
Conclusions/Next steps: PIH will advocate to Malawi Ministry of Health through E-Health technical working group to incorporate other health care service delivery points currently not included in EMR such as Cervical Cancer, STI, and COVID 19.

EPE358

Advancing LGBTQI+ Health in India: evidence, and research and policy/program priorities from the 'Second National Symposium on LGBTQI+ Health'

V. Chakrapani[1], S. Rawat[2], C. Bhattacharjya[3], S. Kaur[4], A. Singh[5], S. Bharucha[5], L. Ramakrishnan[6], K. Ranade[7]
[1]*Centre for Sexuality and Health Research and Policy (C-SHaRP), Chennai, India,* [2]*Humsafar Trust, Mumbai, India,* [3]*United Nations Development Programme (UNDP), New Delhi, India,* [4]*USAID India, New Delhi, India,* [5]*John Hopkins University (JHU) ACCELERATE, Hyderabad, India,* [6]*Solidarity and Action Against the HIV Infection in India (SAATHII), Chennai, India,* [7]*Tata Institute of Social Sciences (TISS), Mumbai, India*

Background: With Supreme Court verdicts decriminalizing adult consensual same-sex relationships (2018) and recognizing the rights of transgender persons to self-



affirm their gender identities (2014), India's legal climate looks promising for promoting the rights and health of Lesbian, Gay, Bisexual, Transgender, Queer and Intersex (LGBTQI+) people. To leverage this enabling environment to advance research and actions, and share best practices in LGBTQI+ affirming healthcare, a "Second National Symposium on LGBTQI+ Health" was held in December (9-11) 2021, in New Delhi, India. Key findings are presented below.

Description: In this hybrid mode-symposium with 14 sessions, 130+ persons attended in person and 1000+ people watched the live-streamed proceedings. Speakers/panelists identified several gaps in LGBTQI+ health research, policies and programs. In relation to men who have sex with men (MSM) and transfeminine people, the government's focus has been on HIV prevention and care, with inadequate attention on mental health, alcohol/substance use, online HIV prevention interventions.

Only a few state governments reimburse costs of or provide free gender-affirmative hormones/surgeries for transgender persons. Limited understanding of the health needs of LGBTQI+ people, secondary to misinformation in medical curricula, lack of institutional policies on gender categories in outpatient/inpatient intake forms and access to restrooms were discussed. Intersex activists reported ongoing practice of medically unnecessary surgeries on children with intersex variations and conflation of intersex people with transgender people. The lack of reliable estimates of LGBTQI+ populations poses a challenge for planning and budget allocation.

Lessons learned: Current evidence and national programs focus on HIV-related issues of MSM and transfeminine people, with little work in relation to mental health, stigma reduction, and health of lesbian/bisexual women, transmasculine people and people with intersex variations. There is a need to support research programs and build the capacities of young researchers in health research, especially researchers from the LGBTQI+ communities.

Conclusions/Next steps: This national symposium helped bringing together diverse key stakeholders and provided a snapshot of the progress and gaps in LGBTQI+ health. An action plan for various stakeholders is being finalized to improve LGBTQI+ health, especially in relation to creating LGBTQI-specific policies, programs and research agenda.

EPE359

Ensuring HIV commodity availability in Ghana through effective data analytics for informed decision making: the case of Western and Western North Regions

D. Forson[1], E. Menyah[1], E. Amegashie[1], D. Kimera[1]

[1]*Contractor for USAID Global Health Supply Chain Program Procurement and Supply Management, Accra, Ghana*

Background: With funding from the U.S. President's Emergency Plan for AIDS Relief (PEPFAR), GHSC-PSM provides support to Ghana's National AIDS Control Program to strengthen HIV commodity management in the Western Region and Sefwi-Wiawso district of the Western-North Region. To ensure a reliable supply of HIV program commodities, the project regularly monitors supply chain performance and uses results to address identified gaps. GHSC-PSM employs data analytics as a key mechanism to drive evidence-based decision-making and improvements in commodity availability at health facilities.

Description: GHSC-PSM's data analytics program analyzes and triangulates monthly HIV consumption data, regional warehouse stock reports, HIV-supportive supervision data to identify facilities with supply management challenges and initiate actions to fill gaps. The project conducts a comparative data analysis of these data sources, using advanced excel analytic tools to generate outputs and create dashboards that help identify potential risks of overstock, expiry, or stockout.

GHSC-PSMshared data analytics outputs with regional supply chain coordination mechanisms to inform discussions and promote the use of data for decision-makingandfacilitated learning and experience sharing by collaborating with the regions to disseminate analytics outputs during regional HIV review meetings.

Using data analytics, partners have conducted emergency central-to-regional level distribution and inter-facility redistribution to improve commodity availability at health facilities. From July 2020 to June 2021, TLD availability increased from 84% to 100% in all ART sites.

Lessons learned: Analyzing and triangulating data at various levels of the supply chain can provide useful information for evidence-based decision-making. In Ghana this approach revealed challenges with the supply management and use of HIV commodities, leading to the adoption of corrective measures to help address gaps. Using supply chain data for intervention-targeting and decision-making can support broader HIV care and treatment goals.

Conclusions/Next steps: GHSC-PSM expects to improve the triangulation of logistics data with service data and strengthen data analytics with the introduction and use of the automated platform Power BI to speed up turnaround time of analytics outputs and visualization. Supply chain actors can utilize data analytics as a tool for driving performance improvement and ensure sustained availability of HIV commodities at the last mile.

EPE360

The impact of seroconversion date estimation on seroconversion rates: analysis of routine HIV test data among female sex workers in Zimbabwe

H.S. Jones[1], S. Musemburi[2], L. Chinyanganya[2], A. Takaruza[2], S.T. Chabata[2], P. Matambanadzo[2], B. Rice[1], B. Hensen[3], J.R. Hargreaves[1], F.M. Cowan[2,4]

[1]London School of Hygiene and Tropical Medicine, Faculty of Public Health & Policy, London, United Kingdom, [2]The Centre for Sexual Health and HIV/AIDS Research Zimbabwe (CeSHHAR Zimbabwe), Harare, Zimbabwe, [3]London School of Hygiene and Tropical Medicine, Faculty of Epidemiology and Population Health, London, United Kingdom, [4]Liverpool School of Tropical Medicine, International Public Health, Liverpool, United Kingdom

Background: Estimates of HIV incidence among female sex workers (FSW) in Sub-Saharan Africa remain challenging to obtain, potentially impacting programming and policy decisions. One approach is to calculate seroconversion rates from routinely collected HIV test data, however these data are susceptible to irregular testing patterns leaving uncertainty around the time of seroconversion. We applied four methods to estimate seroconversion dates between HIV tests to understand how these influenced seroconversion rates.

Methods: We analysed HIV test data from Zimbabwe's national sex work programme between 2009-2019, including all women with an HIV-negative test before 2018 and one or more subsequent tests at least one month later. We assigned a date of seroconversion between last HIV-negative and first HIV-positive test using four methods:

1. Randomly generated,
2. Midpoint,
3. Two weeks before an HIV-positive test, and;
4. Two weeks after a last HIV-negative test.

We used lexis expansion to split our data by two-year calendar periods and calculated rates of seroconversion for these with each method.

	Estimation Method							
	Randomly generated date		Midpoint date		Two weeks before HIV-positive test date		Two weeks after last HIV-negative test date	
Year	HIV+/ person years	rate/100 person years	HIV+/ person years	rate/100 person years	HIV+/ person years	rate/100 person years	HIV+/ person years	rate/100 person years
2009-2011	25/4.6	5.5 (3.4-9.1)	24/4.6	5.2 (2.8-10.5)	17/4.7	3.6 (1.8-7.7)	33/4.4	7.5 (4.6-12.5)
2012-2013	49/11.3	4.3 (2.7-6.8)	45/11.4	4.0 (2.6-6.0)	28/11.6	2.4 (1.6-3.9)	67/11.0	6.1 (4.0-9.2)
2014-2015	118/32.6	3.6 (3.1-4.3)	120/32.6	3.7 (3.2-4.2)	103/33.2	3.1 (2.6-3.7)	141/31.8	4.4 (3.8-5.3)
2016-2017	157/46.6	3.4 (3.0-3.8)	166/46.7	3.6 (3.2-4.0)	160/47.7	3.4 (2.8-4.3)	120/45.9	2.6 (2.3-3.1)
2018-2019	15/8.7	1.7 (1.2-1.6)	10/8.7	1.2 (0.7-2.2)	57/8.9	6.4 (4.8-8.6)	4/8.7	0.5 (0.2-1.3)

Table 1: Seroconversion rates by method of seroconversion date estimation

Results: Among 5,054 women with an initial HIV-negative test, 365 (7.2%) subsequently tested HIV-positive with a median seroconversion interval of nine months (273 days, IQR 140-529). Each method produced similar seroconversion rates for the time period 2009-2019: 3.4/100py (two weeks before), 3.5/100py (midpoint, random), 3.6/100py (two weeks after). Rates calculated for shorter periods showed greater variation, ranging from 3.6/100py (two weeks before) to 7.5/100py (two weeks after) for 2009-2011, and from 1.2/100py (midpoint) to 6.4/100py (two weeks before) for 2018-2019 (Table 1).

Conclusions: Estimating HIV seroconversion rates from routinely collected data is a resource-efficient approach that could become increasingly applicable as regular HIV testing coverage of FSW is optimised. To inform timely and appropriate programming decisions the method of seroconversion date estimation needs to be considered as this could influence calculated rates over shorter periods, potentially under or overestimating the true rate of seroconversion.

EPE361

Engagement in a digital health intervention for young Black and Latinx men and transwomen who have sex with men

S.K. Choi[1], J. Golinkoff[1], M. Mulawa[2], S. Hirshfield[3], L. Hightow-Weidman[4], K. Muessig[4], J. Bauermeister[1]

[1]University of Pennsylvania, Philadelphia, United States, [2]Duke University, Durham, United States, [3]State University of New York Downstate Medical Center, Brooklyn, United States, [4]University of North Carolina, Chapel Hill, United States

Background: Digital HIV interventions (DHIs) have demonstrated efficacy in increasing social support, reducing stigma, and promoting engagement in care among sexual minority populations, yet challenges persist in sustaining participants' use of DHIs. To address a gap in the understanding of DHI engagement, we examined correlates of engagement within a randomized controlled trial among young Black and Latinx men and transwomen who have sex with men (YBLMT) participants.

Methods: HealthMpowerment 2.0 was designed to promote HIV prevention behaviors among YBLMT (ages 15-29). Over the study period, participants' interactions with the DHI were collected in real time. In this study, we summarized 427 participants' weekly time spent on the DHI over 12 weeks. We used t-tests and chi-square tests to compare engagement.

Results: The average total duration of use was 30.67 minutes (range 0.05-574.2). 38.4% of the intervention participants and 15.5% of the control participants used the DHI for more than 30 minutes (active users) across their first 12 weeks in the trial ($p<0.0001$). Participants in the intervention arm spent twice as much time within the DHI as those in the control arm (40.64 minutes vs. 18.90 minutes; $p<0.0001$) over 12 weeks. Engagement for both arms was the greatest in week 0 and week 1 and the difference between the study arms was also the greatest during those weeks (see graph). Participants with an annual income

Poster exhibition

E-posters

Late-breaker abstracts

Author Index

below $20,000 were more likely to be active users compared to non-active users (58.0% vs. 46.1%; p=0.02). At the 12-week follow-up assessment, active users reported higher usability and engagement with various intervention features than non-active users (p<0.01).

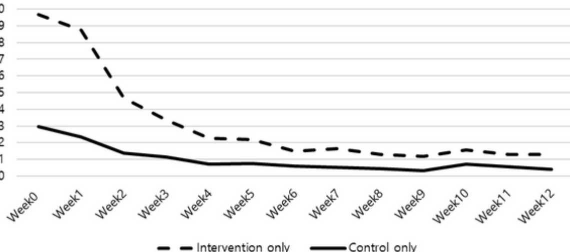

Figure. Weekly minutes spent on the HMP 2.0 by intervention arm.

Conclusions: Participants' DHI engagement declined after 2 weeks of the trial. Given the importance of intervention engagement in DHI, design thinking approaches that consider variabilities in needs and usage could promote the overall engagement and efficacy of DHIs.

EPE362

Improving viral load suppression in four provinces of Mozambique using a tool for early identification of unsuppressed patients

C. Taibo[1], M. Cazonda[1], A. Barros[1], E. Mbalane[1]
[1]*Abt Associates, ECHO Project, Beira, Mozambique*

Background: According to the World Health Organization, the viral suppression of people living with HIV defines the success of antiretroviral therapy. Patients with a viral load (VL) above 1,000 copies/ml must be rigorously monitored to identify the causes of non-suppression and consequently reinforce adherence to treatment.
To facilitate this process, the Efficiencies for Clinical HIV Outcomes (ECHO) Project created a tool that generates weekly alerts to psychosocial support services (PSS) with the aim of reducing the time between receiving the unsuppressed result and implementing follow-up interventions, which continue until viral suppression is achieved.
Description: The project implemented this instrument in March 2020 at 58 health facilities in Tete, Sofala, Manica and Niassa provinces and expanded it to an additional 90 health facilities between April and September of the same year. All unsuppressed VL results, after being entered into the Open MRS system, are then populated into a weekly list that clinicians and PSS staff use to enforce adherence. The planned activities follow national testing algorithms. Prior to the tool's implementation, the project carried out in-service training for clinicians and those responsible for monitoring in each province.
Lessons learned: Reminders delivered make it possible for caregivers to quickly identify patients who need specific interventions such as PSS consultations, clinical consultations, requests for a new VL test, new sample collection, and access to results. This has contributed to an improvement in viral suppression in the four targeted provinces. General VL suppression among the four provinces was 68% in March 2020, rising to 80% in August 2020, after the tool's implementation. In December 2021, the average VL suppression rate was 90%.
Conclusions/Next steps: This tool has proved to be useful in the follow-up of patients who were not suppressed as data shows. The tool makes it possible for caregivers to quickly identify patients who need targeted interventions.
Its implementation could contribute to improved VL outcomes at the national level for patients with unsuppressed viral loads.

EPE363

Introducing a data-driven district-level planning process to strengthen HIV programming, with a vision to achieve 95-95-95 in the state of Andhra Pradesh, India

N. Sundari[1], H. Patel[2], C. Laxmeshwar[2], C. Murugudu[2], J. Lalband[2], K. Kumar[2], A. Phalke[2], U. Sharma[3], M. Nyendak[3], D. Joshi[3], D. Canagasabey[4], A. Hegde[2]
[1]*Andra Pradesh State AIDS Control Society, Vijayawada, India,* [2]*PATH, Mumbai, India,* [3]*Centers for Disease Control and Prevention, New Delhi, India,* [4]*PATH, Washington, DC, United States*

Background: Regular analysis and use of programmatic data for planning has the potential to optimize service delivery and program outcomes. Under the CDC-funded Strengthening Strategic Information Management System (SIMS) Project, PATH supported the Andhra Pradesh State AIDS Control Society (APSACS) to roll out a granular data-driven district-level planning process to improve district-level HIV programming to achieve the first 95.
Description: Continuous quality improvement mentors trained and mentored seven District AIDS Prevention and Control Units (DAPCU) to analyze routine data from national HIV information systems reported by service delivery sites/providers (e.g., Integrated Counseling and Testing Centers, link workers); highlight gaps in reaching targets; develop and implement an action plan; and review progress against action plan (see figure).
The DAPCUs implemented this process from August through December 2021. We compared performance data from this period to data from August through December 2020 to understand if this process led to improved performance against HIV testing indicators.
Lessons learned: There was an observed increase in achievement (table) for annual HIV testing targets (39.7% versus 20.5%; p<0.001) and partner testing (45.0% versus 40.4%; p<0.001). There was no change observed in linkage to treatment (97.7% during both time periods).
Data-driven monthly discussions with DAPCUs and site-level teams enabled mid-course adjustments and informed district-level decisions. Monthly review meet-

ings provided a valuable opportunity for cross-learning; exchanging experiences with peer groups; and refining data required to measure and evaluate specific activities.

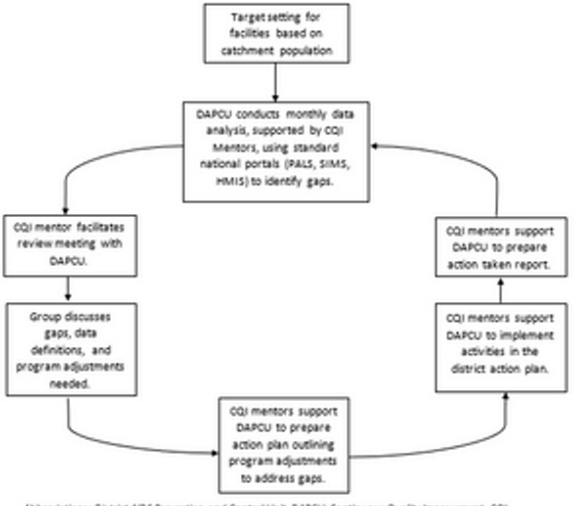

Figure. Flowchart pf data-driven district action planning process.

	Percentage achievement for annual HIV testing targets	Percentage linkage to treatment	Percentage of partners of newly-diagnosed HIV positive people tested
August-December 2020	20.5% (81,109/394,643)	97.7% (2,169/2,221)	40.4% (877/2,169)
August-December 2021	39.7% (156, 671/394,643)	97.7% (3,035/3,105)	45.0% (1,365/3,035)

Table.

Conclusions/Next steps: Application of the data-driven district-level planning process led to improved performance in HIV testing (number of people tested and percentage of partners tested), leading the APSACS to now expand its use across all districts of Andhra Pradesh. Data-driven decentralized program planning is essential to ensuring that programs at all health system levels progress towards epidemic control targets.

EPE364

"We should have access to information at our fingertips" – results of a mixed methods study of data availability and use by decision makers for HIV programs in Blantyre, Malawi

M. de Almada[1], R. Haggard[2], P. Khomani[3], S. Ndira[3], D. Green[4], D. Hoege[5], S. Allinder[6], T. Smith[3], Y. Kamgwira[7], G. Kawalazira[8], C. Holmes[6]

[1]Cooper/Smith, Windhoek, Namibia, [2]Cooper/Smith, Oxford, United States, [3]Cooper/Smith, Lilongwe, Malawi, [4]Cooper/Smith, Seattle, United States, [5]Georgetown University, Center for Innovation in Global Health, New York City, United States, [6]Georgetown University, Center for Innovation in Global Health, Washington D.C., United States, [7]National AIDS Commission, Blantyre, Malawi, [8]District Health Office, Blantyre, Malawi

Background: Timely and high-quality data are key to maximizing the efficiency of HIV programmes. Decision makers need the right data at the right time to make informed decisions. However, data use for decision making in HIV programmes is poorly understood in Blantyre.
We performed a data user study in Blantyre which mapped the key decisions, data, and the information systems decision-makers use for HIV prevention.

Methods: We drew a sample of 71 decision makers. These people leverage data for policy, management, or delivery purposes. We deployed app-based questionnaires collecting both quantitative and qualitative information.
We asked about their decisions, the indicators they use, and what HIV prevention services they focus on. We generated descriptive statistics and used thematic analysis to analyze qualitative data.

Results: Respondents came from civil society (42%), government (38%), and private sector (20%) and represented a variety of organizational levels including the city or district (37%), national (25%), community (23%) and facility (15%). The program areas that most frequently reported for decision making included condoms (54%), adolescent girls and young women (AGYW) (48%), and both STIs and HIV treatment (44% each). Paper based sources such as reports (54%) and registries (49%) were most commonly used while the District Health Information System (or DHIS) was the most commonly used digital data source (28%). Although over 1,000 indicators were reported as available, decision-makers reported using only 93 to support their work. Thematic analyses indicated digital literacy, access to digital systems, and availability of data are critical challenges that hinder data-driven decision making. The community-level was commonly reported as needing capacity building as a data collector as was the facility-level.

Conclusions: A diverse sample of decision makers reported a complex picture of accessing and leveraging data for decisions. Improvements are needed in digital data collection, reporting, and analysis to meet the needs of decision makers. Capacity building in data collection should prioritize the community. Future refinement of

Oral abstracts

Poster exhibition

E-posters

Late-breaker abstracts

Author Index

routine data collection should focus on improving alignment of data needs of decision makers with available indicators. Further inquiry into the sufficiency and value of available and future data sources is needed.

EPE365
The first multi-sectoral, user-driven data pipeline to adaptively manage HIV prevention programs in Malawi

T. Smith[1], D. Green[2], M. Moszczynski[3], S. Asbah[4], P. Khomani[1], S. Ndira[1], D. Hoege[5], S. Allinder[6], Y. Kamgwira[7], G. Kawalazira[8], C. Holmes[6]
[1]*Cooper/Smith, Lilongwe, Malawi,* [2]*Cooper/Smith, Seattle, United States,* [3]*Cooper/Smith, Warsaw, Poland,* [4]*Cooper/Smith, Ramallah, Palestine, The State of,* [5]*Georgetown University, Center for Innovation in Global Health, New York City, United States,* [6]*Georgetown University, Center for Innovation in Global Health, Washington D.C., United States,* [7]*National AIDS Commission, Blantyre, Malawi,* [8]*District Health Office, Blantyre, Malawi*

Background: In Malawi, HIV prevention data are fragmented, managed by different custodians, and are difficult to analyze and interpret nationally and by frontline workers. District, city, and health facility managers have limited views and ownership of HIV data, both within the formal health system and in the community. Despite the importance of social determinants on HIV risk, available data are typically summary statistics without context. This results in underused data and missed opportunities for more targeted and effective prevention activities.
We integrated HIV-related data sources into a 'data pipeline' with real-time, web-based, automated analyses and visualizations for decision makers in Blantyre, Malawi.
Description: We developed the Prevention Adaptive Learning and Management System (PALMS) for Blantyre. PALMS is a data pipeline which leverages the country's existing programmatic, surveillance, research, and donor data sources. As new data are available, PALMS ingests, transforms, analyzes, and visualizes the results. All PALMS development is driven by Blantyre leadership with processes to incorporate feedback, shifting priorities, and new data systems. To improve ease of use, PALMS data are automatically mined to highlight concerning statistics and notify users. Finally, PALMS is developed to 'plug and play' with the national enterprise architecture and is being absorbed by MOH technicians to improve sustainability and facilitate uptake to other interested districts.
Lessons learned: PALMS was rapidly adopted by decision-makers and used to monitor site performance, anomaly detection, and identify hotspots. Systems notifications are the most popular feature and have helped focus attention on facilities and programs that need the most support. The biggest barriers to PALMS development were not technological, but rather involved navigating the complex data ownership landscape and eliciting and integrating user feedback.
Conclusions/Next steps: PALMS will expand to include additional data sources, multi-platform notifications, and interoperate with a new HIV incident management tracker. We believe PALMS will help usher in a new data-driven, event-based surveillance approach to HIV prevention in Blantyre. The PALMS approach can be generalized to other settings and can hone attention and support resource allocation efforts.
Such user centered designed, sustainable, and scalable data systems that satisfy user expectations are feasible and desperately needed for HIV programmes throughout Africa.

EPE366
Data for action - developing a multi-country CLM dashboard for visualization, reporting, and program management

B. Honermann[1], L. Rutter[2], N. Rambau[3], A. Sharp[4], J. Sherwood[1], E. Lankiewicz[1]
[1]*amfAR, The Foundation for AIDS Research, Andelson Public Policy Office, Washington, United States,* [2]*Health GAP, Johannesburg, South Africa,* [3]*Ritshidze, Johannesburg, South Africa,* [4]*O'Neill Institute for National and Global Health Law, Washington, United States*

Background: Community-Led Monitoring (CLM) is a key way to improve healthcare quality and accountability. Despite considerable early successes and impact by CLM projects, an emerging challenge in many programs is the need to rapidly conduct analysis of large volumes of data, produce easily understood visualizations, and develop reports that facilitate real-time advocacy and accountability interventions.
Description: Since 2019, the Ritshidze programme in South Africa has developed an online CLM data dashboarding system to automate critical data functions. Adapted versions of this platform are in use in Haiti, Malawi, Uganda, and Zimbabwe. The system provides near real-time data and analytical support across all stages of CLM implementation including data collection, warehousing, analysis, visualization, report generation, advocacy, and project management.
Lessons learned: Partnership: The data and reporting needs of CLM projects are dynamic and must be responsive to the advocacy needs of civil society. As such, long-term partnership between CLM programme staff and developers of CLM support tools is essential.
Data Warehousing: Recognizing the need to ensure data ownership by the community, CLM tools targeting support for multiple projects should not store multiple project's data together in a single database.
Indicator Analysis: Automated scoring systems for each CLM developed indicator are essential for rapid analysis and tracking of results over time, accounting for unequal sampling sizes and lack of predefined performance targets.

Oral abstracts

Poster exhibition

E-posters

Late-breaker abstracts

Author Index

Data Visualization: CLM projects are inherently focused on fixing issues at the local level. Data visualization systems must direct the analysis towards the lowest possible level where issues need to be resolved, namely identifying facilities that require intervention.
Automated Reporting: High-quality reports at facility, district, and provincial levels are an indispensable tool for routinely sharing findings with health officials, conducting advocacy efforts, and obtaining buy-in from health facilities, without overwhelming the project's staffing and capacity. Reports that contextualize successes and challenges relative to peers are the most effective.
Project Management Tools: Large-scale CLM implementation is administratively complicated. Project management tools for tracking data collection completion and administer users and facilities are essential.
Conclusions/Next steps: Iteratively developed CLM data tools are essential for rapidly moving from data collection to advocacy and accountability.
Ritshidze Dashboard: http://data.ritshidze.org.za

EPE367

The Global HIV Prevention Coalition (GPC) scorecards: a framework for analyzing progress and performance of national HIV prevention responses

C. Benedikt[1], L. Zembe[1], A. Gerritsen[2], S. Arias Garcia[3], I. Wanyeki[3], V. Bendaud[3], K. Sabin[3], M. Mahy[3], S. Orhan[3], P. Auberson-Munderi[1], on behalf of the Global HIV Prevention Coalition
[1]*UNAIDS, Global HIV Prevention Coalition Secretariat, Geneva, Switzerland,* [2]*Independent Consultant, Amsterdam, Netherlands, the,* [3]*UNAIDS, Geneva, Switzerland*

Background: Before the launch of the GPC in 2017 there was no common framework for assessing progress in HIV prevention responses. UNAIDS developed a prevention scorecard with a prevention results logic from outputs (prevention programme coverage) to outcomes (service use / behaviour) and impact (estimated new HIV infections).
Description: Scorecards were produced annually from 2017-2021 for five priority pillars:
1. Prevention among adolescent girls and young women,
2. Prevention with key populations,
3. Condoms,
4. Voluntary medical male circumcision (VMMC),
5. ARV-based prevention.

The scorecard covers indicators on structural and policy barriers to HIV prevention. Scorecards are based on country reporting within Global AIDS Monitoring and include data from population-based surveys, programme records and UNAIDS epidemiological estimates.
Lessons learned: Scorecards revealed large variation in HIV prevention coverage, outcomes and impact across 28 GPC countries (19 in Africa and 9 in other regions). Median coverage of prevention programmes for sex workers was 36% (interquartile range 20-58%), for men who have sex with men 28% (24-60%), for people who inject drugs 27% (5-56%) and for young women in areas with high HIV incidence 35% (22-70%). Median condom use was 79% (63-91%) among sex workers, 67% (54-78%) among men who have sex with men, 50% (35-59%) among young women and 62% (48-75%) among men with non-regular partners. Median progress against 2016-2020 cumulative VMMC targets was 58% (45-99%). The median number of people on PrEP relative to epidemic size (per 100 new infections) was 26 and varied strongly (13-111), while median national ART coverage was 75% (60-86%). On average, new HIV infections declined by 40% between 2010-2020 in GPC countries, ranging from 72% decline in Côte d'Ivoire to 84% increase in Pakistan. Findings suggest that there are high-performing and low-performing countries with all five pillars and structural barriers. Large gaps in prevention coverage exist in most countries. Data gaps were largest for key population programmes.
Conclusions/Next steps: GPC scorecards proved to be a useful instrument to systematically track progress and promote accountability. The application of the scorecard approach will be expanded beyond the 28 GPC focus countries and sub-national scorecard tools developed.

Evaluating large-scale programmes: Approaches to rigorous evaluation

Global software is an open-source LIS tailored for LMIC public health laboratories. The Côte d'Ivoire Ministry of Health and the United States President's Emergency Plan for AIDS Relief have been collaborating since 2009 to implement OpenELIS for HIV data management. This study aimed to quantify the initial and enduring effects of OpenELIS on HIV data quality.

Methods: We performed interrupted time series analyses using negative binomial mixed-effects regression to estimate the effect of OpenELIS implementation on monthly CD4 testing data quality outcomes defined as timeliness, completeness, and validity. We obtained de-identified individual laboratory records from paper registries for 12 months before OpenELIS adoption and from OpenELIS servers since adoption until December 31, 2020. Data were from three reference laboratories and five district laboratories that adopted OpenELIS in 2015, 2018, and 2019 and serve approximately 38,100 people living with HIV in five regions. Each laboratory record was assessed on the primary outcomes and analyzed at the laboratory level. We estimated relative risks representing monthly outcomes compared with counterfactual outcomes had the laboratories not adopted OpenELIS.

Results: There were 79,975 individual laboratory records during the study period, including 57,877 (72.3%) after OpenELIS adoption. A 28.5% increase (95% confidence interval [CI]: 1.026, 1.608) in timeliness, a 1.3% increase (95% CI: 1.001, 1.024) in completeness, and a 0.3% increase (95% CI: 1.000, 1.006) in validity were detected shortly after laboratories adopted OpenELIS. The improvements were sustained throughout implementation.

Conclusions: OpenELIS has improved HIV data quality at public health laboratories in Côte d'Ivoire, particularly in the early stage of implementation. Data in higher quality are more likely to be used and useful in HIV care and treatment. Ease of implementation, continuous technical support, and relative advantage of OpenELIS compared to paper registries have facilitated routine use of OpenELIS. The findings from this study provide evidence for future scale-up of OpenELIS in LMICs to serve HIV surveillance and disease management.

EPE369

The journey of postal testing for HIV and sexually transmitted infections in Wales

A. Williams[1], D. Gillespie[1], K. Hood[1], J. Nichols[2], Z. Couzens[3]
[1]Cardiff University, Centre for Trials Research, Cardiff, United Kingdom, [2]National Health Service, Cardiff, United Kingdom, [3]Public Health Wales, Cardiff, United Kingdom

Background: In response to the COVID-19 pandemic and closure of walk-in sexual health clinics across Wales, a postal testing service (Test and Post) was established allow individuals to continue testing for HIV and other sexually transmitted infections (STIs). Multiple evaluations and projects have been undertaken reviewing the service to identify its strengths and improve its provision.

Description: Test and Post is run by Public Health Wales (PHW) and incorporated into an existing online service that provided information related to sexual health and wellbeing in Wales. Postal testing allows for service users to order tests for Chlamydia, Gonorrhoea, Syphilis, HIV and Hepatitis B & C.

Results are communicated via text message for negative results and a phone call for positive/reactive results where follow-up tests and treatment are organised. The service was available from May 2020 and continues to run.

Lessons learned: From a service user perspective, Test and Post has been a great success. With feedback identifying the service targeting a real need, providing easy access and encouraging more to get tested through the removal of barriers. An increase in testing for Chlamydia and Gonorrhoea from pre-Covid levels was identified, supporting the service provision.

The quick set-up required in the circumstances resulted in the limitation of data management being poor at first. Data linkage for orders, results and linkage to care was not possible but PHW have addressed this since the evaluation. There are still issues within local clinics around using the correct coding to allow for data feedback to PHW.

Public perception around branding was found to be an issue. The integration of postal testing into an existing website (Frisky Wales) resulted in some confusion, with the public thinking the Test and Post was called Frisky Wales. This name was deemed inappropriate by some (mostly healthcare professionals), and has since been changed to Sexual Health Wales.

Conclusions/Next steps: PHW continue to develop the service and methods for testing. Issues with data linkage need to be overcome if accurate estimates of HIV and STI incidence in Wales are to be obtained and achieve the aim of the zero new HIV transmission's goal agreed by UK governments.

EPE370

Designing for impact: rigorous evaluation of two implementation models of a human-centered designed, direct-to-consumer digital intervention to prevent HIV and improve sexual health for Rwandan youth

L. Packel[1], E. Gatare[2], L. Hunter[1], R. Hemono[1], L. Kayitesi[2], S. Bertozzi[1], R. Hope[3], S. McCoy[1]
[1]University of California, Berkeley, United States, [2]YLabs, Kigali, Rwanda, [3]YLabs U.S., Berkeley, United States

Background: Human-centered design (HCD) has been increasingly used to design HIV-related interventions, but rigorous evaluations of these interventions are scant. We designed a robust hybrid effectiveness/implementation impact evaluation of CyberRwanda, a direct-to-consumer digital health platform created using HCD to improve HIV prevention and overall sexual and reproductive health (SRH) among Rwandan youth.

Description: CyberRwanda provides age-appropriate adolescent health and employment information for 12-19 year olds at schools using webcomics and linkage to high-quality, youth-friendly pharmacy services providing access to SRH products (e.g., oral contraception, condoms) through an online shop. Two implementation approaches are being delivered: self-service (independent use of CyberRwanda) and a more resource-intensive facilitated version (student groups with a peer facilitator and activity booklet). We are conducting a 3-arm, non-inferiority cluster randomized controlled trial in 60 schools (20 schools per arm, 100 students per school) across 8 districts to assess the relative performance of the two models to each other and versus comparison schools. Youth aged 12-19 will be followed for 2 years. The primary outcomes are HIV testing in the past year, uptake of a modern contraceptive method, and age of initiation of childbearing, measured at 24 months.

Lessons learned: We enrolled 6,082 students (51% female) with a response rate of 82%. After 8 months of follow up, we have successfully retained 94% of students. Baseline data indicate 38% of students had ever tested for HIV, and 20% had tested within the past year. Preliminary evaluation of process data indicate that distance to partnering pharmacies, cost of products, and stigma may pose significant barriers to contraceptive access. To disentangle these issues, free non-SRH related "mystery gifts" and limited-time product discounts have been added to pharmacies, and additional partnerships have been initiated with health posts in some districts.

Conclusions/Next steps: As one of the few rigorously evaluated HCD-derived interventions being delivered at large scale, the results of this 3-arm cluster RCT will reveal the effectiveness of the CyberRwanda intervention on SRH outcomes among youth. It will also shed light on the optimal implementation model, which will be enhanced by a complementary cost-effectiveness study.

EPE371

Private drug shops as providers of girl-friendly HIV prevention and sexual and reproductive healthcare: scaling and evaluating the *Malkia Klabu* intervention in Tanzania

L. Sheira[1], A. Sabasaba[2], L. Packel[1], A. Mnyippembe[2], M.-S. Kang Dufour[1], W. Maokola[3], S. McCoy[1], J. Liu[4]
[1]University of California, Epidemiology, Berkeley, United States, [2]Health for Prosperous Nation, Dar es Salaam, Tanzania, The United Republic of, [3]Ministry of Health Community Development, Gender, Elderly and Children, Dar es Salaam, Tanzania, The United Republic of, [4]University of California, Nursing, San Francisco, United States

Background: From 2018-2019, we used human-centered design (HCD) to co-develop a theoretically-driven HIV and pregnancy prevention intervention for AGYW ("*Malkia Klabu*"/"Queen Club") at private drug shops called Accredited Drug Dispensing Outlets (ADDOs) in Tanzania. The result, *Malkia Klabu*, was a loyalty program designed to enhance drug shops' role as HIV prevention and sexual and reproductive health (SRH) providers. AGYW earned punches for shop purchases, including free HIV self-tests, redeemable for small prizes of increasing value; free SRH products could be requested discreetly by pointing to punch-card symbols. Our four-month pilot among 40 shops (1:1 intervention/control) showed that intervention ADDOs had higher AGYW patronage, distributed more HIVST contraception to AGYW, and made more referrals compared to business-as-usual ADDOs. The potential impact of the *Malkia Klabu* program in large-scale implementation has yet to be determined.

Description: To rigorously evaluate the effectiveness of *Malkia Klabu* and optimize the implementation model for scale we are now conducting a cluster randomized controlled trial (c-RCT) among 120 ADDOs in forty wards in Shinyanga and Mwanza regions of Tanzania over two years commencing March 2022. Our rigorous design evaluating the HCD-derived intervention will assess the population impact of the intervention on the primary outcomes HIV diagnoses and antenatal care registrations using routine health facility data.

We will also assess implementation outcomes, evaluating program exposure through quantitative interviews with AGYW and assessing shop-level delivery strategies that bolster success.

Lessons learned: Using ubiquitous private drug shops as providers of basic health services/commodities leverages existing resources and provides a unique opportunity to increase access to priority health initiatives for underserved groups such as AGYW.

Informed by our pilot study, we anticipate that the *Malkia Klabu* intervention will result in increased uptake of HIV self-testing, contraception, and antenatal care visits among adolescent girls and young women in intervention wards compared to control wards.

Conclusions/Next steps: Our HCD-grounded program will be one of the first rigorously evaluated through a c-RCT, and will be well-positioned for scale-up should *Malkia Klabu* be effective.

The study will provide timely evidence on closing the gap between evidence and practice for HIV self-testing and contraceptive uptake among Tanzanian AGYW.

Effective approaches to linking population and programme data to inform HIV programming

EPE372

GIPA engagement audit: Assessing the National Association of People Living with HIV Australia's (NAPWHA) engagement of people living with HIV

J. Badge[1], B. Allan[1], A. Coogle[2], A. Ogier[2]

[1]Qthink Consulting, Malmsbury, Australia, [2]National Association of People Living with HIV Australia, Sydney, Australia

Background: The National Association of People Living with HIV Australia (NAPWHA) relies upon its membership and people living with HIV (PLHIV) from across Australia to understand the priorities for PLHIV. As the peak organisation in Australia representing PLHIV, NAPWHA invited Qthink to conduct an independent assessment of their capacity to engage with PLHIV.

Description: Over nine months, NAPWHA engaged Qthink, an external consultant, to ensure the voices of people living with HIV were heard. The consultants selected 'engagement' as a broader theoretical lens than 'involvement' to capture consultation and interaction with PLHIV and positive communities. A bespoke survey was completed by the leadership of NAPWHA's membership group (n=34). Its design was informed by Greater Involvement and more Meaningful Engagement of PLHIV (GIPA/MIPA) principles, and best practice guidelines sourced from a variety of international NGOs, peak bodies and advocacy organisations. In depth interviews were held with six nominated representatives exploring five themes that emerged from the survey results: accountability, autonomy, resources, representation and transparency.

Lessons learned: The final report provides critical insights and observations which will improve NAPWHA's engagement and consultation mechanisms with their members and the diverse communities of people living with HIV. The following five recommendations were put forward:

1. Create an organisation-wide consultation and engagement strategy.
2. Support emerging priority populations.
3. Enhance the capacity, operations and transparency of existing networking bodies.
4. Conduct a review of how improve geographical and representational diversity.
5. Conduct a governance review with a focus upon practices which would enhance accountability, transparency, and responsibility.
6. Improve transparency by publishing half yearly updates on major activities, campaigns and projects.

Conclusions/Next steps: GIPA/MIPA principles provide a sound basis for a PLHIV organisation's engagement review. NAPWHA has already commenced its governance review and will be commissioning an engagement strategy in 2022. By scrutinising internal policies, procedures and priorities through this lens, NAPWHA aims to strengthen its appreciation of and responsiveness to the diverse needs, identities and experiences that are represented among people living with HIV in Australia.

EPE373

Leveraging routinely collected programmatic data to inform extrapolated size estimates for key populations in Namibia

T. Loeb[1], K. Willis[1], F. Velishavo[2], D. Lee[3,4], S. Baral[1], K. Rucinski[5]

[1]Data. FI, Johns Hopkins Bloomberg School of Public Health, Epidemiology, Baltimore, United States, [2]IntraHealth Namibia, Windhoek, Namibia, [3]USAID/Dominican Republic, Santo Domingo, Dominican Republic, the, [4]USAID/Namibia, Windhoek, Namibia, [5]Data. FI, Johns Hopkins Bloomberg School of Public Health, International Health, Baltimore, United States

Background: Estimating the size of key populations (KP) including female sex workers (FSW) and gay men who have sex with men (MSM) can inform both the scale and content of specific HIV prevention and treatment programs at local and national levels. In places where direct population size estimates for KP are unavailable, including those extracted from Integrated Bio-Behavioral Surveys (IBBS) sampling frames (which are often limited in scope), small area estimation (SAE) can help fill in gaps using auxiliary data sources. However, routinely collected programmatic data have not historically been used in SAE approaches.

Methods: We used programmatic data to update national and subnational FSW and MSM size estimates in Namibia. Extrapolated estimates were obtained iteratively using simple imputation, stratified imputation, and multivariable regression of IBBS-collected direct estimates. KP program data, including PEPFAR Monitoring, Evaluation, and Reporting indicators and KP-STAR quarterly data, were used as priors to inform triangulation of multiple direct estimates using a Bayesian consensus-building approach.

		Simple Imputation PSE %		Stratified Imputation PSE %		Multivariable Regression PSE** %
	Region	IBBS	IBBS + Program Data	IBBS	IBBS + Program Data	IBBS
FSW	Zambezi	1.90	2.80	2.60	4.00	3.30
	Ohangwena	1.90	2.80	2.60	4.00	1.01
	Erongo	1.90	2.80	1.40	1.20	2.53
	Khomas	1.90	2.80	1.40	1.20	0.94
	Hardap	1.90	2.80	1.40	1.20	4.18
	Karas	1.90	2.80	1.40	1.20	3.21
	Kavango	1.90	2.80	1.40	1.20	1.22
	Kunene	1.90	2.80	1.40	1.20	4.68
	Omaheke	1.90	2.80	1.40	1.20	3.41
	Omusati	1.90	2.80	2.60	4.00	0.95
	Oshana	1.90	2.80	1.40	1.20	1.28
	Oshikoto	1.90	2.80	2.60	4.00	1.70
	Otjozondjupa	1.90	2.80	1.40	1.20	1.59
MSM	Zambezi	1.50	0.75	2.10	0.80	2.95
	Ohangwena	1.50	0.75	2.10	0.80	2.04
	Erongo	1.50	0.75	1.30	0.70	0.56
	Khomas	1.50	0.75	1.30	0.70	0.80
	Hardap	1.50	0.75	1.30	0.70	0.90
	Karas	1.50	0.75	2.10	0.80	1.43
	Kavango	1.50	0.75	2.10	0.80	1.46
	Kunene	1.50	0.75	1.30	0.70	0.63
	Omaheke	1.50	0.75	1.30	0.70	0.82
	Omusati	1.50	0.75	2.10	0.80	1.57
	Oshana	1.50	0.75	2.10	0.80	2.34
	Oshikoto	1.50	0.75	2.10	0.80	2.76
	Otjozondjupa	1.50	0.75	1.30	0.70	0.80

*Percentage of women and men aged 15-49 estimated to be female sex workers (FSW) and men who have sex with men (MS

**For multivariable regression, program data were not assessed as priors given the limited data points

Figure. Extrapolated regional FSW and MSM population size estimates (PSE) in Namibia, by data source and method.*

Results: Extrapolated national estimates for FSW ranged from 4777.5-11613.7, comprising 1.5%-3.6% of women ages 15-49. For MSM, estimates ranged from 2235.7-4611.2, comprising 0.7%-1.5% of men ages 15-49. The incorporation of program data resulted in a -221%-68% change in regional population proportions (*Figure*), with the largest number of KP predicted in Khomas, Namibia's most populous region.

Conclusions: Using SAE approaches, we combined epidemiologic and programmatic data to predict subnational size estimates for KP in Namibia. While imperfect, programmatic data represent a supplemental source of KP data that can be used to align size estimates with real-world HIV programs, particularly in regions where no other data are available, and necessitate an iterative approach to refine estimates.

Future work is needed to determine how best to include programmatic data in size estimation, ultimately bridging research with practice to support a more comprehensive HIV response.

Data and accountability and transparency

EPE374

Where to care: a new South Africa-based mobile mapping platform delivering accurate information on safe sexual and reproductive health services directly to you - wherever you are

B. Wurst[1], J. Sherwood[2], N. Zungu[3], M. Roemer[2]

[1]The TRIAD Trust, Boston, United States, [2]amfAR, the Foundation for AIDS Research, Public Policy Office, Washington, United States, [3]The TRIAD Trust, Johannesburg, South Africa

Background: South Africa has an established network of sexual and reproductive health (SRH) providers and high smartphone penetration. However, outdated information, unfriendly services, and costly mobile data limit beneficiaries' ability to navigate the health system.

In 2018, TRIAD Trust and amfAR created Where to Care (WtC), a no-cost mobile platform to map and disseminate information on safe, legitimate, public, private, and NGO SRH, Comprehensive Family Planning (CFP) and Gender-Based Violence (GBV) service providers directly to beneficiaries.

Description: The digital WtC map documents SRH providers, including those who offer HIV, safe abortion, and 40 other services. It helps beneficiaries find nearby health services based on their location and provides verified information about quality and friendliness, especially for youth, LGBTQ+ people, and other marginalized populations. A trained team of in-country data collectors populates the map. They conduct three verifying calls to each facility: a survey records available services, a "secret patient" call assesses patient friendliness, and a reconciliation call harmonizes discrepant responses. Update calls are conducted every 3-6 months. The map can be accessed online or sent directly to beneficiaries' phones using the WtC app, which sends a geolocating data-free link to the map through an SMS.

Lessons learned: As of January 2022, WtC covered 60 million individuals across South Africa. More than 35 international, national, and community-based user organizations actively disseminate links to beneficiaries with the WtC app. Most users send >100 messages per month. The average link is opened 2.7 times. This demonstrates high acceptability to providers and beneficiaries.

Conclusions/Next steps: Where to Care benefits providers and beneficiaries. Providers easily share information about local HIV support services, SRH, CFP, and GBV care options with beneficiaries. Beneficiaries access a private, affordable, trusted resource, enabling them to choose the onward care provider that offers the care they want. WtC's novel combination of scalable data collection and dissemination methodology actively provides beneficiaries with accurate information on HIV and SRH service availability and friendliness.

This tool has the potential for broad health benefits and may be especially important for youth and other marginalized populations. It should be standard practice for health and social service providers across the Global South.

EPE375

A data quality assessment of SALVAR (2006-2020), the main public health information system of people living with HIV in Mexico

A. Rodríguez-Atristain[1], F. Macías-González[1], H. Vermandere[1], S. Bautista-Arredondo[1]

[1]National Institute of Public Health (INSP), Health Economics, Cuernavaca, Mexico

Background: The Antiretroviral Administration, Logistics and Surveillance System (SALVAR) captures clinical information of patients living with HIV/AIDS without social security in Mexico. As the HIV/AIDS indicators derived from SALVAR are the basis for decision-making in Mexico, assessing the quality of SALVAR is essential.

Methods: We conducted quality assessments of SALVAR (2006-2020), containing 4,814,282 records of 245,602 patients in six modules:

1. general patient information,
2. treatment regimens,
3. CD4 count,
4. viral load,
5. GESTAR (maternal health data), and;
6. tuberculosis (TB) related data.

We assessed the data for key dimensions from several data quality frameworks. We assessed the entire system for interpretability, uniqueness, and completeness.

We also selected vital variables to assess timeliness, consistency, internal and external validity, and accuracy, defined as the percentage of values within two standard deviations.

Results: SALVAR has limited interpretability due to the lack of support documents like codebooks, metadata, and training materials. Regarding uniqueness, less than 1% of the patient observations were duplicated. For completeness, we found that over 80% of the potentially captured data was present in most modules, except for the GESTAR and TB modules (≈45% was missing).

Regarding timeliness, a delay in data acquisition occurs in 15% of the variables. In terms of consistency, the range of acceptable values for critical variables per module was between 72% and 96%; we found most implausible values in the viral load and CD4 modules. Concerning internal validity, we found illogical relationships in 6% to 28% of dates.

We found the poorest results in the external validity dimension: three modules included at least 52% of variables difficult to interpret. This result was mainly driven by poor coding of critical variables such as patient, facilities, and location identifiers. Finally, the accuracy results were optimal (>90%).

Conclusions: SALVAR is a valuable platform to monitor HIV/AIDS services in Mexico. Improving the timeliness of data collection could improve its usefulness for real-time monitoring. In addition, crucial data related to TB and maternal health is often missing. Supporting documents, locks or filters at the time of capturing, and periodic reviews could strengthen the system.

EPE376

Fit for purpose? Analysis of the quality and implications of PEPFAR's performance targets

B. Honermann[1], A. Jones[1], E. Lankiewicz[1], J. Sherwood[1], G. Millett[1]

[1]*amfAR, The Foundation for AIDS Research, Andelson Public Policy Office, Washington, United States*

Background: PEPFAR is the largest global funder of HIV programming. PEPFAR is intensely data driven, utilizing epidemiological and performance data to set district-level targets to achieve the UNAIDS 95-95-95 targets. Targets are used to assess district and implementing partner performance, and to inform resource allocation decisions. However, comparing results to targets is only useful if targets reflect reasonable expectations of performance.

Methods: We analyzed PEPFAR's district-level targets and results for HIV testing, HIV diagnoses, and treatment initiations from 2017-2021 evaluating the relationship between targets and results, stability of targets, and usability of targets as a metric of performance.

We calculated proportional annual changes and grouped districts by +/-10% proportional changes. Districts with complete annual targets with an annual target >=200 for an indicator were included. We additionally identify districts where targets/results fluctuate by 20% or more in opposite directions in consecutive three-year periods.

Results: 771 districts were included for HIV testing, 767 for HIV diagnoses, and 750 for treatment initiations. For HIV diagnoses, median district level targets increased 150% in 2018, decreased 36% in 2019, increased 20% in 2020, and decreased 35% in 2021, showing significant fluctuation.

Comparatively, median district results increased 5% in 2018 and decreased in each of the following years (12%/16%/8%).

Over the period, 318 districts (41%) experienced target fluctuations of more than 20% in opposite directions in three consecutive years compared to only 52 districts (7%) in results. Findings were similar for HIV testing and treatment initiations.

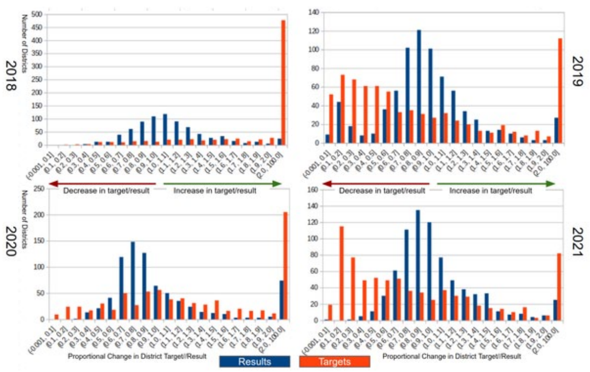

Figure. District level annual proportional change in targets and results for new HIV diagnoses.

Conclusions: Targets are critical for evaluating performance and progress in health programs. However, the quality of the target setting process is critical in whether the targets function as indicators of performance. PEPFAR's targets often fluctuate dramatically year-to-year, while changes in results are more modest.

Performance monitoring should reflect this, and target-setting limited to more gradual changes unless programming changes notably.

EPE377

Data Quality Audit: prioritizing the assessment of data management systems and accurate HIV data reporting of health facilities and civil society organisations in the Eastern Region of Ghana

E.A.A. Abrokwah[1], R. Ansong[2]

[1]*Ghana AIDS Commission, Technical Support Unit, Koforidua, Ghana,* [2]*Ghana Health Service, Eastern Regional Hospital, Koforidua, Ghana*

Background: Accurate HIV Data reporting is crucial to HIV programming and policy development. It is the bedrock of Ghana's agenda to End AIDS by 2030. Prioritizing Data Quality Audit is imperative to understanding the link between health data management systems and the accuracy of HIV Data reported for strategic information.

Oral abstracts

Poster exhibition

E-posters

Late-breaker abstracts

Author Index

Description: Data Quality Audit involves a trace and verification exercise carried out at randomly selected health facilities. The process cross-checks the accuracy of data reported along the reporting lines by re-counting all reported figures from their source documents. In 2021, the Technical Support Unit of the Ghana AIDS Commission undertook a Data Quality Audit exercise to assess data management systems and the accuracy of HIV reported data from January-September, 2021. The exercise covered 14 health facilities, and two Civil Society Organisations implementing Key Population interventions. A Verification Factor (VF) was used to determine if the data was under/overreported or accurate. A VF over 100% indicates an underreporting as more information was found at the site than was reported. A VF below 100% indicated an overreporting as fewer data was found at the time of the audit than was reported. A VF of 100% represents accurate reporting.

Lessons learned:
- 3 health facilities and 2 CSOs with functioning data management systems (100%) reported accurate data in all four health indicators and two KP indicators.
- 4 health facilities with partly functioning data management systems (50%) reported accurate data in only two indicators.
- 4 health facilities with poorly functioning data management systems (less than 50%) reported accurate data in only one indicator.
- 3 health facilities with no functioning data management system reported inaccurate data on all four indicators.
- It's a cost-effective way of providing training on data reporting since on-site training is provided for key staff.
- It provides leverage to address weaknesses in decentralized and national HIV reporting channels.
- It ensures effective programming of the HIV response.

Conclusions/Next steps:
- Advocate for routine data quality audits throughout the year.
- Train all key staff at health facilities in up-to-date HIV reporting systems and data management.

EPE378
Measuring local organization capacity building for USAID/PEPFAR compliance

C. Brokenshire-Scott[1], A.G. Balcha[2], C. Mejia[3], G.G. Admassu[2], Y. Asfaw[3], S. Oli[4], C. Raulfs-Wang[5], D. Kaliel[5]
[1]IntraHealth International, Washington, DC, United States, [2]IntraHealth International, Addis Ababa, Ethiopia, [3]IntraHealth International, Chapel Hill, NC, United States, [4]USAID, Addis Ababa, Ethiopia, [5]USAID, Washington, DC, United States

Background: In April 2018, PEPFAR announced a goal to direct 70% of USAID/PEPFAR funds to local partners through direct prime awards to achieve country ownership of the HIV response. In April 2019, the USAID-funded Accelerating Support to Advanced Local Partners (ASAP) Project, through IntraHealth International, began rapidly developing local organizations to have essential capabilities to serve as prime funding recipients for USAID and PEPFAR, furthering USAID's efforts to support countries' journey to self-reliance.

Description: The USAID Non-US Pre-Award Survey (NUPAS) is used to determine whether an indigenous organization has sufficient financial and managerial capacity to manage USAID funds following US Government and USAID requirements. ASAP expanded NUPAS to develop the NUPAS+ to identify significant weaknesses in organizational functions and procedures to managing US Government funds. NUPAS+ is conducted by external assessors with verifiable data. In Ethiopia, ASAP has conducted 16 NUPAS+ assessments to implement capacity development plans (CDPs). Reassessments were conducted after 12 months.

Lessons learned:
1. Using a metric of 1 to 4, with 4 showing the most compliance with least fiduciary risk, the reassessments showed the following changes:

Score	% at Baseline	% at Reassessment	Comment
1.0 to 1.5	5.71%	0	Risk reduced
1.51 to 2.5	19.5%	4.14%	Risk reduced
2.51 to 3.5	57.41%	65.43%	Improved compliance
3.51 to 4	17.38%	30.43%	Improved compliance

2. The lowest baseline scores were in fraud mitigation with an average of 1.39 and a reassessment score of 2.12, indicating more work is needed to create a culture of fraud risk mitigation and prevention.
3. Areas needing further capacity development include financial reporting, budget variance analysis, performance management, cost allocation, and compliance with legal provisions.
4. When there is a means to measure gender equity it can become an organization priority.
5. Data visualization through NUPAS+ dashboards maintains awareness of compliance standards and organizational procedures among leadership and technical teams.
6. Local primes have limited capacity to support local sub-partners with capacity building.

Conclusions/Next steps: NUPAS+ uses verifiable data to assess an organization's capacity and serves to monitor progress, post-baseline. CDPs are custom-made and implemented by expert advisors co-located for up to 12 months. These approaches and ASAP's metrics are contributing to USAID/PEPFAR's investment in localization.

Building a supportive digital ecosystem for achieving and maintaining HIV epidemic control

O. Velez[1], M. DeZalia[2], C. Pak[1], S. Fowler[2], M. Kumar[3], J. Shivers[4], J. Knueppel[5], P. Biondich[4], V. Shioshvili[1], A. Ngaruro[1], Data Use Community Team
[1]ICF, Rockville, United States, [2]Office of the US Global AIDS Coordinator and Health Diplomacy (S/GAC), Program Results and Impact Monitoring for Epidemic Control (PRIME), Washington, United States, [3]University of North Carolina, Chapel Hill, United States, [4]Regenstrief Institute, Indianapolis, United States, [5]BAO Systems, Washington, United States

Background: Data are critical to providing healthcare workers and health systems decision-makers with information needed to achieve the 95-95-95 goals. Health information systems investment and implementation have been fragmented and ad-hoc, making it challenging to understand best practices throughout healthcare systems to meet data needs, reduce system costs, and decrease documentation burden.

Towards that end, the Data Use Community (DUC) in collaboration with other data-focused groups has brought together key stakeholders to collaborate across facilities, countries, care levels, and organizations to share iterate upon best practices to support a better quality of care through data use and more information savvy healthcare systems.

Description: In a multi-prong approach that stresses local buy-in, accountability, and data transparency, we seek to: better understand effective data practices at facility and county levels; move towards collaborative and cost-effective information systems investments; and promote data sharing practices that reinforce good health data governance principles. The DUC convenes meetings where data users and system implementers share best practices. The meetings provide an opportunity for knowledge sharing in and between countries. Information presented is documented and synthesized for knowledge discovery and dissemination.

Lessons learned: From DUC learnings and building on the WHO Digital Health Atlas, the Digital Health Inventory was developed to routinely inventory digital health investments supported by PEPFAR to provide a better understanding of digital health ecosystems to maximize data use while reducing parallel or inefficient data flows and funding approaches. Similarly, the PEPFAR/MOH Data Alignment Activity (DAA) is a complementary initiative to help understand the full HIV landscape and better define targeted interventions. Facility level HIV results from the Ministries of Health of 23 countries and from PEPFAR are aligned to provide a comprehensive and unambiguous view of national programs. Combined, these activities receive input and support from a PEPFAR inter-agency committee to ensure coordination, and transparency across efforts.

Conclusions/Next steps: It is critical to defragment and de-silo data and systems so that information is accurate and usable for informed decision-making and care provision.

Through coordinated and collaborative efforts, we will expand regional and country support for these activities to increase effective data use towards achieving and maintaining HIV epidemic control.

Monitoring and reporting in the SDG era

EPE380

Monitoring tools for rapid assessment of pregnant women with detectable HIV viral load: using on-line data for the HIV vertical transmission elimination in Brazil

A.M. Brandão Beber[1], R. Brizolara[1], T. Benoliel[1], L. Neves da Silveira[1], F. F. Fonseca[2], A.C. G. Ferreira[1], A.F. Kolling[1], G.F. Mendes Pereira[1], A. Espinosa Miranda[1]
[1]Brazilian Ministry of Health, Department of Chronic Disease and Sexually Transmitted Infections, Brasília, Brazil, [2]Aids Healthcare Foundation, São Paulo, Brazil

Background: Scientific evidence has shown that in pregnant women living with HIV (PW-HIV) with undetectable HIV viral load and great adherence to antiretroviral therapy (ART) the rate of mother-to-child transmission of HIV (MTCT-HIV) is less than 1%.

Description: Brazil has an online virtual national system(SIMC) to monitor public laboratory HIV-VL and CD4+ account data, integrated with the national ART dispensation system. Since 2019, this system has a specific monitoring function for PW-HIV with detectable viral load(≥50copies/mL). As soon as there is an updated information and the PW-HIV achieve undetection, she is automatically excluded.

Managers and health professionals can access daily updated information in a single report. There are different levels of access to information and there are specific protocols to preserve the confidentiality.

This tool supports the organization of health services to prioritize and active search for PW-HIV with detectable viral load in a timely manner so they can re-engage in care and achieve undetection. It also generates updated indicators to support public policies.

Lessons learned: From December 2019 to December 2021,managers and health professionals had access daily updated information of 6,673 PW-HIV identified (mean 1,098 PW-HIV/month) in the SIMC. Mean age was 27 yo, 50.6% were black, 59% had <12 years education, 69% had high viral load (>1,000copies/mL) and no ART use (29%) (Table1). This conditions related to increased risk of MTCT-HIV.

	2019	2020	2021	Total
Viral load(copies/mL)	n=1.182	n=3.078	n=2.413	n=6.673
>1000	65%	70%	69%	69%
50-1000	35%	30%	31%	31%
Antirretroviral Terapy				
No	30%	28%	29%	29%
Yes	70%	72%	71%	71%

Table 1: Pregnant women living with HIV with undetectable HIV viral load, initial profile in SIMC-pregnant. Brazil, 2019-2021.

Conclusions/Next steps: Despite public policies, wide availability of HIV diagnostics, treatment, prophylaxis and efforts to eliminate MTCT-HIV, Brazil still has PW-HIV at high risk for MTCT-HIV. This powerful monitoring tool encourages the integration of care and surveillance in the active and immediate search for these most vulnerable women.

Next SIMC update will expand the inclusion criteria and link PW-HIV with delayed in ART delivery, regardless viral load, and detect PW-HIV with adherence issues and increased risk of detecting the viral load in pregnancy.

EPE381

Automated reporting from a health facility-based Electronic Medical Record System (Uganda EMR) increases accuracy and decreases delays in reporting to a national aggregate DHIS2: Uganda's Military HIV program experience

B. Lutimba Mutebi[1], D. Bwayo[1], J. Akao[2], B. Turesson[3], M. Laverentz[3], R. Zavuga[4], A. Wasukira[4]

[1]University Research Co., LLC, Kampala, Uganda, [2]US Embassy, Department of Defense, DoD, Kampala, Uganda, [3]University Research Co.,LLC, Maryland, United States, [4]Uganda People's Defense Forces, Bombo, Uganda

Background: Uganda's Ministry of Health is strengthening the National HMIS for evidence-based decision-making. However, the inability to report data elements automatically from EMRS hinders this process. At military health sites, data was often manually summarized from registers and later manually entered into the aggregate DHIS2. This manual process affected data completeness, accuracy, reporting timeliness, and increased workload for health workers who support reporting.

It is against this background that the military HIV program piloted Uganda EMR at six of its health sites in May 2020. This abstract reveals the comparison results between the Uganda EMR sites and the non-EMR sites.

Description: A feasibility assessment was conducted at 6 high-volume health sites at which the EMR was rolled out over 12 weeks. Efficiency of the sites was monitored quarterly and compared with the efficiency at 21 non-EMR sites. IT equipment was installed and at sites where power outages occurred, solar backup systems were installed. Focal staff in the ART clinic were oriented on data capture and reporting from the system.

At the end of the first quarter, a quarterly report was run from the system and used to complete the periodic Ministry of Health HMIS quarterly reports then entered into DHIS2.

Lessons learned: Data elements generated automatically from Uganda EMR were 100% complete and accurate, while at the other 21 sites, the manual generation process resulted in a 65% to 100% completeness with accuracy ranging from 45% to 95% through June 2021. The Uganda EMR report required only one staff member to have it complete whereas the manual generation required 4 to 6 staff to do the aggregation. The time factor observation revealed that on average it takes close to seven hours to manually aggregate a quarterly report depending on the site volume, while it is just a few mouse clicks in Uganda EMR to have the same report.

Conclusions/Next steps: Data elements generated from Uganda EMR to DHIS2 have eliminated transcription errors, improved report completeness, and reduced delays in reporting to the district. Currently, the Uganda EMR has been rolled out at 27 military ART sites with 21 sites running the point of care mode.

Using big data in the HIV response

EPE382

Use of machine learning in predicting and improving retention in care

M. Ijaiya[1], I. Duruanyanwu[1], B. Obasa[1], E. Troncoso[2], E. Okwor[1], B. Okeowo[1], J. Kato[1], M. Mutloatse[3], L. De Voux[3], S. Merritt[2], P. Anyanwu[4], B. Dare[1], O. Ogundare[1], E. Atuma[1], M. Strachan[2], I. Iyortim[5], R. Fayorsey[6]

[1]Jhpiego, Abuja, Nigeria, [2]Jhpiego, Baltimore, United States, [3]Palindrome Data, Cape Town, South Africa, [4]ICAP in Nigeria (Columbia University), Abuja, Nigeria, [5]United States Agency for International Development (USAID), Abuja, Nigeria, [6]ICAP at Columbia University, New York, United States

Background: Poor retention in care of patients on ART remains a major challenge to achieving epidemic control in Nigeria. Data-driven predictive models using machine learning have been suggested for identifying patients at risk of experiencing Interruption in Treatment (IIT). These techniques can capture complex non-linear interactions between variables, supporting the complex factors that may result in an IIT.

Machine learning (ML) techniques can identify and rank key predictors of IIT, allowing programs to implement proactive and targeted interventions to improve retention in care.

Methods: We applied supervised ML algorithms to de-identified individual patient level electronic medical records data of a cohort of persons living with HIV from

90 facilities across four Nigerian states at USAID-funded RISE-supported sites. Only patients who had at least two pharmacy refill visits between 1st January 2017 and 31st December 2020 were included in the analysis.
We defined our outcome measure retention in care as clients who have not had a missed clinic drug refill appointment more than 28 days consecutively per PEPFAR guidelines. Merged demographic, clinic, pharmacy and laboratory data were investigated in multiple models as potential predictor variables.
Results: A total of 266,702 records for 41,392 clients were included in the final model. Our best model was an Adaboost Classifier, when fitted resulted in a ROC Area Under Curve (ROC-AUC) of 0.76, had a positive predictive value of 60%, a sensitivity of 61% and a negative predictive value of 73% and specificity of 80%. Length of time in treatment and number of recorded sequential visits were found to be of high predictive importance.
Prescription duration; number of days late to collect the medication; months since last visit; year and day of visit; day of month that the prescribed medication is to be fully consumed; number of visits on a particular regimen; and more than 3 days late to collect medication count were also found to be significant factors.
Conclusions: ML is one tool that can be used to support clinicians in identification of HIV clients at risk of treatment interruption or VL un-suppression. Predictive modelling can help improve patient monitoring, improve retention and patient outcomes.

Impact of COVID-19 on HIV prevention services

EPE383
Sexual behaviour and STI prevention during the COVID-19 pandemic

A. Skaletz-Rorowski[1], N. Brockmeyer[2], S. Nambiar[1], M. Basilowski[1], J. Wach[3], M. Uhrmacher[1], A. Kayser[4], B. Koehler[1], W. Knebel-Brockmeyer[1], A. Kasper[1], A. Potthoff[1]
[1]Walk In Ruhr, Center for Sexual Health and Medicine, Bochum, Germany, [2]Deutschen STI-Gesellschaft (German STI Society), Bochum, Germany, [3]Public Health Department Bochum, Bochum, Germany, [4]Aidshilfe Bochum (Aids Service Organization Bochum) e.V, Bochum, Germany

Background: Almost all sexual health services report lower numbers of sexual transmitted infections (STI) testing and counselling during the COVID-19 pandemic. Data on sexual behavior and incidental STI is controversial.
Given the structure of its attendees, WIR – Walk In Ruhr, Center for Sexual Health and Medicine, is able to obtain data from diverse living environments.
Methods: Based on the online HIV/STI risk test (ORT), questionnaires and data from ongoing studies and attendee data of the WIR, changes in sexual behavior and STI incidence before 2020 and during the COVID-19 pandemic were analyzed.
Results: The use of the anonymous ORT rose by 40.4% from 367 (before 5/2020) to 507 users per month (after 5/2020). While young heterosexuals (18-24 years) used ORT less, heterosexuals between 25 -29 years and men having sex with men used it more frequently, bisexual sex was reported by more than 30% of the participants. More ORT users reported a positive prior STI test or acute symptoms after 5/2020.13% more attendees were observed in 2020 at the WIR center compared to 2019.
The rate of positive STI tests for chlamydia (CT), gonorrhea (NG) and mycoplasma (MG) rose significantly (0.001) from 21.5% in 2019 to 28,8% in 2020. The most common infections among 18-29 years old in 2020 were CT (17.9%), NG (11.4%) and MG (7.6%).
While infections with Treponema pallidum (TP) rose significantly in women (0.01), significantly less HIV infections were detected. Although all participants in our ongoing studies (eg. PrEP study) reported a reduction in the number of sex partners, STI incidence rates increased.
Either the reduction in sexual partners was insufficient or STI protection among those with trusted partners were reduced and STI clusters were leading to higher incidences.
Conclusions: Our data show that in times of the COVID-19 pandemic, prevention messages have to be adapted to ongoing sexual activity. Continuous sexual health services are needed for counselling, diagnosis and treatment of STI during times of pandemic. A population switch of STI risk from MSM and FSF to heterosexual contacts should be taken into account.

EPE384
Changes in sexual behaviors and testing for HIV and sexually transmitted infections among transgender women at Tangerine Clinic during COVID-19 lockdown

P. Srimanus[1], R. Janamnuaysook[1], K. Samitpol[1], A. Chancham[1], J. Kongkapan[1], T. Amatsombat[1], P. Parkpien[1], P. Getwongsa[1], W. Tasomboon[1], M. Bucha[1], M. Avery[2], S. Mills[2], P. Phanuphak[1], R. Ramautarsing[1], N. Phanuphak[1]
[1]Institute of HIV Research and Innovation, Bangkok, Thailand, [2]FHI 360, Bangkok, Thailand

Background: In mid-2021, Thailand faced the most severe wave of COVID-19, peaking at around 20,000 new cases daily. The Thai Government imposed a two-month lockdown (July-August 2021), which included nighttime curfew and closure of non-essential businesses. We investigated the impact of COVID-19 lockdown on sexual behaviors, pre-exposure prophylaxis (PrEP) use, and access to HIV and sexually transmitted infection (STI) services among

transgender clients at the Tangerine Clinic, which provides integrated gender-affirming and sexual health services in Bangkok.

Methods: Demographic characteristics and sexual risk behaviors, routinely collected through self-administered questionnaires, were retrieved for transgender clients who received services in two periods: May-June 2021 (pre-lockdown) and July-August 2021 (lockdown). STI self-sampling and telehealth were made available during both periods. Data on HIV/STI testing uptake, test results, and PrEP service use were retrieved from clinic and laboratory databases.

Results: The number of transgender clients visiting Tangerine Clinic during the lockdown (n=207) was 35.1% lower than pre-lockdown (n=319). Of 61 (29.5%) during the lockdown and 109 (34.2%) pre-lockdown who reported engaging in sexual activity in the past 3 months, 70.4% and 59.5% reported condom use, respectively (p=0.05). Among 130 who used PrEP pre-lockdown, 127 (97.7%) received PrEP refills (96.8% via in-person and 3.2% via home delivery services) while three clients (1.5%) stopped PrEP during the lockdown.

HIV/STI testing (n=118) decreased 59.6% from the pre-lockdown period (n=292). Of those who did not receive HIV testing, 20% reported not engaging in sexual activity in the past 3 months. However, no change occurred in HIV-positive yield during lockdown and pre-lockdown (0.9% and 1.4%, p=0.96) or the rate for chlamydia/gonorrhea infections (20% and 22%, p=0.51).

No difference was seen between the two periods in terms of demographic characteristics and HIV risk perceptions.

Conclusions: HIV/STI testing rate dropped during the lockdown restrictions in Bangkok although transgender clients continued to engage in sexual activity and remained at risk of acquiring HIV/STIs. These findings indicate the need for sexual health service continuation and emphasis on regular HIV testing during the pandemic. Telehealth and self-sampling have high potential to help minimize service interruptions during future waves of COVID-19 and other pandemics.

EPE385

Has the COVID-19 Pandemic changed the quality of patient-provider communication regarding PrEP care?

C. Zhang[1], S. Przybylek[1], Y. Liu[2]
[1]*University of Rochester, School of Nursing, Rochester, United States,* [2]*University of Rochester, Public Health Science, Rochester, United States*

Background: During the two-year-long siege from the COVID-19 pandemic, many activities related to HIV care have been faltered and disrupted, including reduced HIV testing and screening services, fallen prescriptions of the pre-exposure prophylaxis (PrEP), and delayed antiretroviral treatments. On the other hand, a significant proportion of doctor visits transit from in-person to virtually, either voluntarily or involuntarily. However, a scarce of evidence is available to assess the quality of patient-provider communication, especially for PrEP care-related communication.

Methods: In the current study, we employed a semi-structured in-depth interview to collect qualitative data to assess the quality of provider-patient communication regarding PrEP care among 18 PCPs and 25 PrEP-eligible patients. Following the five-step framework analysis, our approach includes familiarization (describing potential themes), thematic framework (generating a nascent code/subcode list), indexing (producing a final consensus code list), charting (critical thematic constructs will organize hierarchical themes), and mapping and interpretation (summarizing and interpreting).

Results: Most patients and providers have had virtual doctor visits during the pandemic. Patients and providers reported pros and cons regarding their virtual experience. Most of them considered that virtual visits were more convenient, efficient, and comfortable than in-person visits. Patients said that sensitive topics (e.g., sex behaviors) were easier to be initiated during virtual visits than in-person visits. However, without face-to-face interactions, some patients felt less empathy, caring, and connected during virtual visits compared to being in-person. On the other hand, health providers expressed concerns about patients' privacy, lack of intimacy, and delayed lab work during the virtual visits.

Conclusions: With COVID cases surging, virtual doctor visits may remain mainstream for seeking healthcare nationwide. Our data indicated that the overall quality of communication remained stable during the in-person to virtual transition, although participants have revealed some concerns. Virtual visits might even facilitate PrEP related communication between patients and providers. With technological advancement, home-testing kits or modern telecommunication tools could mitigate worries regarding delayed lab work.

Background: The COVID-19 pandemic has profoundly disrupted social relationships and health services that are fundamental to sexual and reproductive health (SRH). However, there is limited data on SRH during the initial wave of policy measures to mitigate COVID-19 ('COVID-19 measures').

To address this gap, our team organized a multi-country, cross-sectional online survey on sexual behaviors, intimate partner violence, and essential HIV/STI services.

Methods: Consortium research teams conducted online surveys in 30 countries from July 2020 to February 2021. Sampling methods included convenience, online panels, and population-representative. Primary outcomes included sexual behaviors, partner violence, and HIV/STI service utilization, which we compared three months prior to, and during COVID-19 measures.

For inclusion in analysis, each country was required to have obtained Institutional Review Board approval from a local ethics authority, locally translated and field-tested the instrument, and obtained responses from at least 200 participants. We conducted meta-analyses for primary outcomes and graded the certainty of the evidence using the GRADE approach.

Results: A total of 22724 respondents participated across 25 countries (3 lower- to middle-, 8 upper middle-, and 14 high-income countries) that met the inclusion criteria. Among 4546 respondents with casual partners, condom use with these partners stayed the same for 3374 (74.4%) and 640 (14.1%) people reported a decline. Fewer respondents reported physical or sexual partner violence during COVID-19 measures (1063/15144, 7.0%) compared to the period before COVID-19 measures (1469/15887, 9.3%).

Respondents indicated COVID-19 measures impeded access to condoms (933/10790, 8.7%), contraceptives (610/8175, 7.5%), and testing for HIV/STI (750/1965, 30.7%). Pooled estimates from meta-analysis indicate during COVID-19 measures, 32.3% (95% CI 23.9-42.1) of people needing HIV/STI testing had hindered access, 4.4% (95% CI 3.4-5.4) experienced partner violence, and 5.8% (95% CI 5.4-8.2) decreased condom use with casual partners (moderate certainty of evidence for each outcome).

Meta-analysis findings were robust in sensitivity analyses that examined country income level, sample size, and sampling strategy.

Conclusions: Difficulty accessing conventional HIV/STI testing services suggests the need for HIV/STI self-testing or sampling, and other decentralized approaches. Further research on the impact of the COVID-19 measures on sexual behavior, sexual violence, and SRH service access is warranted.

EPE387

Reception strategies as a tool for timely approach to new cases of HIV infection

C. Ferreira Lima[1], W. Cesar Ribeiro Campos[2], F. Campos Vale[3], M. de Lima[2]
[1]Universidade de São Paulo, Escola de Enfermagem / Faculdade de Medicina, São Paulo, Brazil, [2]Universidade de São Paulo, Faculdade de Medicina, São Paulo, Brazil, [3]Prefeitura de São Paulo, IST/Aids - Secretaria Municipal de Saúde, São Paulo, Brazil

Background: The discovery of HIV infection is a critical moment in people's lives. The approach during the diagnostic revelation with humanized and empathic assistance can facilitate the acceptance of the new health condition and favor adherence to treatment in the long term. The Brazilian Ministry of Health (MH) recommends the initiation of antiretroviral therapy (ART) until the 14th day after diagnosis.
However, barriers within the health services represent challenges to meeting this goal.In view of this, a project was implemented to link and retain people living with HIV (PLHIV) in public health services in the city of São Paulo. Among the objectives of this project, is the effort to attend new cases according to the deadlines set by the Ministry of Health.
The aim of this study was to evaluate ART initiation rates among new cases of HIV infection enrolled in the health services of the project.
Methods: Descriptive analysis of data after implementation of strategies for welcoming new cases (multiprofessional care, exam collection and medical consultation with a date less than the 14th day of diagnosis). The sample consisted of 1455 new cases. Data were collected between 01/2020 and 12/2020, and are part of the project Linking and Retention of PLHIV in public health services: a demonstration project in the city of São Paulo, Brazil. CEP 2.241.860 - SMS/SP.
Results: Of the 1455 new registrations, 1034 (71.56%) started ART with time less than 14 days. Of the 411 (28.44%) that exceeded 14 days, the main obstacle in 61% of the cases was due to barriers in the health service (unavailability of medical agenda; difficulties in collecting exams; delay in diagnostic confirmation; others). 39% reported personal issues as the main reason.
Conclusions: The implementation of welcoming strategies allowed reaching the goal recommended by the MH in more than 70% of new cases assisted by the project.
The improvement of these strategies and the increase in the number of qualified professionals in the health services can enhance this result, allowing the offering of timely care.

EPE388

"Falling through the cracks": provider perspectives on HIV pre-exposure prophylaxis (PrEP) service disruptions and adaptations during the COVID-19 pandemic in Baltimore, Maryland

J.G. Rosen[1], L. Zhang[2], D. Pelaez[2], J.S. Coleman[3], C To[4], L. Cooper[2], P.F. Olatunde[1], T. Toomre[2], J.L. Glick[2], J.N. Park[2]
[1]Johns Hopkins Bloomberg School of Public Health, International Health, Baltimore, United States, [2]Johns Hopkins Bloomberg School of Public Health, Health, Behavior, and Society, Baltimore, United States, [3]Johns Hopkins School of Medicine, Gynecology and Obstetrics, Baltimore, United States, [4]Johns Hopkins Bloomberg School of Public Health, Health Policy and Management, Baltimore, United States

Background: The COVID-19 pandemic continues driving unprecedented disruptions to healthcare provision, including HIV prevention and treatment services. We explored service provider experiences promoting and prescribing PrEP to marginalized populations during the COVID-19 pandemic in Baltimore, Maryland.
Methods: In February–April 2021, we facilitated four virtual focus group discussions with 20 PrEP service providers, representing various professional cadres (physicians, nurses, case managers, outreach workers) and practice settings (hospital outpatient facilities, health department clinics, federally qualified health centers, community-based organizations). Focus groups examined PrEP implementation strategies for marginalized populations, including disruptions and modifications to PrEP implementation precipitated by COVID-19.
Employing an iterative, team-based thematic analysis, we identified salient enablers and constraints to PrEP promotion, initiation, and persistence in the COVID-19 era, as well as innovative adaptations to PrEP service-delivery.
Results: Discussants—most of whom were cisgender women (70%), Non-Hispanic White (60%), and practiced in hospital settings (35%) or health department clinics (35%)—described attenuated demands for PrEP early in the COVID-19 pandemic, exemplified by high PrEP discontinuation rates. Providers attributed this to changes in clients' sexual behaviors and shifting priorities during the pandemic, including heightened caregiving responsibilities. Discussants reported substantial systems-level disruptions impacting PrEP provision, including: suspension of outreach services, personnel shortages due to COVID-19 infections/exposures, and facility restrictions on face-to-face visits. Providers emphasized that these disruptions, though occurring early in the pandemic, had protracted impacts on PrEP accessibility; specifically, workforce/resource reconfigurations (laboratory outsourcing, furloughing of on-site phlebotomists) limited opportunities for providers to make PrEP referrals and for clients to engage with PrEP services.
The transition to telemedicine rendered healthcare services, including PrEP, more accessible/convenient to some clients and expedient to providers. However, structural

Oral abstracts

Poster exhibition

E-posters

Late-breaker abstracts

Author Index

barriers to telehealth engagement (telephone/internet access), coupled with limitations of the virtual care environment (difficulty establishing provider-client rapport), impeded efforts to equitably promote and prescribe PrEP.

Conclusions: Temporary service closures, shifting client priorities, and health system adaptations have complicated PrEP provision during the COVID-19 pandemic.

Expanding the PrEP outreach workforce and availing alternatives to telemedicine (specimen self-collection, street-based mobile care) could minimize PrEP service disruptions and facilitate PrEP care continuity, especially as COVID-19 transitions from an acute to a protracted health emergency.

EPE389

Feasibility and acceptability of remote PrEP provision among adolescent girls and young women in South Africa

M.N. Khoza[1], J. Velloza[2], N. Poovan[1], L.-M. Mills[1], H. Chauke[1], S. Gumede[1], N. Ndlovu[1], S. Hosek[3], C. Celum[2], S. Delany-Moretlwe[1]

[1]Wits RHI, University of the Witwatersrand, Faculty of Health Sciences, Johannesburg, South Africa, [2]University of Washington, Department of Global Health, Seattle, United States, [3]Stroger hospital of Cook County, Department of Psychiatry, Chicago, United States

Background: COVID-19 prompted adaptations to current PrEP delivery to facilitate PrEP persistence. This study aimed to assess the feasibility and acceptability of remote PrEP delivery for adolescent girls and young women (AGYW).

Methods: PrEP SMART is an adaptive sequential trial of scalable PrEP adherence support interventions for AGYW aged 18-25 in Johannesburg. The study team made PrEP delivery adaptations to allow for remote PrEP refills and reduce the number of participants and staff at the clinic.

Between March-September 2021, we conducted interviews with AGYW, who accepted or declined remote PrEP delivery (n=13); PrEP SMART staff (n=12), and key informants (KIs) involved in PrEP programmes (n=10).

We conducted a rapid analysis of interview transcripts to explore the experiences of remote PrEP delivery, including facilitators, barriers, and practicalities of implementing remote PrEP delivery, and considerations for scale-up.

Results: Remote PrEP delivery was acceptable to AGYW, who reported that it made PrEP care convenient, quick, easy, and empowering. However, they also reported anxiety about doing the procedures incorrectly. Half of the interview participants still preferred in-person PrEP due to barriers to remote PrEP delivery including a lack of privacy, fear of blood self-sampling, and getting invalid test results (Table 1).

Staff and KIs suggested that remote PrEP delivery could benefit AGYW but had concerns that preparations could be burdensome for healthcare providers, costly and therefore not sustainable. They suggested that integrating contraception into the package of services and partnering with community-based organizations to deliver PrEP could improve efficiency.

Standard of Care PrEP procedures	COVID-19 Adaptation of PrEP procedures	Benefits/ facilitators of adapted procedures	Barriers of adapted remote procedures
HIV and pregnancy testing by a clinician	Self-testing	• Quick and easy procedures • Convenient • Empowering • Confidential • Video- how to do self-testing • No judgement from clinic staff • First to see own result	• Lack of privacy • Fear of self-prick and blood self-sampling • Concern about invalid test results • AGYW may not do the tests on themselves but test others. • Not having clinician in-person to make AGYW feel at ease about testing
PrEP refills at clinic pharmacy	PrEP home delivery	• Convenient • Reduce cost associated with in-person clinic visits	• Home PrEP Delivery may be costly and unsustainable • AGYW may not be available to receive PrEP their PrEP package. • Accidental PrEP disclosure when someone receives the PrEP delivery • Remote visits contradict efforts to encourage AGYW to access health care services frequently clinic visits.
In-person counselling. In-person health assessments	Telephone-based counselling; telephone health assessments	• Quick, convenient • Reduce judgement and stigma from clinic staff.	• Unable to talk openly – lack of privacy • May still need to visit clinic for contraceptives if it requires provider administration

Table 1: Facilitators and barriers of adapted PrEP delivery procedures

Conclusions: Remote PrEP delivery is feasible and acceptable for AGYW, especially for those with limited time or access to facilities. However, they may not appeal to all AGYW, particularly those who live in confined spaces and had not disclosed PrEP use. These findings support demedicalising PrEP services through remote delivery and increasing access to PrEP for AGYW, irrespective of pandemic status. Programmes will need to focus on overcoming barriers to remote delivery, particularly around self-testing in this age group.

EPE390

Impact of the COVID-19 pandemic on PrEP appointments and adherence: a systematic review and meta-analysis

L.P.L. Wulandari[1], D. Boettiger[1], S. Negara[2], Y.A. Mashuri[3], G. Shalimar[2], A. Probandari[3], M. Liverani[4,5,6], V. Wiseman[1,4]
[1]University of New South Wales, The Kirby Institute, Sydney, Australia, [2]Universitas Gadjah Mada, Center for Tropical Medicine, Yogyakarta, Indonesia, [3]Universitas Sebelas Maret, Faculty of Medicine, Surakarta, Indonesia, [4]London School of Hygiene & Tropical Medicine, Department of Global Health and Development, London, United Kingdom, [5]Mahidol University, Faculty of Public Health, Bangkok, Thailand, [6]Nagasaki University, School of Tropical Medicine and Global Health, Nagasaki, Japan

Background: Engagement in risky behaviors has been reported during the pandemic, highlighting the higher needs of HIV prevention strategies among key population groups during this crisis period. However, disruption to HIV prevention services due to the pandemic has been seen in many parts of the world.
We conducted a systematic review and meta-analysis to estimate how much the COVID-19 pandemic has disrupted PrEP appointments and adherence, and factors that may influence the disruption.
Methods: A comprehensive search was conducted in Embase, Scopus, PubMed, Cinahl, and Medline for studies published until 29 Sept 2021. Articles were selected if they discussed the impact of the COVID-19 pandemic on1 PrEP appointments, and/or 2) PrEP intake adherence. Metaprop in STATA was used to perform meta-analyses of proportions. Subgroup and pooled estimates with inverse-variance weights were obtained using a random-effect model.
Results: COVID-19 has had various impacts on PrEP programs, including the number of PrEP visits to the clinic, and disruption in obtaining prescriptions or refills. Studies reported higher rates of PrEP discontinuation and difficulties in PrEP adherence.
Our meta-analysis showed that the pooled prevalence of PrEP users experiencing disruption to PrEP appointment or prescription/refill was 15% (95%CI 9% - 23% ; I^2 88%). The pooled prevalence of PrEP users experiencing PrEP adherence difficulties ranged from 9% to 42%, with a pooled prevalence of 26% (95%CI 20%-33%; I^2 91.7%).
Studies from the US reported lower proportions of disruptions to both access to PrEP services and PrEP adherence compared with studies from other countries. MSM and LGBTs experienced less disruption to PrEP services than IDUs but higher difficulties in PrEP adherence rates.
Conclusions: There has been a significant level of disruption to PrEP appointments and PrEP intake adherence. Greater support is needed to ensure the maintenance of PrEP delivery during the COVID-19 pandemic.

EPE391

Oral pre-exposure prophylaxis adaptations during COVID-19 in USAID-supported PrEP programs

J. Duncan[1], A. Kimmel[1], L. Jewayni[1], R. Eakle[1,2]
[1]United States Agency for International Development, Bureau for Global Health, Office of HIV/AIDS, Washington, DC, United States, [2]London School of Hygiene & Tropical Medicine, Global Health and Development, London, United Kingdom

Background: By the end of 2020, fewer than one million people had started oral pre-exposure prophylaxis (PrEP) for HIV prevention, falling short of the UNAIDS goal of three million people. The COVID-19 pandemic disrupted services worldwide and programs had to quickly adapt.
We conducted a survey of country-level USAID-supported PrEP programs to describe how these programs adapted in order to maintain services.
Methods: We developed a self-administered 38-question survey using Google Forms to identify and elicit descriptions of PrEP programming adaptations in the context of COVID-19. We used an implementation-focused theory of change guiding PrEP scale-up as a framework for survey design. Questions were organized under six domains: Policy and Enabling Environment; Service Delivery; Demand Creation; Provider Training; Laboratory and Supply Chain; and Monitoring, Evaluation and Learning (MEL). The survey was circulated in August 2021 across USAID Missions implementing PrEP. Two authors extracted and organized data using the framework to describe PrEP program adaptations and innovations to share lessons learned and best practices.
Results: There were 22 responses, covering 21 of the 32 USAID countries implementing PrEP [n=16 (76%) Africa; n=4 (19%) Asia; n=1 (4.8%) Western Hemisphere]. Respondents from 13 countries described guidelines or policy changes due to COVID-19, including multi-month dispensing of PrEP drugs and the use of telehealth for clients. Respondents from 15 countries reported adaptations to service delivery, including expanding community-based service delivery and extending working hours. Respondents from 18 countries described adaptations to demand creation activities, including the use of social media and shifting from group to individual PrEP support. Respondents from 16 countries reported adaptations to PrEP provider training, including shifting to virtual or smaller group formats. Respondents from five countries reported introducing HIV self-testing for PrEP continuation. Respondents from 12 countries described adaptations to MEL, including shifting to virtual MEL visits and changing the frequency of data reporting.
Conclusions: Many USAID-funded programs were able to quickly adapt PrEP services to mitigate the effects of the COVID-19 pandemic and advance innovations in delivery.
The adaptations identified here can equip PrEP policymakers, providers, and stakeholders with specific strategies to mitigate the impact of COVID-19 on PrEP programs.

Leveraging HIV intervention program to promote awareness on COVID-19 among key populations

S. MayilamKunnath[1], Y. Sarlam[2], A. Kadam[1], S. Mhatre[1], S. Mane[2], J. Singh[2]
[1]The Humsafar Trust, HIV Targeted Intervention (TI), Mumbai, India, [2]The Humsafar Trust, Capacity Building, Mumbai, India

Background: With the increasing number of COVID-19 cases, the country went into a lockdown which disproportionately affected the healthcare access services especially among marginalized communities including MSM, TG/Hijras and Female Sex Workers. Due to the travel restrictions and many of the hospitals being converted into quarantine centres, the community members avoided visiting health care facilities due to fear of contracting COVID. Due to the lockdown, the community members were not able to access condoms or other prevention tools.
Description: The Humsafar Trust implements Targeted HIV intervention programs in Mumbai. During the COVID pandemic most of the community members were unaware of the precautions and treatment to be taken, especially if they were HIV positive.
We trained our outreach team on the various aspects of COVID including the importance of COVID appropriate behavior for management of COVID. The outreach team further undertook sessions with their registered community members to provide information and clarify the myths and misconceptions surrounding COVID-19.
Community members who were positive were provided with additional information on adhering to their treatment and help was provided to them in case they were not able to access medicines from their respective centers. The community members were also provided with referrals for mental health counseling, as most of them expressed mental health issues related to lockdown.
Lessons learned: It was crucial to utilize existing resources to address emergency and immediate needs of the community who are marginalized. Since the outreach team already had a rapport with the community, the messages of COVID and HIV management could be easily passed on to the community members. Apart from virtual interaction, the team also shared innovative communication messages through social media with the community members.
Conclusions/Next steps: The outreach team were able to successfully pass on the messages on COVID and reinforce the HIV prevention and treatment communication through virtual medium with the key populations whose unique needs are often ignored by the mainstream communication materials.
Personal communication and follow-up helped the community members to clarify their doubts related to COVID and also seek appropriate help when they tested positive for COVID.

EPE393
Voluntary Medical Male Circumcision (VMMC) service model rebranding amidst novel corona virus-19 (COVID-19) pandemic in meeting set targets in Zambia

J. Masiye[1], R. Kamboyi[1], A. Kaonga[1], P. Lukonde[2], P. Lungu[1], B. Musonda[1], A. Silumesii[1], R. Mwanza[3], J. Chinyonga[4], D. Phiri[5], M. Siame[6], O. Chituwo[7], G. Lingenda[8], T. Mwamba[9], L. Kasonka[10]
[1]Ministry of Health, Public Health, Lusaka, Zambia, [2]Ministry of Health, Clinical Care and Diagnostics, Lusaka, Zambia, [3]Ministry of Health, Quality Assurance and Improvement, Lusaka, Zambia, [4]Ministry of Health, Performance Improvement, Lusaka, Zambia, [5]Ministry of Health, Public Management Unit, Lusaka, Zambia, [6]Ministry of Health, Monitoring and Evaluation, Lusaka, Zambia, [7]Centres for Diseases Control and Prevention, CDC, Biomedical Prevention, Lusaka, Zambia, [8]USAID, Biomedical Prevention, Lusaka, Zambia, [9]Clinton Health Access Initiative, HIV Program, Lusaka, Zambia, [10]Ministry of Health, Permanent Secretary - Technical Services, Lusaka, Zambia

Background: Zambia's Voluntary Medical Male Circumcision (VMMC) program had significant scale-up success in recent years. The national operational plan of 2016-2020 had a target to circumcise 2 million males in five years. Operational plan focused two service delivery models; conducting national wide campaigns accounted 75% of annual performance and routine model accounted for 30%. During campaigns, massive demand generation activities were done such as road shows, public announcements and community mobilizers were recruited to conduct interpersonal communication in the communities.
The program met its annual targets from 2017 to 2019. In March 2020, Zambia recorded its first COVID-19 case, guidelines were given to all programs to remodel service delivery, and that focused on prevention of COVID-19 pandemic. VMMC technical working group changed the service delivery models to get numbers
Methods: In 2020, the program opened up more static sites from 1,715 to 2,200 across the country. Outreach sites were upgraded to offer minimum routine services, more health workers were trained in VMMC skills through conventional training method and blended learning.
Measures employed helped cushion workload in the static sites. Coordinated supply management system with implementing partners was established to ensure adequate supplies reached the sites on time. sites with adequate staffing adopted moonlighting and weekend schedules.
Scheduling of clients helped to avoid crowding at the sites. Demand generation was done through posters, social media platforms and community radio stations. Seats were provided in the sites to enable social distance to clients as they waited for the services. Coordination meetings with provinces and districts were conducted vir-

tually on a weekly basis. Rebranded the program from "a man who cares is circumcised to *"a man who cares; mask up. get circumcised".*
Results: The strategies employed helped the program achieve 125% performance against the target for 2020 and is already at 51% by end of 1st quarter 2021.
Conclusions: Despite the effects of COVID-19 pandemic on HIV prevention programs. Program successfully increased the uptake of VMMC among boys and men. The COVID-19 has helped to remodel our service delivery into sustainable models. The program continued with strategies that worked in meeting the set targets for the country.

EPE394
Tele-PrEP during the Delta COVID-19 outbreak in Vietnam: Use of remote client engagement and home-delivery of pre-exposure prophylaxis and HIV self-test kits to maintain client access during lockdown

K. Green[1], H.A. Doan[1], P.T. Thu Huong[2], T. Le Minh[3], P. Nguyen Anh[4], T. Nguyen Minh[5], K. Quang Do[6], T. Ngo Minh[7], B. Vu Ngoc[1], T. Tran Thi[1], L. Khanh Tran[1], V. Nguyen Minh[8]
[1]PATH, Hanoi, Viet Nam, [2]VAAC, Hanoi, Viet Nam, [3]Glink, Ho Chi Minh City, Viet Nam, [4]My Home Clinic, Ho Chi Minh City, Viet Nam, [5]AloCare, Ho Chi Minh City, Viet Nam, [6]Galant, Ho Chi Minh City, Viet Nam, [7]USAID Vietnam, Hanoi, Viet Nam, [8]PATH, Ho Chi Minh City, Viet Nam

Background: The COVID-19 Delta variant surged in Vietnam from July through October 2021 overwhelming healthcare services leading to rapid closure of in-person healthcare and restricted ability to travel, directly impeding PrEP access among 12,300 individuals on pre-exposure prophylaxis (PrEP) in Hanoi, Ho Chi Minh City and Dong Nai province.
Description: In response, the USAID/PATH Healthy Markets project worked closely with the Ministry of Health (MOH) to define emergency guidance for remote PrEP counseling and home-delivery of three-month PrEP prescriptions and HIV self-test kits (INSTI) for client-led HIV monitoring.
Providers from 31 clinics (12 key population(KP)-led, 1 private and 18 public) were rapidly supported to put in place systems for remote PrEP and were equipped with adequate HIVST kits to enable sustained remote PrEP services. Remote PrEP was available to those continuing on PrEP from end of July to end of October, 2021 when lockdowns were lifted.
Lessons learned: Through this rapid, pragmatic adaptation of PrEP service delivery, we found that during the worst part of the lockdown (August-September), that 84% (n=3086), 49% (n=795) and 28% (n=388) of clients in Ho Chi Minh City (HCMC), Dong Nai and Hanoi respectively switched to remote PrEP, and that the degree of switching aligned with the relative severity of lockdown in these localities (with HCMC being the worst and Hanoi the least). PrEP prescriptions and HIVST kits were primarily delivered by KP peers or clinic staff (84% in HCMC, 93% in Dong Nai and 100% in Hanoi) but delivery via post, family/friends and Grab were also used in HCMC and Dong Nai.
Overall, clients and clinicians reported ease in applying the tele-PrEP model – a rapid quality assurance survey (n=68) found that 96% were willing to use tele-medicine because it felt more convenient (65.1%) and safer (46.5%) than face-to-face care.
Conclusions/Next steps: Tele-PrEP including HIVST enabled PrEP services to continue during a severe COVID-19 lockdown. Both clients and clinicians reported acceptability of the model.
Offering tele-PrEP and HIVST for remote client-led HIV status monitoring as a part of routine service delivery may make PrEP accessible to a greater number of potential PrEP users in Vietnam, further increasing uptake and use.

Impact of COVID-19 on HIV testing services

EPE395
Impact of COVID-19 pandemic in HIV testing in Buenos Aires, Argentina

E. Bottaro[1], D. Cecchini[1], D. Pinto[1], L. Fresia[1], I. Cassetti[1]
[1]Helios Salud, Buenos Aires, Argentina

Background: COVID-19 lockdowns disrupted HIV services leading to drops in HIV testing and diagnoses, referrals to care services and HAART initiations. Argentina, heavily affected by SARS-CoV 2 spreading, implemented nationwide strict lockdown measures in 2020 during the first wave of the pandemic, followed by a social distancing/"new normality" period during the last months of 2020 and 2021. Our institution is the main ambulatory HIV care center for health-insured patients in Argentina, and offers universal free of charge rapid test (DETERMINE HIV 1/2 Abbott), being the principal HIV testing service provider in the private system within the country.
Our objective is to describe trends in HIV testing in our institution during the first two years of COVID-19 pandemic.
Methods: Retrospective analysis of aggregated data regarding HIV testing (number of tests and positivity rate) considering pre-pandemic period (2018-2019) and pandemic years (2020-2021) in an HIV care center in Buenos Aires, Argentina.
Results: During pre-pandemic period (2018-2019) 22895 and 23056 total tests were done, respectively. Average number of tests per month were 1908 for 2018 and 1921 for 2019. During pandemic years annual number of HIV tests were 10470 for 2020 and 11276 for 2021. Average number of tests per month were, 872 for 2020 and 939 for 2021 (graphic). For pre-pandemic period positivity rate was 4.1% and 3.7% for 2018 and 2019 respectively. For pandemic years, positivity rate were 4.2% and 5% for 2020 and 2021, respectively.

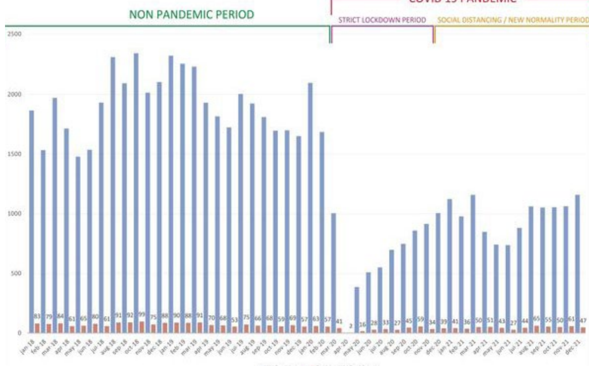

Figure.

Conclusions: COVID-19 pandemic significantly reduced HIV testing in Buenos Aires city (without changes in positivity rate), contributing to a delay in the achievement of UNAIDS targets. The absence of strict local confinement measures during 2021 didn't translate in increasing HIV testing demand to pre-pandemic numbers.

Our center continues to address and promote HIV testing in order to provide timely diagnosis to achieve UNAIDS diagnostic goals.

EPE396

Impact of the COVID-19 pandemic on access to and delivery of HIV testing and other sexually transmitted and blood-borne infections (STBBI) services, among priority populations in Canada

K. Zhang[1], D. Shublaq[1], M. Wong[1], J. Zhang[1], L. Jonah[1], J. Tarasuk[1], K. Lydon-Hassen[1], A. Odhiambo[1], J. Sorge[1], T. Russnak-Redden[1], E. Wong[1], M. Bryson[1], D. Paquette[1], J. Cox[1]

[1]Public Health Agency of Canada, Centre for Disease and Infection Control, Ottawa, Canada

Background: COVID-19 has created unprecedented challenges in delivery of and access to HIV/STBBI services, disproportionately affecting priority populations and impacting the first "90" in the 90-90-90 HIV targets. Canada's rate of new HIV diagnoses in 2020 (4.3/100,000) decreased compared to 2019 (5.5/100,000); possibly partially attributable to decreased HIV testing.

National surveys were conducted to better understand the impact of the pandemic on service providers' (SP) ability to deliver STBBI services, and access to these services by African, Caribbean, and Black (ACB) communities and people who use drugs (PWUD).

Methods: Three self-administered, online, and anonymous surveys were developed in collaboration with community partners, expert working groups, and/or those with lived experiences: SP (November-December, 2020); ACB (May-July, 2021); and PWUD (January-February, 2021). Eligible SP were those providing HIV/STBBI services in Canada. Information collected included types of services provided, associated challenges, and disruptions. Among priority populations, aged 18+ in Canada, self-identifying as ACB, or PWUD including alcohol or cannabis 6 months from survey-start, were eligible. Information regarding use and access to HIV/STBBI services and associated changes was collected.

Results: Participants included 416 SP, 1556 ACB community members (mean age 40.2, range 18-86 years, 66.2% cisgender female, 30.9% cisgender male), and 1034 PWUD (mean age 40.5, range 18-84 years, 61.2% cisgender female, 32.6% cisgender male). SP reported a 66.3% decrease in demand for services while 44.0% reported a "strong decrease" in ability to provide them.

Since the beginning of the pandemic, SP reported that HIV testing either decreased (43.9%) or stopped (30.8%) at some point. Nearly half of ACB (40.5%) and PWUD (49.5%) participants wanting HIV testing services were not always able to access.

Similar barriers were reported among these populations: reduced clinic hours; public health measures; getting referrals, appointments, or contacting health care professionals. In response to barriers, SP either created new, or increased their ability to provide, remote services.

Conclusions: Survey results highlight the COVID-19 impact on access to and delivery of HIV/STBBI testing in Canada and introduction of innovative remote practices. Unintended consequences for healthcare delivery, and access by priority populations, may have decreased HIV diagnosis rates, potentially affecting future HIV trends.

EPE397

Virtual HIV counseling: How to access MSM and transgender people in rural areas in Paraguay in the context of the COVID-19 pandemic

M. Negrete[1], J.D. Centurion[2]

[1]Fundacion Vencer, Asuncion, Paraguay, [2]Organización Ñepyru, Coronel Oviedo, Paraguay

Background: In Paraguay, between 2019 and 2020, due to the impact of the COVID-19 pandemic, access to HIV testing decreased by 28.8% and new diagnoses by 28.4%. These gaps have impacted into the MSM and Trans population to a greater extent. To reduce these gaps, a virtual consulting program was implemented through cellular operators by operational advisers. A project was designed to reduce the gaps in the HIV/AIDS care continuum in 4 rural areas of Paraguay in the context of the COVID-19 pandemic aimed at MSM and transgender people.

Description: 50 virtual counselors from the MSM population have been trained. Home testing services have been offered, promoting self-testing and home delivery of condoms in order not to suspend services during confinement during the COVID-19 pandemic. More than 800 MSM and Transgender people have been reached for 8 months in 2021. The selected areas were rural, since in these areas there were the greatest barriers to accessing the health service.

Lessons learned: The fundamental role of civil society is demonstrated to access key populations with health services and how it contributes to reducing the impact of

COVID in maintaining testing services in key populations. On the other hand, it includes the use of technology to access counseling and receive the testing service in homes or other community spaces.
This experience was effective in rural areas, since, added to COVID, there are other barriers to accessing the health service, such as distances and stigma and discrimination. Adding virtual counseling by peer counselors has facilitated access to the 800 MSM and transgender people.
Conclusions/Next steps: The HIV services offered by civil society organizations cover the gaps that the health service cannot reach, especially in access to key populations. This experience shows that public health services must consider the contribution of civil society and integrate the innovative strategies developed by NGOs as part of the health system in order to achieve a truly comprehensive and universal health system.

EPE398

The impact of COVID-19 restrictions on online sales of HIV self-test kits and implications for HIV prevention: analysis of transaction data from a leading e-commerce platform in China

G. Luo[1], L. Su[2], Y. Hu[1], Y. Zhou[1], Y. Sun[1], A. Feng[1], Y.-F. Lin[1], X. Wu[1], H. Zou[1,3]
[1]Sun Yat-sen University, Guangzhou, China, [2]US-China Health Summit, Beijing, China, [3]University of New South Wales, Sydney, Australia

Background: The effect of the COVID-19 restrictions on HIV self-testing (HIVST) remains unclear. COVID-restrictions may have prevented consumers from obtaining HIVST kits or, alternatively, accelerated a shift away from facility-based to online HIVST.
Our study aimed to quantify the impact of COVID-restrictions on HIVST kit purchasing behaviors in mainland China.
Methods: De-identified transaction data were retrieved from a leading online shopping platform in China. An interrupted time series model was constructed to examine the impact of COVID-restrictions on the weekly number of anonyms purchasing HIVST kits, online orders, and purchased kits, as well as post-restrictions trends.
Results: A total of 2.32 million anonyms submitted 4.46 million orders for 4.84 million HIVST kits between 7 January 2016 and 22 April 2020. In the ITS model, the number of anonyms purchasing HIVST kits, orders, and kits decreased by an estimated 10,545, 17,973, and 18,471 in the first week (23 January 2020 to 29 January 2020) after COVID-restrictions were implemented compared to expected levels, respectively. This represented declines of 51.7% (incidence rate ratio [IRR] 0.483, 95% confidence interval [CI] 0.380-0.615), 55.3% (0.447, 0.361-0.553), and 54.9% (0.451, 0.363-0.562), respectively.
As restrictions eased, the number of anonyms purchasing HIVST kits, orders, and kits gradually increased by an average of 7.4%, 4.8%, and 4.9% per week, respectively. In the first week after COVID-restrictions were lifted in Wuhan city (9 April 2020 to 15 April 2020), the number of anonyms purchasing HIVST kits returned to pre-restriction levels (IRR 0.982, 95% CI 0.821-1.175) in mainland China, whereas the number of orders (0.707, 0.588-0.850) and kits (0.725, 0.606-0.869) were still lower than pre-COVID levels.
The impact of COVID-restrictions on outcomes at the beginning of COVID-restrictions and the increasing trends of outcomes were larger among those living in regions with higher COVID-19 incidence (e.g., Wuhan city and Hubei province).
Conclusions: Online sales of HIVST kits were significantly impacted by COVID-restrictions, and HIVST kit purchasing patterns returned to pre-restriction levels after restrictions were lifted.
Access to HIVST kits should be maintained and strategies to increase testing should be implemented during future public health emergency responses.

EPE399

Factors associated with HIV testing among people who inject drugs: findings from a multistate study in the United States at the start of the COVID-19 pandemic

S. Allen[1], K. Schneider[1], M. Morris[1], B. Saloner[2], S. Sherman[1]
[1]Johns Hopkins University, Health, Behavior and Society, Baltimore, United States, [2]Johns Hopkins University, Health Policy and Management, Baltimore, United States

Background: The COVID-19 pandemic disrupted every aspect of public health, including HIV testing services for people who inject drugs (PWID). Routine HIV testing is vital to public health given that many new HIV infections are transmitted by persons unaware of their status. Existing research that examines HIV testing is informative, but primarily reflects data collected before the COVID-19 pandemic.
This study examines factors associated with having been tested for HIV in the past six months among a geographically diverse sample of PWID in the United States from late 2020 to early 2021.
Methods: People who use drugs were recruited between August 2020 and January 2021 from 21 drug treatment and harm reduction programs in 9 states and the District of Columbia. Program staff distributed recruitment cards to clients and interested persons called the study phone number to be screened for eligibility.
We restricted the sample to PWID who were HIV negative and reported having injected drugs in the past 6 months (n=289). We used logistic regression to identify correlates of PWID having been tested for HIV in the past 6 months.
Results: On average, participants were 39.9 years old and approximately half identified as male. Most (61.8%) identified as White. Less than half reported having completed high school (46.7%) and residing in a large metropolitan area (40.4%). Approximately one in three (32.9%) reported weekly hunger.

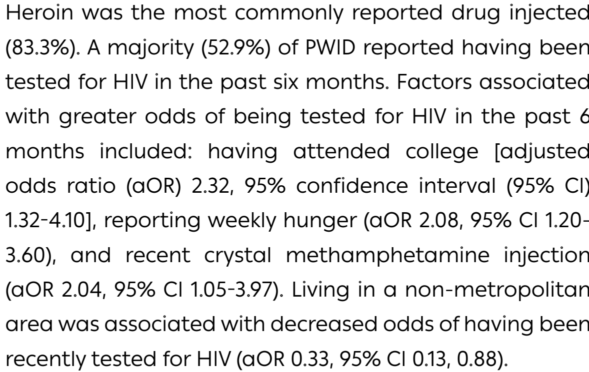
Oral abstracts

Poster exhibition

E-posters

Late-breaker abstracts

Author Index



Heroin was the most commonly reported drug injected (83.3%). A majority (52.9%) of PWID reported having been tested for HIV in the past six months. Factors associated with greater odds of being tested for HIV in the past 6 months included: having attended college [adjusted odds ratio (aOR) 2.32, 95% confidence interval (95% CI) 1.32-4.10], reporting weekly hunger (aOR 2.08, 95% CI 1.20-3.60), and recent crystal methamphetamine injection (aOR 2.04, 95% CI 1.05-3.97). Living in a non-metropolitan area was associated with decreased odds of having been recently tested for HIV (aOR 0.33, 95% CI 0.13, 0.88).

Conclusions: Our results underscore the importance of ensuring HIV prevention services are maintained during crises. Eliminating injection drug use-associated HIV transmission will require renewed efforts to expand access to HIV testing services.

EPE400

DIY: because anybody can. Lessons from Triggerise's promotion of HIV self-testing kits in Kenya during the COVID-19 pandemic

T. von Zahn[1], R. Ndlovu[1]
[1]*Triggerise, Insights, Cape Town, South Africa*

Background: COVID-19 has been enormously disruptive to HIV testing services across sub-Saharan Africa (Ponticiello et al., 2020) (Lagat et al., 2020.). National lockdowns, and other social distancing measures have made facility-based testing difficult for patients and reduced access to routine HIV testing, particularly in low income settings (Ziang et al., 2020). This is cause for concern as testing is a critical step in the HIV care cascade. With limited indication of life returning to normal, it is increasingly clear that innovative approaches are needed to counter the decline in testing.

Description: This paper analyses the impact that switching to self-testing kits had within Triggerise's Tiko ecosystem in Kenya. Tiko is a motivational technology platform targeted at adolescent girls and young women that is designed to promote positive sexual and reproductive health (SRH) choices. It uses mobile technology to connect young women to service providers and a system of behavioural nudges to reward users when they take up an SRH service. In Kenya, Tiko has 593,504 unique users (aged 15-19) who have taken up services since 2018. HIV testing is a key service that the platform promotes given that young women are at particularly high risk of HIV infection. On average, 2100 HIV tests are conducted per month for users on the platform.

Lessons learned: As a result of COVID-19, Triggerise shifted to promoting HIV self-testing kits as an alternative to facility-based testing. In contrast to other studies of the impact of COVID-19 on HIV testing (such a Dorward et al., 2021), we find no statistically significant difference in the number of HIV testing services accessed by users on the platform before and after the change to self-testing kits when conducting a Welch two sample t-test.

Additionally, user data from the platform shows a high degree of understanding of how the self-testing kit is used, and high user satisfaction with the service.

Conclusions/Next steps: From this, we draw a clear policy recommendation: HIV self-testing kits are an effective way to continue to provide HIV testing during COVID-19. More kits need to be provided to low and middle income countries and widespread use should be encouraged.

EPE401

Service uptake, client profile, and acceptability of a self-directed HIV and STI screening clinic in Quebec during the COVID-19 pandemic

K. Yokoji[1], K. Benomar[1], M. Regimbal-Éthier[1]
[1]*Prélib, Montreal, Canada*

Background: Screening for sexually transmitted infections (STI) remains an important public health recommendation amid increasing STI trends in Canada. Prélib, a new clinic in Quebec, Canada, aims to provide accessible STI screening (Chlamydia, Gonorrhea, Syphilis, Hepatitis, Hepatitis C, and HIV) by combining Internet-based risk assessment with a self-collection of samples to address the systematic barriers and stigma associated with STI testing and reach a wide range of populations including high-risk groups.

The objective of this study is to demonstrate the service uptake, client profiles and acceptability of the STI self-testing service before, and during the COVID-19 pandemic.

Methods: The data was collected from December 2018 to December 2021. Participants completed anonymous surveys on the demographics and sexual risk and attended the STI self-screening appointment at the clinic during the period. Service uptake, client profile, and acceptability were assessed based on data from surveys and Net Promoter Scores (NPS) indicated by participants.

Results: Since December 2018, the number of new participants accessing the self-testing service per month increased from 139 to 1922 by December 2021. Of the total of 14,396 participants, 51% were female, aged 28 (sd=10) on average.

Among them were individuals who had condomless sex within the last two months (63%), sex under the influence of drugs (2.4%), individuals who identify themselves as sex workers (1.6%) and as men who have sex with other men (MSM) (12%). Among participants were also first-time testers (24%), those with regular STI screening habits (21%), and 36% used the service recurrently.

Among participants with valid medical results, the positivity rate to any STI was 6.5%, driven by Chlamydia and Gonorrhea. The average NPS score was 94.60 out of 100, indicating a high satisfaction of service users.

Conclusions: Results demonstrated a growing accessibility and uptake of the STI self-testing service even during the COVID-19 pandemic. The self-screening service was benefited by individuals in need of stigma-free and ac-

cessible service, high-risk groups including MSM, as well as individuals who have never tested for STI before, highlighting the importance of STI self-testing clinics for sexual health.

EPE402

MSM / TG communities impacted by covid 19 lockdown resulting in increased hiv prevalence and low testing- anexploratory study from india

S. Dwivedi[1], M. Kumar[2], E. Michael[3], V. Sam Prasad[4], L. Honig[5]

[1]AIDS Healthcare Foundation India, Prevention Services, New Delhi, India, [2]AIDS Healthcare Foundation India, Monitoring & Evaluation, New Delhi, India, [3]AIDS Healthcare Foundation India, Operations and Partnerships, New Delhi, India, [4]AIDS Healthcare Foundation India, Management Health Care Services, New Delhi, India, [5]AIDS Healthcare Foundation, Bureau Chief, Los Angele, United States

Background: AIDS HEALTHCARE FOUNDATION - India implements the HIV rapid community based testing across ten states.The objective of the program is early detection and linkage to treatment in order to compliment the efforts of the National Program in reaching 95- 95 -95. A high proportion of people living with HIV remains undiagnosed especially among MSM and trans population despite long years of HIV program.

The COVID 19 pandemic posed great challenges to the MSM/TG communities in accessing HIV services like testing, counselling, condom access and ART initiation and replenishment.

Methods: AHF India implements Rapid HIV testing program keeping high risk population at the centre. To understand the impact of Covid 19 related restrictions affecting the uptake of HIV testing services by MSM and Trans population. The data from 2019 to 2021 was analysed to see the number of testing and the HIVsero-positivity among the MSM and Trans population. The focus was to observe the HIV testing number and map prevalence among the MSM/trans population.

Results: The results show that in late 2020 when the testing services resumed, the HIV testing numbers extremely low, owing to lockdowns but the sero-positivity among men and Trans was as high as 18.5%. Clients who tested positive were interviewed to understand the reasons for the surge in the sero positivity. Of those who tested positive, 79% (23) revealed that due to loss of employment and wages they did sex work for a living, 7% (2) had casual sex and 14% (4) were already engaged in multi partner sex before Covid 19 itself. The National HIV prevalence among Men having sex with Men (2.69%) and Trans is (3.14%) yet in 2019 and 2021 the HIV sero-positivity is 5.4% and 4.6% respectively which is twice higher than the National prevalence.

Year	Tested	Positive Identified	Sero-positivity
2019	1269	69	5.4%
2020	151	28	18.5%
2021	911	42	4.6%

Table. MSM & TG

Conclusions: Robust and innovative approaches towards providing HIV services for MTH community is the need of the hour. Impact of the COVID pandemic lockdowns need to be considered while adopting and redesigning newer strategies especially for MTH community.

Impact of COVID-19 on HIV treatment services

EPE403

Assessing COVID-related concerns and their impact on antenatal and delivery care among pregnant women living with HIV in Kenya

C. Wexler[1], M. Maloba[2], S. Babu[2], N. Maosa[2], S. Mokua[3], V. Staggs[4], K. Goggin[4], H. Acharya[1], E. Hurley[4], S. Finocchario-Kessler[1]

[1]University of Kansas Medical Center, Kansas City, United States, [2]Global Health Innovations - Kenya, Nairobi, Kenya, [3]Kenya Medical Research Institute, Nairobi, Kenya, [4]Children's Mercy Kansas City, Kansas City, United States

Background: Some studies indicate that pregnant Kenyan women were concerned about COVID-19 exposure during maternity care. We assessed concern regarding COVID-19 exposure and any impact on antenatal care (ANC) enrollment and/or hospital delivery among pregnant women living with HIV in Kenya.

Methods: Data were collected from pregnant women living with HIV enrolled in a cluster randomized trial to evaluate the impact of the HITSystem 2.1 at 12 government hospitals in Kenya (MHR01121245). Participants were interviewed at study enrollment (n=1199) and delivery (n=771). A 5-point Likert scale (strongly disagree to strongly agree) assessed COVID-19 concerns and travel challenges. Gestational age at ANC enrollment and delivery location were compared among women who expressed concerns and those who did not.

Results: Of 1199 women interviewed at baseline, 61 (5.1%) reported delayed ANC because of COVID-19 concerns. More (96 [8.0%]) worried about exposure to COVID-19 during delivery and indicated COVID-19 related travel challenges (321, 26.8%).

Gestational age at enrollment was similar among women who reported COVID-19 concerns or indicated COVID-related travel challenges compared to those who did not (17.7 weeks vs 18.1 weeks and 18.5 weeks vs 17.9 weeks, respectively). Among 767 with delivery location documented; 726 delivered in a health facility, 34 at home, 2 with

the assistance of a traditional birth attendant, and 5 on-route to the facility. Rates of home-based delivery were lower among women who expressed concerns about delivering in a health facility (2/73, 2.7%) compared to those who did not (29/678, 4.6%), but there was too much uncertainty in these estimates to rule out an effect in either direction (Fisher exact test p=0.759).

Similarly, there was little evidence of a difference between rates of home delivery among women who indicated travel challenges (10/221, 4.5%) and those who did not (20/529, 3.9%; Fisher exact test p=0.683).

Conclusions: Few pregnant women living with HIV expressed concerns about COVID-19 exposure in the context of routine ANC or delivery care. Women with and without concerns had similar care seeking behaviors.

The recognized importance of routine ANC care and facility-based deliveries may have contributed to these positive pregnancy indicators.

EPE404

COVID-19 affects Ryan White facility utilization in South United States: a place visitation analysis

S. Qiao[1], Z. Li[2], J. Zhang[3], X. Sun[3], X. Li[4]
[1]Shan Qiao, Health Promotion Education and Behavior, Columbia, United States, [2]University of South Carolina, Department of Geography, Columbia, United States, [3]University of South Carolina, Department of Epidemiology and Biostatistics, Columbia, United States, [4]University of South Carolina, Health Promotion Education and Behavior, Columbia, United States

Background: Few studies on HIV services utilization interruption in Deep South, US which endures double epidemic of HIV and COVID. Using real-time place visitation data of Ryan White (RW) facilities in 8 South states (3/13/2019-6/30/2021) we aim to explore spatiotemporal pattern of the HIV-related health utilization since the pandemic.

Methods: The address of all RW facilities in the 8 states (i.e., Florida, Georgia, Louisiana, Mississippi, North Carolina, South Carolina, Tennessee, and Texas) were retrieved from the HRSA dataset. The place visitation data of all RW facilities (i.e., how many people visit a certain clinic [given a location address] in a particular timepoint) were obtained from cellphones via SafeGraph, a commercial data company.

We calculated the daily (and 7-day smoothed) visitation change rate (VCR) using the same day of the week for year 2020 to 2019 and 2021 to 2019. Temporal pattern of RW facility visitation change was presented by VCR trajectories (Fig 1.a) of states and geospatial pattern was showed by map (Fig 1.b).

Results: The VCR trajectories kept declining since WHO declared COVID-19 a pandemic to April for most of states and then stably increased till June 2020. However, the recovery of visitation volume was significantly interrupted in 2020-2021 winter. The visitation volume in most states (except SC) remained low and did not achieve the level prior to the pandemic with the state VCR ranging -28.3% to -48.3% in 2020 and -21.2% to -48.8% in 2021. Facilities with high VCR were concentrated in FL, GA, and TX.

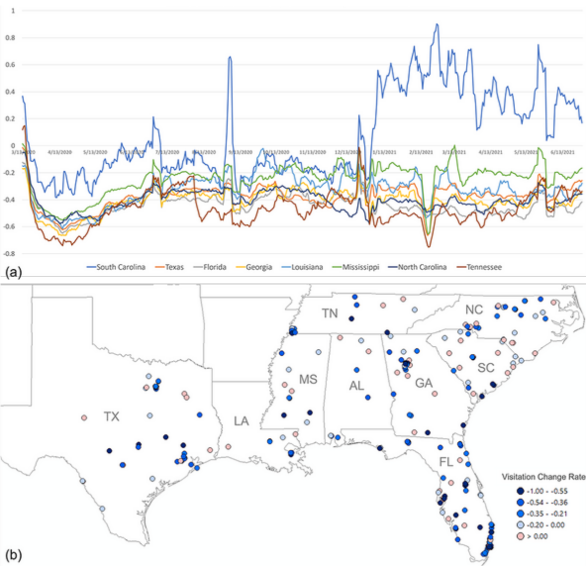


Figure. Ryan White HIV facilities daily visitation change rate since the pandemic.

Conclusions: Based on real-time place visitation data, our study suggests that RW facility utilization in Deep South has been severely affected by COVID-19 and not yet recovered for most of states. Policy makers and health organizations need to pay attention to the profound and long-term impact of the pandemic on HIV service utilization in Deep South.

EPE405

Assessing loss to follow-up in HIV treatment in Tien Giang province during the COVID-19 pandemic

V. Nguyen[1], T. Tran[1], D. Tran[1], S. Nguyen[2], D. Nguyen[2], H. Phan[3], N. Nguyen[4], H. Dang[1], R. Coley[1], D. Levitt[1]
[1]FHI 360, Hanoi, Viet Nam, [2]Tien Giang Center for Disease Control and Prevention, HIV/AIDS, My Tho, Viet Nam, [3]Viet Nam Authority for HIV/AIDS Control, Hanoi, Viet Nam, [4]United States Agency for International Development, Health, Hanoi, Viet Nam

Background: Local transmission of COVID-19 may threaten continuity of care for people living with HIV (PLHIV) in Tien Giang province, Vietnam. The Meeting Targets and Maintaining Epidemic Control (EpiC) project conducted an analysis of Tien Giang's HIV treatment program focusing on clients no longer in treatment and without a known transfer or death—those considered lost to follow-up (LTFU)—in 2020 and 2021 to evaluate the situation and identify factors associated with LTFU in treatment in the province.

Methods: Case management records for all patients on antiretroviral therapy (ART) in Tien Giang's provincial HIV treatment database from January 1, 2020 to September 30, 2021 were reviewed, validated, and analyzed. Appropriate statistical analysis, including univariate and mul-

tivariate logistic regression, were used to calculate odds ratios reflecting associations between patient characteristics recorded in patient records and designation as LTFU.

Results: Among 2,762 ART clients in the observed period (76.2% male, 23.8% female), the mean age was 34.7 (±9.9). Of the 75.6% who had had a viral load (VL) test, 95.1% were virally suppressed (VL <200 copies/mL). Key and priority population status at enrollment included people who inject drugs (PWID) (5.2%), female sex workers (0.4%), men who have sex with men (32.2%), partners of PLHIV (15.0%), and other (47.2%). By the end of September 2021,178 patients (6.4%) were transferred to facilities in other provinces, 37 (1.3%) died, and 130 (4.7%) were LTFU. In univariate analysis, we found no statistically significant effect of age, gender, or duration on treatment on LTFU status (p-value>0.05).

However, unsuppressed viral load is associated with increased likelihood of LTFU (odds ratio [OR]= 5.02, 95% CI: 2.70 to 9.32). PWID at the time of enrollment were also significantly more likely to be LTFU (OR= 3.26, 95% CI: 1.90 to 5.58).

Conclusions: LTFU remained under the program's target threshold of five percent per annum in the observed period. However, efforts should be made to improve treatment adherence, including through employment of adherence planning and motivational counseling, to address barriers to continuity in care among PWID and virally unsuppressed patients for the long-term success of HIV treatment in Tien Giang.

EPE406

Decentralized drug distribution during the COVID-19 surge in Ho Chi Minh City: lessons learned from antiretroviral drug home delivery via postal services

T.A.T. Vuong[1], T.M.N. Nguyen[2], M.H. Duong[3], R. Coley[1], T.D. Tran[1], T.B.T. Bui[1], T.T. Bui[1], D. Levitt[1], L. Basu[2]

[1]FHI 360, Hanoi, Viet Nam, [2]USAID, Hanoi, Viet Nam, [3]Ho Chi Minh City Center for Disease Control, Ho Chi Minh City, Viet Nam

Background: COVID-19 challenged Vietnam's centralized drug distribution management system, in place since antiretroviral (ARV) introduction in 2004. Stay-at-home orders and interprovincial travel restrictions required a pivot towards emergency drug dispensing via post. This process was first used in Ho Chi Minh City (HCMC) because of its COVID-19 burden, including a high number and proportion of patients from other provinces, and restrictions on interprovincial travel.

Description: Ten HIV treatment faciities (HTFs) in HCMC initiated postal ARV distribution in late May 2021. Facility staff developed lists of clients that relocated to other provinces. Patients were then contacted to obtain consent for mail delivery and confirm addresses and agreement to pay for postage upon delivery. HTFs contracted with the two most popular postal service companies. Patients in quarantine for or infected with COVID-19 were also eligible for postal ARV delivery.

Lessons learned: From May to September 2021 (peaking in July and August), 6,825 30-count ARV bottles were mailed to 4,188 patients, representing 22.7% of the patients served by the 10 HTFs. A total of 4,138 of these patients resided outside HCMC.

Given interprovincial travel restrictions, postal service was optimal for delivering drugs to these clients. Postage did not exceed US$2 per parcel, and patients were generally willing and able to pay these delivery costs.

This approach made ARVs accessible to clients and promoted continuity of treatment who lived outside of HCMC or had temporarily relocated during a COVID-19 surge in the city. Home delivery also reduced COVID-19 transmission risks and removed barriers to treatment continuation.

Nevertheless, postal distribution slowed or was temporarily disrupted when the COVID-19 outbreak peaked. Two hundred ARV bottles were stuck in distribution centers because of post office closures due to infected staff or lockdowns at recipient locations. Six bottles were returned to senders and 13 were lost in transit. These service delays and disruptions posed challenges for patient adherence and HTF drug management.

Conclusions/Next steps: Postal delivery was effective for ARV distribution, removing a barrier to treatment continuation. As current national guidelines do not allow for this approach, advocacy efforts are needed for adoption of decentralized drug distribution beyond the COVID-19 context.

EPE407

Home delivery of antiretroviral drugs in Indonesia, Laos, Nepal and Nigeria: implications of COVID-19 experiences for post-pandemic decentralized ARV delivery

M. Bateganya[1], T. Hoke[2], O. Toyo[3], C. Francis[4], L. Ferradini[4], B. Shrestha[5], P. Philakone[6], S.R. Pandey[7], N. Persaud[8], M. Cassell[9], R. Wilcher[1], H. Mahler[8]

[1]FHI 360, HIV, Durham, United States, [2]FHI 360, Health Services Research, Durham, United States, [3]Achieving Health Nigeria Initiative, Uyo, Nigeria, [4]FHI 360, Jarkata, Indonesia, [5]FHI 360, Kathmandu, Nepal, [6]FHI 360, Vientiane, Lao People's Democratic Republic, the, [7]FHI 360, Abuja, Nigeria, [8]FHI 360, Washington, United States, [9]FHI 360, Hanoi, Viet Nam

Background: Confronted with COVID-19-imposed health facility closures and travel restrictions, HIV services in Indonesia, Laos, Nepal, and Nigeria introduced home delivery (HD) of antiretrovirals (ARVs) to ensure HIV treatment continuity.

A 2020 program review revealed HD to be feasible and acceptable across the four countries, with 19%-51% of eligible clients receiving ARVs through HD. We report on

continued HD during in 2021, the pandemic's second year, and present implications for decentralized drug delivery (DDD) beyond emergency circumstances.

Description: Throughout 2021, all four countries continued the ARV home delivery mechanisms initiated in 2020. In Indonesia, the Jakarta Provincial Health Office continued to support *Jak-Anter,* a home-based ARV delivery system which utilizes ride-based apps and transport courier services. In Laos and Nepal, the HD conducted by community health workers continued, with the numbers of clients using the service varying with pandemic intensity. In 2021, in Indonesia, Laos, and Nepal, 29.8%, 47.0%, and 28.4% of individuals on ARVs in project-supported areas were on HD. In Akwa Ibom State, Nigeria, clients were progressively transferred to alternative DDD models, with HD limited to 12% of clients on ARVs in Mbo Local Government Area who could not go to the facility.

Lessons learned: Understaffing in health facilities, exacerbated by COVID-19 infection among health care providers, made ARV HD a valuable service alternative. Six-month dispensing allows HD to be practical and affordable but depends on consistent ARV stocks. In addition, the countries continuing ARV HD rely on donor funding and external technical assistance, and mechanisms for sustaining and scaling the approach without external support are not yet in place.

Conclusions/Next steps: Policymakersand service delivery partners in the four countries support innovative community-based service delivery models to ensure service continuity in the COVID-19 era. While service delivery guidelines have been adjusted to support HD, national policy change is still needed to sustain the approach. New mechanisms for financing, supply chain management, staff training and supervision, and client sensitization are needed to implement HD at scale.

Options for decentralized service delivery will be especially important for future service disruptions caused by other pandemics, natural disasters, or civil unrest.

EPE408

The impact of COVID-19 on HIV care and treatment at sites across the global IeDEA consortium

Maga, Cotonou, Benin, [13]VHS Infectious Diseases Medical Centre, Voluntary Health Services, Chennai, India, [14]Centre National de Reference en Matière de VIH/SIDA, Bujumbura, Burundi, [15]Evandro Chagas National Institute of Infectious Diseases-Oswaldo Cruz Foundation (INI/FIOCRUZ), Laboratory of Clinical Research in STD/AIDS (LAPCLIN-AIDS), Rio de Janeiro, Brazil, [16]University of KwaZulu-Natal, Africa Health Research Institute, Durban, South Africa, [17]ACONDA - Centre de Prise en Charge, de Recherche et de Formation (CePReF), Abidjan, Cote D'Ivoire, [18]Makerere University College of Health Sciences, Infectious Diseases Institute, Kampala, Uganda, [19]Vanderbilt University Medical Center, Department of Biomedical Informatics, Nashville, United States, [20]Vanderbilt University Medical Center, Vanderbilt Institute for Clinical and Translational Research, Nashville, United States

Background: While interruptions in treatment pose risks for people living with HIV (PLWH), effects of the COVID-19 pandemic on HIV services are not broadly documented, particularly in countries with a high HIV burden.

Methods: In late 2020, the International epidemiology Databases to Evaluate AIDS (IeDEA) research consortium surveyed 238 HIV care sites across seven world regions to document service disruptions during the first year of the pandemic and strategies for ensuring continuity of care for PLWH. Descriptive statistics were stratified by national HIV prevalence: <1%, 1-<5%, ≥5%.

Results: Questions about COVID-19's impact on care were completed by 225 (95%) sites in 42 countries with low (n=82), medium (n=86) and high (n=57) HIV prevalence.

Most sites (75%) reported their location had been subject to pandemic-related restrictions on travel, service provision or other operations, with restrictions more common in high-prevalence (91%) than low- (78%) and medium-prevalence (61%) settings.

While 42% of sites reported ever suspending non-urgent appointments, fewer reported suspending HIV testing (26%) or new patient enrollments (10%). Negative impacts on clinic operations (e.g., decreased hours/days, reduced provider availability, clinic reconfiguration for COVID-19 services, record-keeping interruptions, and suspension of NGO support) were reported by 76%.

Increased use of telemedicine was reported by 85% of clinics in low-prevalence settings, compared with medium- (38%) and high- (40%) prevalence settings. In high-prevalence settings, few sites (2%) reported suspending antiretroviral therapy (ART) clinics, and many reported mitigation strategies to support adherence, including multi-month dispensation of antiretrovirals (95%) and designating community ART pick-up points (44%).

Few sites reported stockouts of first- (5%), second- (10%), or third-line (10%) ART regimens. However, stockouts of second- and third-line regimens were more common in high-prevalence settings (25% and 17%, respectively).

Interruptions in HIV viral load (VL) testing were reported, including suspension of testing (22%), longer turnaround times (41%), and supply stockouts (22%); disruptions did not differ across HIV prevalence levels.

Conclusions: Whilepandemic-relateddisruptions in VL testing and drug supply chains negatively impacted HIV care, many IeDEA sites introduced measures aimed at ensuring the continuity of treatment. Impacts of these interventions on HIV care outcomes are yet to be understood.

EPE409

"Culture Shock under the New Normal" Integrating COVID-19 into HIV rogramming for PLHIV in Zimbabwe

S. Mpofu[1], B. Madzima[2], R. Yekeye[3], A. Mpofu[4]

[1]National AIDS Council, Programmes, Harare, Zimbabwe, [2]National AIDS Council, Harare, Zimbabwe, [3]National AIDS Council, Operations, Harare, Zimbabwe, [4]National AIDS Council, M&E, Harare, Zimbabwe

Background: Zimbabwe has an estimated 1.2 million People living with HIV (PLHIV) with an estimated prevalence of 11.9% in 2020 as well as 94% of adults and 70% of children being on Anti-retroviral Treatment respectively. (Ministry of Health and Child Care, 2021, Global AIIDS Response Progress Response). Before COVID, National AIDS Council had managed to establish MIPA Forums where PLHIV would have physical meetings at district, provincial and national levels would have a team of PLHIV visiting selected health facilities to assess availability of medicines. In March 2020 the country had its first lockdown which ran up to July 2020. This disrupted the interactions and psychosocial support that PLHIV provided to each other.

Description: To circumvent the restrictions brought about the COVID-19 restrictions, National AIDS Council established regional MIPA Forums and where by the country's 10 provinces were broken down into two regions of 5 provinces each and establishing regional WhatsApp platforms where PLHIV would share information about COVID-19, medication and providing each other with psycho-social support. The national network of PLHIV also established a call centre whereby PLHIV could make distress calls where-ever they are as they report stock outs and other problems affecting them.

Lessons learned:

- Regional MIPA Forums' WhatsApp groups and Regional meetings have reduced the cost of conducting meeting as well as facilitating closer interactions between PLHIV as they tackle regional access problems that are closer to them.
- The establishment of a call centre has replaced physical community monitoring by PLHIV and has made it easier to report stock outs and allow corrective action to be taken at national level at then shortest possible time.
- The HIV structures have made it easy to integrate COVID-19 into HIV programming using already established structures.
- Fight against Stigma and discrimination under HIV has made it easier to fight against COVID-19 stigma.

Conclusions/Next steps: COVID-19 has presented new challenges but use of HIV experiences has made it easier for PLHIV to deal with COVID-19.

EPE410

Sustaining clinic engagement and viral suppression through modifications to HIV care models during the COVID-19 pandemic: experiences in Uganda military health facilities

M. Ssemmanda[1], D. Bwayo[1], A. Tumusiime[1], T. Rwegyema[1], R. Zavuga[2], B. Lutimba[1], J. Akao[3], E. Turesson[1], M. Laverentz[1]

[1]University Research Co.,LLC, Center For Human Services, Maryland, United States, [2]Uganda Peoples' Denfense Forces, Directorate of HIV/AIDS, Bombo, Uganda, [3]US Embassy, Department of Defense, Kampala, Uganda

Background: The COVID-19 pandemic presented challenges of disrupting continuity of care, potentially worsening HIV outcomes among highly mobile populations. These disruptions called for modifications to HIV care delivery models to ensure continued engagement for people living with HIV (PLHIV) on treatment.

We describe the interventions, outcomes and lessons learned in implementing HIV care delivery modifications from March 2020 in Uganda military health facilities supported by the URC-Uganda Department of Defense HIV/AIDS Prevention Program (DHAPP).

Description: Changes to HIV care strategies involved pre-appointment profiling, line-listing all clients who were due for appointments, and tracking daily attendances.

The DHAPP team used this information to design a community drug delivery program that allowed drop-in refills with no appointment, scaled up multi-month dispensing, and included the use of stickers and alerts in the electronic medical record (EMR) system as reminders for health workers to take viral load (VL) tests of clients before they were reviewed. DHAPP also implemented changes to client flow to strengthen triage and set-up a COVID-19 screening points. Clinic engagement was tracked in Excel-based documents and VL suppression rate was tracked using the national VL dashboards one quarter before and 2 years after the onset of the pandemic.

Lessons learned: Overall 21,500 PLHIV were enrolled on treatment in 31 military facilities,of these 55% were male. The proportion of missed scheduled visits pre-Covid-19 was 15% which initially increased immediately to 35% after lock-downs were introduced. Thereafter, a steady improvement was noted through September 2021, while viral suppression rates slightly improved during the COVID-19 pandemic as shown below.

	Jan - Mar'20	Apr - Jun'20	Jul - Sep'20	Oct - Dec'20	Jan - Mar'21	Apr - Jun'21	Jul - Sep'21
% of scheduled appointments missed	15%	35%	23%	18%	14%	12%	14%
VL Suppression (%)	87%	89%	89%	92%	91%	96%	94%

Table.

Conclusions/Next steps: Efforts to limit the impact of the COVID-19 pandemic on continued engagement and sustaining viral suppression among PLHIV on treatment were effective. There is need to continuously improve HIV care models to address any unanticipated structural disruptions, such as those associated with the COVID-19 pandemic. Further studies on cost implications of these modifications are recommended.

EPE411

Impact of crisis-driven interventions on averting Lost to follow-up among people living with HIV on antiretroviral therapy in Mumbai, India

P.V. Deshpande[1], S. Acharya[2], A. Palkar[1], A. Harshana[1], S.S. Todmal[1], R. Allam[3], M. Nyendak[3]

[1]UW International Training and Education Centre for Health Private Limited, New Delhi, India, [2]Mumbai District AIDS Control Society, Mumbai, India, [3]Centers for Disease Control and Prevention, New Delhi, India

Background: India had national and provincial lock-downs that prompted outmigration before they took effect during two COVID-19 waves. The pandemic posed challenges to treatment continuity and reengagement among people living with HIV (PLHIV).

Multiple interventions were adapted to prevent lost to follow-up (LTFU: no pill pick-up for >28 days since last expected pick-up) in Mumbai metro-city, which caters to 38,000 PLHIV, many of whom are migrants.

Description: We proactively generated a list of PLHIV due for their pill pick-up and called them. An automated interactive voice response system (ART-MITRA) prompted callers to respond on their availability, and a convenient location to reach a nearby ART center. To enable treatment continuity in the setting of out-migration, we instituted an E-transfer-out system. Decentralized drug distribution (DDD) was set up. To avert calling delays, we enhanced data to use to reach PLHIV prior to and on the day of missing pill pick-up. During April- July 2021, we rapidly re-activated and adapted the entire response package of tracking and tracing, and added teleconsultations for the severely ill, along with courier services and community refills.

Lessons learned: In March 2020, of the 7,480 PLHIV due for refill 47% PLHIV were reachable. Through ART-MITRA 1300 PLHIV collected their pills. An additional 1660 PLHIV collected pills from 13 DDD sites. With enhanced case-based tracking, and calling of 27,980, 18,002 (64%) were reached, and 4,866 LTFU PLHIV were re-engaged from October – to March of 2021. During the second wave, teleconsultations for severely ill PLHIV and ART delivery through community volunteers and couriers resulted in the prevention of 1,559 LTFU. A significant (P<0.001) 50% decline in LTFU was observed between the two COVID-19 peaks.

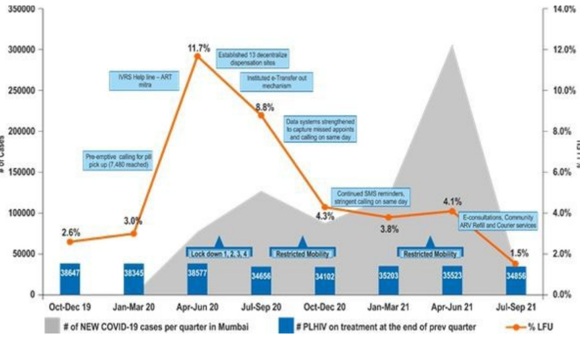

Figure.

Conclusions/Next steps: Interventions tailored to the situation on the ground, and rapid reactivation in subsequent surges led to a decline in LTFU rate and allowed for maintenance of treatment gains.

EPE412

Technology-enabled expert clinical decision making to fast-track HIV-1 viral load result uptake among the network of providers at antiretroviral treatment centers, Maharashtra, India

A. Harshana[1], S. Acharya[2], S. Dhande[1], A Parvez[1], D. Gulati[1], N. Nivate[1], R Agarwal[3], R. Allam[3], M. Nyendak[3]

[1]UW International Training and Education Centre for Health Private Limited, New Delhi, India, [2]Mumbai District AIDS Control Society, Mumbai, India, [3]Centers for Disease Control and Prevention, New Delhi, India

Background: In Maharashtra state, antiretroviral therapy (ART) services are delivered through a tiered pyramidal network of an Adult and Paediatric Centre of Excellence (CoE) at the Apex, 14 ART plus centres, and 91 ART centres catering to 383,790 people living with HIV (PLHIV). The CoEs and ART plus centres have the additional role of mentoring the clinical network of providers and supporting clinical decision-making regarding ART switching through designated State AIDS Clinical Expert Panels (SACEP). Previously, PLHIV would need to be physically present at the SACEP, which led to a cascade of challenges, including decreased access to SACEP due to expenses, delays, and the rescheduling of appointments.

Furthermore, the COVID-19 pandemic aggravated challenges for in-person consultations and delayed critical expert input.

Description: SinceApril 2020, the Tele-SACEP intervention was initiated to provide timely e-consultations for utilization of viral load results and other clinical decisions. We reviewed data to estimate PLHIV with pending SACEP consults and developed a Standard Operative Procedure per national guidelines, incorporating patient confidentiality and a meeting calendar for patient appointments.

We used the Zoom® platform to facilitate case discussions between the ART center staff and SACEP Panels with patients who could attend their closest ART center, preserving patient confidentiality. The SACEP decision was shared with referring ART center providers on the same day for appropriate action for patient care.

Lessons learned: In the 390 Tele-SACEP meetings held, 6,641 cases were reviewed from April 2020 to December 2021. Of these, 4,678 (70%) were recommended for ART switch or substitution with a short turnaround time (TAT). When comparing the median and mean TAT between January 2016 and March 2020 (31 and 44 days) to the median and mean TAT between April 2020 to December 2021 (07 and 17 days), there was a significant difference from referral to the actual SACEP meeting.

Conclusions/Next steps: Technology-enabled SACEPs resulted in the provision of timely clinical decisions and increased the number of referrals for required expert consultation. In addition to providing critical connections during the COVID-19 pandemic, the process intuitively strengthened the clinical acumen of the in-network clinicians through case discussions and aided in easy access to the SACEP.

EPE413

MMD facilitates continuity of treatment and viral suppression for PLHIV during COVID-19 – experience from military facilities in Uganda

D. Bwayo[1], M. Ssemmanda[1], T. Rwegyema[1], R. Zavuga[2], J. Akao[3], E. Turesson[4], M. Laverentz[4]

[1]URC, Programs, Kampala, Uganda, [2]Uganda People's Defense Forces, Kampala, Uganda, [3]US Department of Defense, US Embassy, Kampala, Uganda, [4]URC, Chevy Chase, Maryland, United States

Background: Coronavirus disease 2019 (COVID-19) and its associated lockdowns globally created challenges of continuity of treatment for PLHIV in care. To overcome this disruption, Uganda introduced multi-month dispensing of drugs (MMD) as one of the interventions to adapt to the COVID-19 lockdowns.

We describe the process, outcomes and lessons learned in scaling up MMD in Uganda military health facilities supported by the PEPFAR funded US Department of Defense URC-Uganda project.

Methods: MMD included providing clients with 3-6 months of drug refills (anti-retrovirals (ARVs), Cotrimoxazole, TB drugs) instead of the usual 2-month cycles, training staff on MMD protocols, providing job aides, supply chain strengthening, increasing community-based drug deliveries, mentoring health workers, tracking appointments and increasing appointment reminders. The MMD data from 28 ART clinics were tracked weekly, monthly and quarterly through an Excel-based dashboard; 12-month retention and viral suppression were tracked from national reporting databases. 25 health workers from 10 health facilities were interviewed for their experience with MMD. Descriptive statistics were applied to determine the extent of MMD implementation and outcomes.

Results: Results showed progressive uptake of MMD at all health facilities, improvements in viral suppression and sustained 12-month retention on treatment as shown below.

Variable	March '20	Sep'20	March'21	Sept'21
% of clients on MMD	33%	51%	77%	87%
% of clients with suppressed VL	89%	90%	93%	94%
12-month retention	78%	75%	81%	86%

Table.

Interview findings revealed five success factors for MMD:

1. Increased availability of 3-month packs of fixed dose drugs and other supply chain improvements in quantification and forecasting;
2. Provision of job aids;
3. Training HWs on MMD;
4. Delinking viral load bleeding from refill dates and;
5. Clients' desire to reduce frequency of clinic visits.

Conclusions: MMD is a feasible and acceptable approach to be scaled up and is associated with improved HIV treatment outcomes, treatment continuity and improved viral load suppression.

This success shows that broader MMD access can serve as a new standard of care for HIV and other chronic diseases both during service delivery disruptions and routine care.

EPE414

COVID-19 and HIV: How COVID-19 changed HIV service delivery in Zambian correctional facilities

E. Muchinda[1], Y. Lungu[1], F. Mumba[1], L. Muyendekwa[1], C. Saeli[1], M. Namusokwe[1], F. Chilukutu[1], C. Moonga[2], N. Nyirongo[3]

[1]Zambia Correctional Service, Headquarters, Health, Kabwe, Zambia, [2]Centre for Infectious Disease Research in Zambia, Prison HIV Care, Lusaka, Zambia, [3]Maryland Global Initiatives Corporation Zambia, Men's & Prison Health, Lusaka, Zambia

Background: The Zambia Correctional Service (ZCS), working with the Ministry of Health (MOH) and other implementing partners, has made great strides to reduce HIV prevalence rates among the inmates, from 27.4% (Simooya et.al., 2011) to 14.3% in 2019 (Kagujje et.al. 2021). However, the advent of COVID-19 in 2019 threatened to reverse the gains due to the shift of attention from HIV to COVID-*19*and the subsequent control of entry to correctional centres and partial lockdown affected HIV service delivery. The inmates who suffered severe COVID-19 illnesses and those who died from COVID-19 are mostly those who had either HIV or were co-infected with HIV and TB.

The ZCS, MoH and other implementing partners, implemented an innovative differentiated service delivery (DSD) model of HIV services.

Description: To ensure uninterrupted HIV service delivery, as well as, protect inmates, staff and service providers from COVID-19 infection, ZCS implemented current and novel DSD practices that involved:

- Reducing the frequency of ART clients' visits to clinics by giving them up to 6 months of antiretroviral drugs monitored by trained inmate peer educator;
- Intensifying HIV/AIDS coordinators' and peer educators' adherence support to client on ART;
- Integrating *HIV/AIDS*prevention, treatment, care and support for inmates with COVID-19 prevention services such as sensitization, testing and vaccination;
- Encouraging inmates with*HIV*to get vaccinated against COVID-19 to protect their health, and;
- Pooling together of COVID-19 and HIV resources.

This DSD model enabled 3591 inmates living with HIV between 2019 and 2021 to continue receiving HIV services amidst the COVID-19 pandemic.

Lessons learned: The ZCS approach to DSD of HIV services ensured that all HIV clients among inmates received uninterrupted HIV services, and at the same time, reduced COVID-19 infections in correctional facilities. It also helped to leverage resources and to create effectiveness and efficiency in addressing the two infectious diseases.

Conclusions/Next steps: A holistic approach for combating COVID-19 and HIV in correctional facilities protects the health of inmates living with HIV who are at a higher risk of becoming seriously ill and dying from*COVID-19*

EPE415

Acceleration ofthe implementation of differentiated ART delivery services in the advent of COVID-19 in Zambia

I. Chibanda[1], F. Chirowa[2], E. Sadoki[3], C. Wose Kinge[4], P. Sawulu[5], S. Simubali[6]

[1]Right to Care Zambia, Pharmaceutical Services and Supply Chain, Kasama, Zambia, [2]Right to Care Zambia, Kasama, Zambia, [3]Right to Care Zambia, Technical Services, Lusaka, Zambia, [4]Witts University, Research, Johannesburg, South Africa, [5]Right to Care Zambia, M & E, Kasama, Zambia, [6]Right to Care, Supply Chain, Kasama, Zambia

Background: USAID-funded Right to Care Zambia to support the Ministry of Health in Zambia to implement the UNAIDS 95-95-95. Retention of HIV-positive recipients of care is critical to the attainment of the 95-95-95. However, with the emergence of the COVID-19 pandemic in early 2020, there was concern about disruptions in HIV service delivery. To protect the gains made, the Ministry of Health issued operational guidance to adapt HIV services in March 2020 that included the provision of three or six months of ARV medications as part of differentiated service delivery. RTCZ shares its experience with the provision of differentiated service delivery during the COVID-19 pandemic.

Description: USAID Action HIV accelerated the implementation of differentiated ART delivery at 270 supported health facilities in Northern, Muchinga, and Luapula provinces by offering multiple-month dispenses through fast-tracked drug pick-ups in the health facilities and establishment of community-based medication collection points.

This involved identifying patients with future pharmacy appointments from March 2020 to December 2021.

Lessons learned: The 6MMD uptake stood at 78148 out of the Tx_Curr of 126,881 an achievement of 62%. 10,096 clients were provided services through ccommunity pick-up points and home deliveries 7,797 were dispensed medicines and 1,327 had VL Samples collected in the period under review.

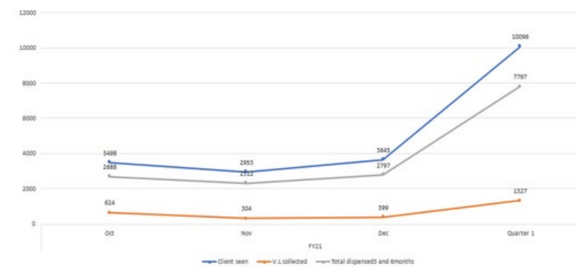

Figure. Clients seen in the community vs. proportion of VL collected and dispensation.

Conclusions/Next steps: Despite all these challenges and limitations, there are opportunities for improvement, which include the need to ensure patient information completeness, the institutionalization of informal pickup locations as key features of the health system, additional resources to support logistics and processes at pickup locations, automation of pickup processes, and demand creation.

Proactive systems for triaging eligible clients can help in rapidly scaling up differentiated service delivery for PLHIV, lessening the burden on the already stretched health system in the era of the COVID-19 pandemic.

Impact of COVID-19 on financing for the HIV response

EPE416
Revisiting sustainable financing for the HIV/AIDS response in the COVID-19 era

E. González-Pier[1], R.J. Kolesar[1]
[1]Palladium, Health Policy Plus, Washington, United States

Background: The SDGs aim to end the AIDS epidemic by 2030. Achieving the Fast Track 95-95-95 targets is essential and requires substantial additional financing for recurrent cost increases over the near and medium term [1].

The share of domestic government spending on HIV/AIDS remains relatively limited among lower-middle-income countries (31.6%) and low-income countries (11%) [2].

Mobilizing, aligning, and optimizing donor, public, and private resources to adequately fund a sustainable HIV/AIDS response is more important than ever.

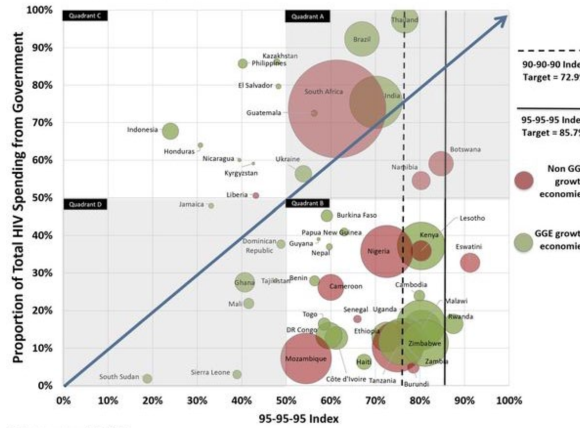
Description: Annual funding for PEFPAR and HIV development assistance peaked in 2011–12, reaching US$17.5 billion, falling to US$14.5 billion in 2020. As donors seek to increase domestic co-financing, COVID-19 places enormous pressures on public budgets [3].

Many countries expect reduced near-term general government expenditures (GGE) due to COVID-19 related economic shocks [4]. Some developing countries are already adjusting monetary policy and are preparing to scale back fiscal support [5].

Lessons learned: Country-specific context is critical to identify the most important HIV/AIDS priorities and strategic opportunities to support both performance improvement and ownership through financial self-reliance.

The negative correlation (-0.29, $p<0.05$, weighted to number of PLHIV) between the achievement of the 95-95-95 targets and domestic financing suggests that context and tradeoffs are not fully balanced.

Figure 1 presents the relative position of USAID/PEPFAR-supported countries vis-a-vis 2030 Fast Track performance and government HIV expenditure.



Data sources: [4, 6, 7]
Note: Five countries not shown due to incomplete data.

Figure 1. 2030 fast track performance and proportion of government HIV expenditure in PEPFAR-supported countries weighted by the number of PLHIV

Conclusions/Next steps: The focus on increased domestic resource mobilization to achieve self-sufficiency should not come at the cost of progress made towards achieving targets. Donors and countries must collaborate to balance replacing external funding while meeting targets. With restricted fiscal space and new competing health needs, the strategic use of data and analytics is essential to increase domestic resources for HIV, optimize resource allocation for scarce available resources, and improve efficiency of HIV service delivery.

EPE417
A pandemic triad: HIV, COVID-19 and debt in developing countries

J. Atienza Azcona[1], C. Birungi[2], D. Munevar[3]
[1]UNAIDS, Equitable Financing Practice, Geneva, Switzerland, [2]UNAIDS, Equitable Financing Practice, Nairobi, Kenya, [3]UNCTAD, Geneva, Switzerland

Background: This paper assesses the impact of the HIV, COVID-19 and debt pandemics dynamics on health, HIV and pandemic preparedness and response-related financing in developing countries.

Methods: Using a novel dataset, we did a cross-national systematic analysis of all data sources available for government expenditures on health, HIV, COVID-19 and debt servicing in selected developing countries. Using panel-regression methods, we estimated the association between government domestic spending on health, HIV, COVID-19 and debt servicing. Finally, we tested the robustness of our conclusions using various models and subsets of countries.

Results: We find an inadequate multilateral response with the ensuing gaps allowing both pandemics to thrive. The G20 Debt Service Suspension Initiative (DSSI) and the Common Framework only covered countries with a third of the global population of people living with HIV (PLHIV). Rising and unsustainable debt levels are limiting the capacity of governments to protect the health of their pop-

ulations. Government spending is already falling in response to high debt payments. Specifically, debt servicing is crowding-out lifesaving investments. In 2020, for every US$ 5 available, US$ 4 was spent on debt servicing. Only US$ 1 was invested in health. This is a binding constraint on countries' efforts to control COVID-19.

Even with a gargantuan effort to increase health expenditure, the outlook for health financing remains negative. Fiscal consolidation, with a heavy emphasis on expenditure cuts, is expected to take place across 139 countries in the coming years.

Conclusions: These findings suggest that fiscal policymakers should be concerned about the crowding-out and constraining effects of public debt.

To this end, pragmatic recommendations are made to treat and cancel debt as a critical policy lever to accelerate the end of HIV and COVID-19 pandemics in developing countries as a key condition to address the growing inequalities and ensure debt can be a benefit, not a burden.

EPE418

Effects of COVID-19 on HIV Financing Prospects in 15 Asian Countries

K. Marra[1], C. Cantelmo[1], P. Stegman[2]

[1]Palladium, Washington, DC, United States, [2]Avenir Health, Glastonbury, United States

Background:

Many countries across the Asia region have made strong efforts to prioritize their HIV responses over recent years, yet the fiscal space to finance the interventions remains limited. HIV funding gaps have grown substantially due to the economic contractions and shifts in budgetary priorities that many countries have experienced throughout the COVID-19 pandemic. This paper uses updated macroeconomic inputs (as of April 2021) to better understand the impact that COVID-19 has had on countries' abilities to increase domestic funding for their HIV response.

Methods: To understand country capacity to increase domestic government spending on health and HIV, HP+ created a model to project future funding levels based on two scenarios (optimistic and pessimistic). Themodel[RR1] assessed GDP, government spending, health spending, and HIV spending[RR2]across 15 countries across the Asia region from 2020 to 2023, accounting for the potential effects of COVID-19 on economic growth projections and prioritization of specific health areas. Inputs were gathered from the October 2019 and October 2021 IMF World Economic Outlook, the World Health Organization (WHO) Global Health Expenditure Database, UNAIDS, and country-specific sources, including budget documents and funding requests.

Results: Across the 15 countries included in this analysis, of the total HIV resource needs required, domestic governments in 2020 could provide a little less than half (46%), assuming optimistic conditions. By 2022, estimates suggest domestic governments could increase financing to 66% of the total resources needed. Under a more pessimistic scenario, this number drops to 41% in 2020 and 36% by 2022. Pakistan and Lao PDR face the largest resource gaps in terms of the percentage of needs that will likely go unmet (greater than 90%).

Conclusions: Decreased spending would jeopardize hard-fought progress toward epidemic control and could result in increased HIV incidence and mortality. To avoid this situation, it is important that governments and implementing partners look for efficiency gains and innovative solutions to improve value for money in the short term and give larger budgetary priority to HIV in the medium and long term.

Optimizing HIV services (prevention, testing and/or treatment) in the COVID-19 era

EPE419

A qualitative study of patient and provider experiences with telemedicine for HIV care

D. Walker[1], C. Moucheraud[1], D. Butler[2], J. de Vente[3], K. Tangonan[3], S. Shoptaw[1], J.S. Currier[1], J. Gladstein[3], R. Hoffman[1]

[1]University of California, Los Angeles, Los Angeles, United States, [2]To Help Everyone, Los Angeles, United States, [3]APLA Health, Los Angeles, United States

Background: There is limited information on impressions and experiences with using telemedicine for routine HIV care, particularly from U.S. federally qualified health centers (FQHCs). We sought to understand telemedicine experiences of people living with HIV (PLHIV) and their providers.

Methods: We conducted interviews with 31 PLHIV taking antiretroviral therapy and 20 HIV care providers and key informants (KIs) from two FQHCs in Los Angeles between March-July 2021. Questions for PLHIV focused on use and perceptions of telemedicine; questions for providers and KIs focused on implementation of telemedicine and perceptions of patient experience. We used the Modified Framework of Access for coding and analysis of PLHIV interviews, and the Consolidated Framework for Implementation Research Guide for provider/KI interviews. All interviews were double coded with Dedoose software.

Results: The median age of PLHIV was 50 years old (range 23-65). 77% spoke English and the remainder Spanish. 21 identified as cisgender men, 7 as cisgender women, and 3 as transgender women. Almost all had used telemedicine by telephone without video. PLHIV largely viewed telemedicine as a convenient way of accessing HIV care, with savings of time and transportation costs. Most PLHIV felt

capable of engaging in telephone visits, but some shared concerns around technological literacy needed for video visits. Nearly all wanted to continue telemedicine as part of their HIV care. Providers and KIs generally agreed that their patients benefit from telemedicine. Both agreed that initial visits should be in-person. Some providers expressed a perception that patients strongly prefer in-person visits or have significant barriers to telemedicine, including limited technology resources.

Benefit / Challenge	People living with HIV	Providers and Key Informants *(7 physicians, 4 case managers, 2 nurses, 7 clinic managers)*
Preference	All but one interested in continuing to use telemedicine in their HIV care	Perception that patients prefer only in-person visits
Travel to clinic and opportunity costs	Less travel time, saves time and costs of transportation Reduced number of visits gives more time for work and personal matters	Perception of less travel time, saves time and costs of transportation, for patients Fewer missed/late appointments Reduced number of visits, especially for stable and suppressed PLHIV
Technology literacy	Some prefer phone, some prefer video Most report feeling tech literate for phone telemedicine or are interested in learning more about how to use video	Perception that most patients prefer phone because it is simpler to use
Technology resources	Most reported access to smartphone, computer/tablet and WiFi/mobile data	Perception that WiFi/mobile data not dependable for many patients Perception that patients with housing instability/homelessness may not have consistent access to phone or computer/tablet
New diagnosis	Better for initial visits to be in person	Better for initial visits to be in person
Privacy	Most reported access to privacy for telemedicine visits and are comfortable with being on video	Concerns around patients' privacy at home/in surrounding environment during visit
Spanish interpretation	Use of interpreters over telemedicine is acceptable	Use of interpreters over telemedicine more difficult

Table. Comparison of telemedicine benefits and challenges as reported by PLHIV and providers

Conclusions: PLHIV found telemedicine highly acceptable, feasible, and convenient, while some providers raised concerns about their patients' access to telemedicine.
Addressing disparate patient-provider views will be important for the successful implementation of telemedicine as part of routine HIV care.

EPE420
COVID-19, telehealth and HIV care

S. Gudipati[1], M. Lee[1], J. Huitsing[1], N. Markowitz[1], I. Brar[1]
[1]*Henry Ford Hospital, Detroit, United States*

Background: COVID-19 has threatened health care for many individuals. HIV clinics, including ours, often share staff, facilities, and logistics with Infectious Diseases departments on the frontlines of the pandemic. Restrictions of resources, redeployment of staff, and patient reluctance to make clinic appointments disrupt continuity of care of existing patients and limit access to care of new ones. To overcome this, we expanded our capabilities by promoting a telehealth, MyChart (MC), application.
In this report, we describe outcomes as measured by HIV viral load and retention in care in a group of patients enrolled in this program.
Methods: We enrolled Ryan White (RW) people living with HIV (PLWH) at Henry Ford Hospital to MC (electronic medical record software) and initiated a program to educate PLWH on how to use this tool. We supplied pre-loaded phones, as needed, to make virtual visits accessible to all patients. As part of this initiative, a tele-health navigator helped patients download the application and provided education on how to use it.
We collected demographic information and clinical outcomes. Goals were to have 85% of patients virally suppressed (HIV RNA <200 copies/mm3) and have 40% of PLWH have at least one MC visit
Results: From 10/2020 - 01/2022, 264 PLWH were enrolled into our pilot program and given telehealth education. Of these successfully enrolled in MC: 83.7% were black, 73% male, 57% were older than 45 years, 88% lived in Wayne County, and 27 needed and received pre-loaded smart phones. Of those PLWH in this pilot program, 88.32% maintained viral suppression, yet only 43% downloaded MC and only 4.7% had at least one MC visit.
Conclusions: Telehealth programs can help overcome barriers to HIV care and maintain patient engagement when crises interrupt traditional care models. Enrollees maintained parity with our overall RW population and had a similar frequency of viral suppression. Although, telehealth visits were under-utilized, the intervention, itself, may have promoted engagement in care.
Other features of the program such as bidirectional provider-patient messaging and prescription updates await further evaluation.

EPE421
Responding to the COVID-19 pandemic: HIV continuing professional development virtual seminars for healthcare workers in Ukraine

A. Shapoval[1], J. Penner[2], T. Bondarenko[1], A. Ihnatiuk[1], M. McDowell[1]
[1]*The International Training and Education Center for Health of University of Washington, Department of Global Health, Seattle, United States,* [2]*The University of British Columbia, Vancouver, Canada*

Background: The International Training and Education Centre for Health (I-TECH) has been supporting HIV service delivery in Ukraine since 2013, including extensive in-service training and mentorship. With the onset of the COVID-19 pandemic, I-TECH has shifted technical support and education for healthcare workers (HCWs) to an online model to continue supporting quality service delivery while respecting efforts to mitigate the pandemic.
Description: In August 2020, I-TECH conducted an initial survey among 184 HCWs to inform the delivery of online training for infectious disease specialists working at 107 I-TECH-supported antiretroviral therapy (ART) sites.
Based on survey results, I-TECH implemented monthly virtual continuing professional development (CPD) series via Zoom with participant surveys after each session.
Email invitations were circulated to potential participants, who registered for each session to gain nationally recognized CPD credits.
One year later, another user survey was conducted among 343 HCWs to guide ongoing CPD delivery. Between September 2020 and December 2021, 15 virtual CPD seminars were conducted with a mean of 111 participants per session.

Lessons learned: The virtual CPD series was well received with a median uptake of 76% among those invited and overall user satisfaction of 96.9%, indicating high or very high level of satisfaction with each session.

Scheduling refinements were made based on participant feedback, including preferences for Thursdays, 3 pm start time, and duration of one hour plus 30 minutes for questions. Participants prioritized monthly sessions. Interactivity was increased based on preferences for incorporating case discussions. CPD credits were a motivator for attendance.

Despite high uptake and user satisfaction, some barriers to participation included unstable Internet access; insufficient Wi-Fi capacity for video streaming; limited computer literacy for navigating Zoom; and translation quality when international experts presented. Participants desired offline access to seminar materials in the Ukrainian language and supplemental in-person training.

Conclusions/Next steps: The virtual CPD series allowed I-TECH to continue providing in-service training despite the COVID-19 pandemic and had high uptake and user satisfaction. Participant surveys were valuable for adapting the program to meet user needs and continue informing ongoing series. A similar approach will be explored for other cadres of service providers.

EPE422

Training adaptations to address quality improvement in PEPFAR-supported Latin America programs in the era of COVID-19

L.I. Tison[1], K. Harrison[2], G. Dougherty[3], D. Hoege[3], J. Soares Lim[3], L. Walker[3], F. Tsiouris[3], N. Farach[4], R.E. Morales Siliezar[4], A.C. Santelli[5], J. Wright[4]

[1]*Centers for Disease Control and Prevention, Division of Global HIV and TB, Atlanta, United States,* [2]*Morehouse College, Public Health Leaders Fellowship Program, Atlanta, United States,* [3]*ICAP at Columbia University, New York City, United States,* [4]*Centers for Disease Control and Prevention, Guatemala City, Guatemala,* [5]*Centers for Disease Control and Prevention, Brasilia, Brazil*

Background: QI approaches implemented at health facility level have been shown to be effective in improving HIV programs globally. The COVID-19 pandemic context necessitated innovative modalities of QI training conducive to social distancing and travel restrictions. CDC-supported countries in Latin America convened a virtual QI training for leadership stakeholders as a means of improving service delivery at the site level. Here we describe the implementation of this remote QI training.

Description: The training was conducted over a nine-week period in Spring 2021 in seven Latin American countries. Training was delivered in English via Zoom platform with simultaneous translations in Spanish and Portuguese. Participants included HIV service providers, CDC country staff, implementing partners, and their counterparts from the Ministry of Health in each country.

The course, usually conducted in person over a two-week period, was adapted to virtual format. Sessions were conducted weekly over an eight-week period and consisted of one-hour didactic lectures covering QI methods and tools facilitated by ICAP and CDC QI experts followed by one hour of peer-to-peer group exercise activities facilitated by in country facilitators.

During these group exercises, facility teams completed QI tools examining common quality challenges related to their own context for peer-to-peer sharing at the beginning of each subsequent session. Final deliverables were a compendium of all QI tools covered throughout the course which were used to address identified challenges. A four-question survey was administered at the conclusion of the QI training to elicit feedback on course content and delivery.

Lessons learned: Participant teams from six countries joined in the QI training. Survey results showed that most participants found the training program improved their knowledge in QI methods, was relevant to current job responsibilities, and met all or most of their expectations. Lack of evaluation of participant knowledge and skill acquisition in robust QI implementation is a limitation of this training and one that can be addressed in future iterations.

Conclusions/Next steps: The PEPFAR remote QI course is a viable alternative to in person trainings in the era of COVID-19. Further evaluation of course content and participant skill acquisition in QI would be useful to inform future trainings.

EPE423

Brazilian Ministry of Health strategies to address disruptions to HIV testing during COVID-19 pandemic

A. Philippus[1], R. Ganassin[1], A. Bigolin[1], M. Villares[1], G. Pereira[1]

[1]*Brazilian Ministry of Health, Department of Diseases of Chronic Condition and Sexually Transmitted Infections, Brasilia, Brazil*

Background: The rapid spread of SARS-CoV-2 during 2020, led to additional challenges in accessing HIV diagnosis, performed in Brazil mainly with HIV rapid tests (RT) in almost all primary care public health units. The need for social distancing and redirecting the services to fight the pandemic, reflected in a reduction of 27% in the number of RT distributed by the Brazilian Ministry of Health (MoH), between 2019 (16 million) and 2020 (11.6 million), leading to a slight drop in the proportion of people living with HIV (PLHIV) diagnosed, from 89% to 88%.

Description: Considering the disruptions in HIV testing services, from May 2020 the MoH published technical guidelines and provided webinars for all 27 states, recommending the following strategies: scheduling for HIV testing; oral fluid self-collection with social distancing; outdoor testing and extraordinary HIV self-testing (HIVST) offer to key and priority populations in health services

to avoid crowds; targeting HIV testing through focused testing strategy aiming to lead to greater PLHIV identification, even with the reduction in the number of tests performed.

Lessons learned: HIVST distribution for key and priority populations increased 82% in 2020 second semester (108,391), the period following the recommendations, in comparison to the first semester (59,442). After the adoption of other recommended strategies, the number of RT (blood and oral fluid samples) distributed increased by almost 44% in 2021 (16.7 million) in comparison to 2020 (11.6 million) and the use of oral fluid RT increased 121% in 2021 (498,010) in comparison to 2020 (225,200).

The transmission of SARS-CoV-2 could discourage health professionals from using the oral fluid test acquired by the MoH and the strategies implemented (self-collection) allowed the use within the validity period avoiding tests loss.

Conclusions/Next steps: The rapid adoption of strategies was crucial in the reestablishment of HIV testing services, showing the importance of close monitoring of testing strategies in health services, allowing strategic decision-making in a fast and well-communicated way.

These findings also suggest that until rapid HIV testing is fully re-established, and services are no longer impacted by the COVID-19 pandemic, it is important to maintain or even expand the implemented strategies.

EPE424

Circumventing the impact of COVID-19 pandemic on access to HIV-1 RNA assay in Nigeria

T.N. Yakubu[1], F. Abbah[1], O. Ejoh[1], E.M. Shabi[1], J. Dung[1], F. Emerenini[1], C.I. Olu[2], P. Anyanwu[1], O.-E. Ughweroghene[3], I. Iyortim[3], Y. Ogundare[2], E. Atuma[2], A. Adewale[1], M. Strachan[4], R. Fayorsey[5]

[1]ICAP at Columbia University, Abuja, Nigeria, [2]Jhpiego, Abuja, Nigeria, [3]United States Agency for International Development, Washington DC, United States, [4]Jhpiego, Baltimore, United States, [5]CAP at Columbia University, New York, United States

Background: The first confirmed case of Coronavirus disease 2019 (COVID-19) in Nigeria on 27th February 2020, preceded the COVID-19 lockdown directive issued on 30th March 2020. The lockdown disrupted the Laboratory Network for viral load (VL) testing and interrupted access to VL services.

To mitigate the interruption in VL testing, RISE Nigeria, with funding from USAID, pivoted innovative strategies to facilitate seamless provision of VL services to clients in Adamawa, Akwa Ibom, Cross River and Niger States in Nigeria.

Description: Stakeholder engagements were conducted to secure COVID-19 passes and remote access to the National Laboratory Information Management System (RA_LIMS). Staff and clients were educated on COVID-19 safety practices using virtual platforms, provided guidelines and commodities for safe practices, implemented an integrated case management model to collect VL samples at home, community-based private health facilities (HF) and in 90 public HF. Samples collected were transported by the National Integrated Specimen Referral Network, electronic results were retrieved via RA_LIMS and disseminated via WhatsApp and email to HF. An excel tool was used for data collection, and weekly virtual meetings were convened to review performance.

Samples collected and results reported between October 2019 and September 2020 were compared using the two-sample independent *t* test pre-COVID (October 2019-March 2020) and during-COVID (April 2020 –September 2020) lockdown at 95 confidence interval and <0.05 level of significance.

Lessons learned: VL samples collected increased from 31,848 (88% of 36191 eligible clients [EC]) pre-COVID to 42,955 (90% of 47945 EC) during COVID lockdown (p<0.001). The number of VL results returned increased from 77% (24,550/31,848) collected pre-COVID to 96% (41,081/42,955) during COVID-19 lockdown (p<0.001). VL coverage (VLC) increased from 87% to 95% (p<0.001); 57% to 77% for children 0-9 years, 71% to 91% for adolescents and young people, 19% to 91% for pregnant and breastfeeding women, 70% to 87% for males >24 years, and 76% to 90% for non-pregnant females >24 years (p<0.001).

Conclusions/Next steps: Our interventions resulted in reduced impact of the COVID-19 lockdown on VL services in RISE supported HF with an increase in VL coverage and results returned.

EPE425

Improving viral load coverage and suppression in four Central American countries during the COVID-19 pandemic

I. Escobar[1], J. Abdo[1], B. Taracena[1], Y. Villaseñor[1], M.I. Castañeda[1]

[1]IntraHealth International, Guatemala, Guatemala

Background: The USAID-funded HIV Care and Treatment project, led by IntraHealth International, provides direct service delivery in 36 facilities across Guatemala, El Salvador, Honduras, and Panama. It seeks to reach 95% viral load suppression (VLS) using strategies aligned with UNAIDS 95-95-95 goals and WHO recommendations. Lockdowns and closure of outpatient laboratory services due to the COVID-19 pandemic exacerbated VL coverage challenges, with coverage decreasing to 19% and suppression to 69% (Q2 FY20) from pre-pandemic levels (37% and 80%, Q1 FY20).

Description: The project implemented a quality improvement bundle, with an action plan to address VL coverage, including granular site management for low performing sites based on root cause analysis. We identified reasons for declining coverage via site monitoring, responding to these challenges through (re)training, VL reagent purchasing, hiring laboratory technicians, increasing

access to VL sample collection testing through peripheral labs, community blood draws, and extended work hours in laboratory and pharmacy. To address declining VLS we optimized patients by switching to Dolutegravir-based regimens, used SMS reminders for appointments, and provided enhanced adherence counseling using Undetectable=Untransmissible (U=U) messaging.

Lessons learned: Granular site management with root cause analysis informed differentiating care to meet clients' needs during COVID-19, resulting in better VL coverage and suppression rates. Implementing the comprehensive action plan led to an increase to 64% VL coverage and 85% VLS (Q1 FY21), and to 86% VL coverage & 90% VLS (Q4 FY21) with more granular site management (Figure 1).

Figure 1. VL coverage and suppression, HIV Care and Treatment Project during FY2020 & FY2021

Conclusions/Next steps: Given the importance of improving VL coverage and suppression to end HIV transmission, an action plan based on root causes analysis, granular site management, and differentiating care can contribute to improved outcomes during times of health systems stress.

EPE426

Introduction of multi-month dispensing and community distribution of antiretrovirals during the COVID-19 pandemic in the Dominican Republic

C. Valdez[1], E. Barillas[2], L. Ledesma[1], H. Espinoza[3], J.A. Ledesma[4], L. Caminero[5], M. Castillo[6], O. Garcia[7]

[1]GIS Grupo Consultor, Santo Domingo, Dominican Republic, the, [2]GIS Grupo Consultor, Washington, United States, [3]GIS Grupo Consultor, Lima, Peru, [4]Former HIV Program Advisor, Santo Domingo, Dominican Republic, the, [5]Former HIV Program Clinical Coordinator, Santo Domingo, Dominican Republic, the, [6]National HIV Council, Santo Domingo, Dominican Republic, the, [7]Servicio Nacional de Salud, Santo Domingo, The Dominican Republic

Background: As in other countries, the Dominican Republic (DR) imposed restrictions on population mobilization and the provision of some health services due to the COVID-19 pandemic. Close to 40,000 persons on antiretroviral (ARV) therapy was, therefore, at risk of interrupting their treatment. Therefore, in March 2020 the DR introduced multi-month dispensing (MDD) to ease the demand in overcrowded facilities. MDD dispending was possible due to the changes in the procurement of Fixed-dose combinations formulation in large packing (90 tablets per bottle). This sole intervention, however, could not assure a continuous supply of ARVs during the pandemic.

Description: The Dominican Republic MoH, with the support of GIS Grupo Consultor support, developed standardized guidelines for the community distribution of ARVs. In order to qualify, patients on ARV therapy must be in a stable clinical situation, be adherent to treatment, and explicitly agree to receive ARVs at home. The prescription must be authorized by the clinician and validated by the pharmacist. A community health worker delivered the ARVs at home, or at an agreed meeting site. The guidelines included procedures to assure confidential dispensing, clinical, epidemiological, and logistic record keeping. By the end of 2021, 4,800 persons were receiving ARVs in the community.

Lessons learned: The combination of MDD and community distribution of ARVs were useful strategies to prevent treatment breakdowns during the COVID-19 pandemic. Five hundred and thirty-four thousand (534,000) ARV units were distributed under this initiative.

Conclusions/Next steps: The cost of the community delivery of ARVs, although significant for the public health system, has to be measured against an increased adherence to treatment and the reduction in transportation costs for the users. Follow-up economic studies are needed to extend this intervention to more persons on ARV therapy and, eventually, to other chronic conditions such as diabetes and hypertension.

EPE427

Delivering COVID19 vaccine to people living with HIV through an AIDS service organization partnership

A. Mahdi[1], C. Kaneza[1], L. Jorgenson[1], C. Wong[1], H. Inoua[1], K. Salam[1], J. Brophy[1,2]

[1]AIDS Committee of Ottawa, Ottawa, Canada, [2]CHEO / University of Ottawa, Department of Pediatrics, Division of Infectious Diseases, Ottawa, Canada

Background: The intersection of the COVID19 and HIV pandemics has presented new but familiar challenges. Vaccination of all populations including PLWH has been recommended, although data on efficacy in PLWH is lacking. Historical distrust and fear of exploitation in racialized people limited their vaccine uptake despite the higher COVID19 burden experienced by them. The AIDS Committee of Ottawa (ACO) aimed to improve uptake of COVID19 vaccine among PLWH in Ottawa through an innovate community collaboration.

Description: ACO, as the primary AIDS Service Organization in the nation's capital, partnered with Ottawa Public Health and a community health clinic (Bruyere Family Health Team) to provide a low-barrier COVID19 vaccination clinic for PLWH/people affected by HIV. Information sessions on COVID19 vaccine safety and COVID19 burden

were held by ACO in partnership with the Canadian AIDS Treatment Information Exchange (CATIE) to answer questions and build confidence among members. A first-dose clinic was held on 22-23 May 2021, with >400 people vaccinated; a follow-up (second-dose) clinic was held on 10-11 July 2021, with 238 people vaccinated. Government-issued identification was not required to attend the clinic. A survey of clients attending the second clinic was conducted, with 236 responses.

Lessons learned: 71% of respondents identified as racialized individuals, with the largest group identifying as Black (49%). Most clients were <40 years old (28% 30-39; 29% 18-29; 9% 12-17). Gender breakdown included 51% male, 43% female, and 5% transgender/non-binary/gender non-conforming/two-spirited. Most were Canadian citizens (78%), with 14% permanent residents, 3% temporary residents, 3% refugees. Half had received both vaccine doses at the ACO clinic, while 11% had their first dose there, and 39% had their second dose. Respondents noted convenient location (97%), ease of booking appointment (96%), and culturally-safe care (99%) as ways in which the clinic had reduced barriers for them.

Conclusions/Next steps: This low-barrier, culturally-safe approach to providing COVID19 vaccine to PLWH in Ottawa is an excellent example of how to reach racialized and marginalized populations to help address the pandemic.

Community-based organizations like ACO represent trusted allies that can address vaccine hesitancy and lack of trust in partnership with local public health services to deliver necessary care to these populations.

EPE428

An innovative HIV self-testing system during COVID-19 pandemic to reach unscreened MSM: results from an online community program

T. Alain[1], E. Fouquay[1], N. Etien[2], D. Michels[1], A. Velter[2], F. Barbier[1], N. Lydié[2], F. Desbordes[3]

[1]*AIDES, Pantin, France,* [2]*Santé Publique France, Saint Maurice, France,* [3]*Blue Savanah, Paris, France*

Background: The Covid-19 crisis has had a large impact on HIV testing in France, evidenced by declines of 14% in HIV blood testing and of 22% in HIV self-tests sales by pharmacies from 2019 to 2020, according to Santé Publique France.

At the same time, self-tests distribution by AIDES association increased by 71%, with a high mail distribution demand. As a result, we launched an online self-test send platform "*Jefaisletest.fr*" involving AIDES, Santé Publique France and Blue Savanah.

As an HIV key population, this analysis aims to identify the factors associated with a first HIV test among men who have sex with men (MSM).

Methods: *Jefaisletest* is a web page, launched in April 2021, where users can order an HIV self-test and provide anonymous sociodemographic (age, gender and sexual orientation) and HIV testing history information. A remote interview is also offered.A multivariate logistic regression was used to identify factors associated with a first HIV test among MSM.

Results: Between April and November 2021, 5657 self-tests were sent all around France through *Jefaisletest* applications. Most users were men (n=4453; 79%) of whom 85% were MSM (n=3772). Of these MSM, 14% (n=543) had never been tested for HIV.

The age distribution of these never-tested MSM was homogeneous: 17% aged 18-24 age group, 23% aged 25-54 and 14% aged 55+. A quarter of the latter lived in Paris region. Remote interview request was made by 9% (n=46). F irst HIV test made through *Jefaisletest* was independently associated with living outside Paris region (aOR 1.5; 95%-CI 1.1-1.9), being between 18-24 years old (aOR 9.1; 95%-CI 6.7-12.6) or between 25-34 years old (aOR 2.3; 95%-CI 1.6-3.1) compared of being between 45-54 years old, and requesting an interview (aOR 2.1; 95%-CI 1.4-3.0).

Conclusions: The innovative Jefaisletest.fr platform was created to mitigate the decline of HIV testing during the Covid-19 epidemic. It offers an HIV testing alternative throughout France, mostly accessed by MSM. First-time testing among MSM was associated with younger age and living outside the Paris Region.

This type of program should be made permanent and more widely available. It could be extended to other STIs and other vulnerable populations.

EPE429

Six-month Antiretroviral dispensing and other comprehensive, person-centered HIV care to increase service efficiency, client convenience and risk of COVID-19 infection in three provinces in Zambia

T. Tulli[1], M. Chanda[2], R. Makufele[1], B. Kafulubiti[2], M. Sichamba[2], S. Zulu[2], C. Madevu-Matson[3], L. Kalima[1], V. Peleka[1]

[1]*John Snow Inc, Monitoring and Evaluation, Lusaka, Zambia,* [2]*John Snow Inc, Technical, Lusaka, Zambia,* [3]*John Snow Inc, Monitoring and Evaluation, Boston, United States*

Background: The USAID SAFE program (SAFE) supports the Ministry of Health (MOH) in Zambia with an integrated approach to HIV prevention and treatment. A five-year (2017–2022) project, SAFE operates in three provinces and has supported 302 health facilities through the COVID-19 pandemic with an increasing volume of people living with HIV (PLHIV) receiving treatment.

Description: SAFE collaborated with the MOH to decrease clinic congestions, increase service efficiency and client convenience, while reducing clients' clinic visit burden and risk of COVID-19 transmission.

SAFE implemented the following strategies:

1. Transition of stable clients to 6 multi-months dispensation (MMD) supply of ART drugs when eligible;

Oral abstracts

Poster exhibition

E-posters

Late-breaker abstracts

Author Index

2. Community integrated delivery of services such as ART deliveries/dispensation, TPT initiation/refill, cervical cancer screening, viral load (VL) sample collection and monitoring, and family planning;
3. Regular review of ART stock status to ensure adequate availability;
4. After-hours and weekend clinics for those unable to access ART during normal working hours; and,
5. Clinical camps and intensive calling of clients for drug pick-up and/or top-up prior to predicted COVID-19 waves by Zambia National Public Health Institute.

Lessons learned: In March 2020, out of 307,778 clients on ART, 66% (203,134) physically attended clinics, with 29% (83,706) of all clients on 6MMD, 47% (136,211) on 3-5 MMD, and 24% (68,198) on less than three months. By December 2021, the overall population of clients on ART increased by 2% (315,245), but the number physically attending clinics in the month decreased by 30% (143,218), with 68% (215,293) of all clients on 6MMD, 24% (75,912) on 3-5 MMD, and the remaining 8% (24,094) on less than three months.

Conclusions/Next steps: The 6MMD and other decongestion measures greatly reduced the volume of health facility visits by PLHIV, while serving larger numbers overall. The reduction in the number of PLHIV attending the facility on each clinic day enabled adherence to COVID prevention measures as there was adequate space for social distancing that enabled sufficient time for health practitioners to attend each client. SAFE will continue to support the MOH to maintain person-centered approaches like 6MMD and community services.

EPE430

Resilience of an HIV program during COVID-19 facilitates the continuum of care and increases the patient cohort in four provinces in Mozambique

A. Ouenzar[1], M. Napua[1], A. Barros[1], J. Pacca[1], A Couto[2]
[1]*Abt Associates, ECHO Project, Beira, Mozambique,* [2]*Mozambican Ministry of Health, Maputo, Mozambique*

Background: Mozambique has one of the world's largest populations living with HIV, and an HIV prevalence of 13.2% (IMASIDA, 2015). The first COVID-19 case in Mozambique was reported on March 22, 2020. By December 16, 2021, 156,729 cases and 1,948 deaths were reported (MISAU, 2021). In March 2020, the Mozambican Ministry of Health (MISAU) released a circular to reorganize patient flow and antiretroviral therapy dispensing to reduce congestion in health facilities.

We analyzed the resilience and capacity of the Mozambican health system to ensure provision of care and treatment during the COVID-19 pandemic.

Description: In accordance with MISAU's circular, USAID's Efficiencies for Clinical HIV Outcomes project (ECHO) began implementing new COVID-adapted service delivery models, including expanded 3 months ART delivery criteria, community drugs delivery (CDD), one stop model, more frequent preventive phone call reminders for adherence, and extended working hours. ECHO supported MISAU to develop standard operating procedures to implement these models in 148 health facilities in Tete, Manica, Niassa, and Sofala Provinces. We analyzed 24 months of site-level program data from electronic patient records.

Lessons learned: Identification through index case testing combined with strong referral systems facilitated the steady enrollment of new HIV patients on ART. A median of 13.001 new patients were enrolled per quarter from March 2020. The ART cohort increased regularly during the pandemic and increased by 45% from March 2020 (220.904 active patients) to December 2021 (321.439 active patients). The combination of preventive phone call reminders and CDD improved early retention for newly enrolled patients. The retention rates for 90 days increased from 71% in March 2020 to 91% in December 2020 and 96% in December 2021.Viral suppression increased from 78% in March 2020 to 91% in December 2021.

Conclusions/Next steps: The COVID-19 pandemic necessitated new strategies to maintain or increase access to HIV care and treatment and mitigate attrition. Coordination between MISAU and ECHO and efficient implementation of COVID-adapted service delivery models permitted to strength the resilience of the HIV program during the pandemic.

The implementation contributed substantially to these results. Continued analysis of program outcomes will help inform service delivery approaches in a post pandemic era.

EPE431

Telemedicine and E-commerce platforms supporting medical care continuity during the COVID-19 pandemic in Uganda

J.M. Bwanika[1,2], J. Ssebwana[1], L. Kamulegeya[1], D. Musinguzi[1]
[1]*The Medical Concierge Group, Research, Kampala, Uganda,* [2]*The Infectious Diseases Institute Limited, Research, Kampala, Uganda*

Background: Government efforts to curb the spread of COVID-19 in Uganda included total or partial mobility lockdowns between 2020 and December 2021. As a result, access to health facilities for both healthcare workers and patients became almost impossible. As a result, telemedicine and e-commerce delivery models gained more prominence, and their utility compounded.

We share the experience of a 24/7 telehealth center serving public health projects and private health insurance members in Uganda.

Description: The Medical Concierge Group (TMCG), a Ugandan digital and telemedicine company, provides telehealth and information communication support to donor-funded public health projects and private health insurers. From March 2020 to Dec 2021, its telehealth centre was used for remote teleconsultations, supporting HIV

care continuity through appointment reminders, and disseminating countrywide COVID-19 prevention and vaccination information through a toll-free hotline, two-way WhatsApp and SMS chat platforms, and an online e-commerce site.

Lessons learned: A total of 34,215 voice teleconsultations were conducted, with the top inquiries being for HIV (22%), COVID-19 (17%), Family planning (12%), Tuberculosis (9%), and Voluntary Medical Male Circumcision-VMMC (8%). In addition, 184,334 people were engaged via SMS or WhatsApp for sensitization and awareness information predominantly on COVID-19 vaccination (63%), general COVID-19 information (12%), and VMMC (6%).

In addition, 18,079 patients received HIV appointment reminders and 31,374 viral load test reminders, with the average appointment keeping for the supported sites being 85% and 92%, respectively. The e-commerce site; Rockethealth.shop had 5741 orders, with the majority being COVID-19 prevention supplies like facemasks, sanitizer, and vitamin supplements. The median age of users was 26 years (18-40), with a 50% share among male and female users.

Conclusions/Next steps: Telehealth and e-commerce platforms turned out to be the primary or complementary access points for healthcare services for the majority of people during the COVID-19 lockdown periods. The adoption is expected to persist and grow further even though it might be slower during periods of unrestricted mobility.

There is a huge opportunity to ride this wave of uptake and grow digital health and technology-supported healthcare models for HIV and the private sector.

EPE432

Programmatic measures leading to viral load coverage improvement after declining due to the COVID-19 pandemic

M. Montebatsi[1], M.-C. Lavoie[2], C. Baumhart[2], N. Blanco[2], R. Marima[2], K. Sebina[1], J. Mangope[1], M. Mudanga[1], M. Mokgwathi[1], D. Ramaabya[3], N. Ndwapi[1]

[1]Bummhi, Gaborone, Botswana, [2]University of Maryland School of Medicine, Baltimore, United States, [3]Ministry of Health and Wellness, Gaborone, Botswana

Background: In March 2020 the Ministry of Health and Wellness introduced several measures aimed at reducing the risk of COVID-19 infections in the health facilities and among health care workers. The measures included a moratorium on viral load (VL) testing for clients with suppressed VL, with the exception of children and pregnant women. Movement restriction also temporarily stopped community interventions for patients follow up. As a result, VL coverage declined from 95% (Jan-March 2020) to 84.7% (July-September 2020).

We describe programmatic measures that contributed to a recovery in VL coverage at PEPFAR supported sites after this decline.

Description: *Botswana*-University of Maryland School of Medicine Health Initiative (*Bummhi*) implemented a series of interventions to support the recovery of VL coverage among patients living with HIV at 52 PEPFAR-supported sites. These measures included the lifting the moratorium on VL testing for previously virally-suppressed clients; line listing of clients with invalid VL; phone recall of clients with invalid VL; reinitiating community visits for clients with invalid VL; engaging 14 temporary phlebotomists to support VL bleeding; extending bleeding hours and provision of transport for VL specimens to testing labs in Gaborone, Moshupa, Kanye, Tutume, and Francistown.

Lessons learned: The interventions contributed to a 71% increase in the number of VL tests performed (22,075 in July-September 2020 to 37,783 in July-September 2021. In contrast, the number of clients with invalid VL decreased from 33,410 in July-September 2020 to 12,775 in July-September 2021VL coverage increased from 84.7% to 95.9% during the same time period.

Conclusions/Next steps: Despite the setback in VL coverage experienced at the start of the COVID-19 pandemic, targeted programmeasures implemented to support VL coverage recovery proved effective in re-establishing the viral load coverage for PLHIV with invalid viral loads to the level recorded before the pandemic.

EPE433

Maintaining ART client retention during the COVID-19 pandemic, St. Carolus Hospital, Jakarta, Indonesia

D.S. Marta[1], I. Rosali[1], S. Hadinata[1], E.W. Danudirgo[1], J. Tandraeliene[1], P.A. Chandra[1], Y. Gunawan[1], A.A. Widyasworo[1], H.I. Permata Sari[1], J. Ekadewi[1]

[1]St. Carolus Hospital, Ruang Carlo, Jakarta, Indonesia

Background: Ruang Carlo Clinic has supported 5,735 people living with HIV (PLWH) on ART since 2009. Most (65%) are MSM and the majority (59%) <30 years old. Pandemic lock-downs, travel restrictions, and reduced operational hours impacted client access to the clinic.

The clinic introduced several innovations to address these challenges that we describe here and compare retention before and during COVID pandemic.

Description: Medical & non-medical care providers together with clients took part in creating a service that meets client needs. From the front desk to meeting the doctor or counsellor, clients are treated with care and respect. Counselling services can extend beyond HIV and can include facilitating reconciliation between parent and child, husband and wife, partners or other struggles faced by PLWH.

Besides its empathic care and detailed record keeping to monitor performance, the clinic has introduced courier ARV delivery and multi-month ARV dispensing (MMD). Clients receive automated phone message reminders for their scheduled appointments. A baseline retention average pre-pandemic was established for 2019 and

compared with the period 1 January 2020 through 31 December 2021. ART retention in 2019 was 3,432 of 3,742 (92%). That number increased to 95% of 3,712 clients in 2020-2021 despite the pandemic.

Lessons learned: Maintaining services that value person-focused care and engagement supported by innovations such as home ARV delivery, MMD, close follow-up and appointment reminders can ensure and even improve retention in the face of adversities like those faced by clients during the pandemic.

Conclusions/Next steps: Facing any clinic access restriction like those faced during the Covid19 pandemic, ART staff and clients should work together to develop new strategies to ensure retention of ART clients and meet any psychosocial needs that arise during lockdowns and pandemic restrictions. During pandemics or similar emergencies we must continue serving clients with care and help clients to build or restore relations with their families and partners.

Clinics must work together with clients in achieving treatment goals; maintain detailed data collection and documentation; find new ways for ARV delivery; lengthen MMD; maintain close communication; and. develop other strategies that support client retention.

EPE434

Supporting Prevention of Mother-to-Child Transmission of HIV (PMTCT) during the COVID-19 pandemic: lessons from the Kyrgyz Republic

A. Ahart[1], A. Bekbolotov[2], E. Tostokov[2], E. Tilekov[1], C. Imanalieva[3], R. Malyuta[4]

[1]*UNICEF, Consultant, Bishkek, Kyrgyzstan,* [2]*Republican AIDS Center, Bishkek, Kyrgyzstan,* [3]*UNICEF, Bishkek, Kyrgyzstan,* [4]*UNICEF, Almaty, Kazakhstan*

Background: Elimination of mother-to-child transmission of HIV is a national priority in Kyrgyzstan. For more than 15 years, the country has been integrating PMTCT services within the perinatal health care system. In 2020, the COVID-19 pandemic threatened to disrupt delivery of PMTCT services and discourage patients from seeking care. Temporary lockdowns, strained resources, and the unexpected large-scale return of labor migrants including pregnant returnees posed formidable challenges.

In response, the country adopted an initiative to minimize service disruptions and encourage uptake of services among vulnerable pregnant women while reducing in-person contact and the risk of COVID transmission.

Description: The initiative targeted pregnant returnees in three districts and was jointly developed by the Ministry of the Health of Kyrgyzstan, the Republican and Osh AIDS Centers, the Kyrgyz State Medical Academy, and UNICEF.

Core components included: an algorithm for case finding and referral of pregnant returnees; introduction of HIV rapid self-testing for pregnant women; development of an electronic educational leaflet; use of a popular messaging platform (WhatsApp) to contact returnees, disseminate information and conduct pre/post-test video counseling for rapid HIV self-tests; virtual training on PMTCT.

From July – November 2020, 806 medical professionals completed a virtual training on PMTCT. A total of 221 pregnant returnees were identified and screened for PMTCT services. Of these, 55% required HIV testing and were offered the option of clinic-based or rapid self-tests. Almost 60% of eligible pregnant returnees opted for rapid self-testing supported by WhatsApp video counseling.

Lessons learned: The introduction of rapid self-testing helped ensure timely HIV screening for this mobile population. Offering a choice of HIV testing (home or clinic-based) helped alleviate patient concerns related to stigma and privacy. The popularity of WhatsApp made it a useful tool for outreach. Patients preferred video calls for pre/post-test counseling. Video calls pose some risks to patient confidentiality and safety which must be addressed.

Conclusions/Next steps: The COVID-19 pandemic accelerated the adoption of new technologies for training, conducting outreach and HIV testing for pregnant women. While these technologies were intended to minimize in-person contact and the risk of COVID transmission, they could prove useful in reaching highly mobile and remote populations in the future.

EPE435

Use of telehealth in the delivery of HIV services in rural America during COVID-19 Pandemic

I. Kabore[1], B. Evans[1], C. Samuel[1], W. Mase[1], S. Smallwood[1], G. Akudibillah[2], K. Achebe[2], B. Wright[2]

[1]*Georgia Southern University, Statesboro, United States,* [2]*Peace Corps, Washington, United States*

Background: COVID-19 pandemic has challenged continuity of HIV services because of the restrictions following the pandemic. Telehealth provides alternative to care access for People Living with HIV(PLHIV) but with challenges such as social distancing, access to reliable broadband connection, adapted HIV services to minorities and vulnerable groups.

This commentary examines the operationality of telehealth for PLHIV in rural areas and recommends strategies to manage HIV services during the COVID-19 pandemic.

Description: PLHIV reported more difficulties accessing HIV services at healthcare facilities during COVID-19 pandemic. Pandemic restrictions, intersectional stigma, medical mistrust, and COVID testing requirements have combined to lower the use of healthcare facilities by PLHIV in favor of telehealth.

However, close to one-third of Americans living in rural areas do not have high-speed broadband service. Furthermore, HIV services through telehealth are limited among vulnerable populations such as elderly, the homeless,

sexual minorities, females, African Americans, and non-English speakers. The utilization of telehealth and virtual platforms come at a high cost for vulnerable populations affected by HIV/AIDS and COVID-19. It also interferes with the in-person communication and human touch traditionally used to help build trust and rapport between patients and providers.

Lessons learned: The COVID-19 pandemic has stalled the progress toward HIV epidemic control and ensuring the treatment continuity. Access to telehealth in addition to ART multi-months dispensing (MMD), HIV mobile health truck units, computer tutorials and access to internet especially in rural areas are recommended.

Moreover, patient-provider relationships should be kept as a priority and in-person visits encouraged as needed to ensure a positive outcomes of telehealth use by PLHIV.

Conclusions/Next steps: The use of telehealth to deliver HIV services in rural areas has increased because of the COVID-19 restrictions. Telehealth is one of the few alternatives to in-clinic care management for PLHIV.

However, it presents a lot of difficulties for adoption and the implementation both from the beneficiaries and their providers and ensuring people have the knowledge and the technology to use telehealth and can support care and services continuity during lockdowns due to pandemics.

EPE436

Acceptability of televisits implemented during COVID-19 among adults living with HIV in Chicago

M. Calamari[1], J. Rivera[2], S. Galvin[1], K. Wright[2], L. Rusie[2], P. Janulis[1], L.R. Hirschhorn[1], S. Tu[1], E. Molina[2], R. Kumar[3], J. Bannon[1], M. Houlberg[2], F.J. Palella[1], M.C. Masters[1], C. Hawkins[1]

[1]*Northwestern University, Medicine, Chicago, United States,* [2]*Howard Brown Health Center, Chicago, United States,* [3]*Georgtown University, Washington, DC, United States*

Background: There is limited research on the effects of telehealth implementation since COVID-19 on provision of quality outpatient care and acceptability among PLH. Using the *RE-AIM* implementation research framework, we measured patient-reported acceptability of a telemedicine program that was introduced in March 2020, among PLH receiving HIV care at an academic (Northwestern University [NU]) and community health center (Howard Brown Health Center [HBHC]) in Chicago, US.

Methods: Surveys at two time-points during the COVID-19 pandemic 12/2020 (S1) and 11/2021 (S2) were administered to adult PLH active in care (defined as having $\geq$2 office visits between 9/2018-3/2020). Surveys included questions on reach, implementation, and maintenance of televisits.

Responses regarding implementation and maintenance outcomes were assessed on a Likert scale (agree/neutral/disagree) and compared between each time-point using the Chi-squared test.

Results: 546/6219 (8.7%) and 377/2400 (16%) responded to S1 and S2, respectively. 834/923 (90%) respondents were male; median age 52 (IQR 21); 60% white. Demographics among respondents did not differ significantly between the two surveys. Among those who completed at least one televisit [784/923 (85%)], most agreed they were satisfied with televisits (S1 71% vs. S2 70%; p=0.98), felt comfortable with the level of communication (85% vs 81%; p=0.26) and agreed that their privacy was well protected (78% vs 76%; p=0.64). Televisits by video were more common in S2 (64% vs. 68%; p=0.01) and the proportion experiencing technical difficulties remained low (16% vs 16%; p=1.0).

Despite favorable ratings of televisit experience, fewer than a third agreed that televisits were the same quality as in-person (29% vs. 28%; p=0.96). Most (81% vs 77%; p=0.32) agreed they would attend televisits again, although the majority preferred half or fewer visits as televisits in the future (69% vs 70%; p=0.8).

Conclusions: Across two large sites of HIV care, PLH found televisits to be an acceptable, feasible and appropriate mode of care delivery during the COVID-19 era. Respondents continued to express an interest in maintaining televisits as an option in the future.

Further study is needed to identify strategies to improve the perceived quality of televisits among patients, to match that of visits in-person.

EPE437

Reducing interruption in treatment during COVID-19 emergency in Guatemala using differentiated service delivery models

M. González[1], F. Castillo[1], Y. Villaseñor[1], P. Alvarado[1], L. Ramirez[1]

[1]*IntraHealth International, Guatemala, Guatemala*

Background: The USAID-funded HIV Care and Treatment program, led by IntraHealth International, provides direct service delivery in facilities across four Central American countries. Lockdowns and closure of outpatient services due to the COVID-19 pandemic had potential to lead to interruption in treatment (IIT); in response, the program increased access to differentiated service delivery (DSD) models.

Description: In Guatemala, DSD models for ART were implemented in 5 of 8 clinics supported by the project, which reach 65% of PLHIV on ART. Four clinics are in rural or underserved areas. DSD included multi-month dispensing (≥3 months), less frequent clinical consultations, community-based drug delivery, and other decentralized drug distribution models such as shipping through private courier and motorcycle messengers. In Q1 FY2021, following DSD implementation, the proportion of people currently on ART increased to 85.5% and IIT was reduced (Figure 1). During Q2 FY2021, DSD implementation decreased as patients returned to their regular clinic visits and DSD was only prioritized for patients who fulfilled criteria such as poor adherence and difficult access to clinics due to distance.

	Q3FY20	Q4FY20	Q1FY21	Q2FY21	Q3FY21	Q4FY21
TX_ML	723	297	165	133	181	168
%DM	75.1%	58.6%	85.5%	17.6%	14.4%	16.6%

Figure 1. DSD effect on interruption in treatment in Guatemala clinics supported by the HIV Care and Treatment Project during FY2020 & FY2021.

Lessons learned: With the increase in implementation of DSD models forced by the COVID-19 emergency, it became evident that their full implementation has a significant impact on reaching new PLHIV and achieving continuity of treatment. Implementing a full set of DSD models reduced IIT during the COVID-19 emergency period in comparison to the post-emergency period, showing that DSD models must be well-prioritized according to patients' needs.

Conclusions/Next steps: The DSD model led to the reduction in IIT during COVID-19 at Guatemalan HIV clinics supported by the project. DSD represents an important, person-centered response to service access barriers posed by the COVID-19 pandemic.

EPE438

Using the mobile clinic strategy to provide HIV prevention, testing and treatment services in the community during the COVID-19 lock down in Uganda

R. Kawooya[1], E. Nagawa[2], J. Nalweyiso[3]
[1]AIDS Information Centre, Prevention, Kampala, Uganda, [2]AIDS Information Centre, Medical, Kampala, Uganda, [3]AIDS Information Centre, Monitoring and Evaluation, Kampala, Uganda

Background: In Uganda, Covid 19 led to the reduction of 30% in the provision of HIV testing services both in the communities and facilities (MOH). ART initiations decreased by 31% between April and June 2020 while viral load coverage decreased from 96% to 85% and CD4 access decreased to 22% between December 2019 to June 2020 due to Covid 19 lock down and its related restrictions.

Description: AIC worked together with community peer mobilizers and Kampala Capital City Authourity (KCCA) through the mobile clinic strategy and provided integrated HIV prevention, treatment and care services during the Covid 19 Lock down in Kampala District.

Peers mobilized communities for the uptake of integrated HIV prevention services, controlled the influx of clients and emphasized Covid 19 prevention Standard Operating Procedures.

Service providers intergrated service delivery to the beneficiaries where they offered services ranging from Behavioral Change Communication (BCC) messages, prevention counseling, HIV testing, ART initiations, ART Refills, Sexual reproductive Health (SRH), GBV prevention, management and condom distribution.

Lessons learned: The flexibility and adaptability of the Mobile clinic strategy in Kampala District made it ideal for the improved service uptake such as ART refills increased by 27% while, PrEP service uptake increased by 30%, HIV testing by 39% and ART initiations by 17%. This was due to the fact that Mobile clinic strategy addressed barriers which had hindered demand and a smooth uptake of integrated services in the vulnerable communities of Kampala District.

Conclusions/Next steps: The mobile clinic model proved to be effective in the provision of Integrated HIV prevention, testing, treatment and care services and Sexual and reproductive Health (SRH) services in the communities of Kampala District since it addressed and unlocked barriers which had hindered service uptake during the Covid 19 Lock down.

EPE439

Impact of COVID-19 on HIV research: challenges and opportunities in a clinical trial setting

N. Chandiwana[1], C. Kruger[1]
[1]Ezintsha, Faculty of Health Sciences, University of the Witwatersrand, Johannesburg, South Africa

Background: The repeated waves of COVID-19 and corresponding mitigation measures have impacted health systems globally with exceptional challenges for the HIV research community.

Description: In response to the pandemic, researchers, regulators, and funders abruptly halted or modified ongoing non-COVID research activities.

For studies that were carried through, new difficulties arose in protecting research staff and patients from contracting the SARS-CoV-2 virus while continuing with clinical research activities.

COVID-19 has put enormous additional strain on HIV researchers tasked with leading the COVID-19 research response and losing progress in solutions for the longstanding dual epidemics of HIV and tuberculosis.

Lessons learned: Notwithstanding these difficulties, the acceleration of scientific knowledge generation has never been greater. In parallel, there has been substantial innovation in research collaboration and real-time implementation of COVID-19 research findings. More than a year after the first reported case of COVID-19 in China, the research world is responding to the pandemic at breathtaking speed.

Regulatory approvals have been expedited and research findings published in record time. With the re-introduction of research activities, several strategies imposed to minimize infection risk, such as telemedicine, have become common practice cutting costs and building inefficiencies to clinical trial management beyond the pandemic.

Conclusions/Next steps: This major global health threat has highlighted the need for a more robust global clinical research infrastructure, agile enough to withstand unexpected emergencies.

EPE440

The effects of COVID-19 on HIV and TB services in China, Guatemala, India, Nepal and Sierra Leone: A Rapid Community-Led Monitoring Study

N. Rafif[1], G. Oberth[2], R. Hodes[2], J. Harries[2], A. Manouan[3], W. Jallow[3], E. Simon[3], S. Baptiste[3]

[1]*International Treatment Preparedness Coalition (ITPC), Community Data and Advocacy, Bryanston, South Africa,* [2]*University of Cape Town, AIDS and Society Research Unit, Cape Town, South Africa,* [3]*International Treatment Preparedness Coalition (ITPC), Bryanston, South Africa*

Background: COVID-19 brought HIV and TB responses to a standstill. Some estimate that it cut ART initiations in half. Global TB case detection fell by nearly 25% in 2020. Amid this crisis, there is a paucity of data on COVID-19's effects on communities of people living with HIV and TB.

This project rapidly mobilized communities for data-driven change.

Description: From September 2020 to March 2021, communities monitored HIV and TB services during COVID-19 at 17 health facilities in China, Guatemala, India, Nepal and Sierra Leone. The monitored sites were predominantly high-volume urban hospitals, together serving more than 20,000 people on ART.

Facility data was collected by communities for 31 quantitative indicators, complemented by 325 qualitative interviews, and used to inform advocacy for improved responses to HIV and TB in the context of COVID-19.

Lessons learned: Across all facilities, 42% of ART initiations were same-day diagnoses. The rate was highest in China (82%) and lowest in Nepal (17%). On average, people who received multi-month dispensing of ART increased from 57% to 72%. COVID-19 catalyzed home ART delivery mechanisms, particularly in China, Guatemala and Nepal. Young people on ART were disproportionately likely to be lost to follow-up in the context of COVID-19. Job loss, food insecurity, restricted movement, stock-outs, and fear of COVID-19 were reported to negatively affect retention in care. A decline in GeneXpert was observed. Just 21% accessed rapid molecular TB tests, delayed by requirements for a COVID-19 test. Stigma and concerns about confidentiality flourished. Communities in Sierra Leone used this data to secure a commitment for a new indicator to track ART treatment failure. After learning of movement restrictions, ART was distributed to 40 refugees from Myanmar who were stranded in China. Communities in India advocated for government to pay for TB patient support.

Conclusions/Next steps: COVID-19 devastated some HIV and TB services while galvanizing others. Community ART delivery, multi-month dispensing, using digital tools, and other differentiated approaches improved. However, rapid molecular TB testing decreased, and stigma and discrimination rose. The urgent need for psychosocial support remains a key advocacy priority.

The Global Gag Rule and access to abortion: impact on law reform in Zimbabwe, Zambia, Mozambique, Eswatini and Malawi

T. Manjonjo[1]

[1]*Southern Africa Litigation Centre, Johannesburg, South Africa*

Background: The Global Gag rule is a US government policy that imposes a condition on foreign NGO recipients of US global health funding not to promote abortion as a method of family planning including providing counselling, advice, lobbying and advocacy for the legalisation of abortion. The Maputo Protocol obligates its member states from the African Union to facilitate access to safe abortion through the repeal of restrictive laws and policies to accessing safe abortion, including criminalisation.

This has been hampered by restrictions on funding and activities through the Global Gag Rule.

Description: The study examined the state of the laws and policies on abortion in Zimbabwe, Zambia, Mozambique, Malawi, and Eswatini, a region that has high incidence of mortality due to complications arising from unsafe abortions, in the context of their obligations in terms of the Maputo Protocol and other international rights standards.

The study looked at the impact of the implementation of the Global Gag Rule in the individual countries and its effects on the ability of civic society to assist the state to implement its international and national obligations for access to reproductive healthcare.

Lessons learned: The study found that the laws on abortion in the 5 countries were highly restrictive and/or unclear, leading to an increase in unsafe abortion, and that there was need for law reform. However, the Global Gag Rule effectively acted as a barrier to effective mobilisation by civic society to advocate for law reform. It also led to fragmentation of civic society, with the real risk of affecting general health outcomes, including the HIV response.

Conclusions/Next steps: States should enact legislative and policy measures to provide access to safe abortion in order to ensure the highest attainable standard of health for women. Policies like the Global Gag Rule impose onerous and unfair barriers to achieving these obligations, which has not only negatively affected regional health outcomes but also threatens state sovereignty when states are hindered from fulfilling their national and international obligations. Although the Global Gag Rule is no longer in force, it is likely to return with a change in government in the US, with dire consequences.

Laws and policies on HIV transmission, exposure, and non-disclosure

EPF002

"I had a one-night stand and followed the law; it ruined my life." Requirements to take reasonable precautions not an improvement on laws criminalising HIV non-disclosure: a case study

V. Parwani[1]

[1]*HIV/AIDS Legal Centre NSW, Surry Hills, Australia*

Background: In October 2018, New South Wales (NSW) became the last State in Australia to remove requirements for people living with HIV (PLHIV) to disclose their status prior to engaging in sexual intercourse. While other Australian jurisdictions replaced these requirements with statements of principles regarding mutual obligations, NSW instead legislated section 79 of the *Public Health Act 2010 (NSW)* (s79) which requires a person with HIV to take reasonable precautions to prevent transmission to another with a maximum penalty of 6 months imprisonment and/or up to an $11,000 fine for contravention.

In practicality, prosecutions under s79 have implications far beyond criminal penalties.

Description: The HIV/AIDS Legal Centre NSW (HALC) is aware of just one prosecution under since s79 to date however the consequences for the defendant in that case, despite them being found not guilty, were rife.

First, the defendant was held in custody on remand for weeks as the Magistrate considered them a risk to public safety.

Second, while the Magistrate cleared the Court (proceedings under s79 must be conducted in closed courts), they omitted to order reporters to remove television cameras from the Court resulting in the mainstream media reporting on the case, including publishing the defendant's name and HIV status. Following the publication, the defendant faced ostracisation and discrimination from their local community.

Lessons learned: Even though the Magistrate in this case found that the prosecution had not satisfied their burden of proof and that the defendant was not guilty, by that stage, it was too late to mitigate the impact on the defendant from the public disclosure of his HIV status.

Lawyers, the judiciary and prosecutors must be trained not only on the current science on HIV treatment and prevention but also to ensure that non-publication orders are sought early in proceedings to prevent any non-consensual disclosure.

Conclusions/Next steps: HALC continually advocates for s79 to be repealed due to its detrimental impact on HIV testing, treatment and prevention and provides ongoing representation for PLHIV facing criminal charges to counter the negative impacts of criminlisation and to ensure that the privacy of PLHIV can be protected at all stages of the process.

EPF003

Combatting HIV criminalization: Francophone activists within the HIV JUSTICE WORLDWIDE Coalition

C. Kazatchkine[1], S. Beaumont[2], I. Kassoumou[3], M. Mambo Amisi[4], L. Pelletier-Marcotte[5], E. Bernard[2]
[1]HIV Legal Network, Toronto, Canada, [2]HIV Justice Network, Amsterdam, Netherlands, the, [3]Coalition Nationale pour la Dépénalisation du VIH au Niger, Niamey, Niger, the, [4]HODSAS, Bukavu, Congo, Democratic Republic of the, [5]Cocq-sida, Montreal, Canada

Background: HIV criminalization is a global phenomenon and Francophone countries are not spared. 19 countries in Francophone Africa have HIV-specific lawS. 16 of these laws that are meant to protect the rights of people living with HIV also criminalize exposure or transmission of the virus. Canada is known for being a world leader in prosecuting people living with HIV and prosecutions have taken place in France, Switzerland, and Belgium.
However, and as widely recognized by HIV and human rights experts, HIV criminalization is bad for public health and harmful for human rights.
Description: HIV JUSTICE WORLDWIDE (HJWW) was created in 2016 to abolish criminal and similar laws, policies and practices that regulate, control, and punish people living with HIV based on their HIV-positive status. Specific space was created within the coalition for Francophone activists working against HIV criminalization. Having a dedicated space provides Francophone activists with a forum to discuss and exchange common issues and experience in their own language.
The Francophone space is also used to connect Francophone activists with other activists worldwide through information sharing on advocacy internationally.
Lessons learned: More than 14 countries are represented on the Francophone space. Support provided includes : learning and resources exchange through list-serv and conference calls; availability of French resources; and technical and financial support to local advocacy. In Niger, a civil society coalition was put in place to combat HIV criminalization. Law reforms efforts are ongoing in Burkina Faso and in Canada. In DRC, capacity building activities have been conducted with people living with HIV, sex workers and the LGBTI community.
In Benin, people living with HIV and key populations mobilized around the reform of their national HIV specific law.
In Belgium, advocates launched a campaign using some progresses made in Canada to support their advocacy.
Conclusions/Next steps: HJWW has focused on creating networks, exchanging information, developing resources in multiple languages, providing technical support, and strengthening local capacities.
With its network and experience, the coalition plays a key role to ensure the significant involvement of people living with and affected by HIV against punitive laws, including in Francophone countries.

EPF004

Reducing the harm: reforming Canadian criminal law to limit HIV criminalization

R. Elliott[1,2], C. Kazatchkine[1,2], I. Annamanthadoo[1,2], R. Peck[3,2], L. Pelletier-Marcotte[4,2], A. McClelland[5,2], M. Longley[6,2], S. Rahim[7,2], E. Mykhalovskiy[8,2], C. Fromstein[9,2], J. Shime[10], C. Johnson[11,12,2], C. Clarke[2]
[1]HIV Legal Network, Toronto, Canada, [2]Canadian Coalition to Reform HIV Criminalization, Toronto, Canada, [3]HIV & AIDS Legal Clinic Ontario, Toronto, Canada, [4]Coalition des Organismes Communautaires Québécois de Lutte Contre le Sida (COCQ-SIDA), Montréal, Canada, [5]Carleton University, Institute of Criminology and Criminal Justice, Ottawa, Canada, [6]Dalhousie University, Dalhousie Legal Aid Service, Halifax, Canada, [7]Kastner Lam LLP, Toronto, Canada, [8]York University, Department of Sociology, Toronto, Canada, [9]Fromstein Law, Toronto, Canada, [10]Cooper, Sandler, Shime & Bergman LLP, Toronto, Canada, [11]Ontario Harm Reduction Network, Toronto, Canada, [12]Toronto Harm Reduction Alliance, Toronto, Canada

Background: In Canada, HIV criminalization has occurred under various offences of general application Most prosecutions are for *aggravated sexual assault*, following Supreme Court of Canada decisions that non-disclosure of HIV+ status before sex posing a "significant risk of serious bodily harm" (*R v Cuerrier*, 1998) – which means a "realistic possibility of HIV transmission" (*R v Mabior*, 2012) – can amount to "fraud" invalidating consent to sex, making it a sexual assault in law.
Prosecutors' and courts' interpretation of this legal test has led to wide application of the law and unjust prosecutions.
Description: In 2017, the Canadian Coalition to Reform HIV Criminalization (CCRHC, www.hivcriminalization.ca) called on Parliament to legislate an end to sexual assault charges and to limit any criminalization to cases of intentional transmission of HIV. This call is endorsed by 174 organizations/networks. In 2019, a Parliamentary committee recommended legislative reform.
From 2019-2022, the CCRHC explored different options for reform, including adding interpretive provisions to the *Criminal Code*to limit the scope of existing general offences versus amendments that would preclude entirely the use of those existing offences and replace them with a new, narrowly-drafted offence specific to HIV transmission.
Lessons learned: As there is no existing HIV-specific law in Canada to repeal or modernize, any legislative amendments need to address multiple aspects (both material and mental components) of the multiple offences that are in play. There are advantages and disadvantages to different approaches.
Considerations include: the degree to which a given approach could limit the scope and severity of the laws (including sexual assault) that have been, or could be, used

Oral abstracts

Poster exhibition

to prosecute; whether a narrow HIV-specific law would be preferable to current very broad application of existing general offences (which *de facto* already single out PLHIV), a trade-off between certainty in law and further stigmatization; the anticipated feasibility of Parliament adopting particular reforms; the risk of limiting criminalization of HIV but expanding criminalization to other transmissible infections.

Conclusions/Next steps: Advocates, including CCRHC, continue to press for Criminal Code amendments to limit HIV criminalization, guided by international recommendations and national community consensus to limit prosecutions to cases of intentional transmission.

EPF005

No justice, no peace for people living with HIV: a global analysis of HIV-related criminal cases, 2019-21

T. Myrie[1], S. Beaumont[1], E. Bernard[1]

[1]*HIV Justice Network, Amsterdam, Netherlands, the*

Background: At least 149 countries have laws that can be used to prosecute people living with HIV for HIV non-disclosure, exposure or transmission, including 75 countries with HIV-specific criminal laws, despite UN and others recommending against such laws, global guidance to limit the overly broad use of other laws, and no evidence of such laws or prosecutions benefiting public health.

Methods: The HIV Justice Network's Global HIV Criminalisation Database contains case reports of HIV-related criminal cases and criminal laws that target people living with HIV. We undertook a global audit of HIV-related arrests and prosecutions reported between January 2019 and December 2021 to establish whether they adhered to global recommendations and guidance and up-to-date knowledge of HIV-related science.

Results: We identified 250 HIV-related arrests and prosecutions with an additional 65 cases where HIV status was treated as an aggravating factor for sentencing or other offences. The majority of cases concerned non-disclosure of HIV status prior to consensual sexual activity with fewer than 30% of cases alleging HIV transmission. A minority of cases concerned spitting, biting, breastfeeding, blood donation, or medical negligence.

Arrests and prosecutions of HIV-related offences often proceed on inaccurate assumptions regarding HIV. In alleged transmission cases, these shortfalls are compounded by the failure of prosecutors and the courts to ensure correct interpretation of scientific evidence and its forensic limitations when seeking to prove actual transmission of HIV. Sentencing is disproportionate, particularly in cases where there is little to no risk of HIV transmission, with non-custodial sentencing options rarely considered.

Courts are timidly acknowledging some scientific advances but remain largely hesitant to depart from previous judicial decisions that do not recognise these advances. In a few isolated cases, prosecutors are concluding that the requisite evidentiary standard for the relevant offence is not met where the accused has an undetectable viral load or has used a condom during sexual intercourse.

Conclusions: Prosecutors and courts continue to ignore scientific developments on HIV-related risk, harms, and proof of transmission. Legislative reform efforts must be complemented by sustained judicial and prosecutorial training and effective implementation of the 2021 UNDP Guidance for prosecutors on HIV-related criminal cases.

EPF006

Transforming HIV policy in the UK Armed Forces – a collaborative approach

O. Brown[1], D. Laycock[2], J. Heskin[3,4,5], T. Manuel[6], J. Josh[5,7], H. Ward[6], I. Green[2], R. Angell[2]

[1]*Royal Navy, Portsmouth, United Kingdom,* [2]*Terrence Higgins Trust, London, United Kingdom,* [3]*Chelsea and Westminster Hospital, London, United Kingdom,* [4]*British Association for Sexual Health and HIV, London, United Kingdom,* [5]*British HIV Association, London, United Kingdom,* [6]*National AIDS Trust, London, United Kingdom,* [7]*UK Community Advisory Board, London, United Kingdom*

Background: HIV charities and medical organisations worked in partnership with a member of the UK Armed Forces living with HIV to challenge policies and practices regarding people living with HIV (PLWH) and people using PrEP. These included:

1. A ban on PLWH entering the military in any capacity.
2. Variation in policies around employment and management of personnel across the three military services.
3. An inconsistent approach to PrEP for recruitment and serving personnel across the British Army, Royal Navy and Royal Air Force.

Description: Policies were challenged with scientific and evidence-based arguments, communicated to key stakeholders within the Armed Services and parliamentarians. Included were the effectiveness of HIV treatment, PrEP safety data and research on blood borne viral transmission in ballistic and trauma incidents. Crucially, a member of the Armed Forces living with HIV made the case internally on the need for review, and the desire for change within all three services. HIV organisations lobbied across government departments to gain ministerial and cross-party parliamentary support. The team then directly engaged parliamentarians in a briefing sharing the professional and psychological impact existing military policy had on PLWH and the advantages of a policy that promotes equality.

Lessons learned: The swift progress in policy change was a direct result of a member of the Armed Forces living with HIV being willing and able to champion change, working synergistically with HIV charities and clinicians. This co-production approach is recommended in future HIV discrimination policy projects in the UK.

Conclusions/Next steps: On World AIDS Day 2021 the UK Armed Forces announced it would end its ban on people living with HIV from entering the military from spring 2022. With immediate effect, serving personnel living with HIV will no longer be automatically medically downgraded, so are now able to deploy to front line roles, and PrEP use is no longer a barrier to service or recruitment. The UK is the only member of NATO and the second country (the first being South Africa) to adopt this policy. Ongoing work will ensure better access to HIV and sexual health prevention services for serving personnel.

EPF007

HIV criminalization laws and intimate partner violence: a qualitative study of Russian women living with HIV

N. Sidorenko[1]
[1]*Eurasian Women's AIDS Network, Tbilisi, Georgia*

Background: Despite growing evidence linking HIV criminalization with women's vulnerability to violence, little is known about real-life experiences of victimized women. This study filled this gap by examining cases of Russian women with HIV who experienced intimate partner violence in a legislative environment that penalizes both HIV transmission and its threat.

Methods: We analyzed cases of eight women, participants of HIV service organizations in 3 Russian cities, who sought protection from intimate partners' violence and threats of criminal prosecution under Article 122 of Russia's Criminal Code (liability for HIV transmission or its threat). The cases, documented between August - September 2021, involved semi-structed interviews with women, their case-managers and peer counselors. The study employed thematic analysis to identify patterns of women's victimization.

Results: The study demonstrated that woman's decision to end a relationship commonly triggered conflict and abuse. In all cases, male partners refused break-up and threatened to initiate criminal proceedings under Article 122. That tactic often worked and women remained in the partnership. Building on that fear, male partners further escalated abuse by threatening to disclose women's HIV-positive status and instilling fear for their safety. In all eight cases, psychological violence was followed by physical assault, commonly involving hitting, slapping, and chocking. Thanks to women's prior links with HIV service organizations, though, they eventually sought assistance from peer counselors or case managers. Women received crisis counseling, social support, consultation on rights protection, and in some cases, services to mediate a family conflict. As a result, all women were able to end their abusive relationship and no criminal case has been opened.

Conclusions: Laws criminalizing HIV transmission increase women's victimization and gender inequality. Organizations working with people living with HIV need to develop services for victims of domestic violence, including crisis intervention, emotional support, as well as housing and legal advocacy.

Laws, policies and practices impacting access to HIV testing, prevention, treatment, care and support

EPF008

The priority population left behind - people who use drugs in New South Wales (NSW), Australia

V. Parwani[1]
[1]*HIV/AIDS Legal Centre NSW, Surry Hills, Australia*

Background: Despite *people who use drugs* being identified as a priority population in National HIV strategies and the United Nations noting that criminalisation of key at-risk populations can have a significant impact on treatment intake and adherence for people living with HIV (PLHIV), possession of small amounts of prohibited drugs continues to be a criminal offence in NSW.

The government uses sniffer dogs and invasive strip searches to target young people and marginalised communities and continually drags them through the Court system.

Description: The Special Commission of Inquiry (the Inquiry) into crystal methamphetamine and other amphetamine-type stimulants (ATS) was established by the NSW Government in November 2018 and noted that:

"*Contact with the criminal justice system, including having a criminal conviction for simple possession, is directly associated with adverse impacts on employment, earning prospects, access to housing, access to treatment, relationships and wellbeing. The criminalisation of simple possession is a powerful source of stigma, which has a serious impact on the physical and mental health of people who use drugs, as well as their willingness to seek help. 38.*"

Despite the Inquiry's recommendations that possession of drugs for personal use be decriminalised and that drug use be treated as a public health issue rather than a criminal law one, the NSW government has not accepted any of the Inquiry's recommendations to date.

Lessons learned: To minimize the harm which drug criminalisation causes, the HIV/AIDS Legal Centre NSW (HALC) frequently represents PLHIV where HALC makes submissions to the Courts in an attempt to mitigate the sentence that the Court might otherwise impose. Despite the offence having been proven, HALC has had significant success in having no convictions recorded for these matters where the Court either dismisses them entirely or imposes a conditional release order where the accused is required to have a period of good behavior.

Conclusions/Next steps: Until such time as significant reforms are made to the State's drug laws and policy, HALC will continue to represent clients in drug possession mat-

ters to mitigate the harms associated with drug criminalisation and continue to advocate for drug decriminalisation.

EPF009

Reducing harm and preventing transmission by assessing complex HIV situations through a multidisciplinary lens: INSPQ's expert support to regional public health departments

F. Maheux Dubuc[1], P.-H. Minot[1], K. Monteith[2], L. Pelletier-Marcotte[2]
[1]Institut National de Santé Publique du Québec (INSPQ), Montréal, Canada, [2]COCQ-SIDA, Montréal, Canada

Background: Complex HIV situations arise when individuals living with HIV, for multiple reasons, do not or cannot take precautions to prevent HIV transmission. These individuals often face conditions that raise ethical and legal issues that can complicate interventions, including the risk of facing threats, violence, criminal charges and/or deportation.
In 2017, Quebec's Ministry of Health and Social Services mandated the Institut national de santé publique du Québec (INSPQ) to provide expert support to regional public health departments (RPHD) faced with complex HIV situations.
Description: An expert support committee (ESC) was set up by the INSPQ to assess complex HIV situations through a multidisciplinary lens. Members of the ESC include physicians, a community representative, a lawyer, an ethicist, and*ad hoc*experts if needed.
The ESC focuses primarily on the person living with HIV, preventing transmission and assessing risk. When a healthcare professional is faced with a complex HIV situation, they reach out to their RPHD to weigh possible interventions. If needed, the RPHD reaches out to the ESC for support, that includes exchanges, risk and emergency assessments, avenues of intervention and referrals.
The approach is not prescriptive: the ESC provides recommendations to the RPHD so that they can in return assist healthcare professionals in their interventions.
Lessons learned: Public health professionals are responsible for preventing HIV transmission and protecting individuals when there is perceived risk of HIV transmission. In practice, most RPHD, especially outside urban centers, are not often involved in complex HIV situations and do not have, in their region, access to the expertise that is provided by the ESC.
Conclusions/Next steps: The ESC is both a prevention tool and a harm reduction support. The service ensures that adequate measures are taken to support the person living with HIV and prevent transmission, while also limiting the use of coercive methods and involvement of law enforcement to deal with complex HIV situations, thus reducing the risk of overcriminalization.
As many RPHD and healthcare professionals do not know about the services provided by the ESC and because the COVID-19 pandemic shut down the promotional efforts that were underway, a new communication plan needs to be devised.

EPF010

A world leading model of best-practice or a reactionary nation? Implementation of mandatory disease testing highlights laws at odds with Australia's reputation as a pillar of human rights

A. Stratigos[1], A. Cogle[2]
[1]HIV/AIDS Legal Centre, Sydney, Australia, [2]National Association of People with HIV Australia, Sydney, Australia

Background: Australia prides itself on having "a world leading model of best-practice" (8th National HIV Strategy), yet in recent years domestic laws have been amended and enacted which penalise, criminalise and stigmatise PLHIV and key populations (KP).
Specifically, this abstract examines the mandatory disease testing laws enacted in six Australian jurisdictions, their detrimental impact on PLHIV and KP and how they undermine Australia's world-leading response to HIV.
Description: As recently as 2021, the Australian state of New South Wales (NSW) passed the *Mandatory Disease Testing Bill*. This allows police to enforce testing for blood-borne viruses (BBV), including HIV, on people who have intentionally exposed emergency services workers to bodily fluids.
This will make it the sixth of eight Australian states/territories to pass such laws. UNAIDS and WHO have long been of the view that mandatory testing should only apply to the screening of blood products for donation, and it is widely recognised that mandatory testing of HIV is detrimental to testing, treatment and prevention efforts.
In partnership with the HIV/AIDS Legal Centre (HALC), the National Association of People with HIV Australia (NAPWHA) undertook a concerted programme of advocacy seeking to head off these changes.
Lessons learned: Misplaced fear of BBV transmission among law enforcement and emergency services workers drives the implementation of such laws. In HALC's criminal law practice it observes police officers reporting such fears as a significant impact of 'spitting' offences. These laws respond to the fear rather than the negligible risk of transmission.
Failing to engage with the scientific reality of BBV transmission results in laws which are not evidence-based, do not prevent BBV transmission, and dramatically undermine the human rights of PLHIV, KP and defendants in criminal proceedings.
Conclusions/Next steps: Mandatory testing laws need to be challenged and repealed. Together, NAPWHA and HALC aim to combat these laws with a tri-level approach. First, at the grassroots HALC provides direct legal representation to individuals impacted by these laws. Second, NAPWHA engages state and territory governments

to advocate the repeal of these laws. Finally, both organisations work together to educate law enforcement and emergency services on the risks of occupational BBV transmission.

EPF011

Antiretroviral therapy supply for foreigners during COVID-19 pandemic in Brazil

B. Brittes Kamiensky[1], A.F. Kolling[1], T. Benoliel Rocha[1], T. Cherem Morelli[1], A. Freire da Silva[1], L. Nobre de Moura[1], T. Vendramini Parra Roda[1], A.C. Garcia Ferreira[1], G.F. Mendes Pereira[1]
[1]*Ministry of Health, Secretariat of Health Surveillance, Department of Surveillance, Prevention and Control of Sexually Transmitted Infections, HIV/AIDS and Viral Hepatitis, Brasilia, Brazil*

Background: Considering the restrictions on international travel caused by the COVID-19 pandemics, Brazilian ministry of Health (MoH) assures the foreigners access to the health services including supply of antiretrovirals (ARV) for all people living with HIV (PLHIV). This abstract aims to compare ARV refill for foreigners before and during COVID-19 pandemic.
Methods: Data were obtained from the Drug Logistic Control System (SICLOM) database, which compiled data from HIV-infected adults. The Prais-Winsten generalized linear regression procedure was used to calculate trimestral increase rates in ARV refill for foreigners during 2019 to 2021.
Results: Throughout the period studied, pre-pandemic data showed the highest rate for ARV refill (5.62; 95% CI 4.29% – 6.93%) during the first trimester of 2020, then it shows a downward trend, likely related to COVID-19 movement restrictions. Shortly thereafter there was an upward trend in the ARV refill, with a mean increase of 2.63% quarterly (95% CI 1.92% – 3.36%).

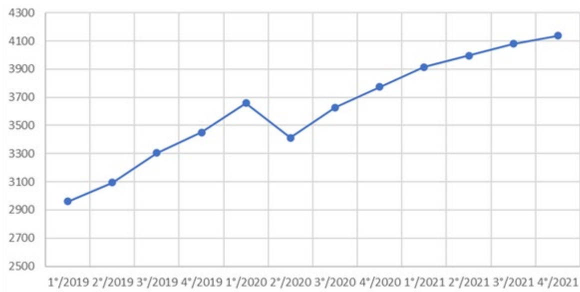

Figure. Time series ARV refill for foreigners, 2019 to 2021

Conclusions: The restriction caused by COVID-19 pandemic impacted the quality of care for PLHIV, mainly those who were outside their home country. During this period Brazilian MoH stretched strategies to assure HIV treatment for foreigners, providing ARV and clinical care. In addition to caring for foreign, the MoH had the means to donate ARV to countries of South America, Central America and Africa.

EPF013

Influence of the voice of the community of women using drugs in Ukraine on decision-making related to policies and programs for HIV and TB prevention and treatment

H. Korniienko[1]
[1]*The Ukrainian Network of Women Using Drugs (UNWUD), Kyiv, Ukraine*

Background: According to the results of a bio-behavioural survey among key population groups on HIV infection in 2020, Ukraine still has a high prevalence of HIV among IDUs (20.3%), the same study indicates that the prevalence of HIV is higher among women IDU (29.6%) than among men who inject drugs (18.1%). The target group of the project is women using drugs (WUD): mainly WUD, who are on the OST program or are in active use, and members of their families. According to the latest bio-behavioural study among IDU in Ukraine, there are about 60,000 women.
Description: Since 2021, the community of women using drugs in Ukraine has been identified as a separate key community in the Global Fund's country project, allowing the community to thrive and represent the interests of WUDs at all levels of decision-making.
The activities aim to raise the visibility of the community of women using drugs, to involve them in decision-making regarding access to HIV prevention and treatment. As of 2022, the WUD community activism centres operate in 13 regions of Ukraine (there are 24 regions in Ukraine).
Lessons learned: Strong stigma against WUD by health professionals, law enforcement, the general population and within the PUD community makes women using drugs an "invisible" community in Ukraine, their problems and needs are not considered important, there is no focus on the community in programs of HIV prevention and treatment, protection of rights, formation of national drug policy. As a result, the coverage of HIV prevention and treatment services is lower (compared to men). Improving the visibility of the community, giving the community a voice in decision-making has a positive effect on reducing barriers to access to HIV prevention and treatment services, reducing stigma and discrimination.
Conclusions/Next steps: The allocation of a key group of WUD at the level of planning prevention and treatment programs will allow for the inclusion of gender-sensitive services in such programs, which will take into account the problems and needs of women.

EPF014

Impact of United States pharmacy utilization management techniques on oral antiretrovirals

D. Koren[1], B. Packett[2], S. Brawley[2], L. McGorman[2], J. Appelbaum[3], W. Short[4]

[1]Temple University Health System, Philadelphia, United States, [2]American Academy of HIV Medicine, Washington, United States, [3]Florida State University, Tallahassee, United States, [4]University of Pennsylvania, Philadelphia, United States

Background: Prior Authorizations (PAs) for medications have been noted by the American Medical Association (AMA) to cause care delays and serious adverse events as well as potential abandonment of treatment.

The specific impact of these processes on antiretroviral (ARV) management has not been previously described.

Methods: Using a questionnaire adapted from a previously validated survey, the American Academy of HIV Medicine (AAHIVM) distributed a cross-sectional survey to its members and credentialed providers (n=4510) between August 3 and September 9, 2021. Participants included physicians, pharmacists, and advanced practitioners who were asked 28 multiple choice or open-ended questions to describe utilization management techniques (UMT) and the impact that they may have on their practice. Descriptive statistics were used to summarize multiple choice questions.

Results: There were 173 questionnaires completed (66% prescribers and 33% pharmacy professionals) with varied HIV experiences (39% >20 years). 43% of respondents described required PAs 1-25% of the time for treatment naïve patients. 51% of respondents described PAs for medication switches 26-50% of the time. Per month, 56% of respondents described PAs affecting up to 10 patients.

Over the last 5 years, 64% of respondents noted an increase in PAs. Due to UMTs, 48% of clinicians responded that their patients/clients resorted to taking a partial antiretroviral regimen and 71% of respondents described UMTs as causing a negative impact on patients' emotional or mental health. Roughly 67% of participants needed dedicated staff for PAs and among those who did not, preferred to have such a person (45%).

Overall, 72% of participants reported UMTs hindering their ability to prescribe optimal ART therapy. Over 50% of respondents described UMTs causing altered prescribing habits (55%), prescribing a less desirable ARV regimen (50%), and opting for generic alternatives of ARV (56%).

Conclusions: One of the key strategies in ending the HIV epidemic is rapid treatment of people with HIV to reach sustained viral suppression. This approach mandates minimizing barriers to ARV access as well as any disruption to therapy. PAs are a barrier to achieving this goal. ARV UMTs require further study to ensure optimal patient care and to reduce interruptions in therapy and likelihood for adverse events.

EPF015

Community voices shaping policy implementation & reform: how PLHIV advocacy is addressing the test and treat policy gaps in Uganda!

W. Ikilai[1]

[1]National Forum of People Living with HIV and AIDs Networks Uganda, HIV Research and Advocacy, Kampala, Uganda

Background: Uganda adopted the Test & Treat policy in 2016, following WHO recommendation to immediately enroll PLHIV on ART, irrespective of their CD4 level or HIV clinical stage to meet the 95-95-95 targets. Amidst implementation, recipients of care had eminent challenges including; inadequate preparation of clients pre and post initiation to treatment which greatly affected adherence & viral load suppression due to limited counselling and treatment literacy.

Description: With support from AVAC, Community dialogues were organized, PLHIV experiences were documented through a special report & policy brief for advocacy. Three National policy makers' dialogues targeting 60 PLHIV networks, Ministry of Health, UNAIDs, PEPFAR were organized to share policy recommendations. Community launched a *"Beyond My Pill"* campaign officiated by UNAIDs Country Director to demand for the Intensive Adherence counselling sessions protocol (IAS); funded treatment literacy programs & recruitment of trained counsellors in health facilities.

https://www.youtube.com/watch?v=h1uJygzPoiw

https://www.newvision.co.ug/articledetails/121709

Social media campaigns were undertaken through; photo voices, E-posters & video clips to rally a better policy environment. A media café was organized with health journalists, newspaper articles written to highlight PLHIV voices calling for policy reform. Resultant, PEPFAR through COP 21 is funding the network to roll out a comprehensive treatment literacy program, there will be standard remuneration of the CHWs. MOH is undertaking quality assurance, supervision to ensure effective policy implementation at the health centers.

Lessons learned: Initiating PLHIV on treatment alone is not enough, ensuring effective adherence is of equal importance to prevent future transmission.

"*The beyond my pill* campaign accelerated community driven advocacy efforts, as a result, PEPFAR is funding the National PLHIV forum to roll out treatment literacy in the country.

Conclusions/Next steps: NAFOPHANU will continue to advance the Test, Treat and Retain campaign to address issues of poor adherence and retention. At Country level, the campaign re-awakened community policy implementation monitoring and improved service provision.

EPF016

Impact of the "Chase the virus, not people" EECA joint community campaign

Г. Довбах[1], N. Podogova[1], D. Alexeeva[2], V. Djuma[3], E. German[3], A. Paluyan[3], P. Sabelashvili[3], O. Byeliaeva[4], Y. Panfilova[5], D. Stolbunov[5], S. Moroz[6], L. Yaroslavskaya[6], O. Stryzhak[7], S. Plecas[7], E. Maron[7], V. Zhovtiak[8], N. Leonchuk[8], I. Maslova[9]

[1]*Eurasian Harm Reduction Association (EHRA), Vilnius, Lithuania,* [2]*AFEW International, Amsterdam, Netherlands, the,* [3]*ECOM – Eurasian Coalition for Health, Rights, Gender and Sexual Diversity, Tallinn, Estonia,* [4]*Eurasian Network of People Using Drugs (ENPUD), Tbilisi, Georgia,* [5]*Eurasian Union of Adolescents and Youth ‚Teenergizer', Kyiv, Ukraine,* [6]*Eurasian Women Network on AIDS (EWNA), Kyiv, Ukraine,* [7]*Sex Workers' Rights Advocacy Network (SWAN), Budapest, Hungary,* [8]*East Europe and Central Asia Union of People Living with HIV (ECUO), Kuiv, Ukraine,* [9]*EECA Sex Workers' Alliance, St Petersburg, Russian Federation*

Background: In 2018, the first time all regional networks of key populations communities had joined forces in one campaign, united by the goals, unified slogan and ready to stand and speak out loud together, defending the rights of each community, of all and everyone, attracting the attention of governments, international organizations to stigma, discrimination, and criminalization.

The campaign addressed advocacy asks of such communities as PLHIV, MSM, TG, PWUD, SW, women affected by HIV, Teenagers, and youth.

Description: The campaign started during the AIDS2018 by 9 regional community networks. Joint effort was well coordinated and supported by more than 100 organizations from the region. Over 500 activists took part in campaign's activities with 12000 participants. Regional and global speakers at the AIDS2018 voiced the campaign's aim and called the AIDS2018 audience to join its appeal. During the following 2019-2021 the campaign was presented and promoted at all big international and regional events, was implemented by community leaders on a national level.

Lessons learned: During 2018-2021, it accumulated efforts of more than a thousand CSO and community activists, delivered its messages to over two million direct recipients and recruited a variety of partners to support campaign. https://chasevirus.org/wp-content/uploads/2021/11/chase-the-virus-campaign-final-overview-eng-1.pdf

Keys for success of the campaign are:

- Joint coordinated effort of all key community networks;
- Clear targets and realistic planning;
- Community ownership.

Conclusions/Next steps: Impact of the loud and efficient campaign and following global advocacy lead to prioritizing the removing of human rights barriers and decriminalization of key populations now is prioritized in global and regional AIDS strategies.

EPF017

Legal opportunities for scaling up HIV treatment access using government use and compulsory licensing: recommendations based on legal framework analysis in the countries of the Eurasian Economic Union

M. Shibaeva[1], S. Golovin[2]

[1]Treatment Preparedness Coalition in Eastern Europe and Central Asia, IP and Access, St. Petersburg, Russian Federation, [2]Treatment Preparedness Coalition in Eastern Europe and Central Asia, St. Petersburg, Russian Federation

Background: TRIPS flexibilities, including compulsory and government use licenses, have proven to be effective to improve treatment access. The antiretroviral therapy coverage in the Eurasian Economic Union (EEU) is below 90% of those knowing their status, partly because of high prices for key medicines, (e.g. dolutergavir), due to patent monopolies. The COVID-19 pandemic reiterated the need to assess legal provisions related to compulsory licenses and government use of inventions for medicines. We analyzed national and regional regulatory framework in the EEU to demonstrate opportunities for govenment use or compulsory licensing to impove access to antiretroviral medicines and beyond.

Methods: For analysis, we used international regulatory framework (TRIPS Agreement, Paris Convention, and Doha Declaration); official national and regional legal databases:
https://www.garant.ru/;
https://regulation.gov.ru/;
https://adilet.zan.kz/kaz/ and,
https://online.zakon.kz/;
http://cbd.minjust.gov.kg/;
https://pravo.by/;
https://www.aipa.am/hy/;
https://eec.eaeunion.org/.

The Russian versions of the following key words and combinations were used: compulsory license/licensing, government use of inventions, use without the consent of the patent holder, anti-competitive practices, limitation of intellectual proprty rights, actions not considered as patent infringement.

Results: Our analysis identified three categories of legal provisions related to use of patents for medicines without the consent of the owner: government use of inventions, compulsory licenses, and use of patents not considered as patent infringement. We focused on language that can be related to access to medicines, such as "healthcare/health", "epidemics", "national security", "medicines", "insufficient use", "non-use" and "anti-competitive practices".

Country	Government use	Court	Use of patent not considered as patent infringement
Armenia	-	+ national security; health (including lack of access to medical products); unfair use of patent rights by restricting competition; non-use or insufficient use;	+ national security (issuing authority n/a)
Belarus	-	+ non-use or insufficient use	+ epidemics (issuing authority n/a)
Kazakhstan	-	+ national security; health protection; abuse of patent rights; non-use	-
Kyrgyzstan	+ national security; epidemics	+ non-use or insufficient use	+ epidemics (issuing authority n/a)
Russia	+ national security; protection of life and health of citizens	+ non-use or insufficient use	-

Conclusions: The key finding is that Armenia, Belarus and Kazakhstan lack provisions related to government use of inventions without patent holder consent, which limits opportunities for rapid actions to close treatment access gaps. In Belarus and Kazakhstan, this could have had a negative impact on increasing access to patented dolutegravir. The media reported that the Kazakh government intended to seek compulsory license for dolutegravir through court.

Countries are recommended to revise their regulatory framework to include provisions enabling government use of inventions for medicines in a variety of situations to improve access to essential medicines.

EPF018

Involving HIV community-based organizations into intellectual property and treatment access work: lessons learnt and opportunities ahead in the Eurasian Economic Union

S. Golovin[1]

[1]Treatment Preparedness Coalition, St. Petersburg, Russian Federation

Background: HIV community-based organizations (CBOs) have tackled intellectual property (IP) barriers to increase treatment access since the early days of the HIV epidemic. The IP work of ITPCru has 4 objectives:

1. Analysing regulatory framework, focusing on TRIPS flexibilities (e.g. compulsory/government use licenses, Bolar exemption, parallel importation, patent oppositions) or TRIPS+ provisions (e.g. patent linkage, data exclusivity);
2. Proposing ways to integrate flexibilities and mitigate/remove TRIPS+ to ensure a better framework for increasing access;
3. Compulsory/government license campaigns and opposing patents for key medicines; and
4. Awareness raising.

Description: ITPCru launched its first IP projects in 2014-2015 and expanded them to the Eurasian Economic Union. Activities included analysing patent status for

drugs, opposing patents, compulsory license campaigns, legal framework analysis with recommendations, publicising news about IP and treatment access. We motivated CBOs to support IP and access work by visualizing the link between treatment shortages, high prices and, subsequently, IP barriers causing high prices. Region-specific access issues, e.g. varying prices for original and generic key HIV drugs, PreP options and HCV direct-acting antivirals have been among illustrative examples.

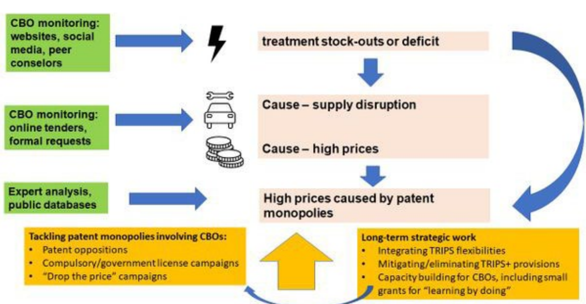

Figure. Involving CBOs into IP and access work: flowchart

Lessons learned: For some sign-on campaigns, we brought together over 30 CBOs. Gaining CBOs' support has contributed to success of several initiatives, including optimization of compulsory license framework in Russia and more than two-fold price reduction for several key patented drugs (including dolutegravir and sofosbuvir). Difficulties with CBO involvement included: negative attitude to generics due to poor information; the topic's complexity; general low awareness about IP and access issues.

Conclusions/Next steps: Involving CBOs into IP-related activities is crucial for revitalising treatment access work, which is important given novel treatment options and current access gaps. More efforts need to be invested into capacity building of communities as to IP and access, including development of community-friendly materials, grant programmes for IP and access, integrating IP into HIV meetings and conferences.

EPF019

Research on evergreening patents in Ukraine

M. Trofymenko[1]
[1]100% Life, Kyiv, Ukraine

Background: There is an active discussion in Ukraine and worldwide on the impact of patent protection on the affordability of medicines and in particular ARV drugs. Big multinational pharmaceutical companies claim that patent protection should be as broad as possible as it allows to swiftly bring innovative products to the market, while their opponents from the civil society organizations refute that argument by stating that excessive patent protection restricts access to affordable treatment.

In order to test this hypothesis, 100% Life, the biggest community-led organization in Ukraine launched an evergreening study, with support from Aidsfonds and ITPC Global.

Methods: The researchers selected 132 patents. Selection of patents was based on:

1. Medicines that are procured from a single source in Ukraine and which are expensive due to the patent protection and
2. Prospective medicines for which competition is blocked because of patents.

The next step of the research was to determine the percentage of the patents that could be defined as evergreening, i.e. patents that are granted to prevent generic competition rather than to protect genuine inventions (UNDP, 2016). The researchers used criteria set in guidelines developed by the UNDP, WHO, UNCTAD and ICTSD in order to determine whether a certain patent could be considered as evergreening.

Results: The analysis was published in 2020 and demonstrated that 60 of 132 (45,45%) patents could be considered as evergreening. The most common type of evergreening patents was a composition/dosage from the known active substance (13), isomers and salts (11), polymorphic forms (11) and the combination of the known substances (9). Of the evergreening patents the majority were related to HIV treatment (15), followed by oncology (10), rheumatoid arthritis (6) and viral hepatitis (6).

Conclusions: The study demonstrates that almost half of the patents for essential medicines in Ukraine could be classified as evergreening. The research was an important argument that persuaded stakeholders in Ukraine to adopt legislation aimed at the reduction of unmerited patents in the summer of 2020. The methodology of the research could be used in other countries to measure percentage of evergreening patents.

EPF020

Advocacy of patent law reform in Ukraine

M. Trofymenko[1]
[1]100% Life, Kyiv, Ukraine

Background: In 2015 around 60.000 people were receiving ARV therapy in Ukraine, while the estimated number of people in need of ARV treatment was 4 times higher. The overall prices for the HIV medicines at that time were high as most of them were patented and could have been procured from a limited number of manufacturers. Therefore, to improve access to medicines, 100% Life, the biggest community-led organization in Ukraine started advocacy of patent law reform with a support from Aidsfonds and ITPC Global.

Description: The goal of reforming the patent law is to enable prompt generic substitution of medicines, leading to sufficient price reductions for essential drugs, in particular ARVs. The draft law advocated by 100% Life had 3 key elements:

1. Enabling patent office to reject patent applications for new modifications of known medicines if they do not contribute to enhancing its efficacy;

Oral abstracts

Poster exhibition

E-posters

Late-breaker abstracts

Author Index

2. Simplification of the process of challenging patents and obtaining compulsory licenses;
3. Limitation of the grounds for patents extension beyond 20-year term. The advocacy of amendments took 5 years (2015-2020) and involved engagement of the key stakeholders. After several unsuccessful attempts to pass the law, e.g., the draft law not getting enough votes of MPs in September 2018, the law was successfully adopted on July 21, 2020.

Lessons learned: Based on 100% Life's experience of advocacy two important conclusions can be drawn:
1. It is important to establish strong partnerships with key stakeholders in order to overcome opposition from the opponents of the patent law reform, such as big multinational pharmaceutical companies;
2. Data-driven research to support the proposed amendments is essential to persuade stakeholders to support patent law reform. In 2015-2020, 100% Life published and disseminated 5 evidence-based studies on the urgency and benefits of the reform.

Conclusions/Next steps: Based on the patent law reform, the prices of essential medicines are expected to reduce 10%-25% in the next 6-8 years. ARV medicines are the most endangered by unmerited patent monopolies, therefore it is expected that ARV prices will decrease with 20%-30%. In practice this means that an additional of thousands of PLHIV can receive ARV treatment.

EPF021

Solving the PrEP failure in the U.S.: a national PrEP financing and delivery program

A. Killelea[1], J. Sharfstein[2], J. Johnson[3], D.T. Dangerfield II[4], C. Beyrer[2]

[1]Killelea Consulting, Arlington, United States, [2]Johns Hopkins Bloomberg School of Public Health, Baltimore, United States, [3]PrEP4All, New York City, United States, [4]Johns Hopkins School of Nursing, Baltimore, United States

Background: In the U.S., less than 25% of individuals with PrEP indications are actually using it and substantial disparities in PrEP access and use based on race, ethnicity, gender, gender identity, and geographic location persist. Without major improvements in PrEP access, the U.S. will almost certainly fail to meet the federal Ending the HIV Epidemic initiative goal of reducing new HIV infections by 90% by 2030.

We developed a policy proposal for a national U.S. program – the "Federal PrEP Program" – for the financing and delivery of PrEP for those who do not have insurance and those on Medicaid.

Description: The Federal PrEP Program replaces the fragmented procurement and delivery system for PrEP in the U.S. with a centralized federal purchasing mechanism for PrEP medications and labs and broad distribution channels through both clinical and non-clinical community providers.

The program supports expanded provider networks by funding novel telehealth partnerships between clinical and non-clinical providers. By design, the program will be able to reach individuals least likely to access care through traditional health care sites by expanding the availability of PrEP in community-based settings via these telehealth arrangements. To develop the Federal PrEP Program, we consulted with individuals using PrEP, clinicians, pharmacies, governmental public health leaders, and federal partners.

Lessons learned: Two core challenges for low-income individuals accessing PrEP in the U.S. include the fragmented and complex system of services and the paucity of PrEP providers who can serve patients in community sites. Also relevant are the interests of manufacturers and the perverse incentives toward prescribing higher cost PrEP medications experienced by a subset of clinicians.

Conclusions/Next steps: Following positive feedback from HIV providers, patients, and federal partners, the team is providing technical assistance to policymakers. Implementing an ambitious new plan will take political commitment and buy-in from HIV providers and people who would benefit from PrEP. The recent approval of a new long-acting but expensive formulation of PrEP has created an opening for reform.

EPF022

Translating international commitments in national lawmaking: lessons from the French advocacy for transparent public subsidies in the research and development of new medicines

I. Alaoui[1], J. Veras[2], T. Brigand[2], M. Jaudon[3], G. Centlivre[4]

[1]AIDES, Pantin, France, [2]Doctors of the World, Paris, France, [3]TRT-5 CHV, Pantin, France, [4]Global Health Advocates, Paris, France

Background: In 2019 at World Health Assembly, facing strong mobilization from civil society, France voted in favor of the transparency resolution of markets for medicines, vaccines, and other health products. Between 2019 and 2021, French health and patient organizations worked together towards the national declension of this commitment. By ensuring the transparency of the amount of public subsidies received for the research and development (R&D) of new medicines, the aim was to secure access to treatments through fair negotiations between the State and the pharmaceutical industry.

Description: Our organizations' goal was first to ensure the adoption of transparency measures in the parliament. During the discussion of the 2020 Social Security Financing Bill in 2019, we led targeted advocacy towards the Ministry of Health and parliamentarians. Our work particularly focused on exchanging with Olivier Véran, then rapporteur of the text. An amendment he introduced was adopted, ensuring the transparency of R&D public subsidies during price negotiations, but was censored by the constitutional council for procedural reasons.

In 2020, we took the opportunity of Olivier Véran's nomination as Minister of Health to demand he fulfills his previous commitments. We reiterated our institutional advocacy strategies during the 2021 Social Security Financing Bill, tied with communication campaigns on social media. An amendment supported by a large majority of both chambers was adopted, yet only ensuring the transparency of aggregated data.

We finally focused on ensuring the enactment of the measure, with the aim of securing exhaustive, readable and diachronic information on public R&D subsidies. Although most our demands remained unanswered, our regular exchanges with the Ministry led to the publication of an implementing decree in October 2021.

Lessons learned: Holding public deciders accountable for their previous commitments by articulating international mobilization and national advocacy strategies compelled France to be the first European country to effectively implement legally-binding transparency measures of public R&D subsidies.

Conclusions/Next steps: Evidence of important public subsidies for the R&D of new treatments could be crucial in contesting excessive prices, thus ensuring access. Next step will be to monitor the implementation of the measure and advocate for a wider scope of transparent information.

EPF023

Medical cannabis in Canada - the hazy road to cannabis legalization

E. Mandarino[1,2], S. Margolese[1], C. Costiniuk[3], G. Lacasse[4], S. Rueda[5], J. Wardell[6,5,7,1], M.-A. Jenabian[8]

[1]*CIHR Canadian HIV Trials Network, Vancouver, Canada,* [2]*MJardin Canada, WILL Cannabis Group, Brampton, Canada,* [3]*McGill University Health Centre, Montreal, Canada,* [4]*Canadian AIDS Society, Ottawa, Canada,* [5]*Centre for Addiction and Mental Health, Toronto, Canada,* [6]*York University, Toronto, Canada,* [7]*University of Toronto, Toronto, Canada,* [8]*Université du Québec à Montréal, Montreal, Canada*

Background: In October 2018, Canada legalized recreational cannabis. The new regulations superseded previous medical cannabis regulations, leaving medical cannabis patients fighting for access rights that were won in 2001. At AIDS2004 in Thailand, we described the long road to the *Marihuana Medical Access Regulations* (2001). Access to medical cannabis was achieved on the basis that laws were unconstitutional, by violating the life, liberty, and security interests of persons under the Canadian Charter for Rights and Freedoms.

The long-fought battles for access to medical cannabis also helped pave the road to the *Cannabis Act,* a legal and regulatory framework for recreational cannabis, and the introduction of government excise tax.

Description: (Table A) Cannabis in Canada Timeline outlines numerous times that medical cannabis patients and advocates intervened, challenged, and succeeded in maintaining a medical cannabis access program in Canada. With the new cannabis regulatory framework and the commercialization of recreational cannabis, clinical research on the risks and benefits of cannabis is critical in informing evidence-based cannabis health policy and ensuring the continuation of a medical cannabis access program.

Year	Event
2000	R. v. Parker (Ontario Court of Appeal) Landmark ruling that cannabis prohibition was unconstitutional because there was no exemption for medical use – a violation of the right to life, liberty, and security of a person.
2001	Canada introduced the **Marihuana Medical Access Regulations (MMAR) -** Access to cannabis for medical purposes including people living with HIV/AIDS - Patients could grow their own or obtain from a government source. This made Canada the first country to legalize cannabis for medical use.
2004	Medical Marijuana - What a Trip! The Canadian Experience - Abstract at AIDS2004, Bangkok, Thailand
2003 - 2011	2003 - R. v. J.P. (Ontario Court of Appeal) MMAR did not create a constitutionally medical exemption that was acceptable. 2008 - Sfetkopoulos v. Canada (Federal Court of Appeal) Licenced producers allowed to grow for more than one person. 2011 - R. v. Mernagh (Ontario Superior Court) Sections 4 & 7 of the Controlled Substances Act were found constitutionally invalid and of no force and effect
2014	The **Marihuana for Medical Purposes Regulations (MMPR)** replaced the MMAR. Medical cannabis could be prescribed by a physician and a government license was no longer required.
2015 - 2016	2015 - R. v. Smith (Supreme Court of Canada) ruled restrictions of dried cannabis under the MMAR and MMPR was unconstitutional and expanded the definition to include any form of the drug. 2016 - R. v. Allard et al - Court injunction for those licensed under the MMAR. BC Superior Court ruled the MMPR was unconstitutional and gave the government 6 months to create a new framework.
2016	The **Access to Cannabis for Medical Purposes Regulations (ACMPR)** replaced the MMPR.
2017 - 2018	2017 - The Canadian Parliament introduced Bill C-45, the ***Cannabis Act***, to legalize recreational cannabis by July 1, 2018. 2018 - The Senate passed the bill in June 2018 and the ***Cannabis Act and Regulations*** came into force on October 17, 2018.
2019 - 2022	**Canadian AIDS Society (CAS) Cannabis Task Force**, formed in 2019 • 2020 BMJ Open, Protocol - *Canadian clinical practice guidelines for the use of plant-based cannabis and cannabinoid-based products in the management of chronic non-cancer pain and co-occurring conditions: protocol for a systematic literature review* • 2022 Canadian AIDS Society and the Task Force publishes the Canadian Clinical Practice Guidelines on the Use of Cannabis in the Management of Chronic Pain and Associated Symptoms **CIHR CTN Cannabis Research Working Group**, formed in 2020 • CTN PT028: A pilot clinical trial to assess safety, tolerability and effect on inflammation in people living with HIV on antiretroviral therapy • CTN PT037: Disentangling medicinal and non-medicinal cannabis use among people living with HIV: Feasibility of a smartphone-based assessment • CTN PT043: Interplay between the expanded endocannabinoid (eCB) system and inflamm-aging: Implication between accelerated atherosclerosis in people living with HIV under ART • Cannabis and mental health in racialized populations • CAMH/CAS Cannabis and HIV Study • Cannabis use and impacts among Ontarians living with HIV in the era of recreational legalization

Table A. Cannabis in Canada Timeline.

Lessons learned: The Canadian AIDS Society Cannabis Taskforce (2019) and the CIHR CTN Cannabis Working Group (2020) were formed to conduct cannabis research and develop evidence-based clinical practice guidelines, to inform cannabis health policy that will enable patients to continue to access to medical cannabis, with a special focus on affordability including private and public insurance coverage.

Poster exhibition

E-posters

Late-breaker abstracts

Author Index

Conclusions/Next steps: The last 20+ years of medical cannabis in Canada have led towards the hazy road of legalization. Medical cannabis patients and advocates have temporarily succeeded in preserving a medical cannabis program in Canada alongside the legalization.

Cannabis researchers and patient advocates now have five (5) years to provide clinical evidence on the risks and benefits of cannabis to inform health policies that will preserve a medical cannabis access program in Canada.

EPF024

Process of the reform of the law on flight against the trafficking and illicit use of narcotic drugs, psychotropic substances in Ivory Coast

A. Jean[1]

[1]Centre International d'Étude en Développement Local (CIEDEL), Science Sociale, Lyon, France

Background: In 2016, Ivory Coast undertook a reform of its drug policy in order to move towards less repressive legislation than the law of July 22, 1988.

Thus, with the technical and financial support of its partners, including Médecins du Monde (MdM), it has drawn up, through the Interministerial Committee for the Fight against Drugs (CILAD), a bill containing major innovations, making Ivory Coast one of the most advanced West African countries on the issue.

Description:

The main innovations contained in the law are:

- A new vision of the drug user (DU), no longer as an offender but as a sick person in need of treatment.
- The integration of harm reduction activities in the health pyramid.
- The drastic reduction of the quantum of criminal penalties for drug use.

In doing so, they will reduce HIV prevalence among this key population by reducing transmission and improving treatment adherence.

The draft law was adopted by the Council of Ministers on July 7, 2021, then by the National Assembly in committee on October 12, 2021, and in plenary session on December 16, 2021.

Lessons learned: The process of drafting and adopting the law was done in an inclusive and collaborative manner with the participation of state structures, namely CILAD and the National Program for the Fight against Smoking, Alcoholism and other Addictions (PNLTA); civil society gathered within the Council of Organizations for the Fight against Drug Abuse in Côte d'Ivoire (CONAD-CI), of which Médecins du Monde is a member; and UNODC.

Following the principle of "do nothing for DU without DU", the Phoenix Group, an advocacy group composed of peer educators and DU, played an important role throughout this process: they were present at all the meetings organized and carried the voice of DU by bringing the most distant actors closer to reality.

Conclusions/Next steps: One of the successes of this reform is the inclusiveness of the process in which all stakeholders participated. The next steps are the adoption of the law by the Senate, then the publication and effective implementation of the implementing decrees.

EPF025

Will voluntary licenses save the world? Impact of voluntary mechanisms on the economy, the policies and the politics of access to medicines

G. Krikorian[1], O. Mellouk[2], S. Kondratyuk[3]

[1]Make Medicines Affordable Campaign (ITPC), Paris, France, [2]International Treatment Preparedness Coalition, Marrakech, Morocco, [3]International Treatment Preparedness Coalition, Kiev, Ukraine

Background: Voluntary licensing is a common practice in industry sectors where patents are numerous, including the pharmaceutical field. The objective of this research was to review different features and impacts that voluntary licenses (VLs) can have on access to medicines for patients, on the economic dynamics of the pharmaceutical market, and on the access to medicines movement and debates.

Description: The research drew from bibliographic resources, licence agreements, and communications with legal experts and other stakeholders involved in implementing or advocating for access to HIV treatment and other medicines policies. Two analysis were conducted: an assessment of the provisions in licence agreements, and a description of the different effects and impacts that they could have on policies and stakeholders.

Lessons learned: The study found a range of potential effects from voluntary licenses. It looks into the positive impacts on access for certain populations in certain countries and the negative features of some agreements, in terms of countries and population targeted, transparency, transfer of know-how, use of active ingredient, prices, grant-back of rights, etc. The study considered the effects of licence deals on the behavior and business practices of pharmaceutical companies (partnerships between companies previously in competition, assessment of the risk to engage in compulsory licensing, weakening of small generic manufacturers, etc.), their impact on the access to medicines movement and the use of TRIPS flexibilities, as well as their impact on access politics, and on debates of access policies.

The study also proposes a range of recommendations to improve licence agreements and their monitoring and regulation, and to limit the indirect creation of new barriers to access to medicines.

Conclusions/Next steps: These results allow a broader understanding of the industrial dynamics and relationships between companies (originators, generic manufacturers from India, generic manufacturers from other middle income countries, etc.) on the markets of different countries.

They underline the indirect role voluntary licensing plays on policies and on the access to medicines environment and are important for informing better policies with the aim of improving access to HIV medicines, and to help stakeholders negotiate according to this objective.

EPF026
The end of patent term extensions in Brazil: positive impacts for the procurement of ARVs

F. Fonseca[1], A. Silva[1], S. Van Der Ploeg[1], P. Villardi[1]
[1]*ABIA, GTPI, Rio de Janeiro, Brazil*

Background: On May 12, 2021, the Brazilian Supreme Court (STF) issued a landmark decision for access to medicines, ending or shortening the term of 3435 pharmaceutical and healthcare patents. The STF declared the unconstitutionality of Art. 40, sole paragraph, of the Brazilian Industrial Property Law, which established an automatic, indeterminate and unjustifiable extension of patent terms, leading to harmful pressure over the budget of the public health system.
The Working Group on Intellectual Property (GTPI), a civil society coalition formed by 17 organizations, coordinated by the Brazilian Interdisciplinary AIDS Association (ABIA) was the first party to become *amicus curiae*, within the framework of the Direct Action of Unconstitutionality (ADI) No 5529, initiated by the Brazilian Public Prosecutor's Office (PGR) in 2016. ABIA/GTPI contributed with arguments and data through technical debates, petitions and oral statements that were observed in the final ruling.
Thanks to this decision, the Brazilian Ministry of Health has the opportunity to explore generic supply for several essential medicines, including for important ARVs.
Methods: This research is based on a holistic, descriptive, single case-study of the Direct Action of Unconstitutionality No. 5529 and its positive impacts on public procurement strategies for essential ARVs.
Results: In the STF's decision, health-related patents were subject to retroactive effects (*ex tunc*). Therefore, approximately 3,435 patents were immediately extinguished or had their term reduced. We evaluated the outcomes of the decision for four ARVs. The results are described in Table 1.

Drug	Monopoly term before STF's decision	Monopoly term after STF's decision	Monopoly term reduction in months	Included in national guidelines?
Etravirine	11/2023	09/2019	50	Yes
Rilpivirine	04/2029	08/2022	98	No
FTC/ Rilpivirine/ TDF	04/2029	08/2022	98	No
Raltegravir	06/2027	10/2022	56	Yes

Table 1.

Conclusions: Generic competition will become possible immediately, in the case of Etravirine, and by the second semester of 2022 for Rilpivirine, FTC/Rilpivirine/TDF and Raltegravir. For the Brazilian HIV/Aids treatment program, this decision represents an opportunity both for budget savings and for the incorporation of new drugs at affordable prices.

Challenging criminalization/penal provisions relating to gender and sexual diversity as an impediment to the global HIV response

EPF027
Is the integration of LGBT people into public HIV care health facilities possible in a country where there is a criminalization of homosexuality? The case of Burundi

T. Nahimana[1], H. Lisoir[2], K. Pouchain-Grepinet[3], T. Niyongabo[4]
[1]*University Hospital ok Kamenge, Internal Medicine, HIV Care, Bujumbura, Burundi,* [2]*Fondation Roi Baudouin, Brussels, Belgium,* [3]*Fondation de France, Responsable du Programme "Sida, Santé et Développement", Paris, France,* [4]*University Hospital ok Kamenge, Internal Medicine, Bujumbura, Burundi*

Background: Homosexuality is a reality in Burundi. After the City of Bujumbura (2011-2014) in collaboration with King Baudouin Foundation, the CPAMP CHU kamenge project to integrate sexual minorities into public HIV care health facilities, in collaboration with the France Foundation (2015-2017), has been extended to all provinces of Burundi. Despite the criminalization of homosexuality, activities in their favor are steadily increasing.
Description: At the beginning, we sensitized health officials and LGBT focal points in Burundi's health provinces during the development workshops.
Afterwards, training and awareness sessions for LGBT people and health providers were organized in all provinces. Afterwards, we organized discussion groups, bringing together LGBT people and sensitized health providers. To reach out to LGBT people, we have identified, with the help of LGBT activist associations, peer educators in each province. These in turn identified LGBT people to participate in awareness and training sessions.
For health officials and providers sensitized, we have involved provincial physicians and district chief physicians during development workshops.
Lessons learned: Jobs done:
- 42 health officials (Ministry of Public Health) and 10 LGBT focal points sensitized.
- 368 health care providers from public health facilities sensitized
- 225 LGBT sensitized on HIV / AIDS prevention and care
- 687 LGBT people tested for HIV
- 30 tested positive for HIV (4.36%)

Oral abstracts

Poster exhibition

E-posters

Late-breaker abstracts

Author Index

- 20 discussion group sessions with the joint participation of LGBT people and health providers: 417 LGBT people and 50 health providers from health public facilities.
Integration of HIV into public health care facilities of LGBT has been effective in 10 of the 15 already sensitized provinces. Seven district hospitals, three regional hospitals, a national referral university hospital and a health center have integrated LGBT people into their HIV health care facilities.
Conclusions/Next steps: Although the situation of prevention and effective treatment of LGBT HIV is constantly increasing in Burundi, we are witnessing a surge in anti-gay speeches and actions by government authorities.
This slows down some initiatives by health providers, activist associations, and beneficiaries, thus preventing the effective integration of LGBT people into both public and private health facilities.

EPF028
Laws and Policies in Eastern Europe and Central Asia as an obstacle to providing HIV-services for MSM and trans people

Y. Yoursky[1], I. Fedorovych[2], O. Guz[2]
[1]NGO, Tallinn, Estonia, [2]NGO, Kyiv, Ukraine

Background: ECOM - Eurasian Coalition on Health, Rights, Gender and Sexual Diversity (ECOM) conducted qualitative research on legal environments for HIV services among MSM and trans people in 11 countries of Eastern Europe and Central Asia, where most of the countries are still considered to be predominantly homo/bi/transphobic.
Methods: A literature review of existing studies has been conducted. The research protocol was elaborated. Assessment was based on data collection via a pre-defined questionnaire on laws protecting or on opposite discriminating MSM and trans people. It was filled out by two legal experts from each country in EECA. Collected data were analyzed and compared with international standards on SOGI and HIV.
Results: State authorities are adopting national legislation to international standards in terms of human rights of MSM and trans people. Nevertheless, there are crucial unresolved questions related to well-being and safety of the latter.
Among them right of freedom of peaceful assembly and freedom of speech for LGBT. Governments not only fail to protect peaceful assemblies organized by LGBT-activists, but it also impedes the restoration of their violated rights, failing to ensure effective investigation and punish the offenders.
Lack of anti-discrimination legislation results in the absence of protection from discrimination based on SOGI.
High level of stigma in "conservative" EECA governments prevents MSM and trans people to use HIV-services and discourages them to disclose any personal information to state authorities, including medical records. It also causes high level of mistrust in the state institutions that protect human rights. Therefore, it influenced people's perception about the efficiency of the state efforts related to combat discrimination and prevent further spread of HIV.
Conclusions: Existing discriminatory laws reinforce the predisposed homo/bi/transphobic notions entrenched in society, create environment of impunity, and exclude MSM and trans people from fulfillment of their right to health.
Only three EECA countries adopted anti-discrimination regulations. Homophobia institutionalized in law enforcement bodies in most of EECA countries deepens the oppression of LGBT.
Law enforcement violence in all of Central Asia states towards these groups weakens the trust of LGBT in state institutions, thus, creating an obstacle to providing efficient HIV-services for them.

EPF029
Legal clinic an effective tool for maximizing HIV services among key population in Cross River State Nigeria

O. Emoefe[1], K.D. Igbudu[1], M. Akanji[2], L. Aondoakaa[3], P. Umoh[2], A. Ajayi[1]
[1]Heartland Alliance Limited by Guarantee, Programs, Calabar, Nigeria, [2]Heartland Alliance Limited by Guarantee, Programs, Uyo, Nigeria, [3]Initiative for Health and Equality, Programs, Calabar, Nigeria

Background: One of the greatest needs of members of the key population (MSM, FSW,PWID,TRANS and, PRISONS) is legal protection. This however is shrouded by the existence of bias and, stigmatizing lawyers who see these groups as nothing but, irresponsible.
There was also to be considered the cost effect of consulting a lawyer, which further shrinks access to justice. In the same vein, the continuous demands of incentives by KP's on treatment was becoming tiresome to funders and draining for the program hence, the Legal Clinic bridge point was built to not only create a means for these groups to be heard without prejudice but also, a reason for which their interest and adherence to the program, is sustained.
Description: Legal clinic was a physical avenue that afforded members of the KP community access to free legal counselling, from which actions were taken in form of representation where needed. The legal clinic was carried out by seasoned lawyers employed on the USAID funded Key Populations Community HIV Services Action and Response 1 Project implemented by Heartland Alliance LTD/GTE in collaboration with key population community-based organization from October 2020 to September 2021.
Lessons learned:
- There was an optimal increase in Uptake of HIV services with the introduction of Legal Clinic with a record of 215 persons who came in for legal clinic and, 70% of that number received HIV services.

- A decline in the cry for incentives was recorded as the Legal Clinic intervention had met a much greater need. Of the 215 persons who came in for legal clinic, 85% of them no longer requested incentives after passing through the clinic.
- KP's in coverage area were more aware and, bolder due to an easy access to legal consultation and justice.

Conclusions/Next steps: The legal clinic intervention not only brought about a legally woke and secure KP community but also, increased the voluntary moral of program participants to uptake HIV services optimally.

EPF030

Women´s r4ealities: addressing safety issues that women activists face in EECA

O. Stryzhak[1], A. Gurinova[2], D. Matyushina-Ocheret[3], A. Bessonova[4], T. Zuravskaia[5]

[1]Positive Women, Kyiv, Ukraine, [2]Deutsche Aidshilfe, Berlin, Germany, [3]Consultant, Hamburg, Germany, [4]Network of Women from Key Communities, Bishkek, Kyrgyzstan, [5]People Plus, Minsk, Belarus

Background: In recent years, attacks, both physical and cyber, against women activists working in the HIV field and in particular women living with HIV and from key populations (KPs) have escalated dramatically in Eastern Europe and Central Asia (EECA). Women activists' insecurity is exacerbated by increasingly punitive legislation targeting KPs and, in general, limiting space for NGOs. The situation of women activists is worsened by the traditionally patriarchal society in EECA and inadequate access to digital literacy, technology and legal aid.

Description: In 2021, women-led networks in Ukraine, Kyrgyzstan, and Belarus, with support from Deutsche Aidshilfe and UNAIDS Technical Support Mechanism, implemented a project that aimed to improve their understanding of physical and digital safety and develop strategies to strengthen their networks in the context of shrinking space for civil society in EECA. With the help of a lawyer, women activists analyzed national legislation and how it affected their freedom of expression and freedom of assembly and how it may impact their advocacy work, organizing training and counseling, conducting interviews, and keeping their workplace safe. This was followed by 2-day country training sessions on digital security where individual and networks' digital risks were analyzed, data security skills trained, and organizational and personal data security plans developed.

Lessons learned: The project led to a significant increase in digital literacy and access to data security tools, as well to closer cooperation between women from different key populations and civil society groups on the country level. Women activists were given necessary tools to encrypt their devices in order to protect their data, and in addition they analyzed risks and developed response protocols.

Conclusions/Next steps: Women-led networks face risks of persecution and violence due to their advocacy aimed at gender equality, HIV-related decriminalization, and human rights defense. Technical support that is focused on activists' safety, with practice oriented outcomes, can improve access to technology among women LHIV and from KPs and strengthen their advocacy capacity.

EPF031

One step forward: challenging anti-LGBT laws in Jamaica

R. Elliott[1], S.K.H. Chu[1], M. Tomlinson[1], S. Varma[2], P. Donovan[3], M. Ghazanjani[4], I. Annamanthadoo[1]

[1]HIV Legal Network, Toronto, Canada, [2]Thompson Hine, Washington, DC, United States, [3]AIDS Free World, Toronto, Canada, [4]McGill University, Montreal, Canada

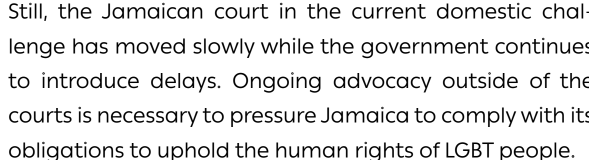
Background: In Jamaica, the *Offences Against the Persons Act* (OAPA) which criminalizes consensual sexual activity between men, is a relic of British colonialism. This law legitimizes discrimination and hostility towards LGBT people and drive men who have sex with men (MSM) away from effective HIV prevention, treatment, care and support interventions. Jamaica's punitive and stigmatizing environment has contributed to HIV prevalence of almost 30% among MSM, the highest in the Caribbean region.

Description: In December 2011, two Jamaican petitioners challenged provisions of the OAPA which prohibit consensual sexual activity between men, in the Inter-American Commission on Human Rights (IACHR). The petitioners described how the OAPA fuels violence, discrimination, and other abuse against LGBT people in Jamaica and sought a declaration from the IACHR that this law violates Jamaica's legal obligations under the *American Convention on Human Rights* Convention).

Lessons learned: In 2020, the IACHR published a long-awaited, landmark report concluding that the OAPA provisions violate individual rights protected by the Convention*.* The report issued a number of recommendations, including for Jamaica to repeal those provisions, adopt a legal framework to prohibit discrimination on the basis of sexual orientation, gender identity or gender expression, and "adopt the necessary measures to ensure the effective access to health services to LGBTI persons without discrimination."

Conclusions/Next steps: To date, Jamaica has failed to demonstrate any effort to comply with the IACHR's recommendations, and LGBT people in Jamaica continue to face the threat of criminalization. A claimant has filed a domestic challenge to the OAPA provisions on the basis that they violate his rights as a gay man under Jamaica's Constitution. The IACHR decision will be instructive as Jamaican courts have found that Jamaica's international human rights obligations are relevant to the determination of domestic cases, and a positive domestic decision would compel the government to change those laws.

Still, the Jamaican court in the current domestic challenge has moved slowly while the government continues to introduce delays. Ongoing advocacy outside of the courts is necessary to pressure Jamaica to comply with its obligations to uphold the human rights of LGBT people.



Conceptualizing political drivers and their impacts

EPF032
The political economy drivers of HIV in marginalized suburban communities in Suriname

O. Adeniyi[1]
[1]*University of the West Indies, Social Sciences - Sociology, St. Augustine, Trinidad and Tobago*

Background: The political economy of Suriname has to be studied to comprehensively establish its impact on HIV incidence in marginalized communities. These communities are more likely plagued by HIV not because residents are promiscuous, rather because of the unfavorably political, economic, and social barriers that drive the epidemic within their societies. The major cities receive more attention politically and economically, while others (suburban) are left to scramble.

This study explored and established the significance of these two factors as the main drivers of the HIV epidemic in Suriname.

Methods: The study utilized mixed qualitative methodologies (Participant observation, interviews, focus group discussion, and desk review) based on the grounded theory approach. A total number of 101 persons who were recruited through local networks in Abra Broki, Texas, and Latour communities of Suriname participated. There were 51 males (including 20 MSM) and 50 females, all between the ages of 16-52years. About 45% of the total participants identified as PLWHA. Structured open-ended questionnaires were used for interviews (86) and 2 focus group sessions (15 attendees in each) were conducted.

Results:

- 83% of participants blamed the government's lack of development plan and activities for the economic downturn in the communities; hence, residents are pressured to engage in risky sexual behaviors as means of survival;
- 100% of participants reported having engaged in risky sexual behaviors such as unprotected transactional sex at one point as a desperate means of survival in response to adverse economic conditions;
- 63% of participants identified a lack of adequate and effective political support for prevention efforts and provision of quality health facilities in the areas as main drivers; and
- 100% of PLWHA interviewed linked their infections to economic pressure at the time.

Conclusions: Although these communities are part of Paramaribo, the capital city of Suriname, poverty, unemployment, illiteracy, poor standard of living, stigma, and discrimination are evident and high. These are all drivers of HIV.

HIV prevention efforts in such communities should be intensified and holistic. The government should consider favorable political, economic, and social policies that would reduce poverty, increase economic opportunities, and foster better collaborations between all stakeholders serving the communities.

EPF033
The life of a foreign agent: Risks and perspectives on operating in Russia as an NGO designated as a foreign agent

I. Zarubina[1], M. Golichenko[2]
[1]*AIDS Foundation East-West, Moscow, Russian Federation,* [2]*HIV Legal Network, Toronto, Canada*

Background: During 2012-2021 Russia enacted more than twenty laws nicknamed altogether as Laws on 'Foreign Agents'. Along with laws on drug and gay propaganda they create significant obstacles for HIV service nongovernmental organizations (NGOs) receiving international funding. By November 2021, fifteen HIV-servicing organizations were included on the list of foreign agents. Six of them have ceased their activities.

This study aims to define the main risks and to propose the risk mitigation recommendations for NGOs to work in the environment of foreign agent laws and policies.

Methods: The study comprises law and policy desk research followed by in-depth interviews with 14 leaders of HIV service NGOs in six provinces in Russia who have been declared as foreign agents. The coding and categorization method was used to carry out a thematic analysis of the transcripts.

Results: Due to the foreign agent laws, HIV service NGOs report a significant increase in administrative burden, strong barriers to receive government funding, and the unwillingness of government officials to engage into meaningful dialogue with NGOs who have been declared foreign agents. These laws also have a chilling effect on the willingness of international donors to fund civil society in Russia, especially such politically sensitive activities as harm reduction and the promotion of human rights of key populations. All respondents reported increased administrative, financial, and psychological burdens associated with periodic inspections of NGO's activities by various government services. Foreign agent laws significantly hamper the activities of the most engaging and professional HIV service NGOs, thus depriving the key and vulnerable group of essential services. The study proposes the risk mitigation recommendations for NGOs, donors, and activists.

Conclusions: After inclusion on the 'foreign agent' list, operations of HIV service organizations have become associated with additional financial and administrative dif-

ficulties. With the implementation of the 'foreign agent' law, there is a gradual narrowing of the space for the activities of HIV-servicing NGOs. There is no reason not to expect further expansion of the laws restricting the activities of NGOs in Russia.

Antiretroviral procurement and supply chain management

EPF034

Strengthening the Government of Vietnam's ARV supply chain management as they transition to sustainable HIV financing: lessons for HIV integration

L. Thai Thi Hong[1], M. Nguyen[1], T. Nguyen[1], D. Nguyen[1], C.A. Thi Nguyen[2]
[1]Abt Associates, Hanoi, Viet Nam, [2]USAID, Hanoi, Viet Nam

Background: As donor funding for ARVs decreases in middle-income countries like Vietnam, many turn to their national health insurance schemes to integrate and finance HIV programs. Technical assistance from partners to strengthen country ownership of the national HIV response is critical for addressing health systems issues, including financing and supply chain, in support of domestically funded HIV programs. USAID's Local Health System Sustainability (LHSS) project is supporting HIV program integration by the Government of Vietnam's (GVN) ARV supply chain management system and the Social Health Insurance (SHI) fund, the country's primary public financing mechanism for health.

Description: In 2021, Vietnam faced an imminent shortage of the main ARV covered by the SHI fund, TLE600, due to global supply chain challenges and unsuccessful procurement from the drug's sole government-approved supplier. LHSS supported GVN processes to add two WHO-preferred ARVs (TLD and TLE400) to the SHI drug list, paving the way for SHI-funded procurement. This was the first time TLE400 and TLD were procured via price negotiation; publishing the results was delayed by three months due to administrative errors in technical bidding documents. Subsequently, LHSS supported GVN to expedite procurement to ensure uninterrupted supply of high-quality, cost-effective treatment.

Lessons learned: GVN procured and distributed TLD and TLE in July 2021, six months before originally planned. By December 2021, approximately 48,000 and 54,000 HIV patients received SHI-covered TLD and TLE, respectively. The Vietnam experience illustrates how strengthening HIV program leadership skills for collaboration, planning, and coordination across multiple government-led agencies is critical to successful program integration.

Commodity procurement must strictly follow bidding regulations; well-prepared technical documents are critical to ensure accuracy and avoid delays in announcing procurement results. Changing ARV procurement policies is political; evidence and engagement to support consensus-building is required to change and operationalize new supply chain policies.

Conclusions/Next steps: The updated SHI drug list with TLD and TLE, the possibility of other advanced ARV drugs in the future, and favorable policies and actions have expanded opportunities for HIV patients to access cost-effective, high-quality ARVs. Vietnam's experience and process has lessons for countries with similar HIV program integration and domestic financing strategies.

Humanitarian crises

EPF035

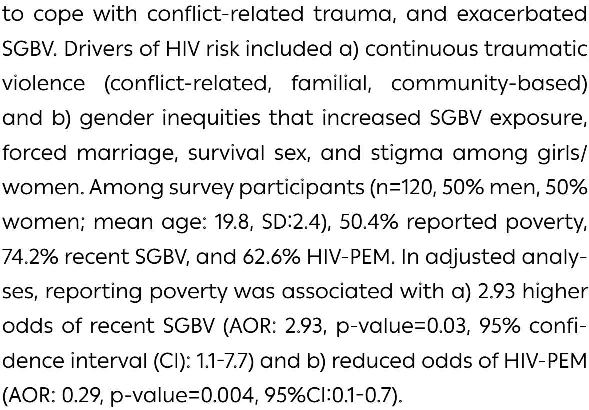
Poverty, cumulative violence, and contexts of HIV vulnerability among refugee youth in a humanitarian setting in Uganda

K. Malama[1], C. Logie[1], M. Okumu[2], M. Loutet[3], A. McAlpine[1], S. Odong[4], N. Kisubi[4], M. Latif[3], S. Parker[3], S. Mwima[2], P. Kyambadde[5]
[1]University of Toronto, Social Work, Toronto, Canada, [2]University of Illinois Urbana-Champaign, Urbana, United States, [3]University of Toronto, Toronto, Canada, [4]Uganda Refugee and Disaster Management Council, Yumbe, Uganda, [5]Uganda Ministry of Health, Kampala, Uganda

Background: Poverty and violence are structural drivers of HIV in humanitarian contexts. Scant research has examined HIV prevention cascade needs with refugee youth in humanitarian settings such as Bidi Bidi, Uganda—the world's second largest refugee settlement. We explored social-ecological factors linked with HIV vulnerabilities among refugee youth in Bidi Bidi.

Methods: This multi-methods study in Bidi Bidi involved 6 focus groups and 12 in-depth individual interviews (IDI) with refugee youth aged 16-24, and IDI with refugee elders (aged≥55) (n=8) and healthcare providers (HCP) (n=8). We applied thematic analysis to understand HIV vulnerabilities. We then conducted tablet-based surveys with refugee youth (16-24 years) that assessed: poverty (no income in past 12-months), recent (past 12-months) sexual and gender-based violence (SGBV) (sexual/physical violence), and HIV prevention engagement motivation (HIV-PEM) (wanting to learn more about HIV prevention). Multivariable logistic regression adjusting for age and gender was used to estimate adjusted odds ratios (AORs) for associations between poverty and SGBV with HIV-PEM.

Results: Qualitative participants included youth (n=60; 50% men, 50% women; mean age: 20.7, standard deviation [SD]:2.16), elders (n=8; 50% men, 50% women), and HCP (n=8; 62% women, 38% men). Narratives revealed chronic poverty resulting in stress, 'idleness', and frustration that elevated substance use. Substance use was also used



to cope with conflict-related trauma, and exacerbated SGBV. Drivers of HIV risk included a) continuous traumatic violence (conflict-related, familial, community-based) and b) gender inequities that increased SGBV exposure, forced marriage, survival sex, and stigma among girls/ women. Among survey participants (n=120, 50% men, 50% women; mean age: 19.8, SD:2.4), 50.4% reported poverty, 74.2% recent SGBV, and 62.6% HIV-PEM. In adjusted analyses, reporting poverty was associated with a) 2.93 higher odds of recent SGBV (AOR: 2.93, p-value=0.03, 95% confidence interval (CI): 1.1-7.7) and b) reduced odds of HIV-PEM (AOR: 0.29, p-value=0.004, 95%CI:0.1-0.7).

Conclusions: Findings signal the confluence of poverty, cumulative violence, and substance use elevate youth HIV vulnerabilities in humanitarian contexts. Poverty drives SGBV and undermines HIV prevention engagement. Structural and gender-transformative interventions addressing unemployment, continuous violence, and trauma-informed substance use services, can reduce HIV vulnerability and enhance HIV prevention cascade engagement among youth in humanitarian crises.

Sexual- and/or gender-based inequalities, inequities and violence

EPF036

Contribution of platforms fighting against Sexual and Gender-Based Violence (SGBV) in the prevention of HIV / AIDS and STI transmission among LGBT people in Benin

J. Ouessou[1], A. Aguessy[1]

[1]*Réseau Bénin Synergie Plus, Atlantique, Abomey-Calavi, Benin*

Background: In Benin, an average of twenty (20) cases of violence of LGBT people are recorded per quarter, in the sole territory of the Beninese crossing of the Abidjan-Lagos Corridor.

To improve responses to SGBV, Benin Synergies Plus Network (BESYP), with the technical support of the Abidjan-Lagos Corridor Organization, set up in 2019 the first platforms (PF) to fight against Sexual and Gender-Based Violence (SGBV) for LGBT people, which became the pillar of the national strategy against SGBV. The platform is a collaborative framework for exchanges, referrals and counter-referrals for actors involved in the response to SGBV. It is made up of members of the Republican police, health professionals, journalists and faith-based or community-based civil society organizations. Today, there are 3 SGBV platforms for LGBT people along the Beninese crossing of the Abidjan-Lagos Corridor.

Description: The SGBV platforms are an innovative response, aiming to strengthen the coordination of interventions, the framework of prevention and care for survivors of SGBV. They integrate:

• A mechanism for collecting data on SGBV,
• Psycho-social care, support and legal guidance for victims,
• Coordination and capitalization of actions.

Lessons learned: From 2019 to 2021,the three SGBV platforms have enabled 153 victims of SGBV to benefit from comprehensive medical (screening, EPT), psycho-social (listening, counseling) and legal care.

The main advances made possible by the implementation of these platforms are the followings:

• Systematization of referral and support for victims of SGBV by the SGBV focal point;
• Commitment of doctors to provide medical care for victims of SGBV within the required timeframe and, for victims of physical violence, to issue free medical certificates necessary for legal procedures.
• Decrease in time to linkage to care through ongoing education of communities about HIV risks due to violence.

But difficulties remain: insufficient resources to expand activities in other departments; socio-cultural constraints; lack of emergency accommodation facilities.

Conclusions/Next steps: • Extend the activities of SGBV Platforms in other departments of Benin;
• Develop and distribute awareness-raising materials on the importance of medical treatment within 72 hours of an event of physical violence.

EPF037

Gender based violence against female sex workers and transgender during COVID-19 pandemic in Dhaka and in selected brothels (Case study of Bangladesh)

R.A. Nur[1], M.N. Huq[2], S. Khan[3], F.J. Peya[4]

[1]*United Nations Population Fund, SRHR Unit, Dhaka, Bangladesh,* [2]*Jahangirnagar University, & Vice Chancellor, RTM Al-Kabir Technical University, Department of Statistics, Sylhet, Bangladesh,* [3]*UNAIDS, Country Office, Dhaka, Bangladesh,* [4]*RTM International, Research Team, Sylhet, Bangladesh*

Background: Female sex workers (FSWs) in Bangladesh face daily threats to their personal and collective safety. FSWs are legally marginalized and socially stigmatized and suffer precarious social protection, economic insecurity, and are targeted with physical, sexual, and emotional violence by the police, managers, clients, and intimate partners.

The transgender in Bangladesh are also subject to a high level of Gender Based Violence (GBV). A study conducted in 2015 among the gender diverse population (GDP) revealed that 42.2% of them GDPs were the victims of rape, 26.1% gang-rape, 55.3% physical torture and another 63.3% faced police arrest due to their gender identity.

The study is conducted to understand the nature and consequences of GBV experienced by the FSW and transgender during the pandemic, to inform HIV policies and programming and to help protect KPs' human rights.

Methods: The study was conducted among the Street Based Female Sex Workers (SBFSW), Transgender and Brothel Based Female Sex Workers (BBFSW).
It adopted a mixed-method approach, both qualitative and quantitative. Semi-structured interviews and in-depth case studies were conducted.
The estimated sample size at 95% level of confidence with precision of 5% and non-response rate of 5%, the total sample size was 951.

Results: Three-quarter of the SBFSW (75.3%) reported to face any form of physical violence in the last 12 months. The rate was relatively lower among BBFSW (60.2%). Among the transgender interviewed, 71.3% mentioned that they faced physical violence in the last 12 months. In addition, more than eighty percent of the female sex workers and 76% of Hijras reported to ever experience physical violence.

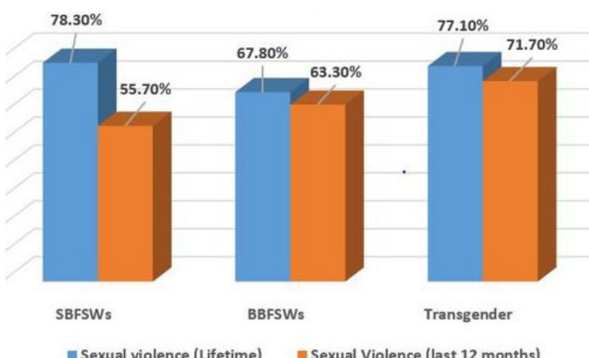


Figure. Lifetime and 12-month prevalence of sexual violence among FSW and Transgender

Conclusions: The study findings provide evidences on violence faced by selected KPs which requires political commitment and supports programmers working with violence, community-based organizations and advocates to highlight and address human rights violations faced by KPs in Bangladesh.

EPF038

The Gender Equality Forum and the 40 billion dollar question: where is HIV?

L. Wanjiku Njenga[1], E. Bell[2], F. Hale[2], B.C. Kelemi[3], L. Orza[4], C. Morrison[4]
[1]*Positive Young Women Voices, Nairobi, Kenya,* [2]*Making Waves Network, London, United Kingdom,* [3]*The Botswana Network on Ethics, Law and HIV/AIDS (BONELA), Gaborone, Ghana,* [4]*Frontline AIDS, Brighton, United Kingdom*

Background: *The Global AIDS Strategy (2021-2026*) and the 2021 *Political Declaration on HIV and AIDS* commit to urgent and transformative action to end gender inequalities. Yet it remains unclear how financial pledges made at the *Generation Equality Forum* (GEF) to advance gender equality can complement these commitments to improve the lives of those most impacted by HIV.

Description: In 2021 world leaders, philanthropic foundations, civil society, feminist leaders and the private sector convened for the GEF – a once in a decade meeting to revitalise action on gender equality. The *Global Acceleration Plan*, launched at the forum, sets the global agenda for the next five years, supported by USD $40 billion in commitments. Yet, for many – including HIV activists – the road ahead is still unclear.

Lessons learned:

- The GEF Acceleration Plan is inconsistent in terms of how inclusive it is of women, girls and gender-diverse people most impacted by HIV. Action Coalition 3 on Bodily Autonomy and SRHR makes no reference to HIV. Those on GBV and feminist movements and leadership recognise HIV status, gender identity and sexuality – but is this enough?
- HIV was rarely mentioned in the Forum and in funding commitments, and there was a worrying silence – even absence – of key allies of the HIV movement. This despite the AIDS epidemic being *one of the most devastating gendered crises facing the African continent in the late 20th century*.
- The Forum did nothing to explicitly engage with women living with HIV or sex workers. Concerns were also raised about the tokenistic involvement of young women and other marginalised groups. However, some sessions had strong transgender speakers, and presence of LGBT+ organisations and activists.

Conclusions/Next steps: How much of the $40 billion will be used to address HIV and support feminist action by HIV activists? We need meaningful community engagement with the Acceleration Plan to deliver and track these commitments. This means fully resourcing organisations led by women, girls and gender diverse people including those living with HIV. Afterall, grassroots mobilisation and collective care by women and girls living with HIV provides *vital lessons for feminist activism and movement building* and the HIV response.

Intersecting inequities in access to justice for trans and non-binary sex workers in Canada

A. Scheim[1,2,3], S. Ciavarella[4,5], J. Vermilion[6], F.S.E. Arps[7], H. Santos[1], N. Adams[8], K. Nation[9], G. Bauer[2]
[1]*Drexel University, Epidemiology and Biostatistics, Philadelphia, United States,* [2]*Western University, Epidemiology and Biostatistics, London, Canada,* [3]*St. Michael's Hospital, Toronto, Canada,* [4]*Peers Victoria Resources Society, Victoria, Canada,* [5]*University of Victoria, Department of Social Work, Victoria, Canada,* [6]*Sex Workers' Action Program, Hamilton, Canada,* [7]*Trans PULSE Canada Team, Toronto, Canada,* [8]*University of Toronto, Ontario Institute for Studies in Education, Toronto, Canada,* [9]*Kelendria Nation Consulting, Vancouver, Canada*

Background: Canada's "end demand" sex work laws purport to enhance sex workers' safety and access to justice. As these claims are contested, the experiences of transgender and non-binary sex workers are often obscured. We sought to characterize access to justice among trans and non-binary people in Canada with and without sex work histories, across intersecting social identities and positions.

Methods: Trans PULSE Canada collected multimode survey data in fall 2019 using a community-based research approach. We estimated age-adjusted predicted probabilities from logistic regression models to compare participants by sex work history, and cross-stratified by sex assigned at birth, ethnoracial group, and household income.

Results: Of 2012 trans and non-binary participants (median age = 28), 280 (16.1%) had ever done sex work. Most (66.5%) were assigned female at birth and 48.9% identified as non-binary. Sex workers were more likely to anticipate (predicted probability = 72.2% vs. 50.5%) and experience (43.1% vs. 15.6%) police mistreatment and to report any physical or sexual violence (61.5% vs. 27.3%) or violence due to being trans or non-binary (41.4% vs. 14.0%) in the previous five years (all p<.0001). Sex workers were more likely to both have needed police services in the previous five years, and to have avoided calling 911 for police (51.4% vs. 18.1%, p<.0001).

Few sex workers trusted that they would be treated fairly by the police or courts if they experienced physical (10.8%) or sexual (4.7%) violence. Intersectional inequalities included that sex workers assigned male at birth and street-based sex workers were most likely to have experienced violence due to being trans or non-binary in the previous five years (58.0% and 53.9% respectively), and that Indigenous and racialized sex workers reported higher levels of police mistreatment and 911 avoidance.

Conclusions: We found very limited access to justice for trans and non-binary sex workers, which was exacerbated for transfeminine, Indigenous, racialized, and street-based workers, in the context of Canadian laws that purport to protect the rights of sex workers and trans people. These inequities, which may exacerbate HIV risks, must be addressed in sex work legal reform efforts.

EPF040

GBV incidence reduction among adolescent girls and young women's (AGYW) and the Violence Against Person's Prohibition Act in South-South, Nigeria: thoughts for the HIV gender, human rights response

F. Esor[1], U. Daniel[2], O. Falola-Anoemuah[3]
[1]*Ebonyi State University (EBSU), Applied Biology, Abakaliki, Nigeria,* [2]*University of Calabar, Human Genetices, Calabar, Nigeria,* [3]*University of Ibadan, Gender Study, Ibadan, Nigeria*

Background: From 2011 to date, the South-South HIV gender and human rights response has, in alignment with national guidelines, pioneered an effective multisectoral programming using gender mainstreaming – a strategy for promoting gender equality in all populations including AGYW. However, challenges with reducing GBV incidence remain, while reviews on the VAPP reveal how AGYW stand to benefit from its domestication and the need for zonal coverage and enforcement towards more effective designs of gender and human rights programmes.

Description: We examined the gender mainstreaming approaches currently used and their impact on GBV incidence reduction. We also reviewed the enabling conditions for gender and human rights programming in the zone, as well as opportunities and threats to enforcing the VAPP law for better outcomes of the HIV gender and human rights activities.

Lessons learned: These 11 years, successes have been recorded with respect to GBV incidence reduction using gender mainstreaming. Currently gender has been mainstreamed into many private and public policy/programming processes, direction provided through guidelines and the gender and human rights emergency response team (GHRRT) constituted in one SS state. Reports of researches have been disseminated and capacity built on the use of standardized data collection tools. Still, GBV incidence reduction is being threatened as very little data on context-specific issues and their effects on AGYW exists. To address this threat, the NACA South-South zonal office (SSZO), in 2021 conducted a rapid appraisal of the VAPP law domestication to inform the redress of programme implementation approaches targeted at AGYW in the zone. More exploration of the VAPP law is ongoing to determine the most efficient way of reducing GBV incidence, intensified advocacy for adoption of the law in the three remaining SS states and innovative GBV mitigation models that, if adapted and implemented will help the SS GHR response.

Conclusions/Next steps: The SS GHR programme for AGYW has demonstrated the need to intensify advocacy for the approval and enforcement of laws for effective

addressing of GBV incidence reduction and related issues. With more gender mainstreaming, local systems can be enhanced to increase access to structured and effective GBV response services backed and empowered by law.

EPF041

Rethinking the development agenda: Advocating for the full inclusion and participation of men who have sex with men and transgender people in the South African health care system

D. Jebese-Mfenge[1], B. Futshane[1], R. Chimatira[1], S. Gaga[1]
[1]*Beyond Zero, East London, South Africa*

Background: In support of South Africa's National Strategic Plan and the National LGBTI HIV Plan, 2017-2022, HIV, TB and STI intervention programme was implemented from April 2019 to reduce the incidence of HIV amongst Men having Sex with Men (MSM) and Transgender (TG) people in 10 selected districts of South Africa.
This abstract highlights areas that have significant implications for the developmental agenda of SA regarding the plight of MSM & TG people as well as the healthcare service delivery.
Description: A mid-term evaluation of the intervention programme was conducted during February and March 2021. Qualitative data collection methods including in-depth interviews and Focus Group Discussions in line with the evaluation objectives, explored various categories of the intervention programme stakeholders including programme beneficiaries, peer educators/ navigators and programme managers as well as other key informants involved in policy formulation including LGBTI, AIDS Council and Civil Society.
Purposive sampling was conducted for these interviews with a total of 21 interviews conducted across the various categories.
Lessons learned: Inequalities in society and in the SA health system was raised as the primary challenge. Programme coverage was described as inadequate. More focus and resources dedicated to a model which would cater for the critical needs of this population such as the provision of hormone therapy for transgender was recommended. Rethink of binary and heteronormative state of patient ablution facilities in health facilities that exclude the minority groups. The need for the proclamation of the third gender in SA was made. Transgender people reported concern with regards to their IDs that are not aligned to their sex change.
At present, the issue of transgender people is not policy hence the challenge MSM and TG people are facing at health facilities.
Conclusions/Next steps: South African health service delivery lacks integration that is inclusive of the diversified populations such as the LGBTI community.
This evaluation highlighted areas that need fast-tracking in the provision of health care service delivery for an inclusive health care system. Inclusion of members of LGBTI in health policy decision making spaces such as clinic committees, school governing bodies is vital towards the achievement of health for all.

EPF042

Routine domestic abuse (DA) enquiring in people living with HIV (PLWH)

N. Ahmed[1], M. Longman[1], P. Puszkiewicz[1], A. Bennett[1], D. Harkness[1], D. Weston[1], S. Edwards[1], L. Waters[1], J. Ashby[1]
[1]*Central North West London NHS Trust, HIV/Sexual Health, London, United Kingdom*

Background: The estimated lifetime prevalence of women subjected to DA globally ranges from 8.1-64.6%, with scant data for men. During the COVID19 pandemic, DA organisations saw an increase in calls. There is increasing evidence of DA in PLWH, correlated to poor health outcomes including death. We aimed to improve routine DA routine enquiry of PLWH at our HIV outpatient service using quality improvement methodology.
Methods: All clinical staff were asked to routinely ask PLWH about DA. All were trained on how to screen and manage disclosures via health advisors to specialist services/organisations. Weekly reminders with DA screening rates were circulated, with support and encouragement. Feedback was undertaken to understand barriers and acceptability to screening: patients were randomly asked by a clinician to partake in informal in-depth interviews, and staff completed an online survey. Characteristics and outcomes for identified cases were also reviewed.
Results: Routine DA screening improved from an 8% average (range 0-19%) pre-lockdown (848 asked), to 33% (range 0-56%) post-lockdown (3508 asked) by clinicians only, with a slight decline to 24% (range 6-45%) when nurses/healthcare assistants were included (2638 asked). Pre-lockdown 8% (3/38) disclosed DA, rising to 92% (35/38) post-lockdown, with a further 6 disclosures. 89% were asked twice before disclosure. The majority of survivors were homosexual non-British white males. Overall, 73% (n=44) accepted referral to DA services, regardless of current or past DA. 14 patients completed interviews. 92% responded positively about screening, all feeling comfortable being asked. 59% felt DA should be screened every time. 26 staff completed the survey. 81% had positive patient encounters when screening. 73% agreed screening should be asked at every opportunity by every staff member.
Conclusions: Routine DA screening for PLWH improved with simple interventions. Increase screening resulted in ten-fold disclosure, the majority not disclosing on first enquiry. Most (past and current) accepted onward referrals. Staff and patients found it acceptable. Screening advocates for management pathways, but ultimately impacts prevention of DA and consequences. The WHO does not recommend routine DA screening due to lack of resources but we believe, and call for this to be an essential part of care with funding re-directed to enable this.

Access to education

EPF043

Our health, our future: mobilising action to advance national commitments on adolescent sexual health and rights in East & Southern Africa

C. Morrison[1], P. Jeckonia[2], C. Chomba[3], J. Nderi[2]
[1]Frontline AIDS, Brighton, United Kingdom, [2]LVCT Health, Nairobi, Kenya, [3]SAfAIDS, Harare, Zimbabwe

Background: In December 2021, Ministers of education, health, gender and youth in Eastern and Southern Africa reaffirmed the Ministerial Commitment on comprehensive sexuality education (CSE) and adolescent sexual and reproductive health and rights (SRHR). Expanding on the agreement made in 2013, Governments agreed to a bold new set of targets.

In the run-up to this re-endorsement Frontline AIDS, LVCT Health Kenya and SAfAIDS - with support from UNESCO - implemented a small programme designed to mobilise political support for the new Commitment within the region and counter growing opposition.

Description: Over 6 months we conducted a series of activities, including:

- Hosting a virtual consultation with over 100 civil society organisations to document the success and failures of the previous ESA Commitment.
- Developing a civil society Call to Action (C2A) with recommendations
- Raising awareness of the new Commitment among civil society and hosting meetings with government departments to build support for our reccomendations.
- Developing a network of youth and community organisations keen to advocate on CSE and creating social media toolkits, press releases and policy briefs to support their work in countering opposition.

Lessons learned: As a result of this work:

- Over 270 organisations from across the ESA region endorsed our C2A.
- Recommendations from the C2A were included in the final Commitment.
- More than 15 countries in the ESA region have now publicly endorsed the new Commitment

Conclusions/Next steps: Frontline AIDS and our partners played a crucial role in mobilising civil society around the new ESA commitment. Although the new Commitment is now in place, significant challenges remain. Knowledge of HIV prevention in the region remains stubbornly low. Less than 50% of adolescents have access to youth-friendly SRHR services. Civil society organisations must continue to play a critical role in tracking domestication and implementation of the new targets, this includes their involvement in accountability mechanisms and periodic review forums to track progress.

At the conference we want to hear how countries plan to make this new Commitment a reality. What priority actions will they take? How can governments and civil society work together to deliver on this agenda?

Criminalization, incarceration and living in closed settings

EPF044

Drug decriminalization done right: a civil society platform

S.K.H. Chu[1], R. Elliott[1], S. Bernstein[2], N. Touesnard[3], C. Shane[4], D. MacPherson[5]
[1]HIV Legal Network, Toronto, Canada, [2]MAPS Canada, Vancouver, Canada, [3]Canadian Association of People who use Drugs (CAPUD), Dartmouth, Canada, [4]Pivot Legal Society, Vancouver, Canada, [5]Canadian Drug Policy Coalition, Vancouver, Canada

Background: Punitive drug laws and policies purported to deter drug use have failed. Worse, they have fueled deadly stigma; epidemics of HIV, HCV, and overdose death; poverty; homelessness; and egregious violations of human rights — particularly against poor and racialized drug users. In May 2020, 180+ civil society organizations (CSOs) in Canada launched a call to decriminalize simple possession. Subsequently, Canada's police chiefs endorsed decriminalization, Canada's prosecution service recommended non-prosecution for simple possession except in the "most serious cases," and numerous bills to reduce criminalization were introduced.

To advance a vision of decriminalization that centres human rights and drug user liberation, a Strategy Group formalized the call by developing a CSO platform for drug decriminalization.

Description: The CSO platform involved multiple rounds of drafting and discussion by a Strategy Group, and consultation with a broader range of CSOs, including Black and Indigenous community organizations and advocates.

The racialized impacts of drug prohibition, especially for Black and Indigenous peoples in Canada, were part of the group's deliberations and the racial justice dimensions of decriminalization are reflected in the platform.

Lessons learned: The CSO platform for decriminalization includes:

- Full removal of criminal sanctions, penalties, and coercive interventions for simple drug possession, as well as for necessity trafficking, defined as the sharing or selling of drugs for subsistence, to support personal drug use costs, or to provide a safe supply.
- Automatic expungement of previous convictions for these activities.
- Removal of police and other law enforcement as "gatekeepers" or "liaisons" between people who use drugs and health and social services, to be replaced by organizations led by people who use(d) drugs or skilled and trained frontline workers.
- Redistribution of resources from law enforcement to programs and services that protect and promote health and human rights, including housing and social services.

Conclusions/Next steps: Non-prosecution policies or diversion programs are inadequate, as are proposals that maintain any punitive sanctions (criminal, administrative, or otherwise) for simple possession and necessity trafficking. Short of the elements proposed in the CSO platform, people who use drugs will continue to face violations of their human rights, including their right to health and HIV prevention services.

Availability and access to harm reduction (including OST and NSP)

EPF045
Analysing the role of stigma and racism in harm reduction policy: a tri-country analysis

S. Srinivasan[1,2], E. Meng[3,4]
[1]Oxford University, Department of History (Centre for History of Science, Medicine and Technology), Oxford, United Kingdom, [2]Harvard University, Department of History of Science (former), Cambridge, United States, [3]Harvard University, Department of History of Science, Cambridge, United States, [4]Harvard Medical School, Cambridge, United States

Background: The systematization of stigma with regards to prevention, treatment, and recovery for PWUD varies across the globe, producing a variation in policy response. This project includes a tri-country analysis of federal health policies in the United States, Brazil, and Portugal, thereby exploring the following question: *How do harm reduction policies and public health response measures reflect sociopolitical beliefs, particularly notions of responsibility?*

Description: In the United States, the racial criminalization of Black and Latinx people as a result of the "War on Drugs" reflects political and social beliefs; in Brazil, PWUD have been increasingly prosecuted as traffickers, even though the nation's public health system has expanded sterile needle access; in Portugal, one can approach a supervised injection facility and use with impunity, while also being referred to social support services.

This abstract presents an analysis of such policies from the past decade, with a focus on comparative, federal response to harm reduction.

Lessons learned: The variations within and across countries as to whether harm reduction and opioid response is the responsibility of the state reveal the extent to which stigma—across race and related to PWUD—is embedded in national policy. In the United States, an analysis of policy language around responsibility depicts dissonance between political parties and, subsequently, between state and federal leadership. With regards to Brazil and Portugal, both countries take a seemingly human rights approach to healthcare through top-down constitutional commitments and universal healthcare systems. However, their respective responses to harm reduction, treatment, and prevention vastly differ, with Brazil taking an increasingly racial/carceral approach to drug use and related crime, compared to the Portuguese system of de-escalation and dissuasion, where social support was accepted and implemented as a nonpartisan responsibility of the state.

Conclusions/Next steps: The juxtaposition of these three countries depict the necessity of both top-down systems response and political participation, as well as a continued vigilance and review of implementation. Even a universal healthcare system such as Brazil's remains inequitable so long as racial bias and stigma against PWUD exists in people and policy. It is crucial that human rights not be dependent on the precariousness of political power.

EPF046
The need for overdose education and naloxone distribution among people who inject drugs in Kazakhstan

M. Darisheva[1], T. McCrimmon[2], A. Terlikbayeva[1], S. Primbetova[1], P. Gulyaev[1], T. Hunt[3], L. Gilbert[3], N. El-Bassel[3]
[1]Global Health Reseach Center of Central Asia, Almaty, Kazakhstan, [2]Columbia University, Mailman School of Public Health, New York, United States, [3]Columbia University, School of Social Work, New York, United States

Background: Overdose is a leading cause of morbidity and mortality among people who inject drugs (PWID) in Kazakhstan; regional data suggests risk of overdose is twice as high among PWID living with HIV (PWID-PLWH). While naloxone is approved for emergency overdose response in the country, there is still no centralized procurement of this life-saving medication, and distribution programs are limited to pilot projects of international organizations. Increasing overdose prevention services for PWID-PLWH may help to engage PWID-PLWH, and link them to a continuum of HIV and other services.

More information is needed to understand the extent of overdose awareness and risk in Kazakhstan's PWID-PLWH population, including their experience and attitudes towards naloxone.

Methods: This study used baseline data collected between 2017 and 2019 from a longitudinal study of 616 PWID-PLWH. Participants were recruited through needle and syringe programs (NSP), HIV care centers, and field-based recruitment in four Kazakhstani cities. Participants completed a computerized self-assessment, including questions on lifetime and recent overdose experience and injectable naloxone use, as well as awareness and willingness to use nasal naloxone.

Results: Nearly three-quarters of participants (72.2%) experienced an overdose in their lifetime, and over one-fifth (22.0%) in the past 6 months.The majority of participants (76.9%) reported overdose from heroin, though overdose from synthetic stimulants was also high (17.3%).

Additionally, 88.9% of PWID-PLWH had witnessed someone's overdose. Only 26.6% had heard of naloxone, yet among those aware, 40.9% reported having used it to reverse an overdose for them or a friend. Only 4.7% of participants had heard about nasalnaloxone, yet one-fourth (24.7%) of all participants were willing to use nasal naloxone if available.

Conclusions: The study results show a high need for overdose awareness and prevention programs and wide spread distribution of take-home naloxone as an effective and inexpensive life-saving medication for PWID-PLHIV. More information about overdose prevention should be distributed among PWID-PLWH communities.

Overdose prevention and naloxone distribution should be widely integrated into HIV care, drug treatment, harm reduction, and other programs available in Kazakhstan.

Financial incentives, micro-finance and other economic approaches

EPF047

Effects of financial incentives for clinic attendance on economic well-being among adults initiating antiretroviral therapy in Tanzania: a three-arm randomized controlled trial

C. Fahey[1,2], P. Njau[3], E. Katabaro[4], Y. Ndungile[5], S. McCoy[2]

[1]*University of Washington, Seattle, United States,* [2]*University of California, Berkeley, United States,* [3]*Ministry of Health, Community Development, Gender Elderly and Children (MOHCDGEC), Dodoma, Tanzania, The United Republic of,* [4]*Health for a Prosperous Nation, Shinyanga, Tanzania, The United Republic of,* [5]*Ministry of Health, Community Development, Gender Elderly and Children (MOHCDGEC), Shinyanga, Tanzania, The United Republic of*

Background: Financial incentives for clinic attendance are shown to promote retention in HIV care and antiretroviral therapy (ART) adherence. However, few randomized studies have assessed potential secondary impacts of these incentives on economic well-being. We examined the effects of different incentive sizes on employment, food insecurity, and wealth among adults (≥18 years) starting ART (≤30 days) in Tanzania.

Methods: We conducted a three-arm parallel-group randomized controlled trial at four clinics in Shinyanga region. Participants were individually allocated (1:1:1) to usual care (control group) or to additionally receive a monthly cash incentive for up to 6 months, conditional on clinic attendance, in one of two amounts: 10000 TZS (US $4.50) or 22500 TZS (US $10). Economic outcomes, collected via a questionnaire at baseline and 6 months, included: currently working, functional limitation (missed work due to illness), food insecurity (Household Hunger Scale), and relative wealth (score from principal components analysis). We compared changes in economic outcomes over 6 months using longitudinal regression models with a group-by-time interaction term, including multiple imputation for missing 6-month surveys (10.6%).

Results: From April 24 to December 14, 2018, we randomized 530 participants (184 control, 172 smaller incentive, 174 larger incentive). From baseline to 6 months, overall improvements were observed in the proportions working (from 60% to 72%) and experiencing household hunger (from 27% to 21%), with little difference between study groups. Compared to the control group, functional limitation declined more in the larger incentive group [-10.9 percentage points, 95% CI: -24.4, 2.6; interaction p=0.11] and wealth percentile improved (3.8, 95% CI: -1.0, 8.6; interaction p=0.12).

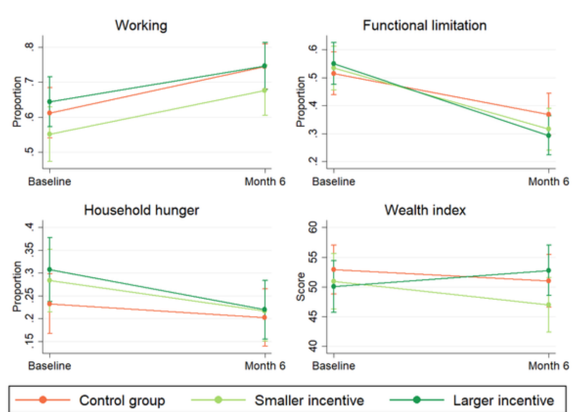

Figure.

Conclusions: Financial incentives to improve retention and ART adherence may have additional benefits for individual and household economic well-being, given a sufficiently large incentive size. These findings contribute further evidence for implementing incentives within HIV care and should be factored into cost-benefit considerations.

Safe housing, social protection and other care and support for people affected by HIV

EPF048

Healthcare and social assistance for the social protection of people with HIV/AIDS in situations of vulnerability: the Brazilian case

P. Werlang[1], L.S.A. Barreto[1], M.R. Colombo[1], G.C. Silva[1], F.D. Costa[1], G.F.M. Pereira[1]

[1]*Ministry of Health, Department of Diseases of Chronic Condition and Sexually Transmitted Infections, Brasilia, Brazil*

Background: Considering the Political Declaration on Ending AIDS by UN General Assembly High-Level Meeting in 2016 and the publication on social protection (UNAIDS, 2018), the Department of Diseases of Chronic Condition and Sexually Transmitted Infections of the Brazilian Min-

istry of Health, worked in partnership with the Ministry of Citizenship for the development of actions on health and social assistance, protecting people with HIV/AIDS in situations of vulnerability.

Description: In 2021, a Technical Cooperation Agreement (TCA) was signed aiming at: establishing joint guidelines for the health and social assistance networks in the fight against HIV/AIDS, among other diseases; sensitizing health professionals in the identification and referral of people in situations of social vulnerability to social assistance; equipping social assistance professionals to promote health and fight stigma and discrimination; strengthen advocacy actions for the improvement of public policies related to the subject. The first product of the TCA was launching an online course on social protection for people in socially vulnerable situations with syphilis, HIV/AIDS, viral hepatitis, tuberculosis or leprosy. Developed by the Pan American Health Organization and the Federal University of Rio Grande do Norte in partnership with Ministry of Health and Citizenship, the 60-hour online course has versions in Portuguese, English and Spanish (https://avasus.ufrn.br/local/avasplugin/cursos/opas.php) It has sought to train health and social assistance to improve access for people with social vulnerability to both services. In four months, 2496 students enrolled and 998 people finished the course.

Lessons learned: Strengthen the performance of health and social assistance networks in the territory in order to facilitate the access of people with HIV/AIDS to social protection programs, as well as improve social assistance services in the identification of people at risk in order to offer early and better diagnosis adherence to treatment.

Conclusions/Next steps: To this end, in the second year of the TCA, a pilot project will be developed, covering the five geographic regions of Brazil to enhance the intervention methodology considering the technical collaboration among the Brazilian health and social assistance networks.

Access to appropriate healthcare services (including for co-infections and co-morbidities)

EPF049

Disparities in the geographic accessibility of Ryan White HIV/AIDS program clinics in the United States

K. McManus[1], A. Strumpf[1], S. Powers[1], E. Kahihu[1], K. Srikanth[1], K. Malloy[1], E. Rogawski McQuade[2]

[1]*University of Virginia, Charlottesville, United States,* [2]*Emory University, Atlanta, United States*

Background: The United States' (US) *Ending the HIV Epidemic*(EHE) initiative allocated funding to high burden jurisdictions to expand access to the Ryan White HIV/AIDS programs' (RWHAP) comprehensive care for low income people with HIV (PWH). US standards suggest one should travel <60 minutes to a specialist. We assessed geographic accessibility using drivetime to RWHAP clinics for PWH by subpopulations and policy context.

Methods: Data were collected from publicly available sources (Centers for Disease Control and Prevention's AtlasPlus, US Census Bureau, Health Resources & Services Administration). Counties of the 48 contiguous US with a total population ≥ 100 and HIV prevalence ≥ 5 were included. We imputed data for counties with suppressed data. Drivetimes were calculated from each county's population-weighted center to the nearest RWHAP clinic and were weighted by PWH population size per county. Stratified by urban/rural, median drivetimes with 95% confidence intervals were calculated by bootstrap for subgroups (age, sex, race/ethnicity, HIV prevalence, EHE status).

Results: Drivetimes and frequencies were calculated for 981,663 PWH within 2,499 US counties (Figure 1). Urban PWH (n=923,730) had a shorter drivetime (9.8 minutes; 95% CI: 6.9–12.9) compared to rural PWH (n=57,933; 75.8, 72.1–79.7). Within urban/rural, there was no drivetime difference by age or sex. Urban Native Hawaiian & Other Pacific Islander (NPHI) PWH (41.8, 38.4-45.3) had longer drivetimes than other racial groups. Rural Black PWH had shorter drivetimes, but all rural racial groups had drivetimes >60 minutes. Within urban counties, drivetime increases with decreasing HIV prevalence. Urban EHE counties had shorter drivetimes (6.7, 6.0-9.8) compared to their non-EHE counterparts (18.1, 14.1-23.2).

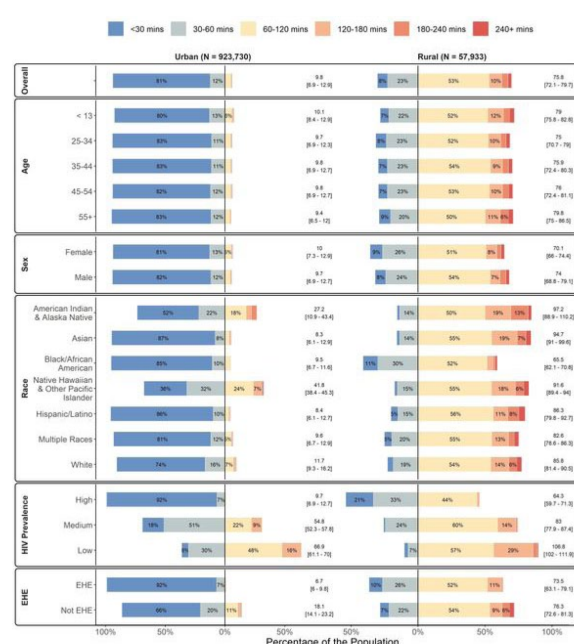

Figure 1. One-way drivetime to closest Ryan White HIV/AIDS program clinic by subgroup.

Conclusions: Poor geographic access (>60 minutes) to RWHAP clinics for urban subgroups of PWH and rural PWH is concerning. Spatial optimization studies are warranted to identify locations for RWHAP clinics/telemedicine-sites to improve access for PWH with long drivetimes.

EPF050

Integration status of HIV/TB services in 12 countries in the Centre and East of the WHO European Region

E. Vovc[1], N. Seguy[1], A. Dadu[1], A. Yedilbayev[1], M. Vitoria[2], G. Kuchukidze[3]

[1]WHO Regional Office for Europe, Copenhagen, Denmark, [2]WHO Headquarters, Geneva, Switzerland, [3]World Health Organization Regional Office for Europe, Joint Infectious Diseases Programme, Country Health Programmes, Copenhagen, Denmark

Background: People with HIV-associated tuberculosis (TB) are often treated separately in vertical and fragmented programs at national levels, offering care for each disease with limited coordination. This "siloed" approach generates diagnosis and treatment delays. In 2020, in the WHO European Region, there were 68% of people living with HIV (PLHIV) who started TB preventive treatment (TPT) along with their antiretroviral therapy (ART) and 55% of HIV+ TB patients had successful TB treatment outcome, which is lower than 77% global rate according to WHO Global TB report. To improve HIV and TB services at national level, interventions for better integration of TB and HIV services are recommended and monitored in countries.

Methods: Integration of core HIV and TB services into the national policies of 12 selected countries of the WHO European Region (Albania, Armenia, Azerbaijan, Belarus, Georgia, Kazakhstan, Kyrgyzstan, Republic of Moldova, Montenegro, Tajikistan, Ukraine, Uzbekistan) reporting to WHO and UNAIDS through policies monitoring tools in 2020-2021 was analyzed.

Results: 41.7% (5/12) countries use the WHO-recommended TB rapid molecular diagnostics and provide ART at the same place as TB treatment countrywide (>95% of health facilities providing HIV testing and care). ART is initiated by same healthcare workers providing TB treatment and both ART and TB treatment are monitored by one healthcare worker countrywide in 58.3% (7/12) of countries. TB screening and TB preventive treatment are recommended in national policies and guidelines for PLHIV in 91.2% (7/12) countries; 50% (6/12) of countries use LF-LAM for diagnosis and screening of active TB in PLHIV as national policies.

Integration of HIV/TB services:	WHO-recommended TB rapid molecular diagnostics	PLHIV with TB receive ART at the same place as TB treatment	ART initiated by same healthcare workers providing TB treatment	ART and TB treatment monitored by one healthcare worker
Countrywide (>95% of health facilities providing HIV testing and care)	41.7% (5/12)	41.7% (5/12)	58.3% (7/12)	58.3% (7/12)
In many (50-95%) health facilities providing HIV testing and care	25% (3/12)	33.4% (4/12)	25% (3/12)	16.7% (2/12)
In few (<50%) health facilities providing HIV testing and care	16.7% (2/12)	8.3% (1/12)	8.3% (1/12)	8.3 % (1/12)
Not integrated in practice	16.7% (2/12)	16.7% (2/12)	8.3% (1/12)	16.7% (2/12)

Table.

Conclusions: Despite progress in integration of HIV and TB services, an accelerated effort is needed to adjust national policies in priority countries lagging behind and to fully implement recommendations and policies aligning with WHO guidelines.

Effective models of NGO structure, funding, partnership, strategy and community participation

EPF051

A promising practice: enhancing access to and uptake of HIV services among grassroots LGBTQI+ youth in Malawi through systems strengthening of their organizations

L. Jalisi[1]

[1]Ivy Foundation, Programmes, Lilongwe, Malawi

Background: Community-based LGBTQI+ youth-led organizations are more effective in reaching out to grassroots level LGBTQI+ youth especially those living with HIV through rights protection in public health, community outreach, mass mobilization to push for policy change and popular education with and for LGBTQI+ young people living with HIV. Despite these game-changing approaches, most community-based LGBTQI+ youth-led organizations experience a plethora of challenges that often make their programming less impactful.

Therefore, the purpose of this paper is to examine how organizational systems strengthening projects in LGBTQI+ youth-led community-based organizations like Ivy Foundation lead to outcomes that enhance HIV programming targeting LGBTQI+ youth living with HIV.

Description: The systems strengthening project was a one-year project running from June 2020 to December 2021 focusing on strengthening organizational systems within IVY foundation an LGBTQI+ youth-led community-based CSO in Malawi. The project focused on technical assistance and capacity development through systems strengthening, setting up governance structures, producing policies and procedures as well as guidelines and strategies for advocacy to better reach and link LGBTQI+ youth aged 18 to 30 living with HIV services and legal literacy.

The project was packaged into several layers which included initial needs assessment which involved the definition of needs and resources for Ivy Foundation, review of Ivy Foundation's capacity gap, analysis of existing systems and infrastructure of Ivy Foundation, leading to the development of a systems strengthening plan.

Lessons learned: As a result, improved systems have led to the effective serving of LGBTQI+ young people living with HIV by Ivy Foundation. Through training, mentorship, and coaching, IVY Foundation has improved in project design, implementation, and advocacy and they

have succession plans in place, better administrative and financial systems that are attracting more funding and partnerships.

Conclusions/Next steps: Documented steps in the approach can be packaged as a promising practice and replicated in Malawi with other CSOs of the same size as the IVY Foundation. The findings underscore the need to invest in strengthening internal systems and processes of community-based organizations so that efficiency in HIV programmes is enhanced at the grassroots level.

Established organizations can support start-up organizations through mentorship and coaching for systems strengthening.

EPF052

Increasing TB diagnoses and proper treatment by identifying and addressing service barriers through community led monitoring and advocacy in Mozambique

H. Hallstrom[1], A.M. Moeller[1]

[1]*ADPP Mozambique, Partnership, Maputo, Mozambique*

Background: Mozambique's tuberculosis (TB) prevalence is 368 per 100,000 population (WHO, 2020), and 45% of TB cases are missed annually, resulting in unnecessary morbidity and mortality, particularly among people living with HIV. Supported by the Stop TB Partnership Challenge Facility for Civil Society from 2020-21, ADPP implemented a community-led monitoring (CLM) project to identify, understand and overcome barriers to TB identification and treatment.

Description: Using the *OneImpact* digital platform, CLM was integrated into the USAID-funded "Local TB Response" project in two districts of Zambezia Province. ADPP collaborated with 28 health facilities and 80 community leaders to train and empower 569 community members (78% TB patients) to use a mobile App to collect information about service barriers and other concerns from TB-affected community members, and use this data to advocate for improved services.

Project staff convened monthly sessions with *OneImpact* users, community members, and district leaders to discuss the findings and co-create solutions.

Lessons learned: Over the course of the project, 215 barriers were reported, including: Lack of information about support service e.g. nutrition and mental health (33%); Stigma and self-shame (30%); Human rights violations, including job loss due to TB status and breaches of confidentiality (23%); Lack of availability and access to TB services (14%).

Generating high levels of awareness, ownership and empowerment among TB-affected communities and health workers, the people-centered CLM process resulted in 98% of the reported barriers resolved at health facility and community levels. CLM can be a powerful tool for improving availability, access and quality of TB services, as an integral component of HIV programs.

Conclusions/Next steps: CLM is a simple, low-cost tool to gather key data from people affected by TB, supporting improvements in health services at community, facility and policy levels. CLM is aligned with the National Tuberculosis Program's community engagement approach, and endorsed by the Global Fund to Fight AIDS, TB and Malaria as a rights-based, gender-sensitive tool for strengthening community health systems.

ADPP encourages Mozambique's government and other countries to adopt CLM as a standard activity in all TB and HIV programs as it promotes local ownership and sustainability of efforts in the journey to self-reliance.

EPF053

Improving program acceleration and capacity for CSOs towards more access to HIV testing and treatment (impact+)

A.R. Iryawan[1], S. Sugiharto[2]

[1]*Penablu Foundation, Research, South Jakarta, Indonesia,* [2]*Penablu Foundation, Program, South Jakarta, Indonesia*

Background: The Impact+ is a project to strengthen the institutional capacity of civil society organizations (CSOs) implementing partners for the HIV program in 26 priority districts/cities in Indonesia.

This program is intended for CSOs to have a better capacity to access, implement and manage grants from national and international development partners towards expanding access to HIV testing and treatment. The impact+ program was facilitated by the Penabulu Foundation with support from UNAIDS Indonesia.

Description: The impact+ program consists of several stages:

1. Initial assessment of organizational capacity,
2. Development of session plans,
3. Implementation of serial webinars and virtual training activities,
4. Face-to-face technical assistance to 10 selected CSOs,
5. Final assessment.

Activities have been carried out from December 2020 to December 2021.

Lessons learned: There are 30 CSOs who have participated in the activities until the end of the program. Each CSO attends a session based on the results of the initial assessment. The tool used for assessment is PERANTI, which has 4 domains as categories for identifying capacity conditions and needs, namely organizational mandates; organizational governance; organizational operational; and organizational sustainability.

Each domain has an interval scale from 1 to 50. The results of the impact+ are seen by comparing the average (median) of each domain at the beginning (pre) and at the end of the program (post).

Conclusions/Next steps: The most significant improvements occurred in organizational governance, organizational operational, and organizational sustainability. Ca-

pacity building and technical assistance in these domains have earned a large portion. For the next impact+ program in 2022, the weight of the material for each domain must be more proportional and the number of CSOs who will receive technical assistance must be increased in order to get a more optimal program impact towards expanding access to HIV testing and treatment.

Figure. Median scores across 4 domains (pre & post).

EPF054
OST services have a great impact of PWID's life and livelihood

S.M.A.A. Reza[1]
[1]Varendra University, Master of Public Health (M.P.H.), Rajshahi, Bangladesh

Background: The GF has been supporting HR program scaled-up intervention aiming to greater coverage in Bangladesh through northern part. A social behavioral longitudinal cross sectional study conducted by a national NGO called APOSH reported that OST had greatly benefited PWID including reinstating their lives through generating income in socially acceptable ways and continuing their livelihood through integration.
OST had helped PWID restore trust in their families and become less of a burden to them through economical sustainability.
Description: Now 218 PWIDs are receiving OST in Rajshahi city.During the starting time(January'20) OST there were 160 PWID married and 45(28%) were separated from their spouse due to the drug addiction. After six months of OST, 22 (49%) PWID were living with their spouse and family members, as they were more stable and socially accepted by the family members.After twelve months, 40 PWID(89%) were fully living with their spouse and family members. Most of the family members, other neighbors accept them as normal human being.
Before starting the OST, 55%, PWID were out regular and decent works, within six months of OST 25% PWID involved different full time and decent works in the city and after 12 months of OST 49% out of 55% were fully involved with full time and decent works with active work force.
OST recipients PWID behavior changes a lot after taking the OST through livelihood and family life. One OST Client mentioned that their close relative accept them as their brother and taken them in every social programs without any hesitation, it was impossible when he was injected drugs regularly.
Lessons learned: OST recipients PWID behavior changes a lot after taking the OST through livelihood and family life. One OST Client mentioned that their close relative accept them as their brother and taken them in every social programs without any hesitation, it was impossible when he was injected drugs regularly.
Conclusions/Next steps: OST services have significant impact of PWID's life and livelihood through changing behavior, income and involved different social and cultural program in Bangladesh. The impact of OST is proven and great intervention through proper communication, outreach and routine monitoring. Government and other stakeholders have a significant amount of involvement for successful implementation of the services.

EPF055
Platform "Faith for Life": uniting people of faith to improve access to diagnostics, treatment and care

S. Dmytriyev[1]
[1]ELEOS-Ukraine, Kyiv, Ukraine

Background: At present finding new cases of HIV within key affected communities reached its limit. In countries of the former Soviet Union the HIV epidemic moved to general population. Since religion plays an important role in lives of people of post-Soviet countries, ow is the time when faith-based organizations and churches can make an input into both finding new cases of HIV infection and ensure timely treatment for PLHIV while also fighting HIV related stigma and discrimination.
Description: In August 2021, Ukrainian FBO "ELEOS-UKRAINE" initiated establishment of the regional interfaith platform "Fight for Health" with involvement of churches and other religious organizations from Ukraine, Moldova, Lithuania, Kazakhstan, Estonia, Latvia, Georgia, Armenia, Bulgaria, Belarus and Russian Federation.
The creation of an international platform with a focal point in Ukraine increased the visibility of people living with HIV, religious organizations that help people living with HIV at the international level.
This provides additional resources to combat the epidemics and stigma and discrimination of PLHIV. Platform participants which have more experience shared their best practices with the newly involved partners.
Lessons learned: The initiative united representatives of FBOs and churches from different countries in counteracting the epidemic, stigma and discrimination. Cooperation with religious communities provides new opportunities in finding new HIV cases in populations previously not covered by prevention programs and refer them to treatment. Platform members from countries where governments are less proactive in fight with HIV infection learned ways to become more involved and influence the policies

and programs, provide care and support interventions to representatives of KPs and PLHIV. Platform representative was delegated to represent the EECA region in "Faith2EndAIDS" platform, it's members participated in events organized by the WCC and UNAIDS.

Conclusions/Next steps: Consolidated interfaith cooperation shows the readiness religious communities to help people with various diseases, including HIV/AIDS. The international experience of religious and public organizations will be useful for Ukraine and partners from Eastern Europe and Central Asia and vice versa.

Platform will continue activities to ensure joining and participation by it's members the Global Partnership for Action to Eliminate All Forms of HIV-Related Stigma and Discrimination following the example of Ukraine.

EPF056

Programs influencing policies: How strategic partnerships and program data were used to foster an enabling environment for key populations HIV prevention and treatment Programing in Nigeria

G. Ekon[1], P. Umoh[2], B. Ochonye[3], G. Emmanuel[3], R. Abang[2], I. Mbaoji[1], K. Abiye[4]

[1]Heartland Alliance LTD/GTE, Lagos, Nigeria, [2]Heartland Alliance LTD/GTE, Akwa Ibom, Nigeria, [3]Heartland Alliance LTD/GTE, FCT, Abuja, Nigeria, [4]USAID, FCT, Abuja, Nigeria

Background: From 2010 till 2019, the USAID/PEPFER funded Integrated MARPs HIV Intervention Prevention Program (IMHIPP) implemented by Heartland Alliance enhanced access to comprehensive HIV prevention and treatment services to key populations (KPs) and their sexual partners in Nigeria.

Throughout the project, Heartland Alliance consistently forge meaningful partnerships and used program data to advocate for necessary policy changes that increased access to comprehensive HIV prevention and treatment services in a nondiscriminatory manner among the Key Populations community in Nigeria.

Description: The Integrated MARPs HIV Intervention Prevention Program (IMHIPP) was characterized by meaningful strategic partnerships with key state and local governments bodies, a primary focus on the KP community-led services, and maximum use of data to comprehend and advance program performance.

This approach created meaningful opportunities for the KP community to have their voices heard, and for project staff and local partners to advocate with government stakeholders and country representatives from USAID and PEPFAR for supportive policies to provide KP with services across the projects thematic areas.

Lessons learned: The IMHIPP contributed to creating a sustainable enabling environment for program implementation across the 6 states in Nigeria. Heartland Alliance One Stop Shops supported updates to national HIV policies and guidelines to better address the needs of, and incorporate evidence-based recommendations for, Key Populations, their sexual partners, and their children. In all 6 states where the IMHIPP was implemented, Heartland Alliance championed the removal of barriers to KP service uptake.

Heartland Alliance also influenced policy-level processes by supporting the formation of a national Key Populations secretariat in Nigeria, strengthening national data systems to include Key Populations specific data and mobilizing domestic resources for KP services.

Conclusions/Next steps: By leveraging the project's routine data, working closely with local decision-makers, and amplifying the voices of the key population's community, Heartland Alliance in Nigeria contributed to advocating for environments that enable effective HIV programming.

These policy changes not only redounded in immediate advancements in service uptake but are also likely to have a sustained impact on epidemic control sweats and quality of life of the Key populations community in Nigeria and globally.

EPF057

CSS walked so CLM could run: examining the community led monitoring structure for improved HIV service delivery

N. Erondu[1], K. Makofane[2], A. Yawa[3], L. Rutter[4], A. Sharp[1], M. Luba[5], A. Russell[4], K. Mwehonge[6], E.M. Steide[7], M. Kavanagh[8]

[1]The O'Neill Institute for National and Global Health Law, Georgetown University, Washington, United States, [2]Harvard University, Cambridge, United States, [3]Treatment Action Campaign (TAC), Johannesburg, South Africa, [4]Health Global Access Project (Health GAP), Johannesburg, South Africa, [5]AIDS Vaccine Advocacy Coalition (AVAC), Lilongwe, Malawi, [6]Coalition for Health Promotion and Social Development (HEPS Uganda), Kampala, Uganda, [7]Housing Works, Port-au-Prince, Haiti, [8]Joint United Nations Programme on HIV/AIDS (UNAIDS), Geneva, Switzerland

Background: Over the past decade, the expansion of HIV prevention, testing, and treatment has halved new infections. Progress has been uneven, however. For instance, incidence is rising among men and men who have sex with men. The failure to disaggregate data has masked the service delivery challenges that gave rise to health disparities like this. Community-based organizations (CBOs) have been instrumental in highlighting these challenges.

Community Systems Strengthening (CSS), and Community Led Monitoring (CLM) are two CBO driven approaches to bridge the data gap and identify service delivery solutions. *The CSS Framework*was developed by the Global Fund in 2010. The first CLM project was established and in 2020, PEPFAR mandated that all its programs implement a CLM project.

Given the lack of literature comparing these frameworks, we sought to identify key differences between the two and describe the added value of CLM.

Methods: We performed a literature review and informational interviews to delineate activities of CSS projects conducted under the Global Fund Health Systems Strengthening (HSS) grant.

We then composed case-studies of three CLM Projects in Uganda, South Africa, and Haiti to examine operational country-specific CLM projects. Using these materials, we qualitatively analyzed CSS and CLM programs, paying attention to structure and activities.

Results: In the context of HSS, a framework for clarifying essential functions within a formal health system, the major contribution of CSS was to highlight the role of CBOs in improving services. Efforts under CSS were uncoordinated and sporadic with an emphasis of capacity building– yet, lacked dedicated funding. By contrast, CLM is a routinized, structured approach to the monitoring and improvement of services.

In all three case-study countries, affected communities led the coordination and implementation of CLM. While it is too early to assess sustainability, multiple donors have committed to continued support of CLM projects.

Conclusions: CSS was essential to building community networks and enhancing their involvement in health care delivery. CLM emerged from CSS but has a strong focus on data-informed advocacy to improve donor and government accountability through a community-owned mechanism. CLM is an important tool to end inequalities around access and treatment.

Human rights of people living with HIV and key populations

EPF058
HIV and rights in Spain

M. Ramiro[1], P. Ramírez[1], B. Martín[1], A. Nastasache[1]
[1]*University of Alcalá, Law, Alcalá de Henares, Spain*

Background: In 2018, the Social Pact for Non-Discrimination and Equal Treatment associated with HIV was approved to strengthen the response to HIV based on human rights in Spain. Among its objectives were:

1. To identify the legal norms that were discriminatory, and;
2. To identify the different barriers that people with HIV face.

What is the reality of HIV in Spain from a human rights point of view?

Methods: Using the Critical Theory of Law, the Spanish legal system has been analyzed, on the one hand, in order to identify legal norms that discriminate (directly, indirectly or by association) against people with HIV, those who are in risk of becoming infected or those persons related to them, and, on the other, the 1,111 consultations received at the CESIDA/UAH Legal Clinic, specialized in the legal literacy of people with HIV, during the period 2019-2021, in order to identify attitudinal barriers and situations of self-stigma.

Results: In the period 2019-2021 specific anti-discrimination regulations have been approved for people with HIV (eg access to public function), but the Spanish legal system still maintains legal regulations that discriminate directly, indirectly or by association against people with HIV, those who are at risk to become infected or those that are related to them.

In addition, some of the legal reforms have not been effective (eg contracting insurance). In Spain a person with HIV cannot be a security guard; the requirement to take out health insurance prevents non-EU students from obtaining a study visa; and people who regularly live with a person with HIV cannot be blood donors.

On the other hand, in 2 out of 3 consultations received at the Legal Clinic there is an attitudinal barrier towards people with HIV (eg denial of health services) or a situation of self-stigma (eg person with HIV excludes himself/herself from the exercise of his rights).

Conclusions: The achievement of the goal set by UNAIDS for 2030 to reduce discrimination associated with HIV is still a long way off. In Spain, legal regulations must be repealed, legal mechanism must be improved, and legal literacy programs for people with HIV must be implemented.

EPF059
Impact of community-led monitoring (CLM) of HIV care services in the context of the humanitarian crisis and the COVID pandemic in Venezuela

M.A. Torres[1], A. Nieves[2]
[1]*International Council of AIDS Service Organizations (ICASO), Toronto, Canada,* [2]*Acción Ciudadana Contra el SIDA (ACCSI), Caracas, Venezuela, Bolivarian Republic of*

Background: Venezuela has been experiencing a humanitarian crisis for over a decade, with a collapsed health system compounded by the continued violation of fundamental human rights. Dismantled and deteriorated infrastructure and services are commonplace, including partial closures of public health centers , outpatient clinics, and hospitals without qualified personnel and lack of the most basic equipment and supplies.

With the government's AIDS response severely weakened, and their inability and uninterest to guarantee the life and health of people living with HIV, Venezuelan and international civil society organizations have stepped in to fill the void.

Description: Civil society organizations (CSO) led by Acción Ciudadana Contra el Sida (ACCSI) and the Red Venezolana de Gente Positiva (RVG+) have played a unique

and vital role in keeping HIV and health-related services active during the humanitarian crisis and COVID pandemic, thus saving the lives of more than sixty thousand people. They have advocated for evidence-based strategies to ensure people living with HIV (PLHIV) receive the care they need.

A team coordinates the work of fifty-five community monitors that collect data based on health indicators through onsite interviews and direct observation on issues of drug procurement, storage and distribution, access to health services and violations of fundamental rights.

The team records the information in a secure database and analyzes and systematizes the findings utilizing new information technologies. The analysis is then used to influence critical decisions regarding prioritizing and allocating resources.

Lessons learned: Direct investment on CLM, stakeholder engagement, partnership and advocacy is key to ensure accountability and ultimately a comprehensive and effective AIDS response.

This project has enhanced the resilience and capacity of PLHIV and civil society to document and analyze evidence and advocate for responding to the health crisis and the complex humanitarian emergency in order to protect the life and health of people living with HIV.

Conclusions/Next steps: CLM has strengthened how PLHIV exercise their rights to participate on decisions regarding their own health and life. Community-led monitoring is an integral part of a comprehensive and effective AIDS response.

Ultimately, our results demonstrate that direct investments in civil society organizations produce impactful actions that save lives.

EPF060

How people with power constrain living and working environments of female sexworkers in Bangladesh: a qualitative study

M.N. Huda[1,2], P. Rawstorne[2], T. Dune[1], N. Stephenson[2]

[1]Western Sydney University, Health Sciences, Sydney, Australia, [2]University of New South Wales, School of Population Health, Sydney, Australia

Background: There are limited peer-reviewed studies of powerful actors' (politicians, gatemen, local men) role in exploiting and constraining female sex workers' (FSWs) living and working environments in Bangladesh and worldwide.

This study examines how people in power produce and perpetuate exploitative sociocultural contexts that constrain FSWs' living and working environments and increase FSWs' vulnerability to poverty and insecurity while maximising their own financial and political benefits.

Methods: Semi-structured in-depth interviews with 10 FSWs and 11 other stakeholders were conducted in a Bangladeshi brothel context. This study also used field notes to document the sociocultural contextual issues influencing FSWs' living and working environment. The interview transcripts and field notes were coded and analysed thematically.

Results: Participants' accounts reveal several themes about exploitative practices reproduced and sustained by politicians, gatemen and local men. By controlling and owning brothel areas, conducting unfair arbitration, and running illegal drug trade, individuals with power increased their financial and political gains, thus deteriorating FSWs' living and working environment.

Conclusions: Findings suggest that FSWs have limited agency to improve their brothel environment in Bangladesh. Therefore, policymakers need to decriminalise sex work in order to enhance FSWs' agency and promote a healthy living and working brothel environment.

EPF061

Impact of human rights violations on access to and utilization of HIV prevention, care and treatment services towards the LGBTIQ community

C. Ssenabulya[1]

[1]Children of the Sun Foundation Uganda, Kampala, Uganda

Background: This study was premised on Levesque's conceptual framework to explore impact of the human rights violations on the access and utilization of HIV prevention, treatment and care services among LGBTIQ victims of human rights violations in greater Kampala metropolitan area (GKMA), Uganda.

The study used the COSF Uganda's raid of 29th March 2020 which victimized 20 young gay and transgender persons under the pretense of newly presidential provisions to respond to COVID-19.

Methods: This study was conducted in the Uganda. A cross-sectional study design utilizing participatory qualitative approaches was used to obtain data from LGBTIQ victims of human rights violations that happened in 2020 and above using focus group discussions (FGDs), in-depth interviews (IDIs) and key informant interviews (KIIs) were used to obtain data from the purposively selected respondents and we used respective guides after obtaining informed consent to discuss. 10 IDIs, 3 FGDs and 5 KIIs were conducted.

Discussions were digitally recorded, transcribed verbatim, codes developed, Nvivo was used for coding transcripts and analysis was done based on the study objectives.

Results: 20 LGBTIQ victims participated in the study. 11 were gay men and 9 were transgender persons aged between 18-24 years. Results showed that human rights violations have a great impact on access to and utilization of HIV prevention, care and treatment services among the LGBTIQ.

Respondents reported having limited chances of having their HIV/AIDS health care need to be met due to these particular human rights violations.

Oral abstracts

Poster exhibition

E-posters

Late-breaker abstracts

Author Index

Social disconnection from family and friends, depression, post-traumatic disorder, hopelessness,and unacceptability of health workers resulted in delayed health seeking, shunning way from the facilities without accessing services, limited their ability to decide to seek HIV services, poor adherence to ART and inability to express their SRH issues that would require thorough examination to receive meaningful medication. Survivors miss ART refills.
These experiences breed fear, stigma among LGBTIQ persons, mistrust in the health care system and inability to engage health care providers.
Conclusions: Without addressing these violations experienced by LGBTIQ persons an effective response to HIV will remain out of reach.
Human rights policies on LGBTIQ violations are needed to improve HIV outcome.

EPF062

Lessons from the Archive: Queer Indonesia Archive and collecting, preserving and exhibiting queer HIV histories within Indonesia

S. Vhisatya[1], B. Newham[1]
[1]*Queer Indonesia Archive, Jakarta, Indonesia*

Background: In Indonesia the lived experiences and narratives of queer people are being challenged, erased, and delegitimized in the national collective memory. For the last two years the Queer Indonesia Archive (QIA) - a volunteer run, Indonesia based digital archiving project - has been building a digital collection reflecting the histories of queer communities. QIA utilises a process of community consultation, material collection and exhibition as it's community archive process.
Through this method the archive has built an accessible collection of digital objects to promote cross generational engagement, build community capacity and ensure a community collective memory of the HIV response.

Figure. Queer Indonesia Archive Collection Process.

Description: In 2020, QIA began to build a repository of community materials reflecting the response to HIV within Indonesia. 2,087 unique materials have now been digitised and are accessible digital collection through the QIA website. Materials were then curated into a digital exhibition - 'AIDS & Queers in Indonesia'. The online exhibition has seen over 4000 viewers and generated significant media interest. Several events were also held inviting HIV workers from multiple generations to respond to archival materials.
Lessons learned: With over 40 years of history of community responses to the HIV epidemic, it is now more important than ever to preserve community histories. Digital technologies now allow for low cost preservation of historical materials whilst also enabling greater accessibility and engagement with the histories that these materials speak to. Through community led curatorship, archival collections are able to promote cross generational HIV knowledge and build community capacity.
Conclusions/Next steps: Community archives, especially in the Asian region are few and the material history of the response to HIV in the region is at risk at being lost if steps are not taken to ensure it's preservation. This project highlights the accessibility and benefits to building community archival collections.

EPF063

The quality of HIV services in Bhutan: findings from the first key population led community-based monitoring

T. Dendup[1], T. Gyeltshen[2], J. Norbu[1], K.D. Tshering[1], T. Tsheten[3], M. Merrigan[4]
[1]*Save the Children International, Thimphu, Bhutan,* [2]*Pride Bhutan, Thimphu, Bhutan,* [3]*Queer Voices of Bhutan, Thimphu, Bhutan,* [4]*Australian Federation of AIDS Organisations, Sydney, Australia*

Background: Community-based monitoring (CBM) is increasingly used by key populations to assess the quality of HIV and related services. Such information needed to inform service providers to improve service delivery is limited in Bhutan.
The findings from the first CBM conducted by Pride Bhutan, an organization working for the LGBT+ community, with the support of the Sustainability of Key Population Services in Asia (SKPA) Program are presented.
Description: The CBM conducted in June 2020 used a community scorecard that was administered to key population members and service providers. Trained community members collected data on services provided in seven Health Information Service Centres (HISCs) established by the Ministry of Health. Data on HIV services and stigma and discrimination were collected using a structured questionnaire.
Given the COVID-19 restrictions, the data was collected through telephonic interviews and social media platforms followed by face-to-face interviews. Participants identified through a community mapping exercise were selected using convenience sampling.
Lessons learned: Of 121 persons who availed HISC services, most were gay and bisexual men, had secondary level of education, and resided in Thimphu. A majority (70.3%)

were satisfied with the services provided, and 83.5% expressed recommending other members to visit a HISC. About 36% of the respondents were not satisfied with the HISC's operation time, and more than half were disinclined to visit HISCs if located in a hospital.
Almost 60% accessed condoms while 64% did not access lubricants. Most (77%) were satisfied with the current method of communicating test results. Only six respondents reported feeling stigmatized.
Of 50 who did not avail HISC service, 48% were not aware of HISCs and the services provided, and six of the 10 service providers expressed inadequate HISC infrastructure and space. All who tested for HIV got tested at a hospital.
Conclusions/Next steps: The findings show that members were generally satisfied with services currently provided. The results also suggest the need to explore alternative operation timing for HISCs and to strengthen the capacity of HISCs in providing key population-friendly comprehensive services.
Interventions designed to address these findings can help enhance service access and utilization that may contribute towards realizing national goals.

EPF064
The violation of the Human Rights of men who sleep with men (MSM) in Ghana and its effect on their daily lives

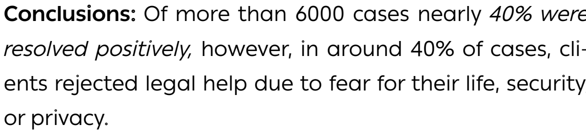
M.A. Boafo[1], B. Mensah[1], M. Asare[1]
[1]*Cornels Human Development Foundation, Accra, Ghana*

Background: Due to proposed legislation to criminalize homosexuality in Ghana, there has been an increased attacks which most often lead to bodily harm and in extreme cases death of MSM individuals in Ghana; thus, violating their fundamental human rights.
Description: Using testimonials from both MSM and activists working in various parts of Ghana, the information collected was analyzed; thus, describing a pattern where MSM and the general LQBTQI community face the threat of criminal charges for their sexual orientation, discrimination, stigma, threat, harm and the inability to benefit from HIV prevention efforts. These testimonials, information as well as interviews from both MSM and activists were gathered between the period of January to December 2021.
Lessons learned: The situation has become so volatile that individuals suspected to be gays often faced discrimination, stigmatization, and sometimes bodily harm in their communities, from their friends and even family. This is affecting this at-risk population to seek for medical help or access HIV/AIDS interventions or treatments thus affecting their general wellbeing and violating their human rights.
Conclusions/Next steps: The international community must join hands with other local organizations to put pressure on the government to help address such issues or else the gains that have been made over the years in the fight against HIV/AIDS will be totally eroded. Again, its important that governments are held accountable for the protection of the fundamental human rights of these people.

EPF065
How to respond to human rights violations effectively through the broadening of coverage with legal aid among the key groups and people living with HIV

V. Kalyniuk[1]
[1]*Alliance for Public Health, International Programs, Kyiv, Ukraine*

Background: Eastern Europe and Central Asia (EECA) is the *only region in the world* where new HIV infections among all ages have continued to rise. Behaviors related to KP are *heavily criminalized* and pose *significant barriers to access services*. Significant countries' domestic resources are directed towards *repressive systems for punishing key populations* instead of providing them with health services and social support.
The *awareness of human rights remains very low among KPs*, which results in unpunished and ubiquitous police violence, arbitrary detentions, and insupportable prosecution. Lack of data impedes evidence-based advocacy for change.
Description: *REAct* - is an online tool to monitor human rights violations, stigma, and discrimination against PLHIV and groups at risk, when accessing HIV prevention and treatment services. REAct helps to:
- record human rights violations
- track legal and medical support, provided to victims
- analyze collected data and plan advocacy actions
Since January 2020, REAct is implemented by *APH* in *7 countries of the EECA region*. *Over 6000 cases* were registered by more than *150 NGOs*.
Lessons learned: 1. *Community-based paralegals* are essential for reaching vulnerable populations with legal aid.
2. *Distance legal consulting* showed effectiveness during lockdowns.
3. *Hotlines for victims* are effective during arbitrary detentions.
4. *Crisis funds* are needed for the victims` rescuing.
5. Secure and easy-to-use *tools for recording* data about HR violations are needed to gather a body of evidence for advocacy.
6. Besides support to victims, there have to be taken *actions to re-educate or punish the perpetrator*:
- *enlightening talks* and brochures about HIV for relatives, who practice stigma against the victim.
- *representing patient`s interests* in medical facilities in case of denial of health services or degrading treatment.
- support in the preparation of *statements, claims, complaints*, and other documents to *punish the perpetrator.*
- *negotiations with state entities* to eradicate stigma and discrimination.



Conclusions: Of more than 6000 cases nearly *40% were resolved positively,* however, in around 40% of cases, clients rejected legal help due to fear for their life, security, or privacy.

Next steps: Broaden paralegals' system, deepen human rights awareness, continue evidence-based advocacy efforts. *Success stories here*.

EPF066

Improving adherence to ARVs by improving ARV distribution

Y. Lazarevych[1]

[1]*Charitable Organization "Network of 100 Percent Life Rivne", Rivne, Ukraine*

Background: In Ukraine, HIV-positive people could receive ART only in public clinics, which in turn brought a number of inconveniences to the patients.

1. Usually such clinics are located on the outskirts of the city with inconvenient transport logistics.
2. The staff is not patient-oriented and not tolerant of key groups.
3. The schedule for ART is often not convenient for patients. Clinics work from 8:00 to 16:00, Saturday and Sunday are weekends, one working week per month ART is not issued to patients.

This situation negatively affected adherence to treatment, with patients refusing and often disrupting treatment due to inability to conveniently receive medications. There were special inconveniences for working patients, because they regularly had to take hours off work to receive drugs.

Description: The first step to solve this problem was the opening of a private clinic "Medical Center 100% Life", which began to provide free treatment services for PLHIV, signing a contract with the National Health Service of Ukraine and ensuring the issuance of ART at this clinic. PLHIV could sign contracts with family physicians tolerant of PLHIV and key communities, which gave them better access to the entire healthcare system. The main principles of work are:

1. Patient orientation
2. Tolerance towards PLHIV and key groups
3. Convenient location of the institution
4. Possibility to receive ART from 8:00 to 20:00 seven days a week.

Lessons learned: The possibility of issuing ART in private clinic emerged through advocacy at both the local and national levels - legislation was amended and permits were obtained at the local level. The main opponents of the changes were the existing state institutions, which were monopolists in providing services to PLHIV.

Conclusions/Next steps: At the "Medical Center 100% Life", PLHIV and key groups can receive free services from other specialists and a wide range of medical examinations through the center's social program, under which 10% of profits go to free services.

It is planned to start provision of anti-tuberculosis drugs and of hepatitis C treatment in this Center.

Advocacy for changes in legislation making possible prescription and issue of ART to patients by family doctors continues.

EPF067

From coercion to help: lessons learned from the community awareness and sensitization of harm reduction approaches in Kachin State, Myanmar

M.T. Aung[1], R. Boulet[1], E. Wisse[1]

[1]*Médecins du Monde (France), Myanmar Mission, Myitkyina, Myanmar*

Background: There were an estimated 93,000 people who inject drugs (PWID) in 2017 in Myanmar. Across all states and regions, HIV prevalence in PWID was the highest in certain townships of Kachin State, standing up to 61%. Harm Reduction interventions faced adversities to fully implement in contexts where the local communities shared a strong negative opinion about drug use.

Description: Though recent changes are made to the country's prohibitionist drug policy, the perceived lack of effective measures to contain booming drug use situations alerted the locals to counter with *'people's war on drugs'*. That had led to the creation of the Drug Vigilante Group, namely *Pat Jasan*, which was founded in 2014 to tackle drug-related problems in Kachin ethnic concentrated areas.

Médecins du Monde (MdM) has been providing harm reduction services to PWIDs in Kachin since 2006. Emerged as a largescale popular anti-drug movement, *Pat Jasan*'s initiatives presented conflicting viewpoints that required harm reduction programs to redesign and adapt to the different environs. Under those circumstances, MdM engaged the local community as well as *Pat Jasan* members in dialogues highlighting the importance of sustainable harm reduction interventions among drug users.

Lessons learned: The focus of awareness and sensitization efforts that have been made and sustained through various ways, such as community consultations, open door days, social media campaigns, etc., did work to diminish misbeliefs and discriminatory attitudes towards the drug users. As a result, harm reduction services have been resumed for more than 1,000 PWIDs in *Moegaung* township where there had been major community resistance to such services.

Key messages that entail the concepts of harm reduction principles and promote the enabling environment for the key-affected populations have been crucial to increase the understanding and acceptance of harm reduction approaches among the community.

Conclusions/Next steps: Due to the changing of situations and contexts, knowledge and perception of the community about harm reduction should be assessed throughout and effective sensitization measures and advocacy strategies should be carried out at different

levels of stakeholders. To conclude, in view of the lessons learned, the role of the community became highly efficient in transforming coercion into help.

EPF068

HIV and LGBTQ rights in Botswana: progress and remaining challenges

G.D. Meswele[1], E. Koko[2], N. Gleeson[1], J. Csete[3]
[1]Ministry Presidential Affairs, Governance and Public Administration, National AIDS and Health Promotion Agency, Gaborone, Botswana, [2]Ministry of Presidential Affairs and Public Administration, National AIDS and Health Promotion Agency, Gaborone, Botswana, [3]Columbia University, Faculty of the Department of Population and Family Health of the Mailman School of Public Health, New York, United States

Background: Despite decades of internationally recognized successes in Botswana's national HIV response, some human rights challenges remain.Among them is building on the judicial decisions in 2019 and 2021 to strike down Penal Code provisions that criminalized consensual same-sex intimacy.

This presentation highlights the actions and strategies being undertaken to translate these judicial milestones into a new reality for the protection, promotion and respect of the rights of LGBTQ persons in Botswana.

Description: Botswana is part of the Global Fund supported Breaking Down Barriers (BDB) initiative that provides financial and technical support to 20 countries to eliminate human rights-related barriers to health services, including stigma, discrimination and unjust criminalization.

Activities, including improving the legislative environment, are central priorities of the national HIV strategic framework, which is complemented by a national plan for removing human rights barriers to HIV and TB services in 2019-2024.

Lessons learned: Judicial decisions alone are insufficient to address the exclusion, discrimination and bullying that MSM and LGBTQ persons continue to face. BDB activities, including rights literacy, access to legal services, engaging with police and health workers and reducing stigma and discrimination in community settings will contribute to reducing abuses and increasing access to justice. Lesbians, Gays and Bisexuals of Botswana (LEGABIBO), Botswana's leading LGBTQI rights NGO, is working with other partners to seek legislation that explicitly protects gay rights and allows transgender persons to reflect their gender identity in official documents, among other rights.

A landmark January 2022 meeting between LEGABIBO leaders and the President of Botswana enabled the public airing of a full agenda of community awareness-raising and policy advocacy actions to be undertaken. Community-led monitoring developed under BDB will continue to be important in tracking continuing instances of rights violations.

Conclusions/Next steps: All programs that are part of the national HIV human rights plan can make an important contribution towards ensuring that the spirit of the judicial decisions on LGBTQ rights is reflected in a transformed legislative and policy framework and enhanced social inclusion and participation for LGBTQ persons in Botswana.

EPF069

Reducing MSM rights violations through peer education in Benin

A. Aguessy[1], J. Ouessou[1]
[1]Réseau Bénin Synergie Plus, Atlantique, Abomey-Calavi, Benin

Background: In Benin, HIV prevalence rates are particularly high among key populations, particularly men who have sex with men (MSM) (7.0% among MSM versus 1.2% in the general population). The stigmatization and discrimination of MSM leads to their marginalization, which confines them to silence and secrecy, and prevents them from accessing quality preventive information and promotes violations of their rights.

To overcome the barriers encountered by MSM in accessing healthcare and basic human rights, the Benin Synergies Plus Network has developed a strategy that aims at strengthening the knowledge of MSM on their legal environment and at deploying human rights focal points at screening sites.

Description: As a first step, MSM peer educators were trained on peer education and on their rights. Three training and information workshops for peer educators were organized for further education and to identify those who can raise awareness among their peers and serve as community relays.

In a second step, the community workers intervened in educational discussions, interpersonal communications, and support groups by raising awareness among their peers within identity organizations. As results, we have:

- 60 MSM peer educators were trained on information, education and communication;
- 10 focal points were trained to serve as community intermediates between peers and health centers located on the Beninese portion of the Abidjan-Lagos Corridor;
- 800 MSM peers were informed and awareness was raised on their rights and self-esteem by peer educators.

Lessons learned: a significant reduction in violence and discrimination and several MSM have been tested since the implementation of these activities on the Sèmè Kraké - Hillacondji portion

Conclusions/Next steps: This strategy has proven its effectiveness in improving the quality of life of MSM. For the sustainability of these actions and their development throughout the national territory, BESYP is currently working to strengthen partnerships and collaborations with

Violence against key populations and people living with HIV in Benin: improved reporting and case-management

S. Ogoudele[1], C. Ahouada[1], J. Martineau[2], M. Nelson[3], O. Sodoloufo[1], D. Kpozehouen[1]
[1]NGO Plan International Benin, Cotonou, Benin, [2]Plan Canada, Montreal, Canada, [3]Plan Canada, Ottawa, Canada

Background: Plan International Benin is implementing a national program funded by The Global Fund for the period 2021-2023 with the primary objective of scaling up access to HIV prevention and treatment for key populations (Homosexual men MSM, Transgender people TG and People who inject drugs PWIDs) and people living with HIV (PLHIV) in Benin.
The current monitoring data of the program's component on addressing Violence against these populations show some important findings.
Description: The program addresses the reporting and management of gender-based violence (GBV) and human rights violations (HRV) experienced by these key and vulnerable populations.
In terms of reporting GBV and HRV, thanks to the training of 317 social workers from all over the country, hundreds of PLHIV, MSM, TG and PWIDs have been informed about their rights, what constitutes violence and what recourse is available.
In the area of victim care, the training of 100 doctors and 202 police officers throughout the country has made it possible to provide more respectful and empathetic support. In addition, psychologists and lawyers dedicated to these population groups have set up consultations in the country's main cities to ensure better access to psychological and legal support following the violence.
Lessons learned: The program routine data show a significant number of cases of GBV/HRV reported by key populations and PLHIV.
PLHIV women report five times more cases of GBV or HRV than PLHIV men. In 9-month time (April to December 2021), 206 and 538 cases of GBV occurred respectively for Transgender women and MSM (including psychological/verbal or physical or sexual forms of violence). Among male PWID, 107 cases of physical violence were reported.
As a result of the program's interventions, 101 survivors received legal support and 35 received psychological support.
Conclusions/Next steps: The program monitoring results show that GBV and HRV against these populations are highly prevalent in Benin and can go unnoticed without adequate measures. Given the link documented in the literature between the presence of such violence and the prevalence of HIV among key populations, this program hopes to observe a positive effect in the use of prevention services to reduce HIV prevalence by 2023.

EPF071

Are people with HIV an insurance liability? Combating discrimination of PLHIV seeking insurance through litigation and advocacy

A. Stratigos[1]
[1]HIV/AIDS Legal Centre, Sydney, Australia

Background: Australia's discrimination legislation provides a mechanism whereby insurers can lawfully discriminate against PLHIV and others with disabilities where actuarial statistical data supports the denial of provision of insurance. The HIV/AIDS Legal Centre (HALC) endeavors to redress this outdated discriminatory provision through; direct legal representation to PLHIV who have been denied insurance and advocacy.
Description: PLHIV frequently contact HALC upon being denied insurance cover to seek redress. HALC engages in litigation to assist PLHIV by commencing proceedings in either the state or federal jurisdiction, depending upon the particulars of the case and the litigant. P
roceedings are commenced based on the assertion that insurers are relying upon outdated or inappropriate actuarial statistical data and that the data no longer supports refusing cover or higher premiums; in short that due to advances in medicine and treatments PLHIV are unlikely to need to call upon the provision of insurance as a result of their HIV condition. HALC represents clients in applications for compensation for the act of discrimination, and/or to obtain the insurance applied for.
Lessons learned: Systemic change has been difficult to achieve due to insurers often making the decision to resolve individual complaints through a conciliation process; the result of this is that no court or tribunal has had the opportunity to examine and determine whether the insurers are relying upon outdated data.
Therefore, although individual litigants often achieve redress, overall systemic change has not yet been achieved. At time of writing HALC has four active cases of this nature at various stages of proceedings.
Conclusions/Next steps: HALC needs to continue to actively assist PLHIV through litigation to combat this issue for the individuals and force change. Steps also need to be taken in partnership with researchers to compile and consolidate the relevant data to ensure that PLHIV are not denied insurance or offered insurance with higher premiums.
More broadly HALC will mobilize with other HIV community organizations to report breaches of discrimination legislation to regulatory authorities and seek investigation through ongoing parliamentary inquires into the financial services sector.

EPF072

Drug enforcement remains a top barrier for people who inject drugs to access HIV and TB prevention, care, and treatment in Georgia, Kyrgyzstan, Moldova, Russia, Tajikistan, Ukraine, and Uzbekistan

M. Golichenko[1], V. Kalyniuk[2]
[1]HIV Legal Network, Research and Policy, Toronto, Canada, [2]The International Charitable Foundation "Alliance for Public Health", Program Department, Kiiv, Ukraine

Background: From January 2020, civil society organizations implemented an online tool, REAct, to document and respond to human rights violations against key affected populations in Georgia, Kyrgyzstan, Moldova, Russia, Tajikistan, Ukraine, and Uzbekistan — countries with high prevalence of injection drug use and serious epidemics of HIV and HCV affecting people who inject drugs (PWID). By November 2021, REAct had documented more than 7,000 cases of human rights violations.

Description: PWID make up a significant portion of REAct clients, from 13% in Tajikistan to 66% in Russia. The most frequent violators of PWIDs' rights are the police (from 18% in Moldova to 68% in Kyrgyzstan) and the healthcare system (from 14% in Kyrgyzstan to 61% in Russia). Discrimination in health care is often linked to punitive drug control measures, such as a mandatory drug registry, the lack of accessible evidence-based drug dependence treatment, and the disenfranchisement of PWID based on criminal record and/or health status. Police violations range from minor verbal assaults and arbitrary street arrests, to the egregious cases of torture and ill treatment (93 cases). Often police stations do not provide any access to drug dependence treatment, which makes people with drug dependence vulnerable to the misuse of withdrawal syndrome by police to obtain confessions to such serious crimes as drug trafficking.

All police violations can be traced back to outdated drug laws, policies, and practices that make PWID vulnerable to human rights violations and undermine public health response to HIV/TB.

Lessons learned: REAct confirmed that despite minor reforms in lifting drug policy barriers to harm reduction services, punitive drug enforcement itself is an obstacle for PWID to make health-centered choices to mitigate the HIV and TB epidemics among PWID.

Conclusions/Next steps: To improve HIV and TB response among PWID, drug policies should de-prioritize drug use–related behavior for law enforcement and replace punitive sanctions with viable public health and social tools. Gradual de jure or de facto decriminalization of drug use, drug possession, and peer-to-peer distribution will lift major barriers to science-based HIV and TB prevention among PWID.

EPF073

PLHIV transgender communities legal and social security

M. Benjwal[1], M.L. Swami[1], Smriti Acharya, Archana Shetty, S. Murugeshan
[1]The Humsafar Trust, Mumbai, India

Background: Indian citizenship safeguards the rights of the Transgender Community including the right to vote. However most transgender communities are yet to receive a voter ID card. The Indian government recognised the Transgender community with equal rights in 2014, but the position of profit is still not there. According to the 2011 census, the number of transgenders in the country was 487203, although there was no record of transgender voters till 2014. Transgender votes were documented for the first time in 2014. In the last election, 28527 transgender voters were registered, although out of this, 1968.

The transgender community is already neglected by mainstream society, if a transgender person is found HIV positive, then is subjected to stigma and discrimination and are also deprived of government services as well.

Description: The Humsafar Trust, an India based Community based organisation has made efforts to advocate for the voting cards by working with the State of Punjab for providing Election Commission. We had a series of meetings with the Election officials on understanding the requirements for obtaining the voter cards for both PLHIV and Non-PLHIV communities so that they can also obtain other social entitlements based on the voter card.

After multiple meetings with Chief Election Commissioner, Punjab, it was decided all those transgender persons living in Punjab for 6 months or more can apply for a voter ID card by self-expression without any proof. We provided a 207-member list from the local CBO from the Ludhiana district.

Lessons learned: Out of 207 Transgender voter ID applications, now we received 193 Voter ID Cards of the Transgender Community in Ludhiana District of Punjab. In continuation, we plan to apply the same strategy in other districts of Punjab.

Conclusions/Next steps: It is important that the HIV intervention programs also need to incorporate providing access to other welfare and social entitlement schemes for the community members so that they are able to other access HIV and other related schemes based on the state level documentation they have, especially for the trangender community as they don't have any documentation to access welfare schemes.

EPF074

Intensification of religious communities in the fight against HIV in military divisions

N. Heiman[1]

[1]*Eleos Ukraine, Kyiv, Ukraine*

Background: In Ukraine, the church influences over 67,5% of the population. That's why we chose a chaplain to give answers to his military congregation to the most difficult questions. Due to many cases of stigma against PLHIV, the level of testing decreases while discrimination and mortality increases. The aim of the meetings of chaplain and military is to prove that the church is ready to work to overcome HIV and stigma.

The military, limited in information and having their subjective views on socially dangerous diseases, jointly address the problem of stigmatization and reduction of HIV, hepatitis, tuberculosis.

Description: The project was implemented in July-November 2021. The military chaplain of the UOC and coordinator of the project visited the units of the air command "East". Informational and educational meetings were held with participation of 50 to 200 people.

The participants included conscripts and commanders, officers of the department of psychological support. Using the manual "HIV: faith, tolerance, hope" the priest found the optimal formula for communication with the military about HIV. It was based on his experience of work with PLHIV in his congregation.

Lessons learned: HIV testing and distribution of condoms started. Medical chaplains organize information meetings aimed at overcoming stigma and discrimination of people living with HIV in their communities. The social video was made to support people with HIV.

We presented a manual "HIV: faith, hope, tolerance" together with doctors of hospitals, military, representatives of religious organizations and HIV-service organization "Synergy of souls". Military priests began to test for HIV and publicly talked about it.

Conclusions/Next steps: Talking about the military, paying attention to the information, education and social activity of the soldiers is necessary. This is the opportunity to move forward in addressing HIV related stigma, and discrimination. The Church is gradually beginning to socialize. The priests have an understanding of being on the front line in this fight.

We plan to intensify local religious organizations, governments and the public through information and educational activities and build a constructive dialog, providing relevant, reliable information on socially dangerous diseases, advancing reduction of stigma and discrimination against people with HIV, risks of HIV transmission.

EPF075

Involvement of law enforcement in the fight against HIV and discrimination among LGBT people in Benin

A. Aguessy[1], J. Ouessou[1]

[1]*Réseau Bénin Synergie Plus, Atlantique, Abomey-Calavi, Benin*

Background: The socio-cultural environment is often unfavorable to sexual relations between people of the same sex in Benin. This social evidence is enforced by law enforcement. During 2018, 10 cases of LGBT arrests were reported. This discriminatory atmosphere leads LGBT people to hide and stay away from health services.

Description: Since 2018, BESYP has developed an approach to raise awareness among law enforcement on discrimination against the LGBT community. Awareness-raising workshops on legal education and the protection of the rights of populations most at risk of HIV were organized. These workshops aimed to promote a favorable environment for the implementation of interventions with LGBT people. 03 advocacy workshops were organized at the national level between 2018 and 2019 and 40 law enforcement officers took part. Identified police personnel were approached and involved in community actions targeting LGBT people.

1 Risk Management Committee has been set up; it is composed of 2 members of the ABDD (Beninese Association for Law and Development), 3 members of BESYP, 8 representatives of the police (representatives of the police stations of the Beninese portion of the Abidjan-Lagos Corridor).

Lessons learned: A significant reduction in the number of arrests. During the first half of 2019, we noted only 02 cases of arrest which turned out to be unrelated to the sexual orientation of the person concerned, compared to 10 in 2018.

It has been observed that the security forces have taken ownership of the testimonies of health personnel presenting the positive effects of the offer of HIV prevention and care services for LGBT people. They were more inclined to focus on repression education in dealing with LGBT issues after these workshops.

Conclusions/Next steps: Some law enforcement agencies are still not in favor of better treatment of subjects relating to sexual orientation, hence the need to develop a strategy targeting them specifically and more broadly. The establishment of a Risk Management Committee at the level of each region, bringing together different actors and stakeholders, to renew the response to violence based on sexual orientation and gender identity is an absolute necessity and it is essential that the forces of order participate in it.

EPF076

Importance of technical support for and by communities of people living with HIV and key populations to strengthen community-led responses

M.C. Chungu[1], L. Sprague[1], C.G.d. Leon Moreno[1], A. Sanchez[1], G. Jones[2], J. Batte[1], D. Kemps[2], C.E. De Lima[1], D. Matyushina-Ocheret[2], E. Nassif[1]

[1]UNAIDS, Community Mobilization Community Support, Social Justice & Inclusion Department, Genève, Switzerland, [2]Independent Consultant, Genève, Switzerland

Background: The current Global AIDS Strategy and the 2021 Political Declaration on AIDS include ambitious targets for community-led responses (including services and advocacy) and full implementation of the GIPA principle by 2025. This workstream prioritizes community-led research and monitoring of stigma, discrimination, HIV service access, and results-based advocacy.

Technical support for community-led data generation and advocacy is paramount in UNAIDS' efforts to fight inequalities and reach these targets.

Description: In 2020, UNAIDS launched its Last Miles First (LMF) Initiative which includes a workstream of technical support to and by communities of PLHIV and key populations. In 2021/2022 LMF provided technical assistance in 35 low- and middle-income countries through eleven implementing partners, six of which are PLHIV and key populations (KP)-led organizations.

LMF covered technical support to the PLHIV Stigma Index 2.0 country implementations, women LHIV engagement in the validation of elimination of the prevention of vertical transmission, community-led monitoring of HIV prevention for KPs and antiretroviral treatment, youth-led monitoring of governments commitments on HIV, and support to the advocacy for decriminalization and sustainable harm reduction programmes.

Lessons learned: Communities of PLHIV and KPs have the willingness, experience and capacities to implement projects and provide peer-to-peer technical support. However, they face an array of challenges rooted in criminalization, stigma and discrimination, a lack of resources, and as a result, exclusion from decision-making.

Technical support provision should be targeted at overcoming these barriers, engaging affected communities as both TS providers and recipients, helping develop partnerships with governmental and academic stakeholders, and documenting communities' input in national and global HIV response.

Conclusions/Next steps: Supporting communities, in their diversity, to lead and meaningfully participate in the process of research design and data generation, provides an accurate picture of the gaps, and needs for PLHIV and KPs. This then gives way to effective and tailored policy interventions, which are only possible when listening directly to the people most affected.

Investing in the provision of quality and tailored technical support while upholding and sustaining the leadership of communities is a game-changer in community-led responses.

EPF077

Community interventions as an effective strategy to reduce barriers to access to health and rights of Venezuelan refugees and migrants in Peru

J. Cruz[1]

[1]ASOCIACIÓN PROSA / ACNUR, Lima, Peru

Background: The proposal seeks to reduce the gaps in access to health services and protection of rights that Venezuelan refugee and migrant populations living with HIV, sex workers and the LTGBIQ population have in the Lima and Tumbes regions of Peru. Prosa, with the support of UNHCR, implement actions and services to reduce these barriers to access to health and rights COVID-19.

Description: The Program implements a series of actions and services using a community intervention strategy in alliance with different sectors of the state, developing actions or facilitating access to:

a. Linking people living with HIV to hospitals and health centers so that they can access antiretroviral treatment;

b. Regularize the migratory status of Venezuelan people living with HIV due to vulnerability for their access to Comprehensive Health Insurance;

c. Sensitization of law enforcement officials such as the National Police and citizen security for better treatment.

d. Provision of emotional support services, peer counseling, group therapies and legal advice

e. Provision of biosafety supplies to Venezuelan sex workers for survival to prevent STIs, HIV and COVID 19 in sex work areas;

f. Community integration actions that contribute to the national response in the fight against AIDS.

Lessons learned: • Alliances between sectors of the Peruvian State and community organizations are key and contribute to reducing the gaps in access to health and protection of rights.

• Community integration is key to generating public policies to protect rights.

Conclusions/Next steps: • Establishing strategic alliances between the state, international cooperation and community organizations have been key to prevention, access to treatment, care and support for refugees and migrants with HIV in Peru.

• Timely access to treatment and rapid care has contributed to saving the lives of Venezuelan refugees and migrants in Peru.

EPF078

Regional consultations with Muslim and Christian religious on stigmatization and discrimination of key populations

D. Niang[1], S. Thiam[1]
[1]*Conseil National de lutte contre le Sida, Dakar, Senegal*

Background: Senegal is affected by a concentrated epidemic with high prevalence among key populations (HSH27. 6%; PS 6.6%; CDI 5.2%) and low in the general population (0.3%). However, public and social health interventions are made difficult by the stigmatization based on religious ideologies of these key populations.

Regional consultations with religious leaders were strategically organized with the objective of providing a space for constructive dialogue with religious leaders on the AIDS Plan, a process of reducing stigma and discrimination.

Methods: The participatory approach used to engage in a constructive debate with Christian and Muslim religious leaders on the issue of stigma and its effects on the deconstruction of achievements in the fight against HIV. Brainstorming workshops including the sacred union around the national strategic plan to fight AIDS.

A total of 500 religious leaders were consulted between 2020 and 2021.

Results: The interventions made it possible to make the concentrated character of the epidemic which requires a multisectoral and multi-stakeholder response with a dynamic of holistic management. An ongoing dialogue between religious leaders and actors in the fight against AIDS is established. An action plan to reduce stigma and discrimination against PHA to contribute to the achievement of Goal 3 X 95 calls for an approach targeting marginalized groups with religious prominence raising awareness and combating stigma.

Also, work on a draft plan of regional activities to fight against stigma and also commitments of leaders to get involved in going through prayers and homilies. In addition to targeted communication, a communication system is set up around community radio stations and local correspondents.

Conclusions: Stigma is a major barrier to interventions for key populations. The goal of zero discrimination is a major guarantee of the success of interventions with key populations. The identification of the religious basis of stigmatization makes it possible to fight by involving religious leaders.

Gender equity and diversity

EPF079

Invisible woman: not so fantastic. Recognising the harmful exclusion, marginalisation and invisibilisation of lesbian, bisexual and other queer women in HIV-programming

R. Walters[1], L. Mondry[1], Z. Ntshuntsha[1]
[1]*Positive Vibes Trust, Cape Town, South Africa*

Background: Since 2017, Positive Vibes has supported key populations in East/Southern Africa to document their healthcare experience; monitor service delivery; analyse programming; dialogue with healthcare workers, programmers and policy makers. One common theme recurs: lesbian, bisexual and queer women, and female-bodied trans persons, go unnoticed and underserved.

In Key Populations programming, HIV-related services and commodities, sexual and reproductive health, they are -- like the Fantastic Four's *"Invisible Woman"* --unseen in a penis-centric landscape.

Description: Multiple sources inform findings. Reviews of HIV NSPs (2018;2020) and PEPFAR COP-20, 21, 22 guidance were conducted. In 2017 - 2021, standardised focus group discussions with LGBTIQ people reflected on service delivery in 40 facilities in 11 towns across 5 countries, producing the *"Perceptions/Perspectives"* series. In 2020/21, LGBTIQ and sex worker groups in 5 countries assessed national PEPFAR-supported KP-programming, producing the *"Talking Points"*series. In 2021, KP-led organisations in 6 countries deployed the *ma'Box* virtual suggestion box to monitor user-experience at selected facilities, generating 1500 unique reviews in Implementation Quarter 1.

Lessons learned: Disproportionate exclusion and marginalisation of queer women are clear. In Botswana (2021), LBQ women accounted for 11% of *ma'Box* facility monitoring data, but carried 60% of low satisfaction reviews.

LBQ women are vulnerable to HIV from, amongst other factors, the pressures and expectations of life in heteronormative social contexts: they are not men or a function of sex with men. They face stigma, discrimination and exposure to physical and sexual violence. Many live with HIV, but are unreached with SRH services, or resist presenting for them (eg. cervical cancer screening).

They are unrecognised in facility intake or reporting forms, unlisted as a priority population, even in the drop-down list of an International AIDS Conference. Backbone and vanguard of community programmes aimed at populations other than themselves they have little access to information suited to their identities and relationships.

Research on LBQ identities, behaviours and vulnerabilities is scarce; where it exists -- eg. BTRI Study, Zimbabwe (2013) -- it is suppressed or unpublished.

Conclusions/Next steps: LBQ health suffers silently; risk and vulnerability increase in a population left behind. Contrary to the comics, invisibility is not so fantastic after all.

EPF080

Engaging peer networks in opioid overdose response in the State of Manipur, India

R.N. Singh[1], A. Mongjam[2], N.M. Singh[1], G.S. Shreenivas[1], P.K. Choudhury[1], B. George[3]
[1]UW International Training and Education Centre for Health Private Limited, New Delhi, India, [2]Manipur State AIDS Control Society, Manipur, India, [3]FHI 360, New Delhi, India

Background: Anecdotal evidence suggests that Opioid overdose is a major cause of premature death among people who inject drugs (PWID) such as heroin in the State of Manipur, India. Reducing the time between the onset of ODIO symptoms, appropriate assistance, including administration of the antidote naloxone, which is easily available in a public health setting, can quickly and effectively reverse the ODIO and prevent mortality.

Description: To address ODIO, an overdose intervention project was initiated in the Imphal-West and Churachandpur districts of Manipur. As peers of PWID are often the first to witness any ODIO incident, an Overdose Response Unit (ORU) was formed.

We trained 268 peer educators and leaders of PWID on ODIO management, including the safe administration of naloxone at the hotspots. Each ORU has up to 6 members, including a coordinator, an outreach worker, and peer educators.

They were all encouraged to use "Helpline Numbers", which is active round the clock. Information on the ORU and helpline was shared through vouchers, interpersonal communication, and social networking sites. An electronic database is maintained for ODIO cases by the project.

Lessons learned: A total of 1,190 ODIO cases have been reported from April 2019 through Sept 2021 in which ORU was able to avert many deaths. Out of 1,190 cases, 1,166 (93%) were referred for help from the PWID peer network.

All death cases were mostly from other districts where ORU does not exist, and reports were mostly from the public. 96% of management was done by administering Naloxone & rest by appropriate non-medical assistance.

Conclusions/Next steps: ODIO has a significant risk of death among PWID. Proper engagement of peer networks within the system of overdose management system can bring a significant change in terms of preventing ODIO incidents and likely saving lives.

EPF081

Influence of the proposed anti-LGBTQ+ bill on HIV&AIDS programs for men who have sex with men (MSM) in Ghana

S.E. Owusu[1], S.K. Wosornu[2], C. Yalley[1], A. Wosornu[1], G. Ekem-Ferguson[3], C. Asamoah-Adu[4]
[1]Maritime Life Precious Foundation, Programs, Takoradi, Ghana, [2]Maritime Life Precious Foundation, Executive Directorate, Takoradi, Ghana, [3]Ghana Health Service, Clinical Psychology, Accra, Ghana, [4]Ghana-West Africa Program to Combat AIDS and STIs (WAPCAS), Executive Directorate, Accra, Ghana

Background: Key populations such as MSM are vulnerable and disproportionately affected by HIV due to factors such as stigma, discrimination and abuse. Anti-LGBTQ+ laws further threaten human rights and response to HIV&AIDS making it difficult to reach an already hard-to-reach populations such as MSM with HIV&AIDS services. In March 2021, "The Promotion of Proper Human Sexual Rights and Ghanaian Family Values Bill" was presented to the Parliament of Ghana for reading.

The proposed bill criminalizes LGBTQ+ people by a maximum five-year imprisonment and a ten-year prison sentence for organizations rendering services to LGBTQ+ people. We sought to assess the influence of the proposed anti-LGBTQ+ bill on HIV&AIDS programs for MSM in Ghana.

Methods: A qualitative cross-sectional survey was conducted to explore the impact of the proposed anti-LGBTQ+ bill on HIV programming for MSM in Ghana. Directors of 3 organizations working with MSM in Ghana, and 30 MSM individuals were purposively sampled and interviewed for this study. In-depth individual and focused group interviews were conducted for the directors and MSM respectively between March and April 2021 using a semi-structured interview guide. Interviews were transcribed verbatim and analyzed using inductive thematic analysis.

Results: Findings from the study confirmed a considerable reduction in HIV&AIDS services for MSM in Ghana. MSM participants reported concerns to accessing HIV services at health-facilities for fear of being discriminated. Results confirmed that MSM have further driven underground and would rather avoid places or services where they could be easily identified as LGBTQ+. Reports from the organizations indicate low turn-out of MSM to community programs that promote HIV prevention, testing and treatment. Again, organizations have stopped having large-group meetings with MSM but instead engaged in interpersonal one-on-one meetings for fear being harassed by the public. Findings revealed increase in attacks on organizations leading to some offices halting activities to ensure safety of staff and MSM.

Conclusions: The influence of the proposed anti LGBTQ+ bill on HIV&AIDS programming is enormous affecting MSM and the organizations offering services to them.

Hence, there is the need for a high-level stakeholder advocacy on the effect of the proposed bill against sexual minorities in the fight against HIV&AIDS.

EPF082
Understanding the urgent need for inclusion of comprehensive sexuality education for Persons with Disabilities (PWDs) in addressing the HIV pandemic in Nigeria

E. Oluwa[1]
[1]*Natineee Empowerment for Sustainable Impact Initiative (NESII), Founder / Chief Responsibility Officer, Lagos, Nigeria*

Background: The World Disability Report shows that up to 25 million people in Nigeria have at least one type of disability with 1/3 of these figures being young people. Young PWDs living across Nigeria like their peers require information, education and communication on sexuality, body changes, gender and psychosocial development.
This study assesses the sexual and reproductive health knowledge attitude and practice of PWDs educating them on CSE to prevent HIV and STIs
Description: 120 PWDs; male and female,15 – 24 years with at least one form of disability were reached within a twelve weeks' period.
Questionnaires were in braille for the visually impaired and sign language interpreters for the deaf and hard of hearing participants.
Focus Group Discussion, one on one structured discussion and interviews were conducted at the agreed location; in some cases the home of eligible subjects to collect data on their knowledge of SRHR including attitudes and perception, HIV/AIDS, sexually transmitted infection testing and treatment services.
Lessons learned: With a baseline response rate of 89.9%, 69% of the respondents were females whilst 30% were male; 49% of all respondents admitted they were sexually active and 91% of all sexually active females had unprotected sex. 25% of males and 18% of females had knowledge of modern contraceptive methods.
85% reported poor access to contraceptives which usually required aid in getting services they would rather be discreet. PWDs experience physical, emotional barriers to information and services.
The ignorance and attitudes of society and individuals, including healthcare providers, raise most of these barriers – not disabilities. 49% of all respondents between the ages of 15-24 have had unintended pregnancies in the past.
This leaves women facing multiple, intersecting discrimination as getting unintended pregnancies often halts their education, other times their skill acquisition program gets disturbed. 87.9% of all respondents have misconceptions about contraceptives and their safety, believing they contain harmful chemicals that can damage their reproductive system.
Conclusions/Next steps: There is an urgent need to promote the participation of PWD when designing programs that address SRH needs and support them in the implementation and programming process to address the gap in their SRH needs and HIV prevention.

Sexual and reproductive health and rights

EPF083
Assessing global progress towards quality school-based comprehensive sexuality education: Urgent investment in scale-up and quality central to reaching global AIDS objectives

S. Beadle[1], P. Abduvahobov[1], J. Herat[1]
[1]*UNESCO, Section of Health & Education, Paris, France*

Background: Comprehensive sexuality education (CSE), or whatever it may be called as part of national education programmes, is a critical intervention in ongoing efforts to end AIDS as a public health threat, to enable young people to reduce their risk of HIV infection and eliminate HIV-related stigma and discrimination. It also promotes SRH, gender equality and healthy relationships.
This global study aimed to build a composite picture of the global status of school-based CSE to assess progress and identify areas needing further investment.
Methods: The study drew on a range of data sources including global data sets (NCPI, UBRAF) through secondary data analysis, data collected in an extensive desk review, a national-level survey in 59 countries and key informant interviews. The study included quantitative data from 155 countries.
Results: Results indicate that despite favourable policies in many countries (85% of 155 countries say they have policies mandating some form of sexuality education at primary and secondary level), there remains a gap between policy rhetoric and implementation. Closer analysis highlights that the breadth of topics covered in curricula in most countries is limited or taught too late with gender and sexual health often insufficiently addressed. Young people report low satisfaction with the quality of sexuality education received.
Moreover, research including the perspectives of teachers and learners indicate that there remains much to be done in ensuring sexuality education covers a diverse range of topics and building teachers confidence and skills to ensure quality of delivery.
Conclusions: Despite compelling evidence for its benefits, many learners are not realising access to quality CSE. Results highlight that policies favourable to CSE need to be backed up by dedicated budgets, alongside continued efforts to expand coverage and ultimately realise the full potential of CSE in preventing new HIV infections and promoting the health and well-being of learners. This will

only be a worthwhile investment when attention is paid to the quality of delivery, which will be achieved through continued curriculum reform and significant investments in teacher training and support. Without stepping-up such efforts, the goals outlined in the new Global AIDS Strategy will not be achieved.

EPF084

Engaging communities on social cultural barriers promotes acceptability to HIV andSexual Reproductive Health Rights(SRHR) services among Adolescent Girls and Young Women (AGYW) living with HIV in Central and Northern Uganda

P. Nanyanzi Luzige[1], W. Iklai[1], D.B. Ndagire[1]
[1]National Forum of PLHIV Networks in Uganda (NAFOPHANU), Programmes, Kampala, Uganda

Background: The Partnership to Inspire Transform &Connect the HIV response (PITCH) Project was a five year project running from 2016-2020 in the districts of Mubende, Gomba and Mityana in central Uganda and Lira & Gulu, in northern Uganda. The project focuses on increasing equal access to HIV and SRHR services among AGYW living with HIV.

Description: PITCH project aims at ensuring equal access to HIV and SRHR services by removing barriers that obstruct AGYW to access services. AGYW face many health challenges particularly reproductive health which include early/unwanted pregnancies, unsafe abortions, STIs/HIV and AIDS, FGM, psychosocial problems such as substance abuse, sexual abuse. This coupled with poor parent adolescent communication and lack of knowledge about sexual matters. Thus, the PITCH project in the five districts employed a number of interventions to mitigate the effect of these barriers. They range from fact finding missions to generate evidence for advocacy, community dialogues involving duty bearers, religious, cultural and religious leaders, capacity building for AGYW to be advocacy champions, participation of young people living with HIV in SRHR and policy design to raising voices during district and national advocacy days.

Lessons learned:

- Engagement of communities has increased ownership of the challenges and enabled joint action planning to address the barriers that bar AGYW from accessing the much needed HIV and SRHR services.
- Working with AGYW to generate evidence on HIV and SRHR services delivery was very effective at getting duty bearers act.
- Increased number of AGYWLHIV overcoming stigma, disclosing their status and accessing SRH and HIV services due to empowerment. Over 56 are providing adherence counselling to fellow youth in health centres.
- Participation of empowered AGYWLHIV in trainings of caregivers and health workers significantly contributes to provision of an enabling environment and uptake of HIV services.

Conclusions/Next steps: Engaging communities has enabled 9047 AGYW living with HIV access HIV and SRHR services. This needs to be replicated in other districts to address the social cultural barriers that have fueled new HIV infections especially among young people.

EPF085

Sexual reproductive health and right freedom is our demand ashawo screened": advancing sexual reproductive health for female sex workers in Vandeikya LGA of Benue State Nigeria

O. Maduabum[1], G. Iloh[2], C. Oliagba[2], B. Okeke[2], G. Nwafor[3]
[1]University of Abuja, Sociology, Abuja, Nigeria, [2]Concerned Women International Development Initiative, Makurdi Benue State, Nigeria, [3]Concerned Women International Development Initiative, Makurdi Benue State, Nigeria

Background: In Nigeria's despite highly restrictive abortion law, induced abortions occur daily and more frequent with key population such as female sex workers. It is estimated that 1.25 million induced abortions occurred in 2018 (Ipas Report 2019), alongside female sex workers between the age of 18-25 seeking postabortion care services.

It is against this backdrop that Concerned Women Int Dev't Initiative with support from Youth Fund aimed to improved access to relevant SRH information, HIV and SRH services of Female sex workers.

Description: Through safe space club CWIDI engaged 52 brothel female sex workers in rural and semi urban of the project site and provided SRHR information such as contraceptive information and services alongside referee for COVID 19 testing. The safe space club was established across 6 brothels, where young FSW between the age of 18-25yrs gather, socialize and also have access to relevant SRH services. The program also adopted the use of WhatsApp as an educational platform for the FSW for quick dissemination of SRHR information.

Lessons learned: Young sex workers are actively aborting using harmful practices thereby putting their life at risk. Also, there are many undocumented abortion deaths that have occurred as a result of the illegal nature of abortion. Below are the most popular abortion methods used by sex workers between the aged of 18-25yrs. Ricinus Communis (Castor Oil Plant) The leaf of the plant is boiled to produce a concoction that is consumed by the patient. Some of the leaves are directly inserted into the vagina until bleeding occurs. Boiling of Coca-Cola Soft Drink and Bicarbonate, boiling of uda seed, scent leave, Uzzia leaves, pepper, ginger, pounded serve drinking till bleeding occurs.

Conclusions/Next steps: Establishment of a multi-stake holder coalition and enhance their advocacy skills build a collective voice to advocate for policy change in Nigeria abortion law will go a long way to reduce deaths associated with abortion.

Mobilizing feminist groups, WLHIV networks, and diverse civil society to influence 2021 HLM on AIDS and Post HLM to safeguard the gains for advancing a gender-transformative HIV response

M. Sejake[1], C. Nyambura[1], L. Mwakyosi[1]

[1]*ATHENA Network, Windhoek, Namibia*

Background: The 2021 HLM was an opportunity to mobilize communities, women and girls, to engage decision-makers to ensure commitments and safeguard the gains secured in the 2016 Political Declaration. In 2016, through the #WhatWomenWant campaign, ATHENA collaborated with civil society, women, and feminist movements to build a campaign that amplified the priorities, demands, and lived realities of women and girls globally.

Description: The HLM 2021 coincided with the Beijing+25/26 anniversary, embodied by Generation Equality's concrete and transformative actions to achieve gender equality. Women's civil society and feminist movements worked with UNAIDS to develop an agenda safeguarding the 2016 gains and advocate for a 2021 Political Declaration that:

Centres gender-transformative HIV responses, promotes gender equality and girls' and women's human rights;

1. Implements the 2021-2026 Global AIDS Strategy.
2. Prioritises meaningful participation from women and girls living with and affected by HIV.
3. Amplifies the lived realities of women and girls globally in a pandemic context.

From April 2021 to the HLM in June 2021, ATHENA mapped opportunities for civil society to collaborate on HLM centred advocacy. ATHENA leveraged opportunities as an advocacy roadmap amplifying voices of girls and young women.

Opportunities included global advocacy processes like the CSW, International Women and HIV Conference, strategic engagements leading to and during HLM, and mobilizing girls, young women and civil society nationally to consolidate policy demands for a gender-transformative Political Declaration.

Lessons learned: There are eight years to end AIDS as a global health crisis by 2030.

Commitments to adolescent girls and young women are ambitious with little time to achieve them by 2025

Like HIV, there is a relationship between COVID-19 and heightened GBV

Like HIV, COVID-19 has gendered impacts and there is an emerging consensus to centre women in the recovery.

Conclusions/Next steps: Through the #WhatGirlsWant campaign ATHENA conducted an intersectional feminist analysis of the 2021 HLM Political Declaration to access if it meets the demands previously mentioned by women's civil society and feminist movements.

ATHENA developed a feminist roadmap which will be disseminated across our networks for endorsement and to inform our advocacy as we work towards ending AIDS as a health threat.

Children's rights and HIV

EPF087

Promoting health equity for orphans and vulnerable children through birth registration: a case study from Nigeria

I. Okereke[1], C. Aruku[1], P. Adekoya[1], D. Akpan[1], D. Magaji[2], I. Abejerinde[3], E. Ezeanolue[3], D. Olutola[1]

[1]*Center for Clinical Care and Clinical Research, INGO, Uyo, Nigeria,* [2]*United States Agency for International Development, INGO, Abuja, Nigeria,* [3]*Center for Translation and Implementation Science, INGO, Nsukka, Nigeria*

Background: In sub-Sahara Africa, 38% of children under five are registered at birth, with wide urban (54%) and rural (30%) disparities. A birth certificate is a gateway to certain rights and protections, facilitates linkages to health services, education, and social security. In Nigeria, policies to address under-registration have been sub-optimal. Despite increased total numbers of births registered from 3 million (2012) to 5 million (2016), inequities between the rich and poor have widened; from 41.9% in 2007 to 64.9% in 2016. Birth registration coverage in Akwa Ibom and Cross River is reported by Government to be at 8% (157,121) and 7% (104,205) when compared with the children population requiring birth registration. The scenario is worse for children from vulnerable households especially those at risk of or living with HIV.

Methods: The Integrated Child Health and Social Services 1 (ICHSSA-1), a five-year program funded by the United States Agency for International Development (USAID) launched in December 2019 in Akwa Ibom and the Cross River States, Nigeria as part of its mandates serves as a vehicle to upscale birth registration (BR) for the 76,375 (61.2%) of the 195,236 enrolled children without BR. A monthly target of 5000 birth certificates was set with the goal to increase registration from 38% at baseline in 2019 to 75% within six months. This invariably aimed to contribute to the BR upscale and coverage in project states.

Results: Strategies included community-level sensitization by community caseworkers; creating easy-to-understand guidance on the process; supporting digitalization of the BR process; bringing BR closer to the community and offering incentives for each completed enrolment (50cents). Within the first month, 3,460 OVC received birth certificates with an additional 3,400 in the second month. By the 6-month mark, nine ICHSSA-1 supported organizations in the target local government areas- 31 in Akwa Ibom and 6 in Cross River had facilitated the registration of 1,212 OVC representing 1.2% of the unmet need.

Conclusions: This initiative has shown that community-based approaches are key strategies to bridging BR inequities for marginalized groups and concerted efforts are needed for efficient digitalization and uptake of BR in order to scale up nationwide coverage.

EPF088
Strengthening children and parents living with HIV - a family centered approach

L. Lindberg[1], V. Hagås[1], E. Kanon[1]
[1]*Noaks Ark Stockholm, Stockholm, Sweden*

Background: Children rarely understand the concept of stigma, however they are intimately connected to their caretakers. Instead, stigma is mediated through adults' perceptions, attitudes and responses to HIV and to stigma. Studies reveal that children living with chronic illness (e.g. epilepsy) often worry about being perceived as "different" and can react through externalizing behaviors such as anxiety, rage, and irritation. Adolescents are often able to interpret complex information and are thus more susceptible to people's reactions to disclosure.
For children and adolescents, these concerns can affect how they develop social relationships, self-esteem, mental health, sense of community, and overall quality of life.
Description: We used an established working model by combining educational activities, psychosocial support, and community building activities to address the emotional, intellectual and supporting needs of PLHIV. To adopt a family centered approach, we integrated relation- ship building methods that address the basic components of living as a family with a chronic condition.
1. Group Theraplay – a non-verbal and adult directed method helps caretakers and children build better relation- ships through attachment based play.
2. Workshops and educational activities were adapted to the intellectual and support-needs of both children and parents in topics such as disclosure, adherence parenting, and how these elements connect and affect parent-child relationships. We used Good2Talk – a resource used for parents and caretakers.
3. We integrated community-building activities for families who lack social network, and who need to feel a sense of community and support among other families living with HIV.
Lessons learned: We achieved our aims by combining educational and community building activities with relationship strengthening activities. For children and families living with HIV, taking a family approach has revealed several benefits: caretakers reported increased confidence in parenting, willingness to disclose their HIV to children and kin, greater skills in dealing with HIV related stigma, and feeling a strong sense of community.
Conclusions/Next steps: A family centered approach strengthens both children and families living with HIV. As practitioners, we need to improve support and services that empower children and families to live full and independent lives.

EPF089
Using mobile courts and community and religious leaders to strengthening justice for children

P. Ndaferankhande[1]
[1]*Malawi Interfaith AIDS Association of Malawi, Programs, Lilongwe, Malawi*

Background: Access to justice by children remains a challenge in Malawi due to barriers in the criminal justice chain of action in the management of sexual violence against children. With funding from the Centre for Disease Control and Prevention (CDC), in January 2019, Malawi Interfaith AIDS Association (MIAA) started engaging communities and stakeholders in the justice sector to understand the barriers/gaps in the criminal justice chain of action in the management of sexual violence against children.
Description: Working in partnership with community and religious leaders, MIAA started implementing SASA faith initiative in Blantyre, Zomba, Thyolo, Mzimba and Chiradzulu districts where leaders are brought together to take action to eliminate cases of violence against children.
The initiative encourages communities to be part of the justice chain of action and uses community action groups and community and faith leaders as ambassadors in promotion of awareness on sexual violence against children and reporting of cases.
MIAA is also working with the Judiciary through facilitation of hearing and prosecution of cases using mobile courts. The use of mobile courts allow community members to follow all the court proceedings.
Lessons learned: Through the project, a total of 115 cases have been reported out of which 46 have been concluded and 15 convictions made. A total of 41 780 Community members (16,380 men and 25,400 women) have participated in the court hearings. There has been an improvement in effectiveness and efficiency in case management (50%) which is attributed to the use of mobile courts and involvement of community and religious leaders.
Conclusions/Next steps: Sexual violence against children can be eliminated communities have access to justice system and community and religious leaders take action.
There is also a need to scale up the use of Mobile Courts from the current five district to cover all the twenty eight districts in Malawi.

Representations of stigma: Social attitudes, media and public debate

EPF090

Turning the tide against PrEP misinformation: temporal analysis of news media framing throughout Taiwan's PrEP implementation

I.Y.-H. Chu[1], P. Huang[2], S.W.-W. Ku[3], C. Strong[4], C.-W. Li[5]

[1]London School of Hygiene & Tropical Medicine, Department of Public Health, Environments and Society, Faculty of Public Health and Policy, London, United Kingdom, [2]National Taiwan University, Institute of Health Behavior and Community Sciences, Taipei, Taiwan, Province of China, [3]Taipei City Hospital Renai Branch, Department of Medicine, Division of Infectious Diseases, Taipei, Taiwan, Province of China, [4]National Cheng Kung University, Department of Public Health, College of Medicine, Tainan, Taiwan, Province of China, [5]National Cheng Kung University, Center for Infection Control and Department of Internal Medicine, National Cheng Kung University Hospital, College of Medicine, Tainan, Taiwan, Province of China

Background: Since Taiwan's government-led PrEP roll-out in 2016, the rampant misinformation has constantly challenged the public's acceptance of and willingness to use PrEP. We present a temporal analysis to reveal the prevalence and change of PrEP misinformation in Taiwan's media framing.

Methods: We performed a quantitative content analysis of media coverage in eight websites (i.e. Google News and seven Taiwanese media with the highest traffic), using 'PrEP' and '(pre-exposure) prophylaxis' for keyword search. Only news articles published from 1/1/2010 to 31/12/2021, written in Traditional Chinese and published in Taiwan were included. PrEP misinformation was defined as inaccurate information presented in news headlines or contents. We mapped out articles aligned with Taiwan's three-stage PrEP roll-out: PrEP Demo Project (limited access to partially-reimbursed PrEP at five hospitals), PrEP 2.0 (national programme with fully-reimbursed PrEP) and PrEP 3.0 (nationwide scale-up with partially-reimbursed PrEP). Two researchers appraised the included articles adapting Young et al.'s analytical framework.

Results: Of 1090 records identified, 158 were included for analysis. The number of articles aligned with each PrEP programme was 52, 71 and 35, respectively. Overall, the majority of included articles provided educational information or raised PrEP awareness of the public. The proportion of articles describing opportunities for PrEP access rose from 19% to 40%, whereas those covering acceptance/motivation dropped from 19% to 3% across all stages. The proportion of articles conveying PrEP misinformation steadily declined from 27% to 14% throughout (Figure). Regarding approaches to framing PrEP, almost all articles (96%) narrated the risk of HIV infection, with few emphasising PrEP's benefits (e.g., improving sexual pleasure and reducing anxiety).

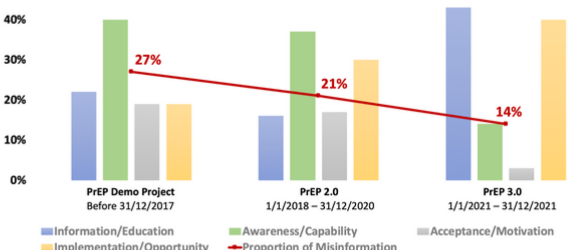

Figure. Topic framing and misinformation on PrEP in Taiwan's news media.

Conclusions: The declining trend of PrEP misinformation in Taiwan's news media may imply a positive shift in public attitudes towards PrEP. Public health messaging comprising both risk and benefit-oriented narratives may facilitate future PrEP scale-up.

EPF091

Media involvement in the fight against HIV and the discrimination suffered by LGBT people in Benin

J. Ouessou[1], A. Aguessy[2]

[1]Réseau Bénin Synergie Plus, Atlantique, Abomey-Calavi, Benin, [2]Réseau Bénin Synergie Plus, Abomey-Calavi, Benin

Background: In Benin, the social environment is hostile for same-sex sexual relations. This social reality is heightened by the media. In 2019, through a media watch carried out by Benin Synergies Plus Network (BESYP) and its allies, 80 cases of incitement to antipathy were expressed in the Benin media, including radio, print and television.

This atmosphere of widespread homophobia constitutes a barrier for LGBT people in accessing health services.

Description: In 2020,BESYP, an identity network of LGBT organizations developed activities aimed at reducing media homophobia by targeting the media that relay it.

Two training workshops were organized nationally in 2021 and 25 journalists took part. As a result of these two workshops, there was media coverage aimed at raising awareness, such as the celebration of the World Day against Homophobia. BESYP assisted journalists in the preparation of various print, radio and television productions, such as a special broadcast on a national television channel on key populations and the right to health in June 2021. Another show on a national radio channel has been broadcasting since June 2021 tackling the violation of LGBT rights.

An exchange platform that serves as a risk management committee was created in 2020, bringing together 10 journalists, 5 members of the BESYP, 2 lawyers, 8 republican police officers, and 4 health professionals, and a network of LGBT Friendly actors was set up to improve the response to violence based on sexual orientation and gender identity.

Lessons learned: As a result of the workshops, 10 print journalists effectively modified their publications and published articles openly fighting against homophobia.

A better involvement of the media in LGBT issues has been observed. This has been particularly reflected in the facilitation of discussion panels and debates on homosexuality by allied journalists in the media sphere. These actions contributed to a reduction in the number of homophobic productions in the Beninese press.

Conclusions/Next steps: BESYP is thus seeking government support and Amnesty International to strengthen the institutional legitimacy of this approach.There remains an important need to improve media communication on homosexuality and to develop strategies and collaborations for working toward this cause.

EPF092

Addressing hate speech towards men who have sex with men (MSM) in the Ugandan media sector

M. Cassolato[1], I. Mugisha[2], M. Mulindwa[3]

[1]*Frontline AIDS, Influence, Hove, United Kingdom,* [2]*Spectrum Uganda Initiatives, Programmes and Policy, Kampala, Uganda,* [3]*Spectrum Uganda Initiatives, Programmes, Kampala, Uganda*

Background: Men who have sex with men (MSM) living in Uganda are frequently the target of hate speech used in print, broadcast and online media. In addition to promoting negative sentiments, discrimination and violence, hate speech reinforces myths and misconceptions about homosexuality and make it more difficult for MSM to access much needed HIV prevention, testing and treatment services.

To address this problem, an LGBT-led organisation based in Kampala engaged journalists and editors in an advocacy campaign aimed at reducing hate speech towards MSM and at improving the relationship between the Ugandan media sector and the local MSM communities.

Description: Between August and December 2021, Spectrum Uganda Initiatives, an LGBT-led organisation based in Kampala, Uganda, implemented an advocacy campaign articulated into three main work-streams

1. Tracking and reporting hate speech appeared in Ugandan print, broadcast and online media (from January 2014 to August 2021),

2. Engaging local journalists and editors in workshops exploring the implications of hate speech on MSM communities and

3. Training local journalists and editors on myths and misconceptions related to MSM and on unbiased reporting.

Lessons learned: Over the duration of programme implementation the team implementing the campaign successfully produced a report tracking hate speech used in Uganda mainstream media and engaged 25 journalists and 25 editors in dialogues related to the evidence produced in the report. Moreover, a total of 45 people working in the Ugandan media sector were trained on unbiased reporting and on identifying and correcting misconception related to MSM and homosexuality in general. The campaign implementation phase also revealed how little some media houses knew about the local MSM communities.

After the training activities, some journalists decided to write favourably about this learning experience and how the dialogues with the MSM community change their perceptions towards homosexuality.

Conclusions/Next steps: Based on articles published after the campaign implementation and on anecdotal evidence, the meetings and training activities organised between the media sector and the community have contributed to improving the relationship between the two.

However, more initiatives similar to the one described are needed to achieve a sustained reduction of hate speech towards the MSM community.

EPF093

Media and HIV: Addressing sensational media reporting through empowering senior editors and media reporters. Experience from Uganda

I. Bazare Owomugisha[1]

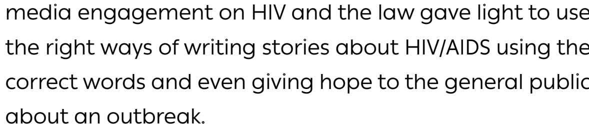
[1]*Uganda Network on Law, Ethics and HIV (UGANET), Advocacy and Strategic Litigation, Kampala, Uganda*

Background: In 2019, Uganda was washed with sensational HIV media reporting which led to the increase in HIV- related stigma. A case in point is of the lady (and for this abstract, I will SK). SK was imprisoned for 7 months in one of the prisons in Uganda for the crime she never committed but because of her HIV status and the way media picked up the story which influence a court of public opinion to judge her so was the criminal justice court.

This influenced UGANET to train media senior editors and reporters to incorporate a human rights-based approach in HIV – related reporting.

Description: The program brought together senior editors and reporters to train on HIV and the law. 30 media personalities were trained. Key areas of focus were on investigative reporting, avoiding sensational reporting and carbing emotions from influencing the reporting. After the training, media personalities were given the opportunity to pitch HIV -related stories on human rights. 70% of those who submitted pitches were facilitated to carry out a thorough investigation and published stories in their specific media houses. HIV social justice media group – a platform used to share experience in HIV reporting on a quarterly basis was formed. As a result, they acquired skills in HIV ethical reporting and 40% won the UNAIDS HIV media reporting award.

Lessons learned: The program that started with only 30 journalists and editors has attracted more media personalities. HIV reporting has greatly improved and we now register ethical reporting as a country on both television media, radio, print, and online media. In fact, one of the reporters noted that the training and other



media engagement on HIV and the law gave light to use the right ways of writing stories about HIV/AIDS using the correct words and even giving hope to the general public about an outbreak.

Conclusions/Next steps: The HIV and the law empowerment training and dialogues with media personalities have changed HIV case reporting. We have registered improved reporting in the context of HIV oftentimes. Media personalities now appreciate the need to use evidence and research on HIV science when reporting HIV-related cases.

Racism and other forms of ethnicity-based social exclusion

EPF094

The effects of structural racism and discrimination on HIV health outcomes: a systematic review

S. Seyedroudbari[1], F. Ghadimi[2], H. Nkwihoreze[2], J. Jemmott[2], F. Momplaisir[2]

[1]*Drexel University College of Medicine, Medicine, Philadelphia, United States,* [2]*University of Pennsylvania, Philadelphia, United States*

Background: Despite the availability of effective antiretroviral therapy (ART), racial and ethnic minority populations continue to be disproportionately impacted by the HIV epidemic. These disparities shed light on systemic and structural inequities that contribute to the persistence of poor health outcomes.

However, the impact of structural racism and discrimination (SRD) on quantitative HIV health outcomes has not been well described.

Methods: This systematic review searched PubMed and PsycInfo databases using keywords including and related to HIV, racism, and healthcare disparities. Inclusion criteria were peer- reviewed, U.S.-based studies in the English language published between 2001 and 2021, reporting an objective HIV outcome. Non-U.S. based studies and qualitative analyses were excluded. Exposures were defined as SRD at the interpersonal (ex. patient-provider interaction), intra-organizational (ex. health clinic structure), and extra-organizational (ex. community) level.

Primary outcomes included adherence to ART, HIV viral load, or CD4 count. Secondary outcomes included the use of PrEP, mental health, or substance abuse services.

Results: The search returned 4802 papers. Based on the inclusion and exclusion criteria, 28 papers were selected. At the interpersonal level, studies show that Black and Hispanic people living with HIV (PLWH) experience substandard patient-provider interactions compared to White PLWH as demonstrated by shorter visits, greater provider verbal dominance in conversations, fewer provider open-ended questions, and less psychosocial conversations (n=11 studies). At the intra-organizational, measures of SRD are generally lacking but some studies have tied a favorable organization climate to PrEP prescription and service coordination; for example, nurse practitioners are more willing to prescribe PrEP and patients have higher odds of linkage to HIV testing, mental health care, and public health services in settings where the clinic climate and culture are favorable (n=2 studies).

At the extra- organizational level, PLWH residing in high-poverty neighborhoods are less likely to maintain viral suppression or to have higher CD4 counts and more likely to have greater risk for mortality (n=15 studies).

Conclusions: We found evidence that SRD negatively impacts ART adherence and viral suppression at the interpersonal, intra- and extra-organizational level.

Alongside the advances made in ART, strategies that reduce SRD may help to largely mitigate HIV health disparities between racial groups.

Experiences and impacts of homophobia and transphobia

EPF095

Relationship between background characteristics of MSM and transwomen experiencing sexual and gender-based violence: focus for HIV prevention

M. Chinenye[1]

[1]*Federal Ministry of Health, Public Health, Abuja, Nigeria*

Background: Sexual and gender-based violence has over the years in Nigeria been perceived as a problem only affecting women and girls. While SGBV among women and girls has been studied extensively, SGBV among MSM and transwomen has not received proportionate attention. These sub-population may face higher violence due to societal perceptions. Outright criminalization of their activities in Nigeria may also expose them to SGBV and subsequently HIV.

Therefore, this study is designed to identify factors associated with its occurrence among MSM and TGF in Nigeria.

Methods: The respondents of the study were MSM residing in any part of Nigeria. A total of 382 respondents completed the online questionnaire. Snowballing method was used to recruit participants while the initial seeds were gotten through interactive sessions with members of the study population. Data analysis was descriptive summarizing important features of numerical data.

Results: There is a relationship between some background, community and societal characteristics of MSM and transwomen and experience of sexual and physical violence. The respondents' background characteristics studied that significantly influenced MSM and transwomen experiencing physical violence were age (adjusted odds ratio:0.06 $p<0.05$), current gender ((adjusted odds

ratio:0.20, p<0.01), BMI (adjusted odds ratio:2.92, p<0.05) and condom use (adjusted odds ratio:2.00, p=0.05) while respondents' wealth quintile significantly influenced MSM and transwomen experiencing sexual violence (adjusted odds ratio=2.52, p<0.05). Marital status (adjusted odds ratio=8.44, p<0.05) as well as sex work (adjusted odds ratio=2.27, p<0.01) have significant effects on intimate partner violence against MSM and transwomen. Community members, male sexual partners and unknown persons were the commonest perpetrators of sexual and physical violence against MSM and transwomen.

Socio-Economic Factors	Sexual Violence (n=382) (%)	Physical Violence (n=382) (%)	IPV (n=382) (%)
Sexual partners in the last 12 months			
1	27.9 (19)	30.9 (21)	14.7 (10)
2-4	30.1 (47)	39.1 (61)	16.7 (26)
5-9 10+	43.5 (40) * 46.4 (26) *	50.0 (46) * 53.6 (30) *	18.5 (17) 28.6 (16)
Sex work in the last 12 months			
No	27.6 (68)	35.8 (88)	12.6 (31)
Yes	47.8 (65) ***	53.7 (73) ***	27.9 (38) ***

Table.

Conclusions: Gender-based violence is in no doubt one of the factors that exposes MSM to HIV infection especially when medical care to prevent HIV transmission is not received. Deliberate efforts should be made to abate exposure of gay and transwomen to sexual violence as to reduce HIV infection among them.

Human rights programmes

EPF096

"Up Against the Wall: Art, Activism, and the AIDS Poster": Lessons and Inspiration from the 8000-strong (and growing!) collection of HIV/AIDS posters at the University of Rochester

J. Lacher-Feldman[1]

[1]*University of Rochester, River Campus Libraries Department of Rare Books, Special Collections and Preservation, Rochester, United States*

Background: The University of Rochester's Department of Rare Books, Special Collections, and Preservation is home to one of the largest, if not the largest collection of HIV/AIDS education posters. A gift from the late Dr. Edward Atwater, the over 8000 posters represent the HIV/AIDS epidemic and messages and means of prevention, activism, and philanthropy from 130 countries and in 76 languages and dialects from 1982 through the present. With a deep commitment to the significance of this collection, every poster has been digitized and made available online at: *https://aep.lib.rochester.edu/*

Jessica Lacher-Feldman, the curator of this collection, will present on the history of the HIV/AIDS poster and illustrate the tactics used over time and space to meet individuals where they are in order to prevent the spread of HIV/AIDS. The first major exhibition of the collection will open on March 6, 2022 at the Memorial Art Gallery at the University of Rochester.

Up Against the Wall: Art, Activism, and the AIDS Poster, will feature 200 of the most visually arresting posters along with personal stories and information that illustrate the use of the poster as a means for advocacy, health management, behavior modification, and beyond. *A book of the same title was published by RIT Press in August of 2021.*

Description: This is a presentation about the significance of the AIDS poster from a global perspective based on extensive work with the collection housed at the University of Rochester, in Rochester NY.

Lessons learned: The significance of the collection, and the individual posters illustrate that everyone on earth has a shared responsibility and vulnerability regarding HIV/AIDS. The posters themselves illustrate the visual and linguistic tools used to get those messages across.

It is illuminating to view the posters from specific countries (abstinence, overt sexual language, use of humor and euphemism) and for specific audiences (IV drug users, women who sleep with men who sleep with men, etc), specific professions (prison guards, sex workers, for example), etc. to deliver messages and change behaviors.

Conclusions/Next steps: This presentation will illustrate the historical significance of the AIDS poster in context.

EPF097

Barriers that prevent adequate access to human rights and justice mechanisms among key vulnerable to HIV groups in Ukraine: evidence collected through the community-based monitoring approach

N. Semchuk[1], O. Pashchuk[1]

[1]*ICF "Alliance for Public Health", Monitoring and Evaluation, Kyiv, Ukraine*

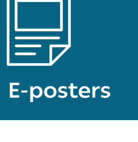
Background: Access to human rights and justice mechanisms among vulnerable to HIV populations has a significant impact on overall HIV response.

Identification of barriers for such access from a client's perspective creates a background for promotion and protection of human rigths and facilitate appropriate conditions for the effective delivery and uptake of essential HIV services.

Description: Data was collected using the Rights - Evidence - ACTion (REAct) system that allows not only to document legal barriers and rights violations of the key groups in their access to HIV and other health care services, but also to respond to barriers identified. REAct is implementing in 18 regions out of 24 in Ukraine by 70 community-based organizations.

Oral abstracts

Poster exhibition



E-posters

Late-breaker abstracts

Author Index

More than 2000 cases of violations were registered in the system in 2021 (dissagregation of clients by key group is in the Table).

REAct clients key group	% of all registered REAct cases in 2021
People living with HIV	30%
Opioid substitution therapy (OST) patient	22%
People who inject drugs	18%
Men who have sex with men	10%
People living with TB	8%
Sex worker	5%
Prisoner	3%
Other	3%

Table.

Lessons learned: Among the major barriers identified are lack of knowledge on how to interact with human rights and justice mechanisms, in particular, about institutions and procedures of submitting applications, lack of faith in a positive result of resolving the case, fear of disclosure of personal and health information, fear of unfair or stigmatizing treatment, fear to contact the human rights and justice mechanism alone without any other professional support.

Conclusions/Next steps: Collected evidence of barriers that prevent key populations from adequate access to human rights and judicial systems can be used to strengthen legal framework for HIV, as well as for futher adoption and integration of human rights-based approaches into HIV programs.

Creation of non-discriminatory environments in healthcare settings and law enforcement agencies, provision of comprehensive information on different legal and human rights mechanisms, ensuring equal access to adequate and affordable legal assistance, consolidated efforts to empower the rights holders to protect their rights are crucial in setting the HIV-related legal environment where human rights are respected, implemented and enforced.

EPF098

Two punishments for one crime

Y. Dorokhova[1]

[1]*CO All-Ukrainian League ,Legalife', Kiev, Ukraine*

Background: At the end of 2021, the estimated number of people living with HIV (PLHIV) in Ukraine is up to 255 000 people. People, who inject drugs (PWID) remain one of the most affected populations with HIV prevalence 20,3% in 2020. Despite of the efforts of national HIV response, people in prison are very limited in access to HIV services and treatment. Prevalence among prisoners increases from 4,4% among imprisoned for the first time to 12,2 % among imprisoned multiple times.

Methods: This quantitative research was conducted in February-November 2017 in Kyiv PDC. Supported by AFEW International within the "Community Involvement Research" program.

The design, questionnaire were developed with the participation of community representatives. A sample of n = 120 HIV-infected prisoners.

Results: The average age of the respondents was 35.8 years, men - 73.3%, women - 26.7%. Have experience of using, also in prison, drugs 60% and alcohol 28.3%.

43% of respondents indicated that they were not tested for HIV before and learned about being HIV-positive for first time in PDC. Among 120 HIV-infected prisoners in Kyiv PDC, only 62.5% receive antiretroviral (ARV) therapy. 53.3% of respondents were not offered medical and social assistance.

The survey revealed the lack of necessary assistance for HIV-positive prisoners and the need for the following services:

Medical	Infectionist consultation	70,8%
	Phthisiatric consultation	26,7%
	Purpose of ARV-therapy	20%
	Diagnostic tests	65%
Psychological	Psychologist consultation	41,7%
	Self-help group	28,3%
	Psychotherapy	25%
	Consultations of social worker	34,2%
Preventive	Disposable syringes, needles	48,3%
	Information-educational materials	55,8%

Conclusions: PLHIV in PDC have limited access to medical and psychological services, including their needs due to HIV infection.

There is a low awareness of PLHIV about their HIV status before entering the PDC. This indicates that PDC is an entry gate for HIV testing and other related services for people.

Obtaining HIV status can be a critical moment for making important decisions, therefore, it is necessary to find opportunities for access to counseling and help PLHIV in prisons. A harm reduction program component is needed in PDC as respective treatment.

EPF099

Address gender based violence and promote access to social and legal justice among women who use drugs in Mombasa and Kilifi Counties

A.A. Badhrus[1], F.A. Jeneby[1], H.A. Taib[1], R. Said[1]

[1]*Muslim Education and Welfare Association (MEWA), Health and Harm Reduction, Mombasa, Kenya*

Background: In Kenya, over 40% of the women and girls face physical and sexual GBV including lifetime physical or sexual, one in every five girls facing early childhood marriages or forced FGM.

Despite the much-reported data on drug use amongst women, there is inadequate robust data and research on drug use and related health issues.

Given the high prevalence of violence against WWUDs and global evidence linking violence to increased HIV risk, decreased HIV testing uptake, and decreased initiation and

adherence to antiretroviral therapy, a central strategy to improve outcomes across HIV prevention, care, and treatment cascade is addressing GBV prevention.

Description: MEWA a local NGO with the 2 years funds from OSIEA has been promoting a human rights approach to complement the public health approach in the fight against Drug use in Kenya. The project goal is to have an inclusive multi-sectorial responsive approach to address GBV and promote social and legal access to justice, among WWUDs and their male counterparts.

MEWA has been working to implement comprehensive GBV prevention, mitigation and response strategies for WWUDs as part of the harm reduction package. Interventions have included medical, case management and psychosocial support, safety and security, mental health, access to justice and rule of law, advocacy and coordination of the various stakeholders.

MEWA has veered towards research and data collection especially on lived experiences of WWUDs..

Lessons learned: MEWA Conducted mobile National ID outreaches at the DIC by the registrar. 1447 clients were screened, 686 benefited, 49 GBV victims rescued, 1019 HIV tested, New HIV Infection 2 (M-1, F-1), PREP (M-39, F- 4), Family planning F-118, Cervical cancer screening F-259.

MEWA is now actively involved in GBV policy reform and engaging with the Mombasa County Ziro draft framework and championing adoption GBV curriculum.

Conclusions/Next steps: Reporting IPV is viewed as family issues to be solved by the families and religious leaders, it always favors the perpetrators.

To be able to develop appropriate interventions, it is important to document the experiences and prevalence of GBV among WWUD. Collecting evidence from the victims of GBV by doing a survey can influence the change of Policy on GBV.

Legal advocacy tools and strategies

EPF100

The changing demands and demographic of HIV-related legal needs in New South Wales, Australia, and its divergences with the epidemiology of HIV in Australia

R. Evans[1], D. Carter[2], A. Stratigos[1], A. Rahmani[2]
[1]HIV/AIDS Legal Centre, Sydney, Australia, [2]University of Technology Sydney, Sydney, Australia

Background: An enabling legal environment is essential for effective HIV responses. In an Australian-first, we analyse the legal needs of those with HIV-related legal issues in New South Wales, Australia, today. We do so by examining the self-reported legal needs of people living with HIV, contextualising and comparing these with the legal services delivered between 1992-2020 by a community-based not-for-profit legal service which delivers high-volume legal services, free at the point of use, to those with HIV-related legal issues.

Description: We elicited information regarding the legal needs facing those living with HIV in NSW through a focused pilot that includes a self-report questionnaire (n = 25) based on a well-established legal needs assessment method used in Australia for the general community. Legal needs were characterised whilst comparing their profile with administrative data on legal services provided to individuals from administrative records and databases held by the HIV/AIDS Legal Centre (HALC).

HALC provides legal services to approximately 10% of all PLHIV in New South Wales per annum, and our administrative data set extends to data relating to 18,833 legal services between 1992-2020.

Lessons learned: At present, the legal needs facing those living with HIV include matters related to immigration, wills and estates, and consumer law, followed by the sorts of matters which have typically been associated with HIV-related law, namely, forms of discrimination. This profile of the legal needs facing those living with HIV is in continuity with current service delivery provided by HALC, but in discontinuity with the legal needs those living with HIV have sought assistance for in the past.

The rise of immigration-related legal needs is particularly pronounced in this regard. A notable change in the demographic profile of people accessing services over time was also identified. They became younger, were more likely to have been born overseas and increasingly identified as heterosexual. The changing demographic of those seeking legal services indicates divergences with the epidemiology of HIV in Australia.

Conclusions/Next steps: Our results provide evidence regarding the contemporary nature and past trends in HIV-related legal needs. When unmet, these legal needs form a barrier to an enabling legal environment for effective HIV responses.

EPF101

No rights, no health: Women Sex Workers in Latin America and the Caribbean build evidence on cases of violence and violation of our rights

E.E. Reynaga[1]
[1]RedTraSex, Buenos Aires, Argentina

Background: We understand HIV prevention from a comprehensive and universal health perspective and a rights-based approach. Women sex workers are subjected to acts of violence and discrimination, especially institutional violence exercised by the security forces that should protect us.

The context of quarantine in our countries has shown that there is no way to guarantee our rights, including the right to health, if there is no recognition of sex work as work.

Oral abstracts

Poster exhibition

E-posters

Late-breaker abstracts

Author Index

Description: RedTraSex designed and implemented a system for the collection of information on cases of rights violations against WSWs in 15 countries. Members of the organizations are responsible for searching for and documenting any rights violations that sex workers may have suffered and include the information in a standardized tool accessible through the Internet, which allows for an analysis of the situation by country, as well as aggregate analyses by sub-region or at the regional level.

Lessons learned: *Training for Empowerment.* The fact that we are sex workers who collect the information and interview the affected sex workers facilitates the approach with the victims and the delivery of the information.

We build evidence for advocacy and political communication. In 2021, we managed to collect 1,369 cases. A regional report was prepared and results were presented at national advocacy roundtables in each country to disseminate these results to key actors in government and civil society.

Conclusions/Next steps: *"We broke the HIV corset" for full access to rights and a life free of violence.* We do not only provide services but work comprehensively for our colleagues to dare stopping being spectators of reality and becoming lead actors in their lives. We stopped taking care of ourselves for others and developed a rights-based perspective, away from the "from the waist down" approach.

Moving towards the regulation of sex work is the key."It is time to unite so that we can defend ourselves and guarantee the rights of FSW (...) not only because we are professionals, but because we are women." (LC, Colombia).

EPF102
Strengthening crisis management cells to include emergency HIV-related services and care

V. Patil[1], V.R. Anand[1], S. Rawat[1], S. Parasher[1], T. Chopade[1]
[1]*The Humsafar Trust, Advocacy, Mumbai, India*

Background: LGBTQ+ communities are vulnerable to violence, blackmail, extortions and other threats including forced/gang rapes. Many LGBTQ+ victims do not seek legal recourse and emergency health care services for HIV prevention due to fear of stigma, shame, and lack of support/sensitization among law enforcers.

To combat this, The Humsafar Trust (HST)—an LGBTQ+ organization in Mumbai instituted a crisis center to support LGBTQ+ communities.

Description: The HST set up a crisis cell team in 2005 to assist LGBTQ+ individuals seeking health services and legal recourse following experiences of threats, violence including violence induced unprotected sex. This crisis cell comprised of field workers and admin support to document the cases.

With support from the district AIDS Control society, we analyzed 100 high crisis sites in Mumbai City. The field outreach staff identified crisis cases in these sites and linked them for immediate health and socio- legal services.

Lessons learned: Since the inception [April2005], over 2000 crisis cases are addressed. In the year 2021, a total of 12 cases of forced sex were provided with PEP services that resulted in averting HIV positive for 9 individuals. As part of the larger intervention, over 5000 police personnel were trained on legal challenges faced the LGBTQ+ communities.Emerging preventive methods such as administration of PEP especially to rape victims is an emergency HIV preventive measure not widely known or available to key populations. The LGBTQ+ community members need to be made aware about newer preventive measures to access emergency services.Ongoing sensitizations of police personnel is key towards ensuring safety, health, and wellbeing of LGBTQ+ individuals.

Conclusions/Next steps: Outcomes from this crisis cell reveal that existing HIV interventions must focus on integrating crisis redressal as a component within their programs for a holistic approach to ensure the health of vulnerable key populations.

Thus, the HST model of LGBTQ+ crisis management makes a compelling case to upscale this intervention model for emergency HIV prevention and enable other socio-legal services.

EPF103
Securing justice for women living with HIV who were sterilised at State Hospitals in South Africa

J.-L. Fredericks[1], S. Brion[2], C. Mkona[3]
[1]*International Community of Women Living with HIV, Human Rights, Cape Town, South Africa,* [2]*International Women Living with HIV, Human Rights, Florida, United States,* [3]*International Community of Women Living with HIV, Lilongwe, Malawi*

Background: In 2014, women living with HIV approached the International Community of Women Living with HIV (ICW) reporting that when accessing maternal or gynaecological services, they were sterilised without their informed consent at State hospitals. Although multiple human rights violations occurred, the pathway to ensure recognition of these violations and redress was not straightforward. ICW and their allies faced a lack of political will and a range of legal barriers.

To address this, ICW developed and implemented a strategic advocacy plan that included research, media engagement, awareness-raising, community education, and a quasi-legal process.

The execution of the strategy secured a successful outcome with the Commission for Gender Equality(CGE). In 2020 CGE released a report that both confirmed that women living with HIV had been sterilised against their will at State Hospitals due to their HIV status and made concrete recommendations to the government.

The evidence in the form of affidavits, the CGE report and sustained pressure from civil society resulted in the National Department of Health appointing an independent committee that is mandated to reach a mutual agree-

Oral abstracts

Poster exhibition

E-posters

Late-breaker abstracts

Author Index

ment on redress with the complainants. The independent committee and complainants are in the process of negotiating suitable redress packages.

Description: This presentation will describe the advocacy and legal strategies used to achieve justice for women living with HIV who experienced coerced or forced sterilisation at State Hospitals in South Africa.

Lessons learned: First, women living with HIV continue to face severe forms of discrimination within health systems at the hands of medical service providers. Second, *joint* strategic legal advocacy by women living with HIV and civil society organizations can produce dramatic changes in the government's willingness to provide redress and effect policy changes. Third, raising awareness about coerced sterilization and other forms of obstetric violence has encouraged more women to come forward. Fourth, the fact that these forms of discrimination occur is often denied and dismissed.

Conclusions/Next steps: The effort to confront and transform stigma and severe forms of intersectional discrimination experienced by women living with HIV in health care settings can benefit from utilizing quasi-legal entities to support demands for dialogue and processes for justice.

EPF104

The right to privacy for persons living with HIV: impact litigation and the judicial response

V. Njogu[1]
[1]*KELIN, Strategic Litigation, Nairobi, Kenya*

Background: Discrimination of persons living with HIV within the health care system and in employment spaces has resulted in high stigma. The decision to disclose HIV status in the context of employment remains at the sole discretion of the person living with HIV.

Description: KELIN undertakes impact litigation for redress for individual clients whose rights have been violated as well as secure lasting social change that secures the rights of persons living with HIV.

Through our litigation department, KELIN supported a woman whose private medical information, including her HIV status and the treatment she had been receiving, were disclosed to her insurance company and her employer, which resulted immense psychological suffering as well as in the termination of her employment.

Lessons learned: In 2020, the court made declarations affirming that the client's right to privacy had been violated by the insurer and the health facility when they disclosed the HIV status to her employer.

The client in this case was awarded a sum of money to be paid by both the hospital and the insurance company. The Court also made a determination that in limited circumstances, hospitals could disclose a patient's HIV status to an insurer including where the viral load was so high as to affect the costs of treatment or where HIV was the sole reason for the medical condition under treatment.

Conclusions/Next steps: This pronouncement made by the court in this case affirm in positive terms the rights to privacy of persons living with HIV, and set out reasonable limits where disclosure of the status of patients can be made to insurance companies by hospitals. We intend to educate persons living with HIV on the implications of this judgment to increase awareness of their rights as they seek health care services in private medical facilities.

EPF105

Human rights defenders at risk: inequalities in access to mechanisms for reporting human rights violations in eleven Latin American countries

A. Cano[1], O. Ramirez[2], F. Vargas[3], M. Vera[4], B. Chete[5], J. Argueta[2], L.G. Flores[6]
[1]*ALEP, Managua, Nicaragua,* [2]*ALEP, San Salvador, El Salvador,* [3]*Alep, Quito, Ecuador,* [4]*ALEP, Bogotá, Colombia,* [5]*ALEP, Guatemana, Guatemala,* [6]*AIEP, Piura, Peru*

Background: The grant in Latin America, financed by the Global Fund to Fight Tuberculosis, Malaria and HIV, led by the Alianza Liderazgo en Positivo y Poblaciones Clave consortium, during 2020, implemented research to review the mechanisms for the interposition of denounce and their variables in the region for people with HIV and key populations.

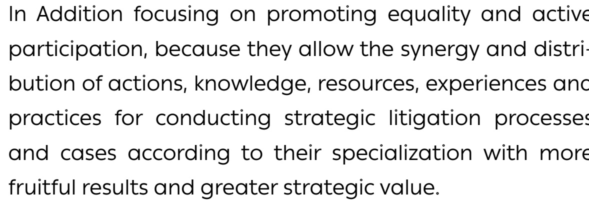
Methods: For the review of the existing mechanisms for filing denunciations in the region and their variables, the main instrument for collecting information was an online questionnaire. The design was made for key populations, people with HIV, key actors, representatives of human rights defenders, leaders and regional secretariats of networks of people with HIV and key populations. Interviews and focus groups were also applied.

204 surveys were applied, although not all were completed. Therefore, only 108 surveys were analyzed, 32 people interviewed and 4 participants in a focus group.

Results: Among the most alarming findings is that only 4 out of 10 people surveyed know how the mechanisms for filing denunciations operate; 3 out of 10 people surveyed do not know; and 2 out of 10 people surveyed have a negative perception of the operation of these mechanisms for reporting human rights violations.

In terms of accessibility and response to the needs of the population, 7 out of 10 people state that the mechanisms are only present in the city. 4 out of 10 people mention that they have virtual spaces to facilitate access to the rural population. 1 out of 10 people considers that the gender perspective and cultural adaptation have been incorporated.

Conclusions: The participation of civil society in defense mechanisms for filing denunciations and reports of human rights violations against people with HIV and populations in situations of vulnerability should be strengthened as joint regional initiatives.



In Addition focusing on promoting equality and active participation, because they allow the synergy and distribution of actions, knowledge, resources, experiences and practices for conducting strategic litigation processes and cases according to their specialization with more fruitful results and greater strategic value.

Stigma and key populations

EPF106

Stigma and discrimination experienced for reasons other than HIV status among Key Populations (KPs) living with HIV in Uganda

P. Nanyanzi Luzige[1], S. Kentutsi[2], D.B. Ndagire[1]

[1]National Forum of PLHIV Networks in Uganda (NAFOPHANU), Programmes, Kampala, Uganda, [2]National Forum of PLHIV Networks in Uganda (NAFOPHANU), Management, Kampala, Uganda

Background: In 2019, NAFOPHANU implemented the People Living with HIV Stigma Index (SI) survey in 9 regions of Uganda. The survey explored stigma among key populations, mental health, resilience and coping mechanisms despite HIV stigma. The goal of survey was to estimate the prevalence of HIV related stigma and discrimination among the PLHIV with an aim to develop evidence-based responsive strategies. The KPs specific objective was to describe how different groups are affected by HIV related stigma especially the key populations.

Description: The SI introduced a concept of double stigma key population face because of belonging to some groups as well a second form of stigma associated with living with HIV. A total of 1398 respondents, 874 (62.47%) females and 524(37.46%) males participated in the second national PLHIV Stigma Index survey. 423 (20.36%) belonged to a KP category (sex workers, PWUID, gay, transgender and MSM). Within the KP category, non- HIV related stigma and discrimination was almost six times more than the HIV related stigma compared to the general population. Discriminatory remarks or gossip about the PLHIV were the commonest non-HIV stigma discriminatory experiences within among all the groups e.g. transgender at 33.65%, MSM at 24.24%, gay homosexual at 16.67%, gay lesbian at 39.39%, sex workers at 28.78 and PWUID at 28.92%. This data confirms the concept of double stigma-that KP face both sex/work-oriented stigma in addition to HIV related stigma and implies the need to deal with both.

Lessons learned: Within the KP categories, non- HIV related stigma and discrimination is almost six times higher than the HIV related stigma. Discriminatory remarks or gossip about the PLHIV were the commonest non-HIV stigma discriminatory experiences within and among all the groups. The opportunity to reach these groups is quite huge as the proportion of those who belong to a support group is high, therefore interventions should target the groups with relevant information and support.

Conclusions/Next steps: The study confirmed double stigma that KPs face; both sex-oriented stigma as well as HIV related stigma and implies the need to deal with non- HIV related stigma for this group as a priority.

EPF107

Internalized and enacted stigma linked to depression and reduced health-related quality of life in the Stigma Index 2.0 survey in Indonesia

A. Rahadi[1,2], D. Devika[2], D. Marguari[3], R. Hidayat[3], J. Gentar[2], T. Salim[3], E. Sukmaningrum[2], R. Magnani[2,3], I. Irwanto[2]

[1]University of Illinois at Chicago, Health Policy and Administration, Chicago, United States, [2]UCoE AIDS Research Center Atma Jaya Catholic University, Jakarta, Indonesia, [3]Spiritia Foundation, Jakarta, Indonesia

Background: HIV stigma can manifest itself in discriminatory behaviors enacted against people living with HIV (PLHIV) or internalized negative feelings. Both can compromise health.

In this study, we examined the correlates of HIV stigma and its impact on anxiety/depression and health-related quality of life (HRQoL) from the Stigma Index 2.0 survey conducted in Indonesia.

Methods: From June to December 2019, we surveyed 744 adult PLHIV in 11 districts across the country. The standard Stigma Index 2.0 questionnaire was used to document experiences of stigma. Counts of stigmatizing behaviors that PLHIV experienced in the household, community, and health care settings were used to quantify enacted stigma and factor analysis was conducted to confirm the reliability of the latent construct underlying internalized stigma (α=0.78). Anxiety/depression was assessed using the Patient Health Questionnaire-4 with four grades of severity from minimal to severe. Respondents self-rated HRQoL using EQ-5D-5L from which an index was computed where a maximum score of 1 indicates perfect health. Regression with survey design adjustments was used to estimate the correlates in the correct distributional form for internalized stigma (Gaussian), enacted stigma (negative binomial), anxiety/depression (ordered logistic), and HRQoL index (beta).

Results: Respondents averaged 35 years of age (range: 19-72 years) of whom 92% were on antiretroviral treatment, and nearly one-third were female. Factor analysis supported the latent construct of internalized stigma from six response items, which was used in regression analyses. Age, time since HIV diagnosis, and current enrolment in antiretroviral treatment were associated with internalized and enacted stigma (P<0.05). No other correlates were found, including membership to a key population. The adjusted odds of more severe grades of anxiety/depression increased by 60% and 28% respectively with internalized and external stigma (P<0.001). Decrements

in HRQoL index were 0.022 and 0.015 for internalized and enacted stigma, respectively, in the adjusted analysis (*P*<0.05).

Conclusions: Key populations in Indonesia face a similar likelihood of experiencing internalized and enacted HIV stigma, which in turn elevates anxiety/depression and diminishes HRQoL. These findings add to the evidence for targeting elimination of HIV stigma or mitigating its negative health effects through HIV programming.

EPF108

HIV treatment and hepatitis B, C within the center for harm reduction from substance abuse to increase access to inspections - treatment of drug users

N. Kanerat[1]
[1]*APASS Thailand, Program, Sathorn, Thailand*

Background: Because it was found that drug users dropped out of the HIV, AIDS, hepatitis B, C treatment system in government services. For reasons, the government service system takes a long time to maintain. Some services have unfriendly services. Drug users are often stigmatized. discriminated against and restrictions on the travel of substance abusers.

Description: APASS organizes testing and treatment services for HIV, AIDS, hepatitis B, C in the Center for Harm Reduction from Drug Abuse. in Bangkok Capital of Thailand since 2021 by developing a model and service management mechanism which is the cooperation of doctors and nurses to perform examination and treatment within the Center for Harm Reduction from Substance Use and Substance Abuse Volunteers public relations function Prepare service recipients, including follow-up and give advice during examination-treatment.

Lessons learned: The result of the provision of examination and treatment services within the Harm Reduction Center was that substance abusers were more interested in receiving services in DIC than hospital admissions, and reduced the ratio of those who received intermittent treatment because there was no cost. pay take less time And there is no concern about stigmatization.

In 2021, it can provide services to drug users as follows:
Access to ___206___ drug users
HIV test,____66___ persons
Test for hepatitis B, Cof ___93____ persons
undergoing treatment for hepatitisof ___20_____ persons
to fill in the number of other services
Drug users infected with COVID-19 taken care of and referred for treatment and have better prospects for accessing our support services.

Conclusions/Next steps: The key findings from the operation were the provision of testing and treatment services for HIV, AIDS, hepatitis B, C. within the Center for Harm Reduction from Substance Abuse As a result, substance abusers are able to receive services in a familiar setting and a friendly environment, including arranging a pre-treatment process and counseling during treatment. by drug users volunteers who have experience to undergo examination-treatment

This helps them to understand their concerns and to provide better advice about the effects during treatment for substance abusers.

EPF109

Influence of boarding secondary school environment on HIV positive students in South Western Uganda

B.R. Kihumuro[1], V. Mubangizi[1], D.J. Muganzi[1], E.G. Wandira[1], R. Alinaiswe[1], J.J. Nanyunja[1], R. Kugumisiriza[1], P. Alele[1]
[1]*Mbarara University of Science and Technology, Faculty of Medicine, Mbarara, Uganda*

Background: Human Immunodeficiency Virus (HIV+) positive adolescents have increased in number since the 1980s. The ability of these students to cope with their academic and healthcare needs while living in a boarding school has been qualitatively unknown. This research investigation is to explore the experiences of HIV+ students surrounding their adherence to antiretroviral therapy.

Methods: A qualitative study that employed in-depth interviews amongst purposively selected 19 HIV positive adolescent students in boarding secondary school and 7 key informants was conducted. Key informants were members of the boarding secondary school staff directly taking care of the HIV+ students and had spent at least two academic terms in that school.

The study participants were recruited from four health facilities in Bushenyi, southwestern Uganda, and key informants from five boarding secondary schools in Bushenyi. Interviews lasted 30 to 40 minutes and were guided by an interview guide. Data was transcribed, coded and the content analyzed thematically.

Results: HIV+ adolescents in boarding secondary school have similar challenges to those outside boarding school settings; however, some are unique to them. They have numerous barriers to their adherence to medication and experience stigmatization in its different forms. Limited disclosure of the student's sera-status was beneficial to the students since it guaranteed support while at school; thus, facilitating adherence and better living. However, students were uneasy to disclose their status and some adopted negative coping mechanisms such as telling lies, escaping from school, and class to access medication and rationalization among others.

Conclusions: Adolescents in boarding secondary schools face similar challenges as compared to their counterparts with some being unique to them. These challenges need to be addressed and a safe environment to encourage limited disclosure should be made.

EPF110

Leading the challenge: lessons learned on HIV/AIDS advocacy and partnership programs of a local university

J. Tayaben[1]

[1]*Benguet State University, College of Nursing, La Trinidad, Philippines, the*

Background: The Benguet State University, Benguet, Philippines started in 2016 to advocate adolescent health programs and advocacy lectures, a school community-led interventions to address HIV/AIDS stigma, misconceptions and young key populations (students and LGBTQ+ groups) both in higher and secondary education and out-of-school youth in partnership with the Commission on Population and Department of Health in the province.

Description: The increasing cases of HIV/AIDS from 23 in 2016 to 104 last year prompted the nursing faculty to facilitate and continuously conduct orientations at the start of school year in the University, training for peer educators and teaching faculty, including capacitating secondary education teachers on how best approach in facilitating discussions on HIV/AIDS with their students.

This program hoped to contribute to eliminating inequality and eliminating HIV- related misconceptions, stigma and discrimination.

Lessons learned: Based on observations and evaluation of the activities conducted from 2016 to 2020, though the advocacy lectures increased their knowledge on basic HIV/AIDS, prevention and management, and value the consequences of risky behaviors, the problem lies on how they share their learnings with their colleagues and peers. Capacitating adult and young learners especially teachers are quiet challenging among non- health practitioners and even students. A partnership model program with the local health authorities and student's groups launched to strategize how different stakeholders coming from various key institutions and interest groups will help in the advocacy.

Through curriculum integration of HIV/AIDS in different degree programs and conduct series of orientation in partnership with the Gender and Development Office in the University for funding helped to sustained the programs.

Conclusions/Next steps: With the increasing HIV/AIDS cases in our locality and despite of restrictions due to pandemic, we are leading the challenge to continuously promoting and conducting the HIV/AIDS advocacy programs with trained and committed facilitators in the University, and the student interest groups who always partner with us.

This presentation will put premium also on the partnership model used in this advocacy and highlights the best practices given the clients (young key populations and teachers) are coming from diverse occupations, ideals, cultures, and multi-linguistic backgrounds in preventing stigma, discrimination and eliminating misconceptions.

EPF111

Social stigma, discrimination, and its determinants among people living with HIV and AIDS in Sudharpaschim province, Nepal

S. Kakchapati[1], S. Chaudhary[2]

[1]*HERD International, Research and Evaluation, Kathmandu, Nepal,* [2]*Nobel College, Public Health, Kathmandu, Nepal*

Background: From the start of the AIDS epidemic, stigma and discrimination have exacerbated the transmission of HIV and greatly increased the negative impact associated with the epidemic. HIV-related stigma and discrimination continue to be manifest in every region of the world and every age group, creating major barriers to preventing further infection, alleviating impact, and providing adequate care, support, and treatment. HIV-related stigma and discrimination adversely affect the health, quality of life, social support, and well-being of people living with HIV/AIDs (PLWHA).

This study assessed the perceived stigma and discrimination and its determinants among PLWHA in the Sudharpaschim province of Nepal.

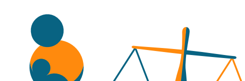
Methods: This study adopted a cross-sectional survey in 2020 to sample 167 PLWHA using a semi-structured questionnaire. Information about sociodemographic characteristics, stigma domain, and discrimination domain was obtained through face-to-face interviews. Ethical clearances were obtained from the Institutional Review Committee of Nepal Health Research Council. Bivariate and multivariate logistic regression models were used to identify the factors associated with perceived stigma and discrimination among PLWHA. R program was used for statistical analysis and creating graphs.

Results: The overall stigma and discrimination was 70% and discrimination was 34%. In the multivariate logistic regression, age [AOR=2.42 (95%CI:1.04-6.62; p-value=0.009], male gender [AOR=1.09(95%CI:1.03,1.15; p-value <0.001], high level of public health concerns [AOR = 12.9 (95% CI: 8.9-37.5; p-value <0.001)], high level of negative self-image [AOR = 10.3(8.8,39.6); p-value <0.001)] were factors significantly associated with higher perceived stigma.

Similarly, female gender [AOR=15.4(95% CI:8.2-35.3) p-value <0.001] and high level of perceived community support [AOR = 8.86 (95% CI: 3.86-32.1; p-value <0.001)] were factors significantly associated with higher perceived discrimination.

Conclusions: The study revealed that HIV-related stigma and discrimination remain ubiquitous and epitomize a core facet of the experiences of PLWHA in Nepal. Stigma and discrimination remain pervasive among PLWHA in this province and most emanate from communities, presenting negative impacts on PLWHA.

Unprecedented measures to enhance the awareness of the PLHIV, their families, and their community about perceived stigma and associated factors are needed to reduce stigma and achieve the commitments of Fast-Tracking towards ending the AIDS epidemic.



EPF112

Experience of stigma and discrimination in health care setting by HIV-positive adolescent girls in Ukraine

Y. Basarab[1], Y. Lopatina[1], S. Moroz[2], A. Żakowicz[3]
[1]AIDS Healthcare Foundation, Kyiv, Ukraine, [2]CO ,Positive Women', Kyiv, Ukraine, [3]AIDS Healthcare Foundation Europe, Amsterdam, Netherlands, the

Background: In 2020, there were an estimated 3,412 people under the age of 18 who live with HIV in Ukraine. The objective of this study was to explore the needs of HIV-positive girls aged 14-18 that live with HIV in Ukraine and analyze if they face HIV-related stigma and discrimination in health care units.

Methods: The cross-sectional study included 250 respondents from 14 regions of Ukraine aged 14-18. Interviews were conducted by trained peer researchers between December 2019 and February 2020. Quantitative and qualitative methods were used. 15 individual girls participated in in-depth interviews.

Results: Majority of the girls experienced respectful and supportive attitude in health care settings (66%), however, 34% of respondents reported rude or biased attitude from health workers. Prejudice in health care units were noticed by 40 girls (16%), isolation in separate rooms during hospitalization were seen in 12% cases, HIV status was disclosed by healthcare workers in 7% cases without girls' permission, 16 girls (6%) did not receive medical care when requested for. Young girls lacked trust in doctors when talking about sexual health, one in five respondents were not able to talk to their doctor about sexual health and needs. Results of in-depth interviews showed that girls were experiencing stigma among their relatives, who forbade girls talking about their status to friends and restricted communication. Only a third of girls knew their rights and where to turn for help in case of any violations, and less than half could rely on receiving legal protection.

Conclusions: This was the first study that investigated the needs of girls living with HIV in Ukraine in relation to attitudes in medical care. The study highlights the need to improve the attitudes towards adolescents who live with HIV at healthcare settings and increase HIV awareness at healthcare settings in general.

Sexual and reproductive health topic was seen by the girls as an area requiring improvement during consultations. Issues related to disclosure and need for legal assistance for the girls and their families were identified.

EPF113

Experiences of MSM and transgender women in accessing healthcare services from public hospitals: a qualitative study from India

B. Mohan[1,2], K. Ranade[3], S. S[4], S. Nair[3], U. Das[5], A. Nuken[6], R. Gaikwad[7], S. Rawat[1], M. Shunmugam[2], R. Nelson[2], V. Verma[5], C. Das[5], V. Chakrapani[2]
[1]The Humsafar Trust, Research, Mumbai, India, [2]C-SHaRP, Research, Chennai, India, [3]Tata Institute of Social Sciences, School of Social Work, Mumbai, India, [4]Madras Medical College, Chennai, India, [5]National AIDS Control Organisation, New Delhi, India, [6]International Centre for Research on Women, New Delhi, India, [7]AiM Institute, Mumbai, India

Background: Stigma and discrimination have been shown to reduce access to health services for sexual and gender minorities. This study was aimed to explore the experiences of MSM and TGW in accessing healthcare, including HIV services, in public healthcare facilities in two metros in India.

Methods: This qualitative study was conducted in January-June, 2021 among a purposive sample of MSM and TGW accessing healthcare services from public hospitalsin Chennai and Mumbai in India.

We conducted a total of 12 focus group discussions (FGDs) with MSM and TGW, including two FGDs with MSM living with HIV. Key informant interviews with 3 health care providers and 4 community leaders were also conducted. Data were explored using a combination of framework analysis and grounded theory analytic techniques to identify key themes.

Results: A total of 37 MSM (median age 31) and 38 TGW (median age 29) participated in the FGDs. Among them, 40.5% MSM and 10.5% TGW were PLHIV, and 35.1% MSM and 63.2% TGW engaged in sex work. Some facilitators of healthcare access identified were the availability of free antiretroviral treatment and quality counselling by some community-friendly counsellors. However, several layers of stigma/ discrimination were identified as well: odd stares at TGW, verbal abuse, body shaming, and sexual harassments from the hospital staff and co-patients.

These incidents were more commonly reported by TGW and*Kothi*- identified MSM (feminine/receptive role). TGW expected free or affordable gender-affirmative hormone therapy and gender-affirmative surgeries to be provided with minimal waiting time, which are currently considerably delayed due to bureaucracy/paper work in the hospital.

Conclusions: Stigma experiences could delay or prevent access to healthcare services, or reduce the perception of service quality in public hospitals.

The findings from this study will be used to inform designing theory-driven multi-level stigma reduction interventions to reduce stigma/discrimination faced by MSM and TGW in public health care settings.

A qualitative study on the stigma experienced by HIV/AIDS positive students in the urban schools of Uganda: a case of Wakiso, Kampala and Mukono districts

S. Nanseko[1], F.I. Igaga[2]
[1]Case Clinic, Counselling, Kampala, Uganda, [2]Inter City Medical Centre, Surgery, Kampala, Uganda

Background: An estimated 150,600 children are living with HIV in Uganda today. More than 27,000 children are estimated to be born with HIV, 50% of whom will die before their second birthday. There are about 76,000 children who urgently need ARVs in the country, but cannot readily obtain them. Only 28% of the eligible HIV-positive children are on antiretroviral therapy. Even the few who start treatment later stop taking the drugs.

This study set out to explore the major cause for the abandonment of ARVs by HIV positive school going children in Uganda.

Methods: A sample of volunteers (N=400) of HIV/AIDS infected students was taken from 50 schools in Wakiso, Kampala, and Mukono districts of Uganda. Requests seeking for a meeting/interview were sent to these volunteers through their counselors. Each of the volunteers was given a questionnaire that they completed in the presence of the researcher. These volunteers were both day and boarding students.

The questions were focused on; access to ART/Vs, caretakers knowledge of serostatus, disclosure to school administration or peers, continued taking of ARVs while at school. School nurses (n=50) were also interviewed on why students didn't want to disclose, and w the effects of non-disclosure to the students that were found HIV/AIDS positive.

Results: Of the n=400, 90% indicated that they had not disclosed and the main reason for none disclosure was fear of stigma/discrimination from fellow students.

Of the 90%, 50% were not sure whether if they disclosed to the school administration, their status would be kept confidential. 50% preferred taking their medication in secret or stopping altogether for fear of stigmatization from their fellow students. 40 out of the 50 nurses had witnessed students with health-related complications i.e. depression and drug resistance as a result of student abandonment of ARVs.

Conclusions: Even with the existence of a government policy to combat stigma in schools, the vice is still rife. HIV/AIDS positive students rarely disclose their serostatus. Even student caretakers fail to disclose to the school administration, all because of fear of stigma and/discrimination. Therefore, there is a need to push HIV/AIDs awareness and fight stigma in school.

EPF115

Healing together through common threads©: combatting trauma and stigma for better health outcomes

M. Cameron[1], V. Johnson[2], K. Parkinson[1]
[1]International Community of Women Living with HIV North America, Washington, United States, [2]Ribbon, Washington, United States

Background: The goal of Healing Together, which is an authorized adaptation of Common Threads© is to create a Community of Storytellers to Combat HIV-Related Stigma and Improve Health through Adherence is a community-informed, evidence-based home-grown intervention. This three-stage, small group peer-led HIV training addresses social determinants of health as an integrated health, vocational development, and prevention intervention over 6 one-hour sessions.

Healing Together/Common Threads will reduce stigma, increase social and health support, and decrease isolation for women living with HIV.

Description: Many WLH are plagued by stigma, inequality, and other factors. Women who have had traumatic life experiences are disproportionately vulnerable to acquiring HIV and prematurely dying from complications arising from HIV, substance use, and violence. The reasons for this inequality are complex. Healing Together/ Healing Together/Common Threads provides an avenue for women living with HIV to overcome these issues. Due to the sensitive nature of these sessions, any information disseminated more broadly is limited to anonymous demographic information, overall success, and testimonials (with participant consent).

Lessons learned: For Programmatic Outcomes, we offer culturally appropriate education that helps reduce stigma, combat common myths about HIV/AIDS, and break down barriers between communities and service providers.

We collect information from participants at registration, 3 months, and 6 months and one year. This helps us understand both the immediate and long-term impact of the program on participants.

Survey data is analyzed quantitatively to first generate descriptive statistics of variables at each time point. We then use analytic methods appropriate for repeated measures research designs to understand how variables change over time. For notes and text, data is analyzed qualitatively to identify challenges and strengths as well as other common themes across discussions.

Conclusions/Next steps: We will continue to work with networks and providers to further expand the program to more women and communities affected by HIV. We also believe that the outcomes of our work will be of interest to the community of HIV researchers interested in improving lives for women living with HIV. We will work with our academic partners to write scientific manuscripts, manuscripts designed to describe practitioner's experiences, and present our work at scientific conferences.

EPF116

Hear us, see us, respect us: respecting the expertise of people who use drugs

S. Patten[1], N. Touesnard[2]
[1]San Patten and Associates, Halifax, Canada, [2]CAPUD, Halifax, Canada

Background: Harm reduction organizations, through their advocacy and activism, have worked to address the overdose deaths, blood-borne infections, and other health and social related harms facing people who use drugs (PWUD). The Canadian Association of People Who Use Drugs (CAPUD) identified the need for more tools and resources on how best to include PWUD in the program and policy decisions and to equip ally organizations to better include PWUD in meaningful, engaging, and equitable ways.

The few guiding documents that exist to provide guidance on these issues were created by large institutions and not by and for PWUD.

Description: This policy document identifies practices that can be used by governmental agencies, non-governmental agencies, research institutions, academics, and community-based organizations who serve PWUD. This report defines standards for proper engagement of PWUD, as defined by PWUD across Canada. This report not only provides a solid evidence base from which to advocate for better inclusion in programs, policies, protocols, and initiatives, and a framework for organizations to reflect on and adapt their own policies, practices and structures to meet the needs of those they seek to engage and empower.

Lessons learned: Some of the best practice recommendations to ensure that PWUD feel feel valued and respected:

- Acknowledge the unique expertise that PWUD bring from drug use culture, and draw from that expertise to educate other staff, managers, and community members
- Acknowledge that PWUD are often hired because of their intimate connection to the PWUD community and their knowledge of the local drug using culture. Thus, it is contradictory to penalize PWUD workers when these relationships enter the workplace context
- Extend your harm reduction philosophy to your own employees and normalize the culture of drug use
- Recognize the trauma, grief, stress and potential burnout for their staff, and provide genuine emotional and psychological supports for PWUD workers

Conclusions/Next steps: The practices recommended in this document have been developed through extensive collaboration with PWUD to ensure these recommendations are grounded in the perspectives, voices and experiences of PWUD and to create equitable spaces that consider individuals' physical, emotional, mental, and spiritual needs that recognize and respect drug culture.

Mistreatment experiences among sexual and gender minorities in Brazil: the burden of racism for Blacks

L. Freitas[1], T.S. Torres[1], D.R.B. Bezerra[1], L.M.S. Marins[1], B. Hoagland[1], V. Veloso[1], B. Grinsztejn[1], P.M. Luz[1]
[1]Fundação Oswaldo Cruz, Instituto Nacional de Infectologia Evandro Chagas, Rio de Janeiro, Brazil

Background: Sexual and gender minorities (SGM) are exposed to recurring marginalizing experiences, which have a negative impact on their health. Moreover, mistreatment may stem from other axes of inequality, such as from race or social class, intersectionally.

We assessed differences in the frequency and reasons for the experiences of mistreatment among Brazilian SGM and explore how race, one axis of inequality, influences the interpretation of mistreatment.

Methods: Cross-sectional online study among SGM ≥18 years living in Brazil recruited on social media (Facebook/Instagram) and dating apps (Grindr/Hornet/Scruff) between November/2021 and January/2022.

We used the 18-item Explicit Discrimination Scale (EDS) which assess experiences of day-to-day mistreatment with possible response options: Never [0], One/two times [1], Many times [2], Always [3].

Scores were calculated by summing all 18-items (range 0-54, higher scores=more experiences of mistreatment). Additionally, for each of the 18-items, participants were asked to indicate the main reason for mistreatment.

Results: Of 8464 SGM, 4961(58.6%) were White, 2174(25.7%) Pardo (Mixed-Black) and 1024(12.1%) Black. Mean age was 37.1 years, 98% were cisgender men, 74% had college education.

EDS scores (mean, standard deviation) were higher among Black SGM (11.3,8.4) [Pardo (8.1,6.8), White (6.7,5.9)]. Black SGM reported more mistreatment in health care (19%, White 11%, Pardo 13%) and physical violence (18%, White 11%, Pardo 13%).

Across the 18-items, Black SGM reported their skin color/race as the main reason for mistreatment in 15 items. In contrast, sexual orientation or social class were selected as the main reason for mistreatment among White and Pardo for all items, except for perceived mistreatment in affective relationships among White (being overweight; Figure).

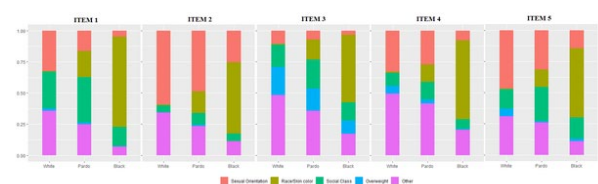

Figure: Distribution of the main reason for mistreatment among participants who reported mistreatment for 5 of the 18 items by race. Item content: item 1: "While at government agencies, such as registry offices, traffic departments, water, electricity, sewage companies or other, have you ever been treated in an inferior manner compared to other people?", 2: "Have you ever been physically assaulted by policemen, security guards, unknown people or even acquaintances without giving reasons for that?", 3: "While trying to date somebody, have you ever been treated with contempt, without having given reasons for that? Consider only situations in which you were treated worse compared to others that also tried to date with this person.", 4: Have you ever taken part in a selection process for a job in which you were rejected despite seemingly having the best qualifications among all candidates?", 5: "While visiting health centers, hospitals or other health services, have you ever been treated in an inferior manner compared to other people?"

Figure.

Conclusions: In Brazil, a setting that severely mistreats and discriminates SGM, we found that Black SGM experience higher mistreatment than other races. Moreover, racism, rather than homophobia, was perceived as the main reason for the mistreatment among Black participants.

EPF118
Using the beauty pageant to fight HIV stigma and discrimination in Uganda

D. Harvey[1], N. Marjorine[2], S. Timothy[1], L. Robinah Elizabeth[3], S. Hamza[4], P. Mugenyi[5], C. Mubanga[6,7], K. Kenny[8], L. Agaba[9], N. Rubuna[10], B. Godfrey[11]
[1]African Young Positives Network, Programs/Field Officer, Kampala, Uganda, [2]Uganda Network of Young People living with HIV, Y+ Ambassadors, Kampala, Uganda, [3]Reach A Hand Uganda, Programs, Kampala, Uganda, [4]Reproductive Health Uganda, Youth Office, Kampala, Uganda, [5]African Young Positives Network, Programs/Field Officer, Kamapala, Uganda, [6]FHI- 360 Zambia, Client Experience Associate TQLA, Lusaka, Zambia, [7]UNAIDS, UNAIDS PCB, Lusaka, Zambia, [8]African Young Positives Network, Head of Programs, Kampala, Uganda, [9]Uganda Network of Young People living with HIV, Mr. Y+ 2021-2022, Kampala, Uganda, [10]Uganda Network of Young People living with HIV, Miss Y+ 2021-2022, Kampala, Uganda, [11]Population Services International - PSI, Youth Office, Kampala, Uganda

Background: The Y+ Beauty pageant by Uganda Network of Young People Living with HIV and supported by African Young Positives Network, GNP+, UNAIDS, PATA, Y+, The PACT, to mention a few, is a unique model campaign promoting beauty with "Zero Discrimination" fighting stigma and discrimination against young people living and affected with HIV. The pageant takes place annually and builds a brand of Y+ ambassadors to re-echo their voices and change the perception that comes with living with HIV and AIDS.

The Y+ model turns around stigma into pride to promote inclusiveness and acceptability of HIV+ persons in society and focuses on beauty and not on the challenges the young people living with HIV face. It creates a platform of learning and showing communities their (inner) beauty and therefore enables YPLHIV to become champions in the fight against stigma and discrimination.

Description: The Y+ Beauty Pageant is a national campaign carried out across Uganda that attracts all YPLHIV. It also attracts different stakeholders such as community leaders, Members of Parliament, government officials working with young people, relevant civil society organizations promoting the fight against stigma, media, religious institutions/leaders and international funding organizations supporting youth-related programmes for YLHIV.

Specific Results

1. 1235 young persons living with HIV reached
2. 98 partnership registered
3. 1,035,000 people reached
4. 10,201.687 people reached on social media

Lessons learned:

1. *Use new ways to communicate about HIV.* The Y+ Beauty pageant has become a national look at the event that attracts representatives of heads of state (ambassadors), ministries, and key other players. We have used this as an opportunity to reach more people where we couldn't have.
2. *Stigma and discrimination are still rampant.* Through the different engagements, there is a need to make leaders understand HIV and they play their part. This will, in turn, lead to more awareness.

Conclusions/Next steps: HIV-related stigma continues to exist in Uganda and Africa in general. Therefore, continuous efforts must be done to ensure that leaders and communities are made aware of HIV.

This, will in turn make it easy to draft meaningful campaigns that promote HIV/AIDS awareness and prevention.

EPF119
The involvement of drug users in advocating for the improvement of their legal and social environment: the example of the Phoenix Group

J. Atta Kobenan[1], C.A. N'Dri[2], A. De Saporta[3]
[1]Centre International d'Études de Développement Local - Université Catholique de Lyon, Sciences Sociales, Lyon, France, [2]Université Houphouet Bouagny, Sociology, Abidjan, Cote D'Ivoire, [3]Sciences Politiques, Toulouse, France

Background: Since 2015, Médecins du Monde (MdM) has been implementing a harm reduction (HR) program for drug users (DU) in Abidjan. An advocacy componentisdeveloped to improve the legal and social environment forDUand the respect of their rights. Improving these elements would also contribute to improving the health situation ofDU, a key population for HIV and tuberculosis.

According to the principle of "nothing aboutDUwithoutDU" and in line with the program's community and empowerment approaches, MdMhas promoted the creation in 2019 of an advocacy group called the Phoenix Advocacy Group (GPP), made up ofDUor ex-DU.

Methods: The objectives of the group are:

- To allow DU to position themselves as credible interlocutors to defend their rights and influence decisions with decision-makers;
- To present HR and the situation of DU to decision-makers and otherstakeholders
- To obtain from the authorities and other key actors their involvement in the promotion and protection of the human rights of DU.

For this, in conjunction with the MdM advocacy officer:

- 15 DU were selected
- Group members have been reinforced on advocacy techniques and human rights
- An annual action plan is developed
- Bimonthly meetings are organized to monitor activities

Results: At least one member of the group systematically takes part in the advocacy meetings organized by MdM with the administrative and institutional authorities.

In particular, the group played an important role in the process of adopting the new Ivorian law on the use of drugs (more favorable to the HR approach) which will be adopted in 2022.

Thus, their speeches during 3 awareness-raising workshops with deputies, 1 with senators and 2 with magistrates were essential in the consideration by these actors of the obstacles faced by DU in their accesstocare, respect for their rights, etc. and their adherence to the project and the law.

Conclusions: The establishment of the GPP has enabled DU to take an active part in advocacy actions aimed at improving their living conditions and to significantly influence decision-making that concerns them.

EPF120

Breaking silence: understanding administrative inclusion of LGBTQIA+ employees at Indian healthcare facilities and its impact on HIV/AIDS

L. Arora[1], P.M. Bhujang[2], C.K. Vasudevan[1], B. Maheshwari[1], A. Ukarande[1], D. Gohil[1], S. Shaikh[3]

[1]YR Gaitonde Center for AIDS Research and Education, Chennai, India, [2]Sir H. N. Reliance Foundation Hospital and Research Centre, Mumbai, India, [3]The Johns Hopkins University School of Medicine, Baltimore, United States

Background: Lesbian, Gay, Bisexual, Transgender, Queer, Intersex, Asexual and others (LGBTQIA+) employees in hospitals encounter several incidents of hidden and explicit discrimination. Literature shows that workplace discrimination also has an impact on organizational commitment, organizational self-esteem, job satisfaction, satisfaction with opportunities for advancement, intentions for turnover, overall career commitment, patient satisfaction and patient retention. A huge research gap exists in studying the experiences of LGBTQIA+ employees in Indian hospitals.

This qualitative exploratory study aimed to explore the experiences of discrimination faced by LGBTQIA+ employees, administrative policies associated with diversity and inclusion and its association with HIV/AIDS.

Methods: Twenty two in-depth interviews of self-identified LGBTQIA+ employees and cis-gender heterosexual administrators were conducted in public, private and trust hospitals of Mumbai and Delhi cities between March 19 and May 2019 and the data was analyzed thematically. Secondary data was analyzed through existing strategic human resources management policies.

Results: 'Discrimination' emerged as the central theme with silence, stigma and violence and administrative policies and practices as core themes. Most of the administrators were ignorant about LGBTQIA+ spectrum and viewed them as a homogeneous group posing explicit (public facility) or implicit (private facility) discrimination.

Mumbai based hospitals were found to be more sensitized with stereotypes in certain departments like Orthopedics and Gynecology.

There were no separate HR department in public hospitals, consideration for social acceptability in trust hospitals and accreditation requirements in private hospitals while considering LGBTQIA+ inclusive policies and practices.

Most of the LGBTQIA+ employees, including doctors and nurses, gave an affirmative response that an inclusive hospital environment can foster HIV/AIDS sensitization among co-employees as well as patients. Healthcare providers also responded that this has the possibility for enhanced HIV testing and treatment adherence.

Conclusions: Further, quantitative research has to be proposed for testing this correlation. Policymakers and executives' accountability rests in better enforcement of ratified human rights treaties and laws, designing inclusive labor laws and health policies and reforming education curricula.

Hospital administrators have to be accountable for implementing inclusive policies and practices and creating non-discriminatory environment for LGBTQIA+ employees which can also reduce the stigma, increase HIV/AIDS testing and adherence in an integrated approach.

EPF121

Factors associated with transphobia among travestis and transgender women in Rio de Janeiro, Brazil: results from an open, prospective cohort

L. Razek[1], R. Henry[2], E.M. Jalil[3], R.K. Friedman[3], M. Derrico[3], B. Fernandes[3], I. Moura[3], V.G. Veloso[3], B. Grinsztejn[3], B.D. Thombs[2], P.M. Luz[3]

[1]McGill University, Montreal, Canada, [2]McGill University and Jewish General Hospital, Medicine, Montreal, Canada, [3]Fundação Oswaldo Cruz, Instituto Nacional de Infectologia Evandro Chagas, Rio de Janeiro, Brazil

Background: Gender-based discrimination is associated with poor mental health, unemployment, and poverty. Travestis and transgender women (TGW) frequently experience discrimination, but associated factors are understudied. Our objective was to identify factors associated with discrimination among TGW from Brazil.

Methods: We used data from Transcendendo, an HIV clinic-based cohort focused on risk factors and health outcomes among TGW in Rio de Janeiro, Brazil. Eligible participants were aged ³ 18 years, assigned male sex at birth, and self-identified as TGW or other identities from the trans feminine spectrum.

We analyzed baseline data for participants enrolled from August 2015 to March 2020. Questionnaires were administered face-to-face and collected socio-demographic data, gender identity, family support, self-reported HIV status, and discrimination experience.
Discrimination was assessed with eight discrimination-related items (example: "were you discriminated against in school for being a transgender person") with response options: "yes", "no", "I don't want to answer"/"I don't know". Total scores were the sum of "yes" responses (range 0-8), with higher scores reflecting more discrimination experiences. Associations were evaluated through multivariable linear regression models among participants with complete data. Estimated Betas>0 imply variables that significantly increased discrimination scores.
Results: There were 559 participants included (28[5%] not included due to missing data); 225 (40%) identified as TGW, 182 (33%) as travesti, and 135(24%) as women. Mean age was 33 (SD=11); 262 (47%) identified as Parda, 139(25%) as White, and 142 (25%) as Black; 240 (43%) self-reported as living with HIV.
In multivariable regression models, factors significantly associated with more experiences of discrimination included: having only one supporting parental figure (Beta=0.44 [95%CI:0.08-0.81]) or no support (Beta=1.55 [95%CI:1.03-2.08]) compared to support from both parents; living in poverty (vs. not) (Beta=0.90 [95%CI:0.35-1.46]); and current (Beta=0.51 [95%CI:0.12-0.91]) and past (Beta=0.59 [95%CI:0.18-1.01]) sex work (vs. never).
Conclusions: The most vulnerable TGW, those with no family support or who were economically deprived, were more prone to experience transphobia. We highlight the lack of parental support, the strongest independent predictor of discrimination experiences, as it likely contributes to emotional and structural vulnerabilities.
The complex interactions that lead to negative health outcomes among TGW must be addressed when developing trans-specific HIV prevention and care strategies.

EPF122
Putting money where our mouth is: the importance of vastly scaled up support to stigma and discrimination reduction

A. Iovita[1], R. Jurgens[1], J. Amon[2], N. Sun[2], J. Csete[3]
[1]The Global Fund, Community, Rights and Gender, Geneva, Switzerland, [2]Drexel University, Dornsife School of Public Health, Philadelphia, United States, [3]Mailman School of Public Health, Columbia University, Department of Population and Family Health, New York, United States

Background: Intersectional stigma, discrimination and other human rights barriers continue to impede access to HIV and TB programs. The societal enablers 10-10-10 targets in the global AIDS Strategy provide an impetus for action. The Global Fund (GF) has vastly increased funding for human rights programs across its portfolio. Its Breaking Down Barriers (BDB) initiative supports comprehensive programs in 20 countries to remove human rights barriers to HIV and TB services. Mid-term assessments and implementation support TA have documented what works to reduce stigma and discrimination as part of a multi-program effort. The Global Fund is a co-convenor of the Global Partnership for action on all forms of HIV-related stigma and discrimination (GP).
Description: Under the GF Strategy, a key performance indicator tracks human rights investments in all HIV and HIV/TB grants. Midterm evaluations of BDB were conducted through interviews with key informants supplemented by desk research.
Further qualitative analysis has been undertaken of programs in each of the GP settings. TA needs assessments identified implementer capacity gaps and informed a prioritized TA plan.
Lessons learned: In 2017-19, over 120 millionwere allocated to human rights programs, 1/3 of them specifically focused on reducing stigma and discrimination. In the 2020-22 funding cycle, investment in these programs increased further, to an estimated 180 million.
In BDB countries, mid-term assessments showed significant progress, both in terms of creating a supportive environment and of program scale-up, and point at the importance of community-led stigma and discrimination reduction programs and action across multiple settings and program areas. To empower communities, GF funds Stigma Index and community-led monitoring of human rights violations in many of its grants.
Partnerships in support of country-owned national strategic plans and implementation of evidence-informed programs at scale are effective vehicles for delivering progress towards global targets.
Conclusions/Next steps: The new GF strategy (2023-28) reconfirms the centrality of reducing stigma and discrimination and calls for intensified efforts and partnerships to safeguard the rights of affected communities and individuals and realize more equitable health outcomes. Lessons from BDB countries in stigma and discrimination reduction will inform such actions and partnerships.

Punitive laws and enforcement practices directed at or impacting on key populations)

EPF123
Violence and harassment among the key population in Nigeria

A. Adesina[1], K. Green[1], J. Blanchard[2], G. Ashefor[3], A.I. Akanji[3]
[1]University of Manitoba/ Institute of Global Public Health/ West African Centre for Public Health and Development, Abuja, Nigeria, [2]Institute of Global Public Health- University of Manitoba, Manitoba, Canada, [3]National Agency for the Control of AIDS, Abuja, Nigeria

Background: Harassment and violence against key populations (KP) have existed for a long time. However, recent emphasis has been focused on this group, despite the fact that the issue continues to be a concern for the health system in the management of HIV/AIDS. Despite progress in the fight against HIV-related stigma and prejudice, discriminatory attitudes continue to exist in far too many countries. Discriminatory legislation, harsh law enforcement, harassment, and violence can push vulnerable people to the margins of society, denying them access to important health and social services, including HIV services. The focus of this research is on violence and harassment directed at KP.
Methods: The rate of reported violence and harassment across the four KP typologies was described in a descriptive analysis of the 2020 Integrated Behavioural and Biological Surveillance Survey (IBBSS) encompassing 17975 KP (Female Sex Workers (FSW), Men who have Sex with Men (MSM), People Who Inject Drugs (PWID), and Transgender (TG)). Microsoft Excel and STATA 13 software were used to sort and analyze the data retrieved.
Results: There are 17975 KP in total. 4974 FSW, 4397 MSM, 4414 PWID, and 4190 TG. 8.8% of FSWs, 16.1% of MSMs, 6.5 percent of PWIDs, and 15.1 percent of TGs had been forced to have sex in the year leading up to the poll. Forced sex was forced on 41.9 percent of FSW, 72.9 percent of MSM, 69.7% of PWID, and 61.4 percent of TG, among which 33.3 percent of FSW, 35.7 percent of MSM, 36.9 percent of PWID, and 54.6 percent of TG were forced without a condom. Prior to the study, 38 percent of FSWs, 17 percent of MSMs, 51 percent of PWIDs, and 32 percent of TGs had been harassed or arrested by law enforcement.
Conclusions: The level of violence and harassment among Nigeria's KP remains alarming, with over 70% of MSM reporting forced sex and over 50% of PWID reporting law enforcement harassment.
As the country works to eliminate the HIV epidemic by 2030, this indicates that violence and harassment among MSM and PWID is a cause for concern.

EPF124
The impact of Ghana's proposed homophobic legislation on men who sleep with men and the LGBTQI community as a whole

V. Owusu[1], M. Okai[2]
[1]University of Ghana, Accra, Ghana, [2]Underground Group, Accra, Ghana

Background: Ghana's legislature is seeking to pass a legislation to outlaw gay rights and any advocacy which is associated with it. This has led to tremendous fear and panic in the LGBTQI community for their lives and has greatly impacted their need to seek for healthcare and other needed help to prevent HIV/AIDS.
Methods: We used our underground organization that offers support and advocacy to the LGBTQI's to undertake a qualitative study to ascertain the effects of these proposed legislation on their lives and also offer voluntary HIV testing. Twenty people took part in our research and voluntarily answered some questionnaires which have been developed for the research. The location have to be kept secret due to the volatile nature of the situation in Ghana.
Results: It became clear in our research as we expected that accessing health care and other fundamental needs of these individuals have been greatly affected due to the fear of being harmed or jailed. Also, following the voluntary HIV testing, five individuals texted positive for HIV.
These are individuals who were too afraid to seek medical help or even go out to get condoms or other materials which could have prevented the contraction of the disease for fear of being attacked or harmed.
Conclusions: It is very clear from our research that the proposed legislation of criminalizing homosexuality in Ghana will greatly affect the LGBTQI community and more especially Men who sleep with men (MSM) and eventually erode the gains achieved so far in the country in the fight against HIV/AIDS.

EPF125
Perspectives of key stakeholders on the potential impact of Ghana's anti-LBTQ bill on provision of and access to HIV services

P. Ayamah[1], K. Atuahene[1], F. Nana Poku[1], R. Sackitey[1], S. Abbah[2], B. Adjei[2]
[1]Ghana AIDS Commission, Accra, Ghana, [2]Micdak Charity Foundation, Kumasi, Ghana

Background: In Ghana's Parliament today is a bill entitled Promotion of Proper Human Sexual Rights and Ghanaian Family Values Bill, 2021 (PPSRGFV) seeking to among other things "proscribe LGBTQ+ and related activities". Its introduction has stoked fierce public debates at home and abroad. This study sought to determine the potential impact of the ensuing law, if passed in its current form, on HIV service-delivery and access by KPs from the perspective of key stakeholders.

Oral abstracts

Poster exhibition

E-posters

Late-breaker abstracts

Author Index

Methods: Using a qualitative cross-sectional design, data was collected virtually from: focus group discussions with MSM (n=25) via zoom; semi-structured interviews with MSM peer educators (n=19) via phone-call, service providers (n=15), independent experts (n=2).

Public discourse on the matter in print, electronic and social media were analyzed. Transcripts were coded, themes identified and analyzed.

Results: Respondents unanimously agreed that the bill was likely to be passed into law albeit with some modifications. This, they attributed to the overwhelming public support for it, the preponderance of memos submitted in its favour, inability of affected populations to publicly oppose it due to fear of violence, and supportive public utterances of some prominent public figures and politicians.

By criminalizing advocacy and funding for LGBTQ and related activities and requiring people to report offenders, the ensuing law, service-providers and other experts contend, will jeopardize the national HIV response by deepening inequality, stoking fear and mistrust which will drive KPs underground, increase violence, stigma and discrimination against affected population and stifle donor funding to HIV and TB.

Likewise, service-providers and other key-informants predict the bill will pose a structural barrier to provision of and access to HIV services by KPs. MSMs and their peer-educators were concerned about worsened stigmatization, discrimination, violent attacks, mental health challenges, restricted service access, worsening HIV incidences and conditions among them.

Conclusions: There's a high-likelihood that Ghana's PPSRGFV bill will be passed into law with far-reaching consequences for the national HIV response. Key actors should therefore focus on championing extensive modifications to mitigate the predicted impacts on HIV service delivery and access. If passed into law, a study is recommended to establish actual impact on HIV service delivery and access.

EPF126
Road to ending compulsory drug treatment in East and Southeast Asia

Q. Lataire[1], K. Peters[2], C. Stoicescu[3,4]
[1]UNAIDS, Regional Support Team for Asia and the Pacific, Bangkok, Thailand, [2]UNODC, Regional Office for Southeast Asia and the Pacific, Bangkok, Thailand, [3]Columbia University, Social Intervention Group, School of Social Work, New York, United States, [4]University of Oxford, Centre for Criminology, Oxford, United Kingdom

Background: Compulsory drug detention is a form of custodial confinement in which perceived or known people who use drugs are forcibly placed to undergo forced abstinence and "treatment" for a pre-determined period of time. Given these facilities' lack evidence-based drug treatment, harm reduction or after care services and evidence of human rights violations their ongoing use has been widely condemned by UN entities.

This study aims to estimate numbers of compulsory facilities and people detained and assess progress toward the transition to voluntary community-based alternatives in 9 countries in Asia.

Methods: Cross-sectional data were collected using a questionnaire distributed to health and drug authorities and a literature review of publicly available governmental records in nine countries: Cambodia, China, Indonesia, the Lao People's Democratic Republic, Malaysia, Myanmar, the Philippines, Thailand and Viet Nam.

A validation process was conducted with national authorities. Descriptive analyses were computed for available data from 7 countries.

Results: The overall number of people detained in compulsory facilities remained the same or increased in most countries between 2012 and 2018. The number of compulsory facilities for people who use drugs remains high. In 2018, there were at least 886 compulsory facilities for people who use drugs in seven countries. Since 2012, 440,000 - 500,000 people were detained annually in compulsory facilities.

Punitive practices including substandard living conditions and overcrowding levels of over 400%, continued in compulsory facilities, exacerbating the risk of HIV, tuberculosis and now COVID-19 transmission. Voluntary community-based drug treatment services remained insufficiently available.

Conclusions: Despite commitments to phase out such facilities, political and financial support for compulsory treatment in Asia continues, evidenced by the high numbers of facilities and people detained. Renewed advocacy efforts and policy reforms are needed to permanently discontinue compulsory treatment modalities and transition to an integrated continuum of voluntary, evidence-based services in the community.

Decriminalisation of drug possession for personal use and expansion of continuum of services rather than compulsory treatment modalities will effectively contribute to ending AIDS and enhancing access to universal health care among people who use drugs in Asia.

Investing in regional HIV programmes and regional key population movements

EPF127

Leveraging regional economic communities to promote equitable access to HIV services for key populations: Lessons from the Southern Africa Development Community and the Economic Community of West African States

M.G. Haileyesus[1], L.G. Kumboneki[2], A. Saha[1], M. Engel[3], V. Macdonald[4], A. Malviya[5], D. Patel[1], I. Modisaotsile[6], D. Ogutu[7], W.K. Bosu[8]

[1]United Nations Development Programme, Istanbul Regional Hub, HIV, Health and Development, Istanbul, Turkey, [2]Southern African Development Community, Gaborone, Botswana, [3]United Nations Joint AIDS Programme, West and Central Africa Regional Support Team, Dakar, Senegal, [4]World Health Organization, Global HIV, Hepatitis and Sexually Transmitted Infections Programmes, Geneva, Switzerland, [5]United Nations Joint AIDS Programme, Eastern and Southern Africa Regional Support Team, Johannesburg, South Africa, [6]United Nations Population Fund, UNFPA East and Southern Africa, Johannesburg, South Africa, [7]Africa Key Population Experts Group, Nairobi, Kenya, [8]West Africa Health Organization, Non-Epidemic Diseases & NTDs, Bobo-Dioulasso, Burkina Faso

Background: According to UNAIDS, in 2020 39% of all new HIV infections in Sub Saharan Africa, and 72% of new infections in West and Central Africa occur among key populations, i.e., sex workers, men who have sex with men, people who use drugs, transgender people, and prisoners. Recognizing the importance of addressing this issue for an effective national response, countries are putting in place a range of strategies in their National AIDS Strategic Plans. However, significant challenges remain in achieving the desired result due, inter alia, to long standing opposition to rights of key populations in African countries.

One way of changing such entrenched legal and social sanctions is development and adoption of regional strategies that provide collective guidance, direction, and mutual accountability, to Member States through Regional Economic Communities.

Description: With technical support from UNDP, WHO, UNAIDS, and UNFPA, the Southern African Development Community (SADC) and the Economic Community of West African States (ECOWAS) developed regional strategies for HIV, TB and Hepatitis prevention and improving Sexual Reproductive Health Rights of key populations in 2017 and 2019 respectively.

These regional strategies covering thirty-one countries and approved by the Minsters of Health, constitute a major milestone in recognizing key population issues as integral and critical aspects of national and regional responses to HIV and AIDS in the two regions.

Lessons learned: Development of the regional strategies required a long, rigorous, and coordinated effort by all stakeholders. Member States, through the SADC Secretariat and the West Africa Health Organization (WAHO), fully owned and led the process. Key population communities, through the Africa Key Population Experts Group (AKPEG), extensively and directly contributed to the development of the strategies. UN agencies and regional CSOs provided continuous technical support and mobilized the financial resources.

Conclusions/Next steps: While the regional strategies are technical documents that provide detailed approaches, interventions, targets, and indicators for HIV prevention and SRHR, they are also political commitments demonstrating the collective will of Member States to protect the rights of key populations for effective and equitable HIV, TB and SRHR services. Implementation of the strategies, therefore, needs to take this dual nature of the strategies into consideration.

EPF128

The importance of regional spaces for local HIV outcomes: enacting lessons from the Global Commission on HIV and the law

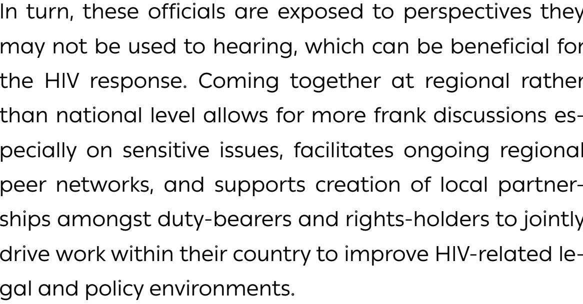
L. Ferguson[1], K. Esom[2], L. Bok[2], M. Dhaliwal[2], S. Gruskin[1]

[1]University of Southern California, Institute on Inequalities in Global Health, Los Angeles, United States, [2]United Nations Development Programme, HIV, Health and Development Group, New York, United States

Background: The Global AIDS Strategy (2021-2026) and the Political Declaration from the 2021 High Level Meeting on HIV and AIDS set forth a necessary and ambitious agenda. Based on findings from the evaluation of the Global Commission on HIV and the Law ("the Global Commission"), evidence highlights the importance of regional spaces for collective action within the HIV response, for countries and across regions, to help deliver on these commitments.

Description: A mixed-methods evaluation of the impacts and legacy of the Global Commission was carried out in 2021. This included a desk review and 30 key informant interviews. Data were collected and thematically analyzed in an iterative process drawing from the different sources.

Lessons learned: The Global Commission created regional spaces for consultation, collaboration and knowledge exchange, ensuring that affected communities could interact with judges, lawyers, police, health workers, policymakers, and one another, with their collective deliberations informing efforts towards legal change at global, regional and national levels. Regional level discussions can foster fruitful peer-to-peer knowledge exchanges, particularly in the context of similar legal systems. Individuals who face restrictive legal and policy environments at home can voice their experiences with HIV and the impacts of the law in a safe space, even if shared with government officials from their home country.



In turn, these officials are exposed to perspectives they may not be used to hearing, which can be beneficial for the HIV response. Coming together at regional rather than national level allows for more frank discussions especially on sensitive issues, facilitates ongoing regional peer networks, and supports creation of local partnerships amongst duty-bearers and rights-holders to jointly drive work within their country to improve HIV-related legal and policy environments.

Conclusions/Next steps: Regional level activities facilitated by support for follow-on work within countries play a critical role in improving national HIV-related laws and the lives of key populations, demonstrating the powerful potential of investing in regional spaces for the HIV response.

Sustained support for regional spaces, and the knowledge and experience sharing they facilitate, is key to supporting local HIV responses and achieving the end of AIDS by 2030.

EPF129

The power of our voices: adolescent girls and young women engagement in decision-making platforms

M.C. Jokonya[1], A. Kyendikuwa[1], T.G. Rufurwadzo[1]

[1]*Global Network of Young People Living with HIV, Cape Town, South Africa*

Background: In sub- Saharan Africa, AGYW aged 15 to 24 years accounted for 24% of HIV infections in 2019, more than double their 10% share of the population and continue to be disproportionately at risk of new HIV infections. The low level of participation of young women in decision-making processes and programming is one of the key enablers of this situation and puts AGYW in a disadvantaged position in the HIV response.

Relying on the HER Voice Fund model across 13 African countries, the HER Voice Fund's mission is to provide funds to grassroots organizations to contribute to change in non-gender-transformative laws and policies, processes, and events related to the health and rights of adolescent girls and young women from local, subnational to national levels.

Description: HER Voice Fund works through appropriate systems, national processes and structures including Country Coordinating Mechanism (CCM) and Country Operational Plan (COP) meetings, which directly link to the development of concrete national health strategies and funding requests e.g. to the Global Fund, National Strategic Plan (NSP) consultations, Technical Working Groups (TWGs) and other fora related to HIV, sexual and reproductive health and rights (SRHR), gender, and violence against women and girls to maximize AGYW engagement, create ownership and strengthen synergies.

Lessons learned: The HER Voice Fund model has concreted diversity and left no AGYW behind by providing funds to support the engagement of grassroots organisation. Currently, the fund has elevated ten (10) of the grantees serve LGBTQI AGYW, four (4) of the grantees serve AGYW with disabilities; four (4) of the grantees serve AGYW internally displaced, eleven (11) of the grantees serve AGYW living in fishing camps areas, twenty-eight (28) of the grantees serve AGYW living with HIV, seventeen (22) of the grantees serve AGYW in general, two (2) of the grantees serve young women selling sex.

Conclusions/Next steps: Strengthening AGYW's capacity to participate and exercise leadership in key decision-making spaces has significantly improved the power and agency among women and girls. Contracting 94 grassroots grantees facilitated and supported a stronger role for AGYW to participate in existing community-led monitoring mechanisms to ensure and promote accountability.

Ethical aspects and standards in research (including clinical trials)

EPF130

The practice of pilot/feasibility studies in informing the conduct of HIV clinical trials in sub-Saharan Africa: a scoping review

S. Nalubega[1], L. Osuwat Obado[2], B. Poku Agyeiwa[3], C. Evans[4], J.B. Matovu Junior[5]

[1]*Soroti University, Nursing, Soroti, Uganda,* [2]*Soroti University, Pathology, Soroti, Uganda,* [3]*University of Nottingham, School of Sociology and Socio Policy, Nottingham, United Kingdom,* [4]*University of Nottingham, School of Health Sciences, Nottingham, United Kingdom,* [5]*Ministry of Health, STD/AIDS Control Program, Kampala, Uganda*

Background: Pilot/feasibility studies represent a fundamental phase of the research process and play a vital role in the preliminary planning of a full size clinical trial. They are essential in assessing the feasibility, acceptability, safety of treatment or interventions, recruitment potential, randomization and blinding processes, and provide estimates for sample size calculation. Indeed, pilot/feasibility studies can result into improvements in the quality of research conducted and reduces waste. Despite the potential benefits however, the practice of undertaking pilot/feasibility studies as a pre-requisite for conducting HIV research is not well documented.

We conducted a scoping review of published HIV clinical trial protocols in sub Saharan Africa, to establish the extent to which the proposed clinical trials are informed by a prior pilot/feasibility study.

Methods: We followed the Joanna Briggs Institute methodology for scoping reviews. Six databases (MEDLINE, CINAHL, EMBASE, Web of Science, Cochrane Central Register of Controlled Trials databases, and African Index Medicus) were searched to identify eligible papers.

We included protocols in the English language, were published in the previous 10 years (2011-2020) and whose proposed (ongoing or completed) HIV clinical trials were undertaken in sub-Saharan Africa. Data were extracted using a structured tool and were analysed and interpreted using simple descriptive statistics.

Results: Thirty two (32)protocols were included. The results showed that the majority (56%) of proposed HIV clinical trials were not informed by pilot/feasibility studies.

The number of HIV clinical trials informed by a pilot/feasibility study were found to be steadily increasing in the preceding 8 years, from 1 in 2012 to 5 in 2020, a trend that indicates positive uptake of pilot/feasibility studies in HIV research.

Only five countries (South Africa, Uganda, Zimbabwe, Malawi and Kenya) contributed to more than 70% of all protocols that were informed by a pilot/feasibility study.

Conclusions: Although there is an increasing interest among researches to integrate pilot/feasibility studies in HIV research, limited countries in sub-Saharan Africa appear to have embraced this trend. This is an evolving area of research, with more evidence needed to inform policy recommendations.

EPF131

Development of quality standards for the ethical and meaningful participation of children and young people in clinical trials and research

M. Conway[1], T. Burke[1]

[1]*Fondazione Penta Onlus, Padova, Italy*

Background: Fondazione Penta ONLUS (Penta) is a leading international research organization in paediatric infectious disease.

The UN Convention on the Rights of a Child (UNICEF, 1989) states children have 'the right to freely express their views on all matters' and for them to be given 'due weight'. Paediatric clinical trials seldom engage children in their development and delivery. Children are disengaged with the science relating to their healthcare, and funders and trialists feel ill equipped to deal with this.

Description: Since 2017 Penta has developed a model of engaging young in research. In 2021, Penta engaged expert consultants and key stakeholders to develop a set of Quality Standards on the 'meaningful participation of children and young people in the design and delivery of clinical trials and research'.

The Standards were developed over through research and consultation, which included:

- A Steering Group representing: Researchers, WHO, CIPHER, ATC, Y+Global, EGPAF, Zvandiri, conect4children and ViiV Healthcare.
- YPLHIV consultation workshops.
- Key stakeholder interviews.
- Analysing current Standards in youth participation and health.
- A extensive editing process.

This provided insight that directed the content and structure of the final Standards.

Lessons learned: The consultation process provided essential direction on user needs and content. This included the Standards needing to be:

- Concise, clear and accessible.
- Exploring the wider structures beyond individual trials, prioritising topics to be investigated and governance of research sites.
- Focused on key roles across design, development and delivery.
- Suitable for large multi-trial institutions through to small-scale projects.
- Able to recognise current practice.
- Realistic of resource constraint.
- A progressive challenge for higher engagement and power sharing.
- Practical, covering engagement issues: safeguarding, reward and recognition of participants and costs.

Conclusions/Next steps: The Standards have strived to be clear and accessible, covering: Funders/Sponsors, Research Centre Leadership; Research Project Leadership, REC/IRBs .

They explore five core themes: Institutional and governance issues; Research agenda setting; Plan and Design; Delivery and management; Reporting of results.

They offer three indicators: 'Foundation, Emergent and Progressive' to support those new to engagement, through to improving existing participation models. The Standards are available online: (https://penta-id.org/) and Penta is now developing plans to support implementation where required.

Ethical considerations of international transfer of biospecimens out of Kenya for research: a scoping review of literature and policy

W. Nyandiko[1,2], V. Naanyu[1], E. Gillette[3], A. Chory[3], M. Scanlon[4], N. Choudhury[3], D. Lagat[2], J. Aluoch[2], C. Ashimosi[2], W. Beigon[2], D. Munyoro[2], J. Lidweye[2], J. Nyagaya[2], A. DeLong[5], R. Vreeman[3,2], R. Kantor[5,2]

[1]*Moi University, College of Health Sciences, Eldoret, Kenya,* [2]*Academic Model Providing Access to Healthcare, Eldoret, Kenya,* [3]*Icahn School of Medicine at Mount Sinai, Arnhold Institute for Global Health, New York, United States,* [4]*University of Indiana, Center for Global Health, Indianapolis, United States,* [5]*Brown University, Providence, United States*

Background: International research partnerships between high-income and low-or-middle-income (LMIC) countries can facilitate access to sharing of resources for biospecimen analysis. Bioethical challenges may arise as research partners navigate current and historical cultural and regulatory environments. As members of a multi-national research team including investigators from North American universities and Moi University in Kenya, we

sought to review and synthesize existing data, to identify gaps related to ethical considerations of international sharing of biospecimens and inform future improvements.

Methods: We conducted a scoping review of global academic literature as well as national and institutional guidelines promulgated by Kenyan governing bodies regarding ethical considerations for the international transfer of biospecimens for research. We searched peer-reviewed literature in Google Scholar and PubMed by combining variations of the following terms with Boolean operators: *bioethics*, *research regulation*, *biospecimen*, *data sharing*, and *Kenya*.

We also conducted a review of guidelines published by the National Commission for Science, Technology and Innovation (NACOSTI) and Kenyan research and academic institutions. Articles and guideline documents that met inclusion criteria were analyzed inductively to identify key themes.

Results: Five peer-reviewed articles conducted in South Africa and Malawi and by international research groups, and five guidelines authored by Kenyan institutional ethics committees and the Kenya Medical Research Institute were included, and the following themes were derived:

1. Need to utilize ongoing consent processes that address specimen exportation and allow agency over biospecimen use;
2. Need for detailed Materials Transfer Agreements between institutions; and
3. Ensuring approval from, and the continuing involvement and development of research infrastructure at the institution where samples originated.

Conclusions: Despite their abundant use and necessity, limited peer-reviewed literature is available on the ethics related to international transfers of biological specimens for research. Guidelines from Kenyan institutions outline the minimum ethical standards for the process of transferring biospecimens internationally and some terms of specimen and data ownership.

Further research is needed to expand bioethical guidelines to ensure and inform ethical transfers of biospecimens between institutions. Additionally, research teams should invest in capacity-building for biospecimen research testing in-country.

EPF133

The inclusion of children accompanied by caregivers in research to validate a paediatric screening tool for HIV: an ethical conundrum

J.L. Dunlop[1,2], C.L. Tait[1], B. Mabilane[1], K. Rees[1,3]

[1]Anova Health Institute, Parktown, South Africa, [2]University of the Witwatersrand, Division of Community Paediatrics, Johannesburg, South Africa, [3]University of the Witwatersrand, Public Health, Johannesburg, South Africa

Background: There is a need to advance testing, treatment and care for children living with HIV (CLHIV). In South Africa, there is a strict requirement for parental consent to participate in research for children under 18 years old, however many children reside with another caregiver, limiting their inclusion in research. We conducted a study to optimise a screening tool for identifying children 5-14 years old needing HIV testing.

The research ethics committee required that children accompanied by their father or a caregiver were not eligible to participate, unless their mother had died, in order to prevent indirect disclosure of maternal HIV status.

Methods: The study took place in 14 health facilities in urban Johannesburg and rural Mopani districts, South Africa. Data was captured for all children screened for eligibility on who accompanied them and whether they were able to consent, from June to December 2021. The number and proportion of children included and excluded is reported and HIV prevalence in included children was calculated, by type of caregiver.

Results: A total of 8,278 children were screened for inclusion with 675 children excluded based on their attendance with a caregiver ineligible to provide consent (8.3%). Of the 6,620 children tested for HIV in the study, 36 were found to be HIV positive (0.5%). The HIV prevalence in children with their mother was 0.5% (30 CLHIV), compared with 3.1% in maternal orphaned children with a caregiver (6 CLHIV). The HIV prevalence of children with a caregiver ineligible to consent is unknown. For children attending with ineligible caregivers, an older sister was the most common (24.6%) followed by their grandmother, father or aunt (24.0%, 17.9% and 15.6%).

Conclusions: Ethical considerations when researching CLHIV need to balance the risks of the research to the mother and child, both together and separately. However, ethical requirements regarding parental consent for minors resulted in the exclusion of vulnerable children who could benefit from the intervention being studied and the resulting tool.

Ethics bodies should work together with researchers to balance the risks of inclusion and exclusion of vulnerable children in research. Alternative models of consent for vulnerable children should be considered.

EPF134

Still talking about us, still not listening to us. Women and trans people living with HIV at AIDS2020

M. Tholanah[1], C. Chung[2], A. Welbourn[3], E. Bell[4], F. Hale[4]
[1]Making Waves Network, Harare, Zimbabwe, [2]Transgender Law Center, Oakland, United States, [3]Salamander Trust, London, United Kingdom, [4]Making Waves Network, London, United Kingdom

Background: WHO's 2017 Guideline on Sexual and Reproductive Health and Rights (SRHR) of women living with HIV states we should be equal partners in research.
We explored whether AIDS2020 provided meaningful opportunities for women living with HIV as co/authors of oral abstracts, compared to our AIDS2018 findings.
Methods:

- AIDS2020 Abstract Book manual search for abstracts co/authored by organisations of people living with HIV and/or key populations.
- Abstracts identified as community co/authored were read for relevance to women (including trans women) living with HIV.
- Keyword search of the abstract books for 2020, 2018 and 2016 (see Table).

Results: Oral abstracts: While 55% of presenting authors at AIDS2020 were women, and 0.05% were transgender women, there were even fewer opportunities than at AIDS2018 for women living with HIV to present our work in oral abstracts: only 1 oral abstract was co/authored by organisations of people living with HIV and specifically focused on women living with HIV, down from 2 oral abstracts at AIDS2018, one of which focused on trans women living with HIV.
At AIDS2020, 13/202 (6%) oral abstracts were co/authored by organisations of people living with HIV or key populations, and were of (potential) relevance to women living with HIV in all our diversities (ie not specifically focused on women living with HIV, but indicate some inclusion of or possible relevance to women living with HIV). This compared to 8% of oral abstracts at AIDS2018.
Key word search: The search of abstract books shows mentions of women has fallen between 2016 and 2020. There were strikingly few mentions of SRHR and GIPA, particularly in 2020.

Key word	2016	2018	2020
Women	3009	3378	2519
[ ]Gender	667	731	716
Transgender	409	603	556
SRHR	78	117	38
GIPA	9	7	5
Human rights	277	303	215

Table.

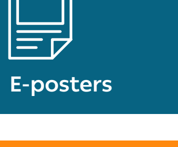
Conclusions: At AIDS2020 women living with HIV were rarely co/authors of oral abstracts. Future conferences must not talk ABOUT us but hear FROM us, not as subjects/objects of research but as researchers, co/authors and presenters, in order to adhere to WHO Guidelines. Co-production, community co-authorship or community-led research should be recognised in abstract selection criteria.

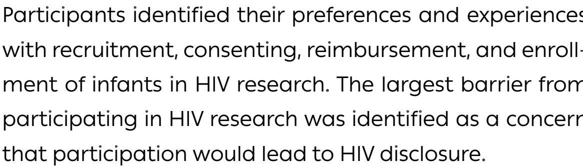
EPF135

Perspectives on research participation from pregnant women living with HIV

C. Raciti[1], J. Marsha[2], A. Nafiseh[3], E. Masese[4], E. Apondi[4], M. McHenry[5]
[1]Oakland University William Beaumont School of Medicine, Auburn Hills, United States, [2]Academic Model Providing Access to Healthcare (AMPATH), Eldoret, Kenya, [3]Indiana University School of Medicine, Indianapolis, United States, [4]Moi University School of Medicine, Department of Child Health, Eldoret, Kenya, [5]Indiana University School of Medicine, Department of Pediatrics, Indianapolis, United States

Background: Pregnant women living with HIV (PWLHIV) are becoming increasingly involved in HIV research; however, the ethical concerns regarding their decision-making in relation to research participation are understudied.
This qualitative study aimed to understand the perspectives and lived experiences of PWLHIV, with the goal of identifying important considerations to inform best practices related to involving this population in research.
Methods: This study used semi-structured interviews (SSIs) of PWLHIV who participated in research studies in Eldoret, Kenya. Participants between the ages of 26 to 51 were recruited from the Academic Model Providing Access to Healthcare (AMPATH) program's Maternal-Child Health (MCH) clinic at Moi Teaching and Referral Hospital.
Before each interview, multiple choice and short answer questionnaires were distributed to obtain demographic information and past research experiences. All interviews were conducted between October 2019 and November 2020 and were audio-recorded, transcribed, and translated.
Qualitative analyses were performed, with line-by-line coding, constant comparison, axial coding, and triangulation to identify central concepts. Twelve PWLHIV participated.
Results: Overall, participants had positive experiences with HIV research. Most participants had difficulty distinguishing differences between the research process and enhanced clinical care. They viewed research as access to healthcare as they sometimes received medications and diagnostic testing that they hadn't previously had.
The majority of participants recalled providing informed consent prior to serving as research subjects; however, only a few understood the key features of the study and none knew the findings of the study in which they had participated. They reported a willingness to participate in future HIV research studies and indicated altruism as the primary motivator.





Participants identified their preferences and experiences with recruitment, consenting, reimbursement, and enrollment of infants in HIV research. The largest barrier from participating in HIV research was identified as a concern that participation would lead to HIV disclosure.

Conclusions: Researchers should be cognizant of particular challenges that PWLHIV might have and understand the importance of sharing abnormal findings and referring appropriately.

By understanding the lived experiences of PWLHIV who participate in HIV research, future researchers can design studies and consenting processes to optimize ethical research practices.

Ethical aspects and standards in prevention programmes

EPF136

Project PrEP 1519 Brasil main actions to guarantee the rights of participating men who have sex with men (HSH) and transgender women (TGW) adolescents, in accordance with research ethics guidelines

L. Carvalho[1], D. Bartolomeu Greco[1], M.J. Greco Lisita[1], A.P. Silva[1]

[1]*Universidade Federal de Minas Gerais, Belo Horizonte, Brazil*

Background: PrEP demonstration studies conducted with vulnerable adolescents face unique ethical/legal constraints. We describe actions taken to guarantee the rights of vulnerable adolescents participating in Project PrEP 1519 in Brazil.

This demonstration study to evaluated PrEP effectiveness among MSM and TGW adolescents aged 15-19 years in three cities: Belo Horizonte, Salvador and São Paulo. It followed the Brazilian research ethics directives (Resolution CNS/CONEP 466/2012) and was approved by local and WHO institutional ethical review committees.

Methods: We will emphasize some unique vulnerable situations faced by this population, especially those between 15-17 years as according to Brazilian laws they are not legally responsible and also, they are more exposed to personal risks while participating in a such a study, including among their families, which many times are not aware of their sexual orientation.

We describe main actions taken to guarantee their rights, especially those aged 15-17 yo., including those related to confidentiality; adequate information; clinical and psychosocial care and especially post-trial guarantee to care and to PrEP/combined prevention.

Results: Complying with Brazilian guidelines, the Project developed several actions, including: implementation of appropriate informed consent/assent processes; access to information during and post-study (legacy); effective participation of adolescents in the entire process of study implementation; ensuring access to necessary healthcare during the study, including adaptations during the Covid19 pandemic.

And especially and more complex, ensuring post-study access to PrEP and combination prevention until health public guidelines, currently approved for 18y+, include 15-17 years adolescents.

Conclusions: In the current global backlash against sexual and reproductive rights, it is critical that projects like this are designed and implemented with a special focus on human rights and ethics, considering the specific vulnerabilities of young people belonging to sexual minorities. This will generate evidence to be applied in public health, aiming at guaranteeing respect, protection and fulfilment of their rights.

In this direction it is fundamental to expand and deepen the discussion on their needs, always with the involvement of the affected population, aiming at transforming study results in effective human rights and public health policies to all.

Ethical aspects of public health policy and programmes (including allocation of resources)

EPF137

HIV molecular surveillance in HIV prevention: Stakeholders' views on repurposing drug resistance tests without patient consent

K. Sullivan[1], S. Rennie[1], S. Day[2], S. Parker[3], A. Dennis[2]

[1]*University of North Carolina at Chapel Hill, Center for Bioethics, Department of Social Medicine, Chapel Hill, United States,* [2]*University of North Carolina at Chapel Hill, Division of Infectious Diseases, Chapel Hill, United States,* [3]*North Carolina Agricultural and Technical State University, Department of Social Work, Greensboro, United States*

Background: Across the US, HIV sequence data collected in the context of clinical care to identify drug resistant mutations are repurposed by public health departments for HIV molecular surveillance (HMS). In HMS, HIV sequences are analyzed with surveillance data to better understand transmission dynamics and "clusters", to inform focused public health responses. Ethical concerns surrounding HMS have been raised, including the lack of an informed consent process.

We conducted a qualitative study among key stakeholders in North Carolina (NC) to explore ethical considerations surrounding consent and HMS to inform community engagement approaches.

Methods: Semi-structured interviews were conducted with 41 stakeholders including PLWH (n=15), providers (n=8), public health professionals (n=10), advocates (n=6),

and bioethicists (n=2). As appropriate, participants were provided with a written introduction to HMS. Interviews probed awareness, perceived risks and benefits, consent, cluster response and communication strategies.

Interviews were analyzed using a thematic analysis approach. This analysis focused on views surrounding the reuse of HIV sequence data for HMS without patient consent.

Results: Across groups, stakeholders expressed a range of views on repurposing HIV sequence data for HMS without consent. Those who asserted consent should be required believed not doing so violated individuals' rights to privacy and control of their personal health data.

In contrast, those who did not believe a consent process was needed described the significant public health benefit of HMS outweighing low potential risks to patient privacy, the similarities to surveillance approaches used for other communicable diseases, and decreased participation and data utility if consent were required.

However, these same respondents also commonly described a strong need for greater transparency around HMS, noting this was critical for patient and community trust and demonstrating respect.

Conclusions: HMS stakeholders expressed a variety of considerations and perspectives on the conduct of HMS without patient consent, weighing the public health benefits of the approach against individuals' rights and autonomy. Across respondents, the need for greater transparency and communication with PLWH and communities surrounding the HMS process was an overarching theme.

These findings will importantly inform the development of practical recommendations within a community engaged partnership framework surrounding HMS in NC.

Inclusion considerations for research and development and other trials

EPF138

New opportunities in engagement: the expansion of Civil Society advisory groups by product developers

N. Luthuli[1], S. Hannah[1], N. Jain[1], Y. Raphael[2], D. Nhamo[3], J. Ouma[4], G. Kumwenda[5], C. Makura[3], M. Warren[1]

[1]AVAC, New York, United States, [2]Advocacy for Prevention of HIV and AIDS, Johannesburg, South Africa, [3]Pangaea Zimbabwe AIDS Trust, Harare, Zimbabwe, [4]National Empowerment Network of People Living with HIV/AIDS in Kenya, Nairobi, Kenya, [5]Pakachere Institute for Health and Development Communication, Lilongwe, Malawi

Background: Civil society (CS) engagement is foundational to ensure clinical and implementation research is conducted ethically and reflects community needs, priorities and interests, as highlighted by Good Participatory Practice (GPP) Guidelines. Product developers are increasingly committed to engaging with impacted communities throughout research to rollout.

While an important step toward expanding GPP, this work deviates from traditional engagement mechanisms used in publicly and philanthropically funded clinical trials and requires innovative, co-created engagement strategies between advocates and product developers.

Description: Prior to developing study-specific stakeholder engagement plans for their respective protocols, Gilead (PURPOSE program), Merck (IMPOWER program), CONRAD (Project Engage), Viatris & Populations Council (under the Dual Prevention Pill Consortium) participated in independent consultative meetings with AVAC and partners over 2020-2021 to discuss stakeholder engagement models.

Subsequently, formal global and regional CS advisory groups were established. Advocates supported by identifying other members, including Africa-based and young women, to participate.

Terms of Reference (ToR) were co-created and clear communication plans established as part of the engagement model. ToRs highlighted unique roles and responsibilities of members and product developers.

Lessons learned: Establishing expectations for global and regional advisory mechanisms brought clarity to members' roles. Where ToRs were co-created and detailed, discussions were most efficient and productive.

Formal mechanisms allowed for a partnership dynamic, and better supported members to identify where and when their input resulted in changes in protocols and decision-making. In most cases, formal mechanisms ensured consistent and ongoing engagement.

Global and regional advisory group members, some of whom participate in multiple mechanisms, noted the need for coordination across groups so that input on key issues could be shared.

Conclusions/Next steps: Civil society representatives welcome the growing interest from product developers to engage. To be successful, all advisory groups should co-create formal terms of engagement that outline roles, responsibilities, and communications plans. Greater coordination across advisory groups is also essential; the establishment of an umbrella CS advisory network could help ensure perspectives are shared across product developer-led groups, as well as with independent groups and advisory bodies to publicly-funded trials, allowing for greater impact and less duplication of efforts by advocates.

Policies regarding HIV services and programmes

EPF139

Access to pre-exposure prophylaxis for HIV prevention among young people aged 15-24: a global policy review

A. Kimmel[1], R. Schaefer[2], L. Watson[1], S. Dalal[3], R. Eakle[1,4]
[1]*United States Agency for International Development, Bureau for Global Health, Office of HIV/AIDS, Washington, United States,* [2]*World Health Organization, Global HIV, Hepatitis and STIs Programmes, Geneva, Switzerland,* [3]*World Health Organization, Department of HIV/AIDS, Geneva, Switzerland,* [4]*London School of Hygiene & Tropical Medicine, Global Health and Development, London, United Kingdom*

Background: In 2020, young people aged 15-24 accounted for 31% of new HIV infections globally. Oral pre-exposure prophylaxis (PrEP) remains a priority intervention for young people at substantial risk of acquiring HIV, yet access is often limited and uptake and effective use have been low in many countries. This global review aimed to determine the extent to which national policies and guidelines are enablers or barriers for young people's PrEP access.

Methods: We conducted a comprehensive search of national policy and guideline documents from 2019 or earlier pertaining to PrEP. We extracted data on the following indicators related to PrEP initiation:

1. Age requirement;
2. Weight requirement;
3. Parental/guardian consent requirement;
4. Statements indicating that young people can or cannot access PrEP.

Results: We reviewed documents for 70 countries. Thirty-three countries' guidelines (n=33/70, 47%) included an age requirement for PrEP initiation, a weight requirement for PrEP initiation, or language regarding PrEP for young people. Eighteen countries' guidelines (n=19/70, 27%) stated an age for PrEP initiation ranging from 12-21 years. Of these guidelines, thirteen guidelines (n=13/70, 19%) stated a minimum age of 18 years. Five guidelines allowed adolescents <18 years to initiate PrEP; an additional four allowed adolescents <18 years to initiate PrEP in certain circumstances. Eight countries' guidelines (n=8/70, 11%) included a weight requirement, ranging from ≥ 35 to 40 kilograms. No guidelines explicitly stated requirements for parental/guardian consent. Twenty-three countries' guidelines (n=23/70, 33%) included language indicating that young people could use PrEP.

Conclusions: Restricting PrEP to those at least age 18 years misses a large segment of the population at risk of HIV. No guidelines in this review included parental/guardian consent for PrEP initiation; however, guidelines for programs that serve as an entry point to PrEP, such as HIV testing services or family planning services, may include age, weight, or parental/guardian consent requirements. If PrEP for young people is not explicitly endorsed in national guidelines, their access to PrEP may be limited, preventing them from accessing the complete range of HIV prevention options.

EPF140

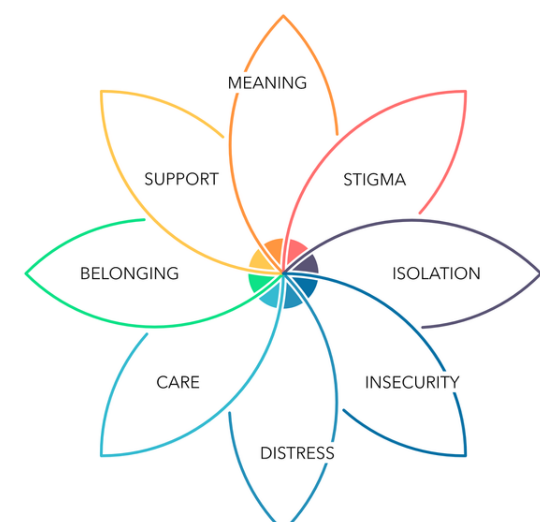
The Australian Community Accord on Quality of Life for People with HIV — an agenda for action to achieve good quality of life for people with HIV by 2030

D. Reeders[1,2], B. Allan[3]
[1]*Australian National University, School of Regulation and Governance (RegNet), Canberra, Australia,* [2]*National Association of People Living with HIV Australia Inc, Sydney, Australia,* [3]*Qthink Consulting, Melbourne, Australia*

Background: There are calls to recognise quality of life as the 'fourth 90' in WHO and UNAIDS targets for the global HIV epidemic response (Lazarus, *2016*). In order to reduce the incidence*and* impact of HIV, achieving high rates of viral suppression is not enough. However, quality of life is a broad concept and local consultation is required to give it concrete meaning.

Description: With funding from ViiV Healthcare, the National Association of People Living with HIV Australia (NAPWHA) delivered an interactive webinar series that invited participants (n=389) to share their insights and experiences. Findings were used to develop an *Australian Community Accord on Quality of Life for People with HIV*.

Lessons learned: Thematic analysis revealed eight drivers of quality of life (see image). These factors vary in personal salience across the life course and according to individual circumstances. They represent accumulated evidence, lived experience and practice wisdom.



The Accord calls for Australia's National HIV Strategy to recognise quality of life as the goal underpinning all of its 95-95-95 goals. It proposes an ambitious, measurable target of achieving 'good' quality of life for 95% of people with HIV by 2030 (up from 63-64% currently: Power, *2019*; Allan, *2021*).

To monitor achievement of this target, consultation participants strongly endorsed use of the PozQOL instrument, a short (13-item) validated scale with four domains including physical and mental health, social wellbeing and functional capability (Brown, *2018*). The validation study (ibid) defines 'good' as scoring 3.3–3.5 out of five on most items.

Conclusions/Next steps: Development of the Accord and the availability of the PozQOL measure put Australia in position to lead in the global push to recognise good quality of life as a central goal for national and global strategies that seek to reduce both the incidence and impact of HIV.

EPF141

Monitoring the development of HIV policy at the sub-national level through Indonesia policy lab

E. Sutamto[1], I. Praptoraharjo[1], C. Thomas[1], E. Sukmaningrum[1], L. Wahyuniar[2]

[1]Atma Jaya Catholic University of Indonesia, UCoE - ARC Health Policy and Social Innovation, Jakarta, Indonesia, [2]UNAIDS Indonesia, Jakarta, Indonesia

Background: The main problem in implementing the HIV response in Indonesia is more on governance because Indonesia is decentralized governance where sub-nationals have the authority to determine autonomous policies for public services in their respective regions.

Monitoring the existence of policies that support or hinder the HIV response at the sub-national level is a strategic step to create a conducive environment for equitable HIV services.

Description: In mid-2021, UNAIDS Indonesia together with the AIDS Research Center, Atma Jaya Catholic University developed a Policy Lab which is an initiative to monitor policies at the national and sub-national levels relevant to the HIV response. Four policy domains are monitored in this policy lab, including policies on treatment and care services, prevention and testing, structural and health sector at large. The initial stage of developing a policy lab is focused on monitoring policies at the national and 34 provinces in Indonesia. In later stages, monitoring will be carried out for 514 districts.

The results of this monitoring are presented in the form of a dynamic dashboard available at www.labkebijakanhiv.org

Lessons learned: HIV policies in Indonesia are still dominated by sectoral national policies, especially the Ministry of Health. Structural policies are not yet available. Only less than half of the provinces have regulations on HIV response in their area. Implementation of the HIV response for key populations has been hampered by regulations related to public order or security. The disparities between provinces in current HIV outcomes may be explained contextually if policy data is at the district level where services are directly provided to the communities.

Conclusions/Next steps: The next stage of developing this policy lab is to identify policies at the district level according to the specified domain. Policy advocacy will be carried out in collaboration with the Indonesia HIV AIDS Research Network (IHAR-Net) whose members consist of policymakers, researchers, program implementers, and key population spread across various provinces in Indonesia.

EPF142

Maternal HIV testing after first ANC visit: country guidelines and implementation

J. Thuku[1], A. Vrazo[1], A. Traub[1], N. McDavid[2], B. Ddamulira[2], M. Sloan[1], O. Muraleetharan[1], O. Kumwenda[3], G. Lingenda[4], H. Mabasa[5], R. Bulaya-Tembo[4], M. Matsinhe[6], I. Yonga[7], E. Baramperanye[8], S. Mathias[9], M. Mirira[10], H. Asiimwe[11], M. Srivastava[1]

[1]U.S. Agency for International Development, Office of HIV/AIDS, Prevention, Care and Treatment Division, Washington, D.C., United States, [2]U.S. Agency for International Development, Office of HIV/AIDS, Strategic Information, Evaluation and Informatics Division, Washington, D.C., United States, [3]U.S. Agency for International Development, Lilongwe, Malawi, [4]U.S. Agency for International Development, Lusaka, Zimbabwe, [5]U.S. Agency for International Development, Pretoria, South Africa, [6]U.S. Agency for International Development, Maputo, Mozambique, [7]U.S. Agency for International Development, Nairobi, Kenya, [8]U.S. Agency for Interational Development, Bujumbura, Burundi, [9]U.S. Agency for International Development, Dar es Salaam, Tanzania, The United Republic of, [10]U.S. Agency for International Development, Mbabane, Eswatini, [11]U.S. Agency for International Development, Kampala, Uganda

Background: To eliminate mother-to-child-transmission (MTCT), more timely diagnosis of HIV in pregnant and breastfeeding women (PBFW) is needed. Global guidelines recommend HIV testing after the first antenatal clinic visit (post-ANC1) and during the third trimester of pregnancy and postpartum in high HIV prevalence (≥5%) settings. However, post-ANC1 testing has lagged in many countries.

We analyzed program and survey data to understand guidelines and practices, including facilitators and barriers, to post-ANC1 testing implementation.

Methods: Thirteen USAID PEPFAR country teams and implementing partners completed a 19-question survey on post-ANC1 testing policies and practices. Results from the survey were analyzed thematically.

In addition, routine aggregated post-ANC1 data from October 1, 2018 to September 30, 2021 (Fiscal Years [FY] 2019-2021) were analyzed. Post-ANC1 testing rate was calculated as a proportion of total clients who did not test positive at ANC1 (either tested negative at ANC1 or recently tested negative prior to ANC1).

Late-breaker abstracts

Author Index

Results: Between FY19 and FY21, the proportion of women tested for HIV in post-ANC1 settings remained constant (FY19, 32%; FY20, 33%; FY21, 33%) (Table 1). All countries reported post-ANC1 testing policies at one or more of the following periods: every three months during pregnancy and/or breastfeeding (n=4); labor and delivery (n=4); third trimester (n=3), and/or six months after delivery (n=4). Reported facilitators for post-ANC1 testing include use of HIV risk screening tools to identify high-risk PBFW (n=2), testing at alternative entry points (n=10), and self-testing (n=4). Reported barriers include inability to attend all ANC visits (n=9), insufficient demand creation (n=8), limited staff (n=7), commodity shortages (n=7), and clinic workflow (n=4).

Fiscal Year (FY)	USAID PEPFAR Results		
	Number of HIV-negative PBFW identified at ANC1	Number of PBFW Tested Post-ANC1	Proxy proportion of HIV-negative PBFW tested post-ANC1
FY19 (Oct 1, 2018 to Sept 30, 2019)	3,735,209	1,192,300	32%
FY20 (Oct 1, 2019 to Sept 30, 2020)	3,331,440	1,087,852	33%
FY21 (Oct 1, 2020 to Sept 30, 2021)	3,517,110	1,164,190	33%

Table 1.

Conclusions: Although national guidelines support post-ANC1 HIV testing of PBFW in all 13 countries, data revealed challenges with taking testing to scale. Preventing MTCT of HIV and eliminating new child infections requires focused efforts to actively facilitate enablers and reduce country-level barriers to post-ANC1 testing.

Policies addressing social and economic determinants of vulnerability

EPF143

Accelerating the efforts to end HIV in the United States: the U.S. Department of Health and Human Services' priorities

H. Phillips[1], K. Hayes[2]

[1]The White House, Washington, United States, [2]U.S. Department of Health and Human Services, Office of the Assistance Secretary of Health, Washington, United States

Background: On December 1, 2021, President Biden marked World AIDS Day by announcing the release of a new National HIV/AIDS Strategy (NHAS). The updated NHAS aims to accelerate efforts to end the HIV epidemic in the United States by 2030. NHAS was informed by substantial contributions from stakeholders within the HIV community, including people living with HIV, and supported by partners at the federal level. It recognizes racism as a public health threat, places an emphasis on addressing the of people with HIV who are aging, and expands the focus on addressing the social determinants of health.

This session will feature senior HHS staff and Harold Phillips, Director of the White House Office of National AIDS Policy, as well as two community stakeholders, including one from the rural South and one from Presidential Advisory Council.

Description: NHAS and the EHE initiative were both molded by national stakeholder involvement. The Strategy and the initiative will both guide the development of federal policies and priorities in the coming years, including working with the Department of Justice, and others to reform HIV criminalization laws.

The process used to develop the NHAS included expanded involvement from across the U.S. government, including the Departments of Agriculture and Education, in recognition of the whole-of-government approach that must be taken to comprehensively address HIV and tackle ongoing racial disparities.

Lessons learned: During the development of the current NHAS, ongoing community engagement was key in refining messages and tactics included in the Strategy. Additionally, COVID-19 has drastically affected data collection and service delivery in the United States. HHS has invested in the interventions of HIV home testing, telehealth, including telePrEP and tele-harm reduction, and virtual planning and convenings.

Conclusions/Next steps: The current NHAS will continue to be implemented through 2025, with the goal to decrease new infections in the United States by 2030. The panel will discuss the NHAS Federal Implementation Process, the involvement of the community in that process, and how progress will be tracked and reported.

Information will be shared about the process to develop a new indicator for NHAS focused on quality of life for people with HIV.

Policies addressing HIV in the workplace and/or educational institutions

EPF144

HIV and labour relations in Kenya: combatting discriminatory workplace practices

L. Guantai[1]

[1]International Network of Religious Leaders Living with or Affected by HIV (INERELA+), Nairobi, Kenya

Background: The Law in Kenya does not mandate employers to have in place a workplace policy on HIV and AIDS. While the public sector has a policy that applies to government employees, the private sector which forms the largest employer in Kenya is left at discretion to choose whether or not to have HIV policy.

This study is an analysis of workplace practices that violate the rights of people living HIV and the legalities of such practices in Kenya.

Description: The Constitution of Kenya and the Employment Act of 2007 prohibit direct or indirect discrimination or harassment against an employee or prospective employee on grounds of HIV status. The reality is far from the aspiration of the law, as witnessed in multiple lawsuits heard before Kenya's HIV and AIDs tribunal and the Employment and Labour Relations Court pertaining to HIV discrimination at various stages of employment. The study is an analysis of ten such employment lawsuits determined between the years 2010 and 2021.

Lessons learned: Common violations were perpetrated by way of disguising unfair termination of employees on basis of HIV to read 'dismissal on grounds of non-performance' or ‚redundancy.' Other discriminatory practices were demonstrated by concealing the HIV test as a 'routine test' and not disclosing to the employee that the test will entail a HIV test. Some organizations made the HIV test compulsory during the recruitment process, and proceeded to deny the person employment on HIV status while citing other non-existent legal grounds for non-employment. Lack of workplace policy guidelines on HIV continued to perpetuate human rights violations against people living with HIV.

Conclusions/Next steps: This study establishes the existence and continued tolerance of discriminatory workplace practices against People living with HIV. The study proposes a comprehensive HIV framework that encompasses prevention, care and treatment without jeopardizing the rights of employees. It establishes the niche to build the capacity of employers to develop and implement workplace policy on HIV pursuant to the ILO code of practice.

The study shall inform the Kenya National Aids Control Council and Ministry of Labour to develop guidelines on HIV at work in Kenya.

Policies related to treatment access (including intellectual property policy)

Increasing patient access to improved ART regimens through Vietnam's Social Health Insurance drug list with modeling data

D. Nguyen[1], A.C. Thi Nguyen[2], H.T. Thi Nguyen[3], P. Khanh Nguyen[4], H.P. Thi Thu[5], N. Thi Do[5]

[1]Abt Associates, Hanoi, Viet Nam, [2]USAID, Hanoi, Viet Nam, [3]FHI 360, Hanoi, Viet Nam, [4]Health Strategy and Policy Institute, Ministry of Health, Hanoi, Viet Nam, [5]Vietnam Administration for HIV/AIDS Control, Hanoi, Viet Nam

Background: As donor funding for ARVs decreases in middle-income countries like Vietnam, many are turning to their national health insurance schemes to integrate and finance their HIV programs. In line with global HIV treatment guidance, the Government of Vietnam (GVN) transitioned first-line antiretroviral therapy (ART) from Tenofovir/Lamivudine/Efavirenz (TLE) to Tenofovir/Lamivudine/Dolutegravir (TLD) fixed dose combination in 2017. In 2018, nearly 115,000 HIV patients in Vietnam were slated to transition to TLD.

However, wide-scale uptake of TLD was not likely until 2021 because the GVN required additional evidence on budgetary implications before including it in the Social Health Insurance (SHI) drug list.

Description: The USAID funded Local Health System Sustainability (LHSS) project has worked closely with Vietnam's Ministry of Health (MOH) to generate the evidence on TLD's clinical benefits and financial impact required to advocate for its inclusion on the SHI drug list. LHSS then collaborated with MOH to organize technical meetings and advocacy workshops with the SHI Drug Council and policymakers to disseminate evidence showing that TLD is an effective and cost-efficient treatment.

Lessons learned: LHSS's analysis demonstrated that TLD meets treatment needs, is cost-effective compared to alternatives, and has fewer side effects than other drugs resulting in lower attrition. Compared to TLE, TLD increased patient life-years from 21.5 to 25.2 and decreased SHI costs by approximately USD $4.75 million per year. These findings demonstrate that TLD meets Vietnam SHI inclusion criteria.

Analysis findings were included in the comprehensive TLD dossier submitted to the MOH, resulting in the MOH mandating that TLD to be included in the SHI drug list for the benefit of HIV patients.

Conclusions/Next steps: With the new policy in place, people living with HIV (PLHIV) in Vietnam can access a fixed-dose combination of TLD covered through the SHI fund, effectively reducing barriers to life-saving treatment. The MOH started procuring TLD in early 2021 and distributed it to more than 50,000 PLHIV beginning in July 2021, which was 6 months earlier than planned. TLD is now the ARV regimen for the majority of PLHIV in Vietnam.

Community advocacy actions to breaking ID card barriers on transgender people in Indonesia

J. Kaunang[1]

[1]Indonesia AIDS Coalition, Program, South Jakarta, Indonesia

Background: The issue of ID-Card ownership among KAP had been incriminating HIV response since it has led to challenges in accessing health services and government social support and was aggravated in COVID-19 pandemic situation, whereas ID-Card required to access COVID-19 vaccination. Transgender people are difficult to obtain ID-Card due to complicated beuracratic system and practices of stigma and discrimination.

This programme aims to facilitate transgender community in accessing ID-card, initiated by a group of community-based organizations that grew into an extensive community movement involving transgender community across the country, which highlights the power of community collaboration in a comprehensive and structured advocacy actions, and the existance of voluntarism.

Description: Period: July-December 2021

Location: National and 29 Districts

Advocacy Activities:

1. Community National Advocacy to Directorate General of Civil Registry.
2. Community Mobilization: increase awareness of ID-Card ownership importance to improve livelihood and recruitment of voluntary district focal points.
3. District Advocacy: intense communication between community and district government to ensure district implementation.
4. Programme Evaluation to document activities and initiatives conducted to enable knowledge and information sharing.

Lessons learned: To date, the programme had facilitated 480 Transgenders obtained ID-Card, which opened access to other necessities e.g. national health insurance and government social supports. The collaborative efforts of the community indicates that voluntarism is not yet extinct, as the programme was conducted without specific donor. However, donor support might broaden intervention areas and promote programme sustainability.

National Regulation/Policies are not automatically be implemented in district level, and community monitoring is essential to encourage implementation. Each district has various initiatives and innovation to ease the procedures and mechanism for ID-Card registration and printing.

Lack of interest from the community to obtain ID-Card is driven by life-long stigma and discrimination, and scepticism towards government bodies. Extended socialization and community focal points are necessary to tackle this issue.

Conclusions/Next steps: This programme had marked that significant changes are possible through strong community collaboration. Further investment will focus on expanding this intervention to other districts and key population groups, and also applying its methods to facilitate access to other necessities e.g. national health insurance, and other social supports, particularly health services.

EPF147

Understanding gaps in implementation of national HIV policies in South African public health facilities using Ritshidze community-led monitoring data

A. Yawa[1], N. Rambau[2], S. Xaba[2,3], N. Mpofu[1], L. Rutter[4], E. Lankiewicz[5]

[1]Treatment Action Campaign, Johannesburg, South Africa, [2]Ritshidze, Johannesburg, South Africa, [3]SANERELA+, Randburg, South Africa, [4]Health GAP, New York, United States, [5]amfAR, The Foundation for AIDS Research, Public Policy Office, Washington, United States

Background: South African HIV policies and guidelines incorporate human-rights and people-centered approaches to healthcare, a critical strategy for closing retention and viral suppression gaps. These standards include guidelines for friendly, efficient, and private/non-coercive healthcare services that are not often captured by traditional service delivery monitoring.

Using data from the Ritshidze Community-Led Monitoring (CLM) Programme in South Africa, we describe the extent to which quality of care aspects of policies are being implemented with fidelity.

Methods: Ritshidze community monitors conducted electronic surveys at 402 PEPFAR-funded facilities in South Africa, surveying 7,654 public healthcare users from April 1 to June 30, 2021. CLM data from indicators on friendliness of staff (n=2), efficiency (n=1) and privacy/non-coercion (n=2) were compared to HIV-related National Department of Health (NDOH) standards, charters, and guidelines to measure the extent to which public healthcare users reported adherence to national policies.

Results: CLM indicator alignment with NDOH guidelines on friendliness was low, with 16% of PLHIV reporting staff are welcoming when they return to the facility after missing a visit and 62% of respondents reporting that staff are always friendly and professional (Table 1). Alignment with guidelines related to privacy/non-coercion was higher, with 90% of PLHIV reporting the facility keeps people's HIV status confidential, and 79% of respondents report being told they could refuse to give the names of their sexual partners during index testing. Clinic efficiency was rated generally low, with 31% of respondents reporting the queue at the facility is not long. Provincial variation was reported, with ranges from 14% (efficiency) to 29% (non-coercion).

Category	Guideline (Source)	CLM Indicator	National (Provincial Range)
Friendliness	"All staff in the facility are welcoming, acknowledge it is normal to miss appointments and/or have treatment interruptions, support and empower patients to improve retention after re-engagement." (Standard Operating Procedures: Minimum package of interventions to support linkage to care, adherence, and retention in care, 2020)	% of PLHIV reporting staff are welcoming when they return to the facility after missing a visit	16% (4-25%)
	"A positive disposition displayed by health care providers that demonstrate courtesy, human dignity, patience, empathy and tolerance." (The Patients Right Charter, 2019)	% of public healthcare users reporting staff are always friendly and professional	62% (51-72%)
Privacy/ non-coercion	"Voluntary, freely, and no-coercive: The principles of human rights should be maintained. The index client may opt out of/withdraw from ITS at any stage without providing a reason and without punishment or denial of other services." (Standard Operating Procedures for HIV Index Testing Services, 2020)	Among public healthcare users reporting having participated in index testing, % reporting they were told they could refuse to give names	79% (64-92%)
	"Information concerning one's health, including information concerning treatment may only be disclosed with informed consent, except when required in terms of any law or an order of the court." (The Patients Right Charter, 2019)	% of PLHIV reporting they think the facility keeps people's HIV status confidential and private	90% (77-95%)
Efficiency	"Patients are attended to within an acceptable period of time and in accordance with their needs." (National Core Standards, 2011)	% of public healthcare users reporting they don't consider the queue at the facility to be long	31% (22-36%)

Table 1. Comparison of NDOH guidelines and CLM indicators

Conclusions: In South Africa, CLM data highlights substantial gaps and provincial variation in the full implementation of policies meant to protect the rights of people in South Africa to adequate healthcare services. CLM data should be used by the NDOH to monitor and address gaps in the implementation of policies to ensure friendly, efficient and private/non-coercive service delivery.

Policies supporting increased demand, uptake and retention of key populations for HIV services and programmes

EPF148

On the way out of HIV treatment refusal in China: a mixed-methods study

Y. Hu[1], H. Li[2], X. Zhou[1], G. Luo[1], R. Bi[1], Y. Deng[1], H. Zou[1,3]

[1]Sun Yat-sen University, School of Public Health (Shenzhen), Guangzhou, China, [2]Shizhong District Center for Disease Control and Prevention, Jinan, China, [3]University of New South Wales, Sydney, Australia

Background: Treatment refusal negatively impacts the well-being of people living with HIV (PLWH). We aimed to assess the prevalence and correlates of HIV treatment refusal in China.

Methods: A mixed-methods study was conducted among PLWH and health care providers (HCPs) in China April-December 2021.

A telephone-based semi-structured interview of PLWH and HCPs was conducted to understand existing discrimination. Thematic analysis was employed to qualitatively analyze potential themes. An online survey among PLWH was conducted to collect information about treatment refusal. Correlates of treatment refusal during the most recent non-HIV-related outpatient and inpatient visits were assessed using multivariable logistic regression.

Results: We enrolled 30 PLWH (gender: 83% male; age: median 34 years, IQR: 27-45) and 27 HCPs (gender: 41% male; specialty: 63% non-infectious diseases departments) in the interview and 902 PLWH (gender: 91% male; age: 32 years, 27-38; time since HIV diagnosis: 3.2 years, 1.6-5.4; CD4 count: 47% were >500 per mm3) in the online survey. In interview, PLWH reported various forms of discrimination, including treatment refusal, humiliation, excessive precautions of HCPs, and breaches of confidentiality. HCPs suggested preparedness of HIV occupational post-exposure prophylaxis (PEP) at work, clear definition of responsibility, financial compensation to HCPs and HIV testing for all emergency patients may help minimize treatment refusal. In online survey, 56% (n=502) PLWH reported non-HIV-related outpatient experience, 42% (n=212) of whom experienced treatment refusal. Just under 30% (n=262) reported non-HIV-related inpatient experience, 63% (n=165) of whom experienced treatment refusal. For outpatients, PLWH who were <30 years (AOR 0.51, 95%CI: 0.33-0.79), infected through male-male sex (0.47, 0.27-0.83), and attended service after Jan 23, 2020 (0.57,0.33-0.99) were less likely to experience treatment refusal. Whereas PLWH who were ART naïve (11.09, 1.20-102.61), disclosed HIV infection to HCPs (1.54, 1.02-2.33), and attended the department of surgery (2.11, 1.23-3.61) were more likely to experience treatment refusal. For inpatients, PLWH from Central China (2.94, 1.18-7.30) and whose HCPs were male (2.16, 1.1-3.97) reported more treatment refusal.

Oral abstracts

Poster exhibition

E-posters

Late-breaker abstracts

"RIPOSTE - the voice of key populations": towards a better valorization and recognition of the role and status of peer educators of key populations

C. Iova[1], E. Tiphonnet Diawara[2], V.G. Some[3], J.C. Some[3], H.I. Cisse[3], N.C. Da[3], E. Rwamuco[4], E. Sanasee[5], S.C. Hamala[6]
[1]Coalition PLUS, ARAS Romania, Bucharest, Romania, [2]Coalition PLUS, Pantin, France, [3]Revsplus NGO, Bobo-Dioulasso, Burkina Faso, [4]ANSS NGO, Bujumbura, Burundi, [5]Pils NGO, Port Louis, Mauritius, [6]Arcad Santé Plus NGO, Bamako, Mali

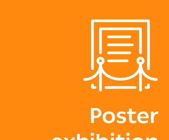
Background: According to the recommendations of the last UN High-Level Meeting on HIV/AIDS (June-July 2021), ending the global HIV epidemic will require a greater commitment to address inequalities, stigma and discrimination that continue to fuel the epidemic and prevent many people, in particular key populations (KPs), from accessing the services they need. In this context, the "peer education" strategy of community-based and ledorganizations fighting HIV, viral hepatitis and STIs is essential to ensure access to health services for these populations. Through their field work and the various training programs they follow, peer educators (PEs) develop skills in health mediation, legal assistance, support for people living with HIV and/or hepatitis, etc. Still, despite their involvement at all stages of the HIV/hepatitis care cascade, their contribution to community mobilization and the protection of KPs from stigma and discrimination, the status of PE remains mostly undervalued and precarious.
In 2021, the PE and KP leaders participating inthe RIPOSTE project,i.e. the community-based organizations (CBOs): REVS PLUS (Burkina), ANSS (Burundi), ARCAD Santé PLUS (Mali) and PILS (Mauritius) came together to collectively analyze this issue and identify solutions.
Description: The analysis of the role and status of PEs in the HIV, viral hepatitis and STIs responses, was done through an experience capitalization process that took place between June and October 2021. It involved the participation of 35 PEs and KPs community leaders. The main objective of this process was to identify concrete solutions for a better valorization/valuing of PEs' roles.
Lessons learned: The capitalization process allowed the identification and prioritization of PE requests, the most important of which weremoral and formal recognition of the contribution of their work in the fight against HIV/AIDS, viral hepatitis and STIs; legal recognitionas employees with all the rights deriving from this status.
Conclusions/Next steps: As actors on the front line in the fight against the various epidemics and an indispensable interface between health systems and KPs, the legitimate demands of PEs must now be heard and translated into public policies and concrete measures in employment law.

EPF150

Engaging and empowering LGBTQand PLHIV multicultural communities, to increase access to services and encourage health seeking behavior

T. Wark[1], L. Nguyen[1], S. Shehata[1]
[1]ACON Health, Sydney, Australia

Background: New South Wales (NSW)has seen significant declines in HIV notifications among Australian-born gay, bisexual and other men who have sex with men (GBMSM). However, data has shown little decrease in notifications among overseas-born GBMSM, especially those from East and South-East Asia.
LGBTQ people from multicultural backgrounds also experience poorer mental health outcomes due to racism, homophobia and transphobia.
Australia's largest LGBTQ organisation, ACON, has developed a comprehensive Multicultural Engagement Plan (MEP) to address these intersecting health needs by increasing the cultural safety and equity of HIV testing and prevention initiatives for LGBTQ people from multicultural backgrounds.
Description: The Plan was led by an internal working group of staff with lived experience and an external advisory panel of experts(researchers,community leaders and government).
An extensive community consultation process was conducted with 55 stakeholders including community members and professionals working in the HIV, LGBTQ and multicultural sectors. Of the participants, 74% were from a non-Anglo/European backgrounds. In terms of gender, 46% were women, 40% were men and 14% were non-binary. Of the women, 13% were transgender, and of the men, 14% were transgender.
The Plan was directly informed by the findings from these consultations and centred the voices of multicultural and migrant LGBTQ communities.
Lessons learned: The Plan was led by an internal working group of staff with lived experience and an external advisory panel of experts(researchers, community leaders and government).
An extensive community consultation process was conducted with 55 stakeholders including community members and professionals working in the HIV, LGBTQ and multicultural sectors. Of the participants, 74% were from non-Anglo/European backgrounds. In terms of gender, 46% were women, 40% were men and 14% were non-binary. Of the women, 13% were transgender, and of the men, 14% were transgender.
The Plan was directly informed by the findings from these consultations and centred the voices of multicultural and migrant LGBTQ communities.



Conclusions/Next steps: ACON has launched the MEP and appointed a project officer to oversee the implementation of the Plan.
Further, the consultation findings and consultation methodology from this project can be adapted to other organisations working with multicultural and migrant communities to meaningfully address their intersectional health needs.

EPF151
COVID 19 Lockdown policies leading to late presenters, co-morbidities and delayed initiation to ART – Need to re-shape HIV services policies during COVID lockdown

E. Michael[1], V.S. Prasad[2], M. Kumar[3], S. Dwivedi[4], K. Prasanna Viswanath[5], L. Hong[6]
[1]*AIDS Healthcare Foundation India, Operations and Partnerships, New Delhi, India,* [2]*AIDS Healthcare Foundation India, Management Health Care Services, New Delhi, India,* [3]*AIDS Healthcare Foundation India, Monitoring and Evaluation, New Delhi, India,* [4]*AIDS Healthcare Foundation India, Prevention Services, New Delhi, India,* [5]*AIDS Healthcare Foundation India, Clinical Services, New Delhi, India,* [6]*AIDS Healthcare Foundation, Bureau Chief India, Los Angeles, United States*

Background: AIDS HEALTHCARE FOUNDATION – India implements community based rapid HIV testing (CBT) across ten states. The objective of the program is early detection and linkage to treatment in order to compliment the efforts of the National Program in reaching 95- 95 -95.Due to COVID lockdown and restrictions in 2020, many HIV related services were hampered including community based testing and new enrolments to treatment. Before COVID, 30% of the enrolments in the clinic were late presenters who had less than 200 CD4 count.
It was decided to undertake an operational study to understand the scenario after the onset of COVID.
Description: The study considered all new enrolments to the clinic in 2019 and 2020/2021 with the objective to compare the percentage of late presenters among enrolments, before and after COVID 19 lockdowns and restrictions were imposed. In 2020 the CBT was halted and there were no active enrolments to the clinic due to lockdowns and curfew. The testing services were partially resumed by the end 2020 and went to full capacity by mid-2021.
Lessons learned: The results showed that in 2019, 30% of the new registrations in the clinic were late presenters with < 200 CD4 Counts. These 30% late presenters were represented by 86% Men, 13% Women and 1% Transgender. The data post-COVID-19 lockdown and restrictions revealed that there is a steep increase (67%) in late presenters, who included 82% men, 15% women and 3% from the transgender community.
The restrictions imposed by COVID-19 led to low CD4 Counts and presence of various co-morbidities at the time of registration in the clinic.
Conclusions/Next steps: The National Policies needs to be augmented to facilitate continuity of HIV Services especially in Community Based HIV Testing and pave way to easy access testing services and early detections. This will reduce the presence of co-morbidities and facilitate early initiation of ART.

COVID-19 and politics, human rights, ethics or policy

EPF152
Combining online and offline approaches to protect the rights of PLHIV on the basis of a community-led organization during the lockdown caused by COVID-19 in Ukraine

M. Ignatushyna[1]
[1]*Charitable Organization «All-Ukrainian Network of People Living with HIV/AIDS» (Co «100 Percent Life»), Legal Department, Kyiv, Ukraine*

Background: New officially registered cases of: HIV-infection - 31000, AIDS - 8282 in Ukraine during the COVID-19 pandemic (2020-2021).
Violations of rights of PLHIV is a serious problem in Ukraine. According to the PLHIVStigma Index 2.0 Ukraine 2020 report, 50% respondents knows about laws that protect PLHIV from discrimination. 41% - do not know about it, 6% are convinced that there are no such laws. However, only 17% of respondents whose rights were violated tried to take action to protect them.
Many people with HIV and tuberculosis and representatives of vulnerable groups (hereinafter the Clients) did not have access to offline services during the lockdown. Therefore, there was a need to combine online and offline ways to provide legal aid.
Description: The response to these challenges was a chatbot "Legal Bot 100% LIFE" (hereinafter the Legal Bot) that has been implementing by CO "100 PERCENT LIFE" in the Project of Legal Network.
The Legal Bot became a topical way to obtain legal advice during lockdown by giving legal answers to the most common questions remotely, optionally and anonymously which helped to reduce the negative impact of lockdown on the Clients.
Lessons learned: There were 3590 answers to legal questions through the Legal Bot and almost 6000 legal consultations provided by legal office concerning issues of violation of rights to access to medical care, services and family rights, etc. in 2020-2021.
Legal support was provided in 296 pre-trial cases (83% of cases were resolved in favor of the Clients) and 51 strategic cases (10 of them are proceeding in the European Court of Human Rights) in the Project.
The combination of efforts of 12 legal offices and the Legal Bot has made the most convenient way for the Clients

to get legal aid using online or offline or combining these methods at the same time.

Conclusions/Next steps: The Project implementation shows the high level of efficiency of combining free legal aid by offline 12 legal offices and online Legal Bot within the restrictions of the lockdown and quarantine measures. It ensures the sustainability of legal services for the Clients using modern digital technologies.

EPF153
State of vaccination in hospitalized and deceased patients with HIV in Mozambique

A. Couto[1], M.d.P. Nhavane[2], R. Langa[2], O. Tiberi[1], I. Gaspar[1]
[1]Ministry of Health - Mozambique, STI, HIV and AIDS Program, Maputo, Mozambique, [2]Minstry of Health - Mozambique, Medical Assistance Directorate, Maputo, Mozambique

Background: The first case of COVID_19 occurred in March 2020 and immediately the Government of Mozambique declared a state of emergency. A variety of intervention were taken in order to slow the increase the number of cases such us social distance, compulsory use of masks and regular wash hands. In March 2021 the country started the vaccination of priority groups like health providers, patients with Diabetes and Hypertension with age above 60 years old. In June 2021 more groups were included and expansion started for the second phase of vaccination. After 10 months the country has vaccinated 10.3 million of general population vaccinated, approximately 30%, and out of that 8.5 million completed the doses (2 or 1) and this includes HIV patients.

Description: Routine data from hospitalizations were analyzed from June 2021 till January 2022 (January 19th). It was possible to observe the proportion of vaccinated people among hospitalized and deceased patients living with HIV.

Lessons learned: From June 2021 to January 2022 (19th), it was registered that 628 patients with COVID_19 were hospitalized and only 51 of them were vaccinated (8.1%). Also, it was observed that 275 death that occurred in patients with HIV and only 26 of them were vaccinated (9.5%). There is a noticeable difference in the number of vaccinated COVID-19 patients from July and August 2021 (third wave) to the number in the fourth wave in December 2021 and January 2022. The percent of PVHIV vaccinated rose from 5% in the third wave to 14% in the fourth wave.

Conclusions/Next steps: The vaccination for COVID_19 still ongoing and efforts are being made by the Government of Mozambique to include all the eligible populations. Despite the protective factors of the COVD-19 vaccination, there were still a higher proportion of vaccinated PVHIV in the fourth wave than in the first, a worrying indicator for future COVID-19 waves.

EPF154
Upholding human rights and the rule of law during a pandemic - lessons from the judiciary in Africa's response to the COVID-19 pandemic

M. Tabengwa[1], A. Meerkorter[2], C. Tshimbalanga[1]
[1]UNDP, Johannesburg, South Africa, [2]Southern Africa Litigation Center, Johannesburg, South Africa

Background: Across the world, COVID-19 resulted in the use of extraordinary laws, law enforcement limiting rights, including through extreme restrictions on freedom of movement and access to services, as well as laws criminalising behaviours, in the interests of public health. The panic occasioned by the pandemic raised concerns that the rule of law might take second place in courts and police actions, with a disproportionate impact on marginalized groups.

Description: The project monitored the response of African Courts during the COVID-19 pandemic to assess adherence to the rule of law. Engagements with KP organisations indicated that measures addressing the pandemic were often blind to the real-life impact on marginalised groups. The measures also impacted the ability of marginalised groups to access the courts to assert their rights. The Siracusa Principles on the Limitation and Derogation Provisions in the ICCPR continue to guide the judiciary to ensure emergency measures are also proportionate.

Lessons learned: Initial court responses to restrictions allowed States to decide adequate measures to curb the pandemic. Typical arguments used focused on the Precautionary and Greater Good Principles, and Doctrine of Necessity. Courts were however alive to the need for the State to use its powers in accordance with the law and in a proportionate manner, and were willing to set aside measures that ignored the potential negative impact on vulnerable communities except where that impact was adequately demonstrated through evidence by the appropriate applicants. Courts further urged States to restrict policing powers and address impunity and lack of oversight of the police.

Conclusions/Next steps: As with the HIV pandemic, courts' ability to assess whether measures were a disproportionate violation of rights relied on the judiciary's ability to understand and evaluate the evidence. Cases were often brought on urgency with inadequate evidence placed before the courts for decision-making. Coupled with misinformation and panic, courts struggled to overturn measures without the necessary evidence. Where the courts' jurisprudence cautioned against abuse of power, it was ineffective, the judgments were neither acknowledged nor implemented. Availability and accessibility of complaints mechanisms would better address rights violations occasioned by a breakdown of the rule of law and police impunity.

EPF155

Communities committed to promote the human rights, sexual and reproductive rights, and the eradication of violence against people living with HIV and key populations in the context of COVID-19

C.R. Murguía Pardo[1], E. Rodriguez[2], A. Boccardi[3], K. Suárez[4], E. Rodríguez[5]
[1]United Nations Population Fund - UNFPA, Youth and Gender Programme Analyst, Lima, Peru, [2]Ministry of Justice and Human Rights, Human Rights Directorate, Lima, Peru, [3]UNAIDS, Country Director, Lima, Peru, [4]UNAIDS, Gender and Human Rights Specialist, Lima, Peru, [5]Centro de la Mujer Peruana Flora Tristán, Coordinator of the Sexual and Reproductive Health Program, Lima, Peru

Background: *https://youtu.be/olw5Tb3ILtY*
In Peru, discrimination constitutes a crime (Penal Code and Law N°27270). However, currently 7 out of 10 Peruvian feel that human rights are little or not protected at all and that it will not improve in the coming year. In this regard 1 out of 3 people has suffered discrimination, mainly on the street (28%) and workplaces (29%); 1 in 5 people maintain that homosexuality is a disease and 71% maintain that LGBTQ+ people are the first group discriminated against; like so 7 out of 10 consider that people with HIV, being the second group most discriminated.
This figure increases when they are women, mainly in rural areas where prejudice accentuates discriminatory behaviors.
Description: *https://drive.google.com/drive/folders/1-NdYeXBX0tYLpVQdiP0ynHbxKEIb25GE?usp=sharing*
The Ministry of Justice and Human Rights with technical assistance from UNAIDS, UNFPA and the NGO Flora Tristan launched a community campaign, with emphasis on the gender and human rights approach, to raise awareness, inform and educate populations about situations of normalized discrimination against women: indigenous, LGBTIQ, living with HIV, migrant and domestic workers, exacerbated in the context of COVID-19.
4 lines of action:Participatory assessment to explore the social norms and discriminatory practices in key populations; capacity building of community leaders, civil society activists and the media; high-impact communication campaign to change social norms, attitudes and behaviors that violate the rights of key populations: through radio micro-programmers and other strategies prioritizing the intersectional approach; M&E and partnership with key actors (public and private sector, SCO, etc.)
Lessons learned: The citizens valued that the government leads a campaign to make visible the discrimination and defense of human rights of key population.
The intersectional approach of the discrimination and violence has been key to understand the multiple impact of discrimination.The active participation of key populations, activists and media guaranteed the success of the initiative.
Conclusions/Next steps: The justice sector has been strengthened in its leading role in protecting the human rights of key populations.736,000 people recognize discrimination as a public problem and are willing to take action to eradicate it, including native communities (Amazon).69 journalists are sensitized against discrimination and committed to eradicating it.
Local Municipalities are committed to sustainability.

Building partnerships with Civil Society to prioritize resourcing for children and adolescents in the HIV and TB response in the face of Covid-19

R. Igweta[1], C. Zinyemba[2], P. Matsasa[3], M. Motseko[4], G. Mutiso[5], M. Murenga[6]
[1]Elizabeth Glaser Pediatric AIDS Foundation, Public Policy and Advocacy, Nairobi, Kenya, [2]Elizabeth Glaser Pediatric AIDS Foundation, Public Policy and Advocacy, Harare, Zimbabwe, [3]Elizabeth Glaser Pediatric AIDS Foundation, Programs, Maseru, Lesotho, [4]National AIDS Commission, Programs, Maseru, Lesotho, [5]Formerly EGPAF, Nairobi, Kenya, [6]Lean on Me Foundation, Nairobi, Kenya

Background: Children and adolescents living with HIV experience poorer health outcomes across the clinical care cascade compared to adults with HIV, but pediatric populations are often insufficiently prioritized when allocating resources for national HIV/TB strategies.
To meaningfully engage diverse stakeholders and civil society organizations during the COVID-19 pandemic, the Elizabeth Glaser Pediatric AIDS Foundation (EGPAF) developed a replicable model for virtual engagement of civil society to create a consensus charter delineating policy priorities to ensure inclusion of children in national HIV/TB responses.
Description: EGPAF collaborated with Kenyan civil society organizations (CSOs) to engage the Global Fund Country Coordinating Mechanism to ensure that pediatric resource needs were prioritized in Kenya's Global Fund funding proposal. Due to the COVID-19 pandemic, several virtual consultations were convened in order to develop a consensus charter advocacy tool enumerating national priority needs of children/adolescents related to prevention, diagnosis, and treatment of HIV/TB. An analysis of national gaps in pediatric HIV/TB response that require resourcing informed the charter, including the need for optimization of pediatric antiretroviral therapy and procurement of point-of-care commodities. Due to the success of the initial civil society convening in Kenya, a second convening was hosted in Lesotho with civil society partners. The Lesotho National AIDS Commission, which coordinates HIV/TB programs, was part of the discussions with civil society, highlighting the value of partnerships with various stakeholders.
Lessons learned: The virtual consultations in Kenya and Lesotho led to the development of critical advocacy tools to ensure strategic and targeted engagement with key

decision makers (e.g., Global Fund and PEPFAR), in the HIV/TB response on priorities for children/adolescents. These consultations and resulting charters serve as a replicable model for successful virtual engagement of civil society, which has been a key challenge during the COVID-19 pandemic.

Conclusions/Next steps: The charters will coordinate advocacy and fund mobilization, ensure effective program implementation, and assist CSOs to speak with one voice. Additionally, the process identified for virtually consulting CSOs will be replicated in additional countries, providing a method to ensure community voices are represented in decision making, even under adverse circumstances.

EPF157

Can podcasts be reliable sources for informing policy makers and general public on the lessons from AIDS for the COVID-19 pandemic?

B. Plumley[1], T. Espera[2], J. Tobias[1], E. Espera[3]

[1]Ikana Health Action Lab, New York, United States, [2]Global Health Reporting Center, New York, United States, [3]News Doc Media, Sacramento, United States

Background: Forty one per cent of US citizens listened to at least one podcast per month in 2021. A Shot In The Arm Podcast with 65 episodes, was launched in 2019 and is a video podcast about innovation and equity in global health. In March 2020, we pivoted to identify lessons from HIV to inform the COVID-19 pandemic and expanded our audience significantly to share these lessons more broadly.

Description: We report on how we are balancing "quality" with "quantity" in audience size, in collaboration with with podcast hosting platforms and public health academia.

Our guests are multidisciplinary, including Anthony Fauci, Barbara Lee, Peter Piot, Micheal Ighodaro, Yvette Raphael, Martina Clark, Peter Staley and Emily Bass. The podcast's most popular episode is with Dr Huma Abbasi of Chevron on how corporate health and medical functions are now the frontline of the COVID response, building on the company's HIV workplace programs, with over 125,000 listens/views via Linked In. A two part episode on India's 2021 COVID outbreak, and its impact on Hijra marginalized communities, generated 59,000 listens, through Instagram, primarily from South Asia.

However, audience expansion brought increased content and speaker criticism by "bots" and "trolls". Many of these were associated with anti-vax and misinformation groups. We have removed obvious bots and trolls, prioritized distribution through Linked In, and focused Facebook engagement, away from imprecise promotion tools to targeted interaction with interested networks - for example, nurse practitioners and vaccine implementers, and communities of people with HIV.

Lessons learned: Clear guidelines for managing podcast subscriptions are a central priority for all health-related podcasts and social technology outreach. Size of podcast audience is not, in itself, an indicator of success. We are now a project of the Ikana Health Action Lab and are collaborating with the Health Podcast Network to build an expanded targeted public health audience, and to articulate further impact of the content with influencers and stakeholders.

Conclusions/Next steps: While the reach of the podcast has been evaluated with Facebook and Linked In metrics, we are now collaborating with Brown University School of Public Health to further understand impact with key audiences.

EPF158

Legal and human rights interventions for persons living with HIV, KVPs, other vulnerable and marginalized groups during COVID 19 lockdown 2020-21: Uganda Network on Law, Ethics and HIV/AIDS (UGANET) experience

B. Odur Lee[1]

[1]Uganda Network on Law, Ethics and HIV/AIDS(UGANET), Legal, Kampala, Uganda

Background: Uganda implemented lockdowns, curfew,banning of both private and public transport systems and mass gatherings to minimize spread of COVID19.Media reports indicated that cases of domestic violence increased and these accounts of violence were commonly sexual and gender-based violence against women and girls.

The lockdown also saw a great number of Persons Living with HIV, women, girls and vulnerable communities face gross human rights violations; domestic violence, stigma and discrimination,denial of access to medical services (ART) for PLHIV who missed appointments because there was no public transport and even those with cars were unable to because of lockdown.

Community paralegals were great resources to the communities during lockdown, they worked with Lawyers and ensured that Persons Living with HIV and other vulnerable and marginalized communities are/were not left behind.

Description: Human rights violations across Uganda increased exponentially during the COVID 19 lockdown. This kept Human rights Lawyers on their feet. UGANET found innovative ways of responding to needs of communities by starting a toll-free line in handsets with 16 channel 24 hours Call center, coordinating with community paralegals and picking cases from media. To get the community served, adverts were put on TV and in local radios in all regions of the country.

UGANET also established a GBV shelter and rescue program by 29thMay 2020,to provide holistic support; legal, psychosocial, safe space, security for survivors of violence.

Lessons learned: 70 calls received per day 55% F with about 40, 57% cases were for serious follow up and most of the cases had TB/HIV/GBV context.

167(M-30, F137) 82% F and 17%M supported through legal interventions. This impact was realized through availability of lawyers and community paralegals.

751(M248,F503) community members across the country called through Call center toll free and sought legal services. The findings were 66% F comprised of mainly Adolescent Girls and Young Women and also PLHIVs. This impact was made possible because of the 24/7 legal support.

Conclusions/Next steps: Social injustices and human rights violations for vulnerable and marginalized groups can be mitigated through legal and community led interventions. However, the availability of lawyers who are willing to offer free legal services remains an issue.

Impact of COVID-19 on HIV risk and HIV care among refugees, migrants, asylum seekers and internally displaced persons

EPF159

Access to HIV care and treatment before and during the COVID-19 pandemic for Venezuelan migrants in four urban settings of Colombia

S. Das[1], M. Stevenson[2], J.R. Guillen Cañizares[3], A. Wirtz[2], S. Arciniegas[2], K. Bevilacqua[2], J.L. Ortiz Melo[3], J.J. Lopez Avendaño[3], K. Page[2], P. Spiegel[2], A. Abdul-Quader[1], H. Ruiseñor-Escudero[1]

[1]Centers for Disease Control and Prevention, Atlanta, United States, [2]Johns Hopkins University, Baltimore, United States, [3]Corporación Red Somos, Bogota, Colombia

Background: Colombia hosts the largest population of Venezuelan migrants, more than 1.7 million, as of March 2021. People living with HIV (PLHIV) are among those leaving Venezuela, often in search of better healthcare. However, most migrants enter Colombia with irregular immigration status and do not have access to national health services, including HIV care, and can access only emergency services and vaccines.

We describe access to HIV care and treatment before and during the COVID-19 pandemic for recently migrated Venezuelan adults residing in Colombia.

Methods: We conducted formative research for a biobehavioral survey of recently migrated (since 2015) Venezuelan adults (≥18 years) residing in Bogotá, Soacha, Barranquilla, and Soledad. In-depth interviews (IDIs) were conducted with 24 stakeholders and 31 adult migrants, between June and October 2020 and April and June 2021, respectively. During the latter timeframe, a single focus group discussion was held with adult migrants. Stakeholder interviews included staff and healthcare workers from humanitarian organizations and government entities. The 31 adult migrants included 16 males, 15 females, 10 PLHIV, and 21 non-PLHIV. Transcripts were thematically coded in ATLAS.ti following study domains and new codes were generated as themes emerged.

Results: Participants reported migrants' barriers to accessing HIV care and treatment, including immigration status and navigation of healthcare options, prior to the COVID-19 pandemic. Humanitarian organizations significantly facilitate healthcare provision for migrants, both prior to and during the pandemic. Multiple impacts to HIV healthcare provision during the first year of the pandemic include inadequate healthcare staffing and delay or pauses in services (e.g., antiretroviral medications (ARVs) delivery and rapid HIV testing). Participants also reported healthcare organizations utilizing telehealth appointments, delivering ARVs to patients' homes, and disseminating sexual health information via electronic channels. Participants experienced continued necessity for in-person services like HIV testing and medication pick-up due to service delays and inadequate medication supply.

Conclusions: COVID-19 exacerbated existing challenges to accessing HIV care and treatment in addition to creating new disruptions in the HIV care continuum for Venezuelan migrants in Colombia. Despite telehealth availability and medication delivery during early peaks in the pandemic, these results emphasize a continued need for in-person services.

EPF160

AMPF Strategy for Combination Prevention and rights-based care to migrants and refugees living with HIV during the Covid-19 pandemic

D.M. Abdellatif[1], M. Sabih[1], N. Said[2]

[1]L'Association Marocaine de Planification Familiale (IPPF Member Association), Rabat, Morocco, [2]International Planned Parenthood Federation (IPPF) Secretariat, London, United Kingdom

Background: HIV prevalence remains low in Morocco, among the key populations are IDPs and migrants with an observed prevalence 7.1% and 3% respectively (National Screening data, 2017). Women refugees and migrants are at a higher risk to HIV and SGBV due to their high exposure to sexual coercion (IBBS, 2013). With the onset of the COVID-19 pandemic all health efforts focused on reducing the spread of COVID-19 and services suffered from disruptions. To protect some of the gains reached by the National Strategic Plan for the fight against AIDS 2017-2021, AMPF with partners intervened quickly through targeted response to PLHIV, recruiting volunteer doctors to monitor vulnerable cases and digitalised services to reach those at risk.

Description: The COVID-19 HIV and SGBV multisectoral rapid response started in 2020 based on the assessments of the COVID-19 situation in Morocco. The action plan included key areas:

a. Strategy to reach the most vulnerable refugees and migrants with rights-based prevention and care;

b. The design and development of education information materials (in Arabic-French and English) on COVID 19 and HIV;

Oral abstracts

Poster exhibition

E-posters

Late-breaker abstracts

Author Index

c. Referral system of health services for refugees/migrants, contacts of focal points for HIV and COVID19 treatment;
d. Setting up telehealth platforms for the community to reach health Workers, volunteer doctors and AMPF project officer when in need.

Lessons learned: - Using comprehensive SRHR to reach refugees and migrants especially those at risk of HIV and SGBV proved to be successful during the pandemic.
- using telehealth approaches (hotline services, social media channels and WhatsApp accounts, home delivery of medications and testing at home, virtual prescription services) with the support of the volunteers from the refugee and migrant communities ensured their trust in the services.
- Well connected referral systems with partners is a best practice preparedness tool to response to the needs of those affected by HIV and SGBV.
- Enabling self-care services for HIV and SRH enhances reproductive autonomy and increased quality of care.

Conclusions/Next steps: Responsive, innovative and rights-based service the refugees and migrants impacted by HIV and SGBV during the COVID-19 pandemic should continue. Self-care, telemedicine, digitalisation and community engagement are key enables of this strategy.

EPF161
Water and food insecurity are linked with increased HIV vulnerabilities during the COVID-19 pandemic among urban refugee youth in Kampala, Uganda

C. Logie[1], M. Okumu[2], I. Berry[3], A. McAlpine[1], Z. Yaregal[1], A. Perez-Brumer[3], J.-L. Kortenaar[3], D. Kibuuka Musoke[4], R. Hakiza[5], P. Kyambadde[6], L. Taing[7], H. Mehmood[7], L. Mbuagbaw[8]
[1]University of Toronto, Social Work, Toronto, Canada, [2]University of Illinois Urbana-Champaign, Urbana, United States, [3]University of Toronto, Toronto, Canada, [4]International Research Consortium, Kampala, Uganda, [5]Young African Refugees for Integral Development (YARID), Kampala, Uganda, [6]Uganda Ministry of Health, Kampala, Uganda, [7]United Nations University Institute of Water, Environment & Health, Hamilton, Canada, [8]McMaster University, Hamilton, Canada

Background: It is critical to understand COVID-19 impacts on HIV vulnerabilities among refugee youth in Uganda—Sub-Saharan Africa's largest refugee hosting nation. This is particularly salient in Kampala, where youth HIV prevalence is 7.7%. To understand HIV prevention needs during COVID-19, we conducted a multi-method study with urban refugee youth living in informal settlements in Kampala, Uganda.

Methods: We conducted in-depth individual interviews (IDI) with refugee youth aged 16-24 (n=24), followed by cross-sectional surveys with a peer-recruited sample of urban refugee youth (N=440) in Kampala. We applied thematic analyses across qualitative data to explore linkages between ecosocial factors and sexual and reproductive health (SRH). Multivariable logistic and linear regression assessed quantitative associations between food insecurity and water insecurity and: pandemic-related disrupted SRH access; past 12-month transactional sex; pandemic-related unplanned pregnancy; condom efficacy; and sexual relationship power (SRP), adjusting for age, gender, and informal settlement.

Results: Key themes across qualitative narratives (n=24; n=12 women, n=12 men; mean age: 21 years old) included:
a. Pandemic-related economic insecurity contributed to survival sex, migration, and subsequent unplanned pregnancy;
b. Reduced SRH service access (e.g., condoms, HIV testing, contraception) was amplified by pre-existing low SRH knowledge and pandemic-related lockdowns; and,
c. Water-insecurity (WI) and food-insecurity (FI) magnified chronic stress.

Survey participants (n=440; mean age: 21 years old, 51% women, 49% men) reported high FI (65%) and WI (47%). In adjusted analyses, WI (adjusted odds ratio [aOR]: 1.82, 95% confidence interval [CI]:1.12-2.96) and FI (aOR: 1.89 95%CI=1.10-3.27) were associated with increased odds of disrupted SRH access. WI was associated with increased likelihood of unplanned pregnancies (aOR: 2.49, 95%CI=1.11-5.62) and transactional sex (aOR: 2.67, 95%CI=1.03-6.93) and reduced SRP (adjusted β= -2.34, 95%CI= -4.58, -0.09). Women (vs. men) (adjusted β= -3.61, 95%CI= -5.07, -2.16) and water insecure participants (adjusted β= -3.96, 95%CI= -5.44, -2.47) reported reduced condom efficacy. WI was associated with higher odds of FI (aOR: 2.27; CI:1.40-3.68).

Conclusions: Multi-method findings suggest that co-occurring FI and WI were associated with HIV vulnerabilities and also described by refugee youth as central stressors. Understanding interactions between FI and WI within larger socio-structural risk environments can advance localized HIV prevention with refugee youth.

EPF162
Impact of COVID-19 on HIV treatment and care among refugees, a call for action, Uganda experience

C. Ssentongo[1,2], R. Nanyunja[3]
[1]Program for Accessible Health Communication and Education, Research, Monitoring and Evaluation, Kampala, Uganda, [2]Hopkins Integrated Development Intiatives, Research, Monitoring and Evaluation, Kampala, Uganda, [3]Hopkins Integrated Development Intiatives, Programs, Kampala, Uganda

Background: Uganda is hosting 1,446,378 refugees, 17,000 live with HIV/AIDS, on track to achieve UNAIDS "90-90-90" 2030, 84% (know their HIV status),87% on ART, 88% virally suppressed. However COVI 19 pandemic, strict lockdown, threatened reverse achievements, presented barriers to HIV testing (0%) mainly to vulnerable refugees in 12 districts. no care services and access to ARVS, HIV clin-

ics closed, health workers focused on COVID, neglecting other health conditions. ART refills not accessible, 98% telehealth services derailed, nutritional levels drooped as no incomes, donor agencies not available, as they faced COVID

Methods: A mixed-methodology employed targeting districts hosting refugees, 1220 living with HIV, (920 F, 300 M) 99 households reached.

Pre, post COVID-19 literature on restrictions, impact on HIV/AIDS infections among refugees reviewed.

Quantitative household survey in settlements, host community to assess impact of COVID 19 on refugees with HIV/AIDs.

Quantitative survey among HIV/AIDs refugees in settlement and surrounding communities assess accessibility to HIV/AIDs services.

Qualitative key informant interviews, HIV/AIDS services providers, local leaders, expert clients interviewed to support HIV/AIDs refugees, policy consideration, building refugees capacities to be resilient in case of epidemics.

Results: 98% reported almost 100% reduction HIV testing services, 70% increased death due to opportunistic infection, 90% women, 60% men reported loss of HIV/AIDS services, 95% were on ART pre COVID, accessing service centers was possible, with restriction 45% women, 30% males were on involuntary default on ART.. 100% reported, transport restrictions, abuse by security agencies resulting in involuntarily default on ART, 100% reported loss of income, 95%have their nutrition affected, 30% women and 20 males were reported lost clients, none availability of a functioning telehealth services (89%). 95% of respondents requested for policy change for epidemics management for continued HIV services, 100% requested a transfer of funds to boost incomes.

Conclusions: Measures implemented to mitigate COVID spread impacted refugees, more for COVID positive, lessons learnt must guide effective strategies allowing access to HIV/AIDS care, continued service provision, policy reforms, stakeholders' interventions for a strong supporting functioning environment, health system for uninterrupted timely, equitable HIV/AIDS care for refuges and a community epidemic resilience.

EPF163
Who is paying attention? The impact of COVID-19 laws on sex workers in Southern Africa

A. Mmolai-Chalmers[1]
[1]*Southern Africa Litigation Centre, Johannesburg, South Africa*

Background: The purpose of the research was to assess the impact of COVID-19 laws among sex workers in 7 SADC countries (Botswana, Namibia, Eswatini, Tanzania, Zambia, Zimbabwe, Malawi). The research also assessed how sex worker NGOs addressed the challenges brought by movement restrictions.

Description: In 2019 as COVID-19 hit the world, Governments' across the globe introduced movement restriction laws and travel bans to control infections. These laws affected the provision of HIV services for sex workers. The research assessed the impact of COVID-19 laws on sex workers accessing HIV services and how sex worker organisations manoeuvred policy restrictions to reach an already marginalised population.

Lessons learned: Conversations conducted with eight activists leading sex worker organisations revealed that COVID-19 regulations reversed the progress made in enabling sex workers to access services in a stigma-free environment. Movement bans restricted access to community drop-in centres to refill medications. Organisations providing mobile services could not track clients to link them to services. The focus on enabling access to HIV service provision for sex workers shifted to sensitising sex workers on COVID-19 and providing food packages to families of sex workers.

Conclusions/Next steps: Sex worker activists have over the years presented evidence to show how perceived criminalisation of sex work makes them easy targets of harsh laws and exacerbate exclusion, discrimination, and violence. COVID-19 pandemic has shown that governments made decisions without due consideration of the human rights of sex workers.

EPF164
Sexual behaviours and condom use among young refugees in Acholi and West NileSub-Regions

V. Kiwujja[1], C. Kajungu[1], P. Bukuluki[2], S. Wandiembe[3], W. Mugwanya[1], C. Anena[1], R. Kindyomunda[1], R. Kareodu[1]
[1]*UNFPA, Sexual and Reproductive Health, Kampala, Uganda,* [2]*Makerere University, School of Social Sciences, Kampala, Uganda,* [3]*Makerere University, School of Statistics and Planning, Kampala, Uganda*

Background: Uganda is a host to over 1.5 million refugees (UNHCR, 2021), majority from South Sudan and DRC. The refugees experience challenges accessing and utilizing health care, including Sexual and Reproductive Health and Rights. Young refugees adopt negative coping mechanisms as their rights are suppressed by negative cultural norms such as early marriages and stereotyped gender roles, which place them at higher risk of HIV infection. There is however a general lack of evidence on factors that influence behaviours to inform targeted programming thus the necessity for a Knowledge, Attitudes, and Practices (KAP) study.

Methods: A household study based on a mixed-methods approach was conducted between June-October 2021 to establish KAP on SRHR/GBV among young refugees across seven refugee hosting districts.A total of 840 refugees aged 10-24 years were surveyed.

Results: At least 53.5% of young refugees had ever had sex. Among those that have ever had sex, six in ten had their sexual debut while they were still children (below 18

years); while half of these (50.8%) sexually active (SA) had had sex in the last four weeks. One in five young refugees engages in sex with multiple partners while 20.4% have been coerced into sex.

One in ten young refugees reported engaging in transactional sex in the last 12 months. Further, of the SA, at least 35.2% reported not to have used a condom at the last sexual act while 42.4% of those engaged in high-risk sex used a condom at the last high-risk sex.

This is alarming given that only 41% of the SA had taken an HIV test in the last six months and 27.8% are currently using any method of contraception. However, nearly all (97.6%) of those that have never had sex plan to abstain consistently.

Conclusions: These findings highlight that young refugees engage in sex at an early age with many coerced calling for emphasis on enforcement of defilement laws as well as development of life skills for assertiveness, negotiation, and self-efficacy amongst young people, especially young women to negotiate for delay of sexual debut and safe sexual practices including condom use.

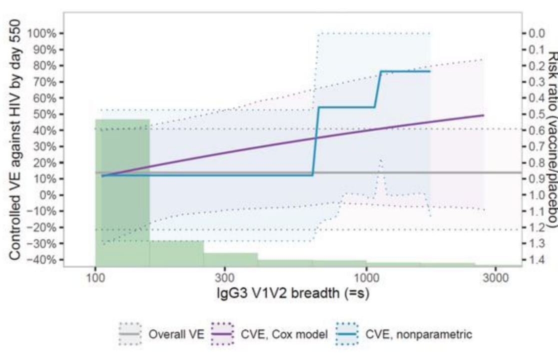
Background: In the phase 2b Imbokodo clinical trial (HVTN 705/HPX2008; NCT03060629), the investigational HIV vaccine regimen consisting of a vector-based vaccine (Ad26.Mos4.HIV) in combination with clade C gp140 protein was evaluated. Our analyses evaluated immune response markers as correlates of risk (CoR) for HIV-1 acquisition and protection (impact on VE).

Methods: Immune markers were measured in samples from month 7 (4 weeks post-third vaccination) in a breakthrough case-control cohort (n=52 cases, 231 non-cases) from per-protocol vaccinees (HIV negative through month 7, received first 3 vaccinations within vaccination windows, without major protocol deviations). Binding and functional antibodies were measured in sera by ELISA, BAMA, ADCC, and ADCP; T-cell functionality was assessed via IFN-γ ELISpot and ICS. Forty-one markers (6 primary, 35 exploratory), including IgG and IgG3 magnitude-breadth and multi-epitope function scores, were assessed as univariate CoR and correlates of protection for HIV-1 acquisition over 550 days post-month 7 via Cox and nonparametric modelling adjusted for baseline prognostic factors. Multivariable CoR were assessed by Cox modelling (primary markers) and machine learning (all markers).

Results: The analyses did not support statistically significant CoR (p-values for multivariable Cox model of primary markers: 0.11-0.72). There was a consistent trend toward IgG3 V1V2 breadth being associated with decreased HIV-1 acquisition, suggesting an immune correlate with a hazard ratio of 0.51 (p=0.11) in the multivariable analysis and 0.67 (p=0.24) in the univariable analysis per 10-fold increase, and increased VE with this marker (Figure).

VE mediated through this marker was 25.3% (95% CI: 6.2%, 40.5%). The preclinical correlate combining ELISA and ELISpot responses was not recapitulated in this clinical trial.



CVE, covariate-adjusted vaccine efficacy; HIV, human immunodeficiency virus; IgG3, immunoglobulin G3; V1V2; first and second variable regions; VE, vaccine efficacy.

Notes: Covariate-adjusted VE with 95% CIs by IgG3 V1V2 breadth score, estimated using proportional hazards (purple) or nonparametric modelling (blue). The purple and blue shaded areas represent 95% CIs. The green histogram is an estimate of the density of the month 7 marker. VE curves are plotted over marker values from smallest value (100) to the 97.5th percentile (2710) for Cox modelling and the 95th percentile (1451) by nonparametric modelling.

Figure. IgG3 V1V2 breadth (weighted avg log10 Net MFI): Month 7

Conclusions: Multiple statistical analyses revealed a trend of high IgG3 V1V2 BAMA breadth scores associated with lower infection risk and partial vaccine protection.

OALBA0103
Flt3 agonist enhances immunogenicity of arenavirus-vector based vaccines in macaques

A. Boopathy[1], A. Nekkalapudi[1], B. Sharma[1], S. Schulha[2], R. Wimmer[2], D. Jin[2], J. Sung[1], J. Murry[1], M. Nagel[1], B. Carr[1], S. Ahmadi-Erber[2], H. Lauterbach[2], K. Orlinger[2], T. Makadzange[1], M. Kuhne[1], R. Geleziunas[1], B. Falkard[1], S. Schmidt[2]

[1]Gilead Sciences, Foster City, United States, [2]Hookipa Pharma, New York, United States

Background: Strong virus specific CD8 T cell responses are associated with viral control, in both non-human primate models of SIV infection and in HIV infected elite controllers. Arenavirus vectors elicit potent antigen specific CD8 T cell responses by infecting and activating dendritic cells (DC) and other antigen presenting cells. In clinical oncology studies, Flt3 receptor activation expands peripheral DCs. Here, we evaluate the potential of Flt3 receptor agonism to enhance immunogenicity of an arenavirus-based alternating two-vector SIV vaccine in rhesus macaques.

Oral abstracts

Poster exhibition

E-posters

Late-breaker abstracts

Author Index

Methods: Healthy rhesus macaques (n=13/group) were immunized with attenuated replicating arenavirus-based vectors, with artificial genome organization, i.e. artPICV (Pichinde Virus) and artLCMV (Lymphocytic choriomeningitis virus) in alternating sequence.

Both vectors encode SIVsmE543 Gag, Env and Pol immunogens and were administered alone (Vaccine vectors on weeks 0, 4, 8, 12) or in combination with Flt3 agonist (Flt3 ligand-Fc fusion protein dosed on weeks -1, 3, 7, 11).

Vaccine immunogenicity was assessed by SIV-specific IFNγ ELISpot, using SIV peptide sub-pools for cellular breadth, and Env-binding antibodies by ELISA. SIV-specific T cell polyfunctionality, activation of T cells, DCs and innate immune cells was evaluated by multi-parameter flow cytometry.

Results: No safety concerns or drug accumulation was observed with repeated Flt3 agonist dosing. In combination with Flt3 agonist, the alternating prime-boost dosing with artPICV/artLCMV resulted in a robust increase of conventional type 1 DCs (14-fold, $p<0.001$) and activated monocytes (2-fold, $p<0.01$) over baseline.

Combination treatment significantly increased SIV-specific IFNγ T cell responses (8-fold, $p<0.0001$), expansion of SIV-specific cellular breadth (9-fold, $p<0.0001$), T cell activation (2-fold, $p<0.001$), and SIV Env-binding antibodies (3-fold, $p<0.0001$) after the 4 vaccine doses.

Importantly, Flt3 agonism significantly augmented vaccine induced peak polyfunctional SIV-specific CD4 and CD8 T cells (by 2-4-fold, $p<0.05$) that express IFNγ, TNFα and IL-2 after each vaccine dose.

Conclusions: Flt3 agonism is a novel immunomodulatory strategy that augments the magnitude, breadth, and polyfunctionality of SIV-specific T cell responses and SIV-specific antibody responses induced by arenavirus vaccination with a potential to be part of a combination therapeutic approach for HIV cure.

OALBA0105
Metabolomic and lipidomic correlates of time-to-HIV-rebound in viremic controllers treated with vesatolimod

Y. Cai[1], S. Deeks[2], L. Zhang[3], L. Giron[4], K.Y. Hong[4], A. Goldman[4], L. Selzer[3], L. VanderVeen[3], S. Guo[3], C. de Vries[3], E. Vendrame[3], D. SenGupta[3], M. Abdel-Mohsen[4], J. Wallin[3]

[1]Gilead Sciences, Biomarker, Foster City, United States, [2]UC San Francisco, San Francisco, United States, [3]Gilead Sciences, Foster City, United States, [4]The Wistar Institute, Philadelphia, United States

Background: Metabolites andlipids are biologically active molecules involved in several cellular processes and immunological functions. Recently, several metabolites and lipids were suggested as potential correlates of time to HIV rebound (TTHR) post-antiretroviral therapy (ART) interruption in chronically-infected people living with HIV. We examined plasma metabolite and lipid profiles in a placebo-controlled Phase 1b study of the TLR7 agonist vesatolimod (VES) in ART-suppressed viremic controllers.

Methods: We enrolled 25 ART-suppressed HIV viremic controllers [pre-ART plasma viral load (pVL) 50-5000 copies/mL]. Seventeen participants received ten biweekly doses of VES, and eight received placebo, followed by an analytical treatment interruption (ATI) phase for up to 48 weeks. pVL was measured by qPCR, proviral HIV DNA was measured by the intact HIV proviral DNA (IPDA) assay, and plasma metabolites and lipids were measured by HPLC-MS/MS. Baseline (predose) levels of metabolites and lipids were used to determine associations with time to pVL of 200 or 1000 copies/mL, or the duration of HIV control below 400 copies/mL during ATI, using the cox proportional hazard model and Spearman's correlations.

Data collected at 1-day after VES dose 10 were used to evaluate the effect of VES. Wilcoxon Signed-Rank test and Rank-Sum were used to compare between timepoints and populations.

Results: VES treatment resulted in induction of pro-inflammatory tryptophan metabolism, increased protein-synthesis-related aminoacyl-tRNA biosynthesis, and enhanced the phosphatidylinositol signaling pathway.

At baseline, glycoursodeoxycholic acid, some ceramide lipid groups, and cholesterol ester (ChE 20:2) were associated with longer TTHR and larger reduction in IPDA; while phosphatidylcholine (18:3_18:3), and phosphatidylethanolamine (19:1_18:1) were associated with shorter TTHR. Pathways associated with TTHR or changes in IPDA included several pathways which were previously reported to be associated with delayed HIV rebound, such as the Glutamine/Glutamate and Histidine metabolic pathways, and arginine biosynthesis.

Additional pathways found in this study included beta-Alanine metabolism and pantothenate and CoA biosynthesis, which were associated with accelerated immune recovery.

Conclusions: This exploratory analysis highlights potential metabolic and lipidomic changes mediated by VES treatment and/or associated with viral control post-ART-cessation in HIV viremic controllers. These findings warrant further investigations in larger independent cohorts.

Background: VRC01 is a broadly neutralizing antibody (bNAb) targeting CD4 binding sites with demonstrated anti-HIV-1 activity in adults. Safety and efficacy in infants living with HIV-1 are unknown.
Methods: Infants, age <12 weeks initiating antiretroviral therapy (ART), were randomized to four doses (Weeks 0, 2, 6, 10) of open-label, subcutaneous VRC01 (VRC01) at 40mg/kg or no VRC01 (No-VRC01). Follow-up was 48 weeks, with primary safety and efficacy outcomes assessed at Week 14. Laboratory testing included VRC01 plasma troughs, droplet digital PCR for HIV-1 DNA and Genosure® MG and PhenoSense® Neutralization assays for ART and VRC01 resistance.
Results: Infants enrolled (30 to VRC01; 31 to No-VRC01) between April 2019-March 2020 in Malawi, Botswana, Zimbabwe, and Brazil; 84% Black non-Hispanic, 57% female. Baseline characteristics were (VRC01 vs No-VRC01): median age (72 vs 73 days), $\log_{10}$ plasma HIV-1 RNA (4.10 vs 4.35 copies/mL), and $\log_{10}$cellular HIV-1 DNA (3.12 vs 3.16 copies/million PBMCs). Initial ART included nevirapine (53% of VRC01; 29% of No-VRC01) or lopinavir/ritonavir. Baseline ART resistance was detected in 44% (VRC01) and 33% (No-VRC01) of infants, mostly NNRTI. Baseline resistance to VRC01 (IC50 ≥50mcg/mL) was detected in 5/17 (29%) infants receiving VRC01. All VRC01 doses were administered.
Local injection reactions (all Grade ≤2) occurred in ≥90% of infants. Adverse events Grade ≥3 (none attributed to VRC01) through Week 14 occurred in 40% of VRC01 (95% CI:23%, 59%) and 47% of No-VRC01 (95% CI:28%, 66%), and most were anemia, neutropenia and gastrointestinal disorders. Median (Q1, Q3) VRC01 plasma trough was 83.1 (36.1, 111.8) mcg/mL, however 31% were <50mcg/mL.
No VRC01 anti-drug antibodies were detected. HIV-1 DNA $\log_{10}$ copies/million PBMCs median (Q1, Q3) declines from Week 0-14 were 0.41 (0.30, 0.56) in VRC01 and 0.53 (0.33, 0.70) in No-VRC01 (Wilcoxon p=0.42).
Conclusions: Subcutaneous VRC01 was feasible and no safety concerns were observed in this first treatment study in infants living with HIV-1. HIV-1 DNA declines did not differ by treatment arm, however ART and VRC01 resistance and VRC01 troughs <50 mcg/mL may have lessened VRC01 effectiveness.
Further studies are needed to determine optimal approaches with more potent bNAbs for early treatment of perinatal HIV infection.

OALBB0103
Enhanced tuberculosis screening using computer-aided X-ray diagnosis and novel point of care urine lipoarabinomannan assay among adults with HIV admitted to hospital (CASTLE study): a cluster randomised trial

R. Burke[1], S. Nyirenda[2], H. Twabi[3,1], M. Nliwasa[3], E. Joekes[4], N. Walker[4], R. Nyirenda[5], A. Gupta-Wright[6], K. Fielding[7], P. MacPherson[4], E. Corbett[6]
[1]Malawi Liverpool Wellcome, Blantyre, Malawi, [2]Government of Malawi, Zomba Central Hospital, Zomba, Malawi, [3]Kamuzu University of Health Sciences, Helse Nord Tuberculosis Initiative, Blantyre, Malawi, [4]Liverpool School of Tropical Medicine, Liverpool, United Kingdom, [5]Government of Malawi, Department of HIV/AIDS, Lilongwe, Malawi, [6]London School of Hygiene and Tropical Medicine, Faculty of Infectious and Tropical Disease, London, United Kingdom, [7]London School of Hygiene and Tropical Medicine, Faculty of Epidemiology and Population Health, London, United Kingdom

Background: People living with HIV (PLHIV) have high mortality if admitted to hospital.Tuberculosis (TB) is a major cause of death, reflecting diagnostic challenges. This randomised trial investigated whether screening for TB using high-sensitivity urine lipoarabinomannan (LAM) testing and digital chest Xray with computer aided diagnosis (dCXR-CAD) could improve TB diagnosis and reduce mortality.
Methods: We conducted an unblinded cluster randomised trial among adult PLHIV admitted to medical wards at Zomba Central Hospital, Malawi, with admission-day the unit of randomisation.

Admission-days were randomly assigned to: enhanced TB diagnostics using high sensitivity urine LAM (SILVAMP-LAM, Fujicorp, Japan), dCXR-CAD (CAD4TBv.6, Delft, Netherlands: provides score 0 to 100 with higher scores more likely to be TB) plus usual care; or usual care alone.

The primary outcome was TB treatment initiation during admission.

Secondary outcomes were 56-day mortality, TB diagnosis within 24-hours and microbiologically-confirmed undiagnosed TB at discharge. Trial registration NCT04545164.

Results: Between 2 September 2020 and 15 February 2022, 415 adults in 207 clusters were included in intention-to-treat analysis. At admission, 90.8% (377/415) were taking ART and median CD4 cell count was 249 cells/mm^3 (IQR 124 - 440). In the enhanced diagnostic arm, the median CAD4TBv6 score among participants was 60 (IQR: 51 - 71), and 4% (9/207) had SILVAMP-LAM-positive urine. TB treatment was initiated in 46/208 (22%) in the enhanced TB diagnostics arm and 24/207 (12%) in the usual care arm (risk ratio [RR] 1.93 [95% CI 1.21-3.08]).

There was no difference in mortality by 56 days (enhanced TB diagnosis: 54/207 [26%]; usual care: 52/207 [25%]; hazard ratio 1.05, [95% CI 0.72–1.53]) or TB treatment initiation within 24 hours (enhanced TB diagnosis: 8/207 [3.9%]; usual care: 5/208 [2.4%]; RR 1.61 [95% CI 0.53–4.71]). Undiagnosed TB at discharge based on sputum culture was 0/207 (0.0%) and 2/208 (1.0%) enhanced TB diagnostics and usual care arms, respectively (RR not estimated).

Conclusions: High sensitivity urine LAM plus dCXR-CAD screening led to more hospitalised PLHIV initiating TB treatment, but did not reduce mortality. Better understanding of the causes of death and additional interventions are required to improve clinical outcomes for people with HIV admitted to hospital.

The "City of Hope" Patient: prolonged HIV-1 remission without antiretrovirals (ART) after allogeneic hematopoietic stem cell transplantation (aHCT) of CCR5-Δ32/Δ32 donor cells for acute myelogenous leukemia (AML)

J. Dickter[1], S. Weibel[2], A. Cardoso[3], S. Li[3], K. Gendzekhadze[4], Y. Feng[5], S. Dadwal[1], R. Taplitz[1], J. Ross[6], A. Aribi[4], R. Stan[7], T. Kidambi[1], L. Lai[8], S. Chang[9], A. Chaillon[2], M. Al Malki[4], J. Alvarnas[4], S. Forman[4], J. Zaia[3]

[1]*City of Hope, Medicine, Duarte, United States,* [2]*University of California, San Diego, Medicine, La Jolla, United States,* [3]*City of Hope, Center for Gene Therapy, Duarte, United States,* [4]*City of Hope, Hematology and Hematopoietic Cell Transplantation, Duarte, United States,* [5]*City of Hope, Medical Oncology and Therapeutics Research, Duarte, United States,* [6]*City of Hope, Department of Pharmacy Services, Duarte, United States,* [7]*City of Hope, Translational Development Center, Duarte, United States,* [8]*City of Hope, Surgery, Duarte, United States,* [9]*City of Hope, Pathology, Duarte, United States*

Background: HIV-1 remission has been described post aHCT. We report a 66-year-old Caucasian male, diagnosed with HIV-1 in 1988 (CD4 nadir <100 cells/uL), undetectable HIV-1 viral load on ART since 1990s. In 2018, he developed AML, treated with chemotherapy followed by aHCT from unrelated HLA-matched CCR5-Δ32 homozygous donor. He continued emtricitabine/tenofovir alafenamide/dolutegravir 25 months (m) post-aHCT. After analytic treatment interruption (ATI), he remains in HIV-1 remission.

Methods: 3/2019-current, City of Hope.

Pre-aHCT: HIV-1 DNA quantification, sequencing of genotypic tropism. Post-aHCT: blood, intestinal biopsies were obtained for cellular HIV DNA, RNA (by droplet digital PCR); compartmental testing for donor cells; ART levels; HIV-1 antibody quantification; peripheral blood mononuclear cells (PBMC) challenged with HIV-1; HIV, CMV T-cell responses.

Results: Pre-aHCT: 80 HIV-1 DNA copies/million PBMC, majority R5 tropic virus (10% false-positive rate). Post-aHCT, 14m post-ATI: 100% donor chimerism.

Post-aHCT: HIV-1 RNA undetectable (<20 copies/mL), sporadic (low-level) detectable cellular HIV-1 DNA, RNA in PBMC, gut tissue:

Date post-aHCT months (m)	RNA: msTatRev copies/1 million CD4+ T cells	RNA: skGag copies/1 million CD4+ T cells	DNA: skGag copies/1 million CD4+ T cells
+ 2m PBMC	0	35	0.00
+ 3 months PBMC	0	0	0.00
+ 6m PBMC Gut biopsy	0	0	0.00 4.22
+ 10m PBMC	11.4	0	0.00
+ 13m PBMC Gut biopsy	0	0	0.00 0.00
+18m PBMC	21.9	0	0.00
+ 24m PBMC	0	0	0.00
+ 30m PBMC (5 months post-ATI)	0	0	0.00
+ 37m PBMC Gut biopsy (12m post-ATI)	0	0	0.00 0.00

Table.

ART levels unremarkable at 7m, 12m post-ATI. We observed declining HIV-1 specific humoral, no detectable HIV-specific cellular immune response. Participant's CD8-depleted PBMC remained uninfected after ex vivo challenge with HIV R5 strains. Immunological studies 37m post-aHCT, 12m post-ATI: viral recall antigen analysis showed robust response to CMV stimulation, no response to HIV (CD4, CD8 T-cells).

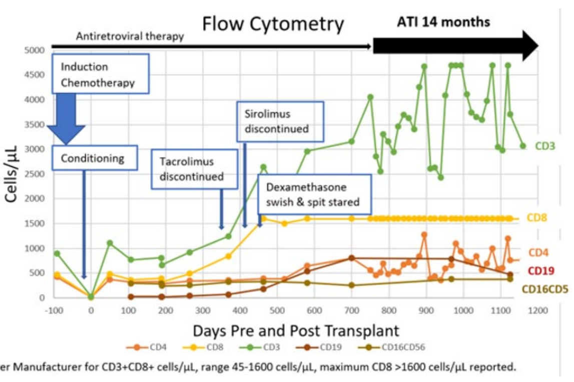

Figure.

Conclusions: We report an individual with HIV-1 transplanted for AML with CCR5-Δ32/Δ32 donor cells who at 14m post-ATI, 39m post-aHCT, has no evidence of HIV-1 RNA rebound and no detectable HIV-1 DNA. HIV cure is feasible post-aHCT as described here and in previously described reports.

OALBB0105

Incident tuberculosis as a risk factor for viral non-suppression 48 weeks among patients switched to dolutegravir based therapy with recycled nucleoside reverse transcriptase inhibitors in Lusaka, Zambia

N. Mbewe[1], D. Engamba[1], S. Fwoloshi[1], L. Mulenga[2], S. Lakhi[1]

[1]*University of Zambia, Department of Internal Medicine,, Lusaka, Zambia,* [2]*Ministry of Health,, Ndeke House, Lusaka, Zambia*

Background: Dolutegravir (DTG) based therapy has been hailed as the missing key to quickly curb the HIV epidemic in resource-limited settings. Inadequate viral load testing had slowed the rate at which individuals currently on nucleoside reverse transcriptase inhibitors (NRTI)-based regimens could be transitioned to DTG based therapy. However, as evidence emerges on the utility of recycled NRTIs, it remains to be known which factors could contribute to viral non suppression on Dolutegravir based therapy.

Methods: We conducted a retrospective sub-analysis for individuals enrolled in the VISEND study at the University Teaching Hospital in Lusaka, Zambia; with a baseline viral load >1000 copies/ml at the time of the switch and analysed virological outcomes at 48weeks post transition. Data on patient demographics, duration of previous antiretroviral therapy, and occurrence of opportunistic infections. Descriptive statistics were computed using STATA version 13. Viral suppression rates, Incidence rate ratios, and Multivariate logistic regressions for common factors associated with treatment failure were computed

Results: 786 records were screened, with 675 individuals with baseline viral load >1000copies/ml whilst on Tenofovir + Lamivudine + Efavirenz (TLE) meeting eligibility. 375 individuals were transitioned to Tenofovir Disoproxil Fumarate + Lamivudine + Dolutegravir (TLD) or Tenofovir Alafenamide +Emtricitabine + Dolutegravir (TafED) and 300 were to Zidovudine + Lamivudine + boosted Lopinavir or Atazanavir (AZT/3TC/LPV-r or ATV-r). Viral suppression rate was 87.9% on PI-based therapy versus 94.7% on TLD/TafED at 48 weeks (p-value = 0.002). There was a three-fold higher chance of virological failure with a TB event during the 48 weeks (p = 0.022) but no significant difference in TB outcomes between the groups nor any other significant factors associated with virological non suppression.

Variable	Crude OR [95% CI]	Adjusted OR [95% CI]	P value
Male Gender	2.14 (1.3 -3.69)	1.95 (1.08 -3.53)	0.027
Extremes of age (≤20 or≥60)	1.71 (0.87 -3.38)	1.55 (0.77 – 3.10)	0.215
TB Event	**3.19 (1.13- 8.93)**	**3.46 (1.19 -10.01)**	**0.022**
Baseline BMI	0.94 (0.88 -1.01)	0.98 (0.91-1.04)	0.533
Missed visit(s)	0.95 (0.44 -2.07)	0.98 (0.44 -2.16)	0.914

Table.

Conclusions: The results of this study emphasise the need for thorough screening for TB for patients being transitioned to DTG based therapy with recycled NRTI backbone and the need for prospective follow-up studies to establish utility of newer molecules such as Tenofovir Alafenamide/Emtricitabine/Dolutegravir with antituberculous therapy.

Background: The COVID-19 wave driven by the SARS-CoV-2 Omicron variant prompted the need to explore asymptomatic carriage among HIV-immunocompromised adults.

Methods: In the trial we are assessing COVID-19 mRNA-1273 vaccine efficacy in persons with HIV (PWH) or another COVID-19-associated comorbidity across 7 sub-Saharan African countries. Previously vaccinated persons were excluded. Baseline testing included HIV screening, CD4⁺ T-cell count and HIV viral load (if HIV⁺), anti-SARS-CoV-2 antibodies, and nasal swab SARS-CoV-2 reverse-transcriptase polymerase chain reaction (RT-PCR). Participants had to be without COVID-19 signs/symptoms to be vaccinated at enrollment. Here we examine December 2021-April 2022 data to characterize asymptomatic SARS-CoV-2 infections and assessed correlation with CD4 count.

Results: 6397 adults, including 4437 PWH, were enrolled (median age: 38 years; female: 75%). Baseline nasal swab data were available for 5772/6397 (90.2%). 336/5772 (6%) had asymptomatic SARS-CoV-2 infection, more frequent among SARS-CoV-2 seronegative than seropositive participants (9% vs 4%, p<0.001). Infection was detected among 98/1463 (7%) of PWH with a CD4 count<500 cells/mm³ vs 152/2974 (5%) with counts ≥500 cells/mm³ (p=0.037), an association irrespective of SARS-CoV-2 serostatus. A 10-fold CD4 decrease corresponded to 1.72-fold higher odds of PCR positivity, adjusting for serostatus, sex, and non-linear temporal trends (95% confidence interval [CI]:1.09-2.72-fold higher, p=0.019, *Figure 1*).

Over time, the adjusted odds of PCR positivity were highest during the Omicron surge in December 2021 and 44% lower in men than women (95% CI: 17%-62% lower, p=0.004). Gene sequencing on a subset confirmed Omicron.

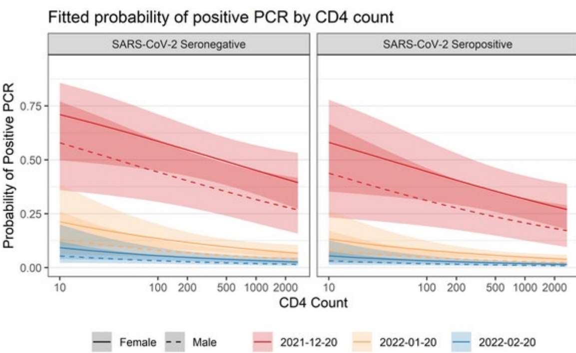

Figure 1. Estimated probability of positive PCR by baseline SARS-CoV-2 serostatus and sex assigned at birth, with corresponding 95% CIs. Logistic regression was used to model the probability of PCR positivity by CD4+ T-cell count, adjusting for baseline serostatus, sex assigned at birth, and a nonlinear temporal effect via a cubic spline. Fitted probabilities are summarized at three points: near the peak of the Omicron wave (December 20, 2020, in red) and at one and two months after the peak (in orange and blue, respectively).

Conclusions: Our study of the largest cohort of PWH in a COVID-19 vaccine clinical trial to date reports the asymptomatic SARS-CoV-2 carriage rate was 3-6-fold higher than COVID-19 vaccine trials before Omicron. Additionally, lower CD4 count in PWH strongly correlated with increased odds of SARS-CoV-2 PCR positivity.

These data highlight the urgent need for larger studies to better characterize how HIV-associated immunocompromise influences infection acquisition/clearance.

OALBC0103
A phase IV open-label evaluation of safety and tolerability of coformulated bictegravir/emtricitabine/tenofovir alafenamide for post-exposure prophylaxis following potential exposure to HIV-1

A. Liu[1], R. Xin[2], H. Zhang[1], L. Dai[1], R.E. Wu[3], X. Wang[1], A. Li[1], H. Wei[1], J. Li[1], Y. Shao[1], Y. Gao[1], Z. Wang[1], J. Ye[1], G. Abudourexiti[4], Z. Li[1], L. Sun[1]
[1]Beijing Youan Hospital, Capital Medical University, Beijing, China, [2]Beijing Center for Disease Prevention and Control, Beijing, China, [3]Colgate University, Hamilton, United States, [4]The eighth Affiliated Hospital of Xinjiang Medical University, Urumqi, China

Background: Single-tablet regimen provides a convenient once-daily regimen for the prevention of HIV infection. Here, we investigated the adherence and safety of co-formulated bictegravir/emtricitabine/tenofovir alafenamide (BIC/FTC/TAF) as a 3-drug, single-tablet regimen for post-exposure prophylaxis (PEP) in China.
Methods: This was a prospective, open-label, single-arm trial conducted in an STD/AIDS clinic of a tertiary hospital in Beijing, from May 2021 to February 2022. Adults requiring PEP were prescribed BIC/FTC/TAF one pill once a day for 28 days. Clinical and laboratory data were collected and analyzed at baseline, weeks 2, 4, 8, 12, and 24.
Results: Of 112 participants enrolled in the study, 109 (97.3%) were male and the mean age was 30±8 years. PEP completion was 96.4% (95% CI: 91.1-99.0). Two participants stopped PEP after 2 days because the source partner was identified as HIV uninfected. One participant was excluded due to hepatitis B virus infection according to the exclusion criteria. One discontinued due to the participant's decision. No participant acquired HIV through week 24. Adherence was 98.9% (standard deviation [SD], 3.3) by self-reporting and 98.5% (SD, 3.5) by pill count.
Only 5 participants experienced mild clinical adverse events attributed to study drug (including headache, diarrhea, and nausea) and 4 participants had elevated serum creatinine (grade 1).
Conclusions: A once daily, single-tablet regimen of BIC/FTC/TAF used as PEP was safe and well-tolerated with a high rate of completion and adherence. BIC/FTC/TAF may be a good option for PEP.

OALBC0104
National roll out of community HIV screening among key populations in Indonesia: assessment of early results

B. Utomo[1], R. Kurniawan[1], I. Trihandini[1], K.N. Siregar[1], S. Rahayu[1], R.J. BaharuddinNur[1], P. Loh[2], A.I. Sirait[2], I.A. Tasya[2], R.J. Magnani[2,3]
[1]Universitas Indonesia, Department of Biostatistics and Population Studies, Depok, Indonesia, [2]PATH, Seattle, United States, [3]Universitas Indonesia, Faculty of Public Health, Depok, Indonesia

Background: Although progress has been made, Indonesia remains far from achieving the first "95" of the UNAIDS 95-95-95 framework with only an estimated 43% of PLHIV knowing their HIV status in 2019. In response, the Indonesian Ministry of Health has revised its HIV testing guidelines to permit community-based HIV screening/self-testing using oral fluid rapid tests. National roll out of the new strategy began in late 2021.
This study assesses the early results in terms of community response, impact on HIV testing coverage, and linkage with treatment.
Methods: Test kits distribution and outcome data, including linkage with confirmatory testing and as needed with treatment, were compiled from four MoH implementing partners covering the October 2021 – March 2022 period. Distribution data were analyzed in terms of distribution models and modalities, as well as in terms of the characteristics of persons engaging in community screening. Testing-to-treatment initiation cascades were constructed both in the aggregate and for key population subgroups.
Results: A total of 34,981 valid community screening tests had been performed by April 2022. Hotspot distribution of test kits for assisted screening was the most common distribution mechanism (76.7% of all test kits distributed) followed by workplace distribution with assisted screening (8.4%). 95.2% of persons undergoing community screening were male, reflecting a late start in distribution to female sex workers. Of the persons screened, 75.8% were MSM, 14.3% were male employees of strategically chosen companies, 3.9% were transgendered females, 4.7% person who inject drugs, 0.9% female sex workers, and 0.3% others. 98.7% were first-time HIV testers. The HIV positivity rate in community screening was 3.6% (5.1% among transgendered females). Among persons with reactive community screening tests, 42.4% had received a confirmatory test at a health facility, and among those with reactive confirmatory tests 50% had initiated ART. The rates of both confirmatory testing and treatment initiation were especially low among FSW and male PWID.
Conclusions: Community-based HIV screening is reaching previously under-served segments of HIV key populations as evidenced by the high first-time tester rates. However, linkage with confirmatory HIV testing is low, as is linkage between confirmatory testing and treatment initiation.

OALBC0105

Predictors of high viral load among adult HIV recipients of care in Zambia, 2021: a cross-sectional analysis of HIV case-based surveillance data

S. Nyimbili[1], M. Kalubula[2], S. Bosomprah[3], P. Somwe[4], J. Mutale[4], M. Lumpa[4], J. Pry[1], D. Mwamba[4], B. Hanunka[5], K. Mweebo[5], M. Mudenda[5], P. Funsani[2], C. Sianyinda[2], T. Sinkala[1], M. Mwansa[2], S. Sivile[2], L. Tally[5], P. Minchella[5], M. Wa Mwanza[1], T. Savory[1], C. Bolton[1], I. Sikazwe[1], L. Mulenga[2], C. Phiri[2]

[1]Center for Infectious Disease Research in Zambia, Lusaka, Zambia, [2]Ministry of Health,, Lusaka, Zambia, [3]Centre for Infectious Diseases Research in Zambia, Lusaka, Zambia, [4]Centre for Infectious Diseases Research, Lusaka, Zambia, [5]Centers for Disease Control and Prevention, Lusaka, Zambia

Background: Controlling the HIV epidemic in Zambia will require achieving high viral suppression coverage, as outlined by UNAIDS 95-95-95 targets. Identifying and characterizing predictors of high viral load among recipients of care (RoC) could help guide development of interventions critical to improving HIV treatment outcomes.

Methods: We conducted a cross-sectional analysis of HIV case-based surveillance data from January to December 2021 of adult RoC (≥15 years) in Zambia with record of receiving antiretroviral therapy (ART) for ≥ 6 months and latest valid viral load (VL) measurement per national electronic health record.

We assessed association of sociodemographic characteristics and ART duration on 31 December 2021, with high VL load, defined as >1,000 copies RNA/mL, based on the latest VL measurement in 2021. Regression analyses were conducted to estimate unadjusted and adjusted odds ratios to estimate effects of covariates independently associated with high VL.

Results: A total of 531,864 HIV RoC met inclusion criteria with majority (64.8%) female, median age of 35 years (interquartile range [IQR] 29-42), and median ART duration of 52 months (IQR: 29-99). High VL occurred in 18,540 (3.49%) RoC, of whom 11,083 (59.90%) were females, and 13,822 (74.55%) had been on ART for > 18 months.

Factors independently associated with high VL included: being male (adjusted odds ratio [aOR]=1.42, 95% confidence interval [CI]: 1.37-1.46), younger age: 15-19 (aOR=2.68, 95% CI: 2.52-2.85), 20-24 (aOR=1.78, 95% CI: 1.70-1.86), 25-29 (aOR=1.40, 95% CI: 1.35-1.46) compared to those > 30 year; shorter ART duration: 6 months (aOR =4.54 95% CI: 3.99-5.17), 7-12 months (aOR =2.75, 95% CI: 2.64-2.87), 13-18 months (aOR =1.42, 95% CI: 1.35- 1.49) compared > 18 months; and rural setting (aOR=1.15, 95% CI: 1.10- 1.19) compared to urban setting.

Conclusions: We identified being new on ART, male and young adult as predictors of high VL and intensifying activities centered on service delivery models for these risk groups will help the Country in its efforts to achieve high viral suppression coverage.

Further evaluation of health services in rural settings may identify gaps in HIV service delivery. Identifying pathways for high VL among identified sub-populations may represent an opportunity to reach the UNAIDS 95-95-95 targets.

Understanding COVID-19 vaccine confidence in people living with HIV in Canada: a pan-Canadian survey

C. Costiniuk[1], J. Singer[2,3,4], J. Needham[3,4], Y. Yang[5], H. Qian[3,4], C. Chambers[6], A. Burchell[6,7], H. Samji[8], I. Colmegna[9], S del Canto[10], G.H. Godin[10], M. Habanyama[10], C. Hui[11,10], A. Kroch[12], E. Mandarino[10], S. Margolese[10], C. Martin[10], M. Owino[10], T. Mohammadi[3], W. Zhang[3], S. Pelaez[13], C. Cooper[14], A.H. Anis[3,2,4]

[1]McGill University Health Centre, Department of Medicine, Division of Infectious Diseases and Chronic Viral Illness Service, Montreal, Canada, [2]School of Population and Public Health, University of British Columbia, Vancouver, Canada, [3]Centre for Health Evaluation and Outcome Sciences, St. Paul's Hospital, Vancouver, Canada, [4]Canadian HIV Trials Network, University of British Columbia, Vancouver, Canada, [5]McGill University, Department of Medicine, Montreal, Canada, [6]University of Toronto, Dalla Lana School of Public Health, Toronto, Canada, [7]St Michael's Hospital, Unity Health, Department of Family and Community Medicine, Toronto, Canada, [8]British Columbia Centre for Disease Control and Faculty of Health Sciences, Simon Fraser University, Burnaby, Canada, [9]McGill University Health Centre, Department of Medicine, Division of Rheumatology, Montreal, Canada, [10]Community Advisory Committee, Canadian HIV Trials Network, Vancouver, Canada, [11]Ryerson University, Yeates School of Graduate Studies, Ryerson University, Toronto, Canada, [12]Ontario HIV Treatment Network, Toronto, Canada, [13]School of Kinesiology and Physical Activity Sciences, Faculty of Medicine, University of Montreal, Montreal, Canada, [14]The Ottawa Hospital and Ottawa Hospital Research Institute, Ottawa, Canada

Background: While the advent of safe and effective COVID-19 vaccines for the general population has led to mass vaccination roll-outs, certain populations may lack vaccine confidence. Our objectives were to determine demographic factors associated with taking at least 1 COVID-19 vaccine, and to determine whether there were particular elements of vaccine hesitancy associated with vaccine behaviour.

Methods: With community members, we developed a study questionnaire with items from the validated National Advisory Committee on Immunization Acceptability Matrix. PLWH were recruited via social media and community-based organizations from January-April 2022. Descriptive statistics were used to summarize results and compare responses between PLWH who have received vs those who have not received COVID-19 vaccine(s).

For each participant, scores on the 5-point Likert scale were added together (reversing for direction, as necessary). Logistic regression models were used to identify factors associated with COVID-19 vaccine uptake such as age, sex, gender, and responses to the vaccine confidence questions.

Results: 205 individuals completed the survey and indicated whether or not they received≥1 vaccine dose. Mean age was 47±14 (SD) years and 73% were male. Eighty percent had completed at least some highschool. Mean VHS scores were 33 ± 17 for the 153 individuals, and 17± 6 for the 21 individuals, who did and did not take at least one COVID-19 vaccine, respectively. Univariate analyses revealed that the odds of taking at least one vaccine dose were increased 2.80-fold [95% CI 1.91, 4.41] with each increase in age of 10 years ($p<0.0001$).

No effect was observed for sex or education. Individuals accepted COVID-19 vaccines more for altruistic reasons (i.e., protection of community) than individual reasons (i.e., protection of self). Individuals who felt that the pandemic would linger on longer were more likely to accept the vaccine than those who did not feel the pandemic would last that long.

Conclusions: Older PLWH and those who anticipated that the pandemic would be prolonged in duration were more likely to accept COVID-19 vaccines. PLWH appear to accept COVID-19 vaccines more for altruistic rather than individual reasons.

OALBD0104

A community-based participatory approach to understanding preferences, needs, and barriers to uptake of longer-acting formulations of PrEP in transgender and gender diverse Texans

P.W. Schnarrs[1,2], J. Zuniga[3,2], G. Benitez[1,2,4], P. Fliedner[1,2], A. Norwood[5,2,5], R. Lane[6], J. Oeffinger[6], K. Brookins[7], A. Andersen[7,8], K. Hausmann[7,9], H. Dulce[7], A. Olujimi[7], M. Croll[10,7], E. Schelling[11]

[1]Dell Medical School - The University of Texas at Austin, Population Health, Austin, United States, [2]Dell Medical School - The University of Texas at Austin, PRIDE Health Lab, Austin, United States, [3]The University of Texas at Austin, School of Nursing, Austin, United States, [4]The University of Texas at Austin, School of Architecture, Austin, United States, [5]Dell Medical School - The University of Texas at Austin, Internal Medicine, Austin, United States, [6]Texas Health Institute, TransFORWARD, Austin, United States, [7]PrEP for ALL Community Advisory Board, Austin, United States, [8]Austin Community College, Department of Physics, Austin, United States, [9]The University of Texas at Austin, Steve Hicks School of Social Work, Austin, United States, [10]The University of Texas Rio Grand Valley, Political Science, Edinburg, United States, [11]Transgender Education Network of Texas, Houston, United States

Background: It is estimated that only 3% of transgender and gender diverse (TGD) people currently use PrEP despite the carrying a disproportionate incidence and prevalence burden. Long acting formulations of PrEP (LA PrEP)

may improve uptake and adherence, but little is known about TGD individuals' preferences, needs, and barriers related to LA PrEP.

The purpose of this community-based participatory research (CBPR) project was to better understand the needs of TGD individuals, healthcare providers, and the similarities and differences between these groups.

Methods: Using a CBPR approach, our team consists five researchers, three co-investigators who represent Texas Health Institute, Trans*FORWARD - a Patient Centered Outcomes Research Institute Engagement Project (EASC-COVID-00284),*Transgender Education Network of Texas, and a community advisory board (CAB) that includes 6 TGD community members. Participants were recruited online, through existing participant pools, and through the social/professional networks of the CAB and other community partners.

We conducted semi-structured, virtual interviews with health care providers (HP; n = 20) and TGD (n = 10) participations and hosted 2 virtual world café conversations (WCC) with TGD Texans (n = 20) via Zoom. Interviews and WCCs were recorded, transcribed and are currently being thematically coded by three members of the team to ensure reliability and validity of the coding process.

Results: Preliminary results identify a number of barriers and facilitators to LA PrEP uptake related to contact with the healthcare system, trauma/discrimination, and reduced worry around adherence.

However, of note is a disconnect between HP and TGD participants regarding intramuscular (IM) LA PrEP, with TGD indicating they did not want it, but HP believing this would be the most suitable formulation for TGD patients. Further, there is a also concern among healthcare providers regarding the rollout of LA PrEP.

Conclusions: Cultural humility or shared decision-making strategies are likely needed to increase uptake of LA PrEP in TGD patients, as are interventions that leverage community leaders or trusted members of the community, such as community health worker programs or social network interventions. Also, TGD community members should be included in paid roles to support the development of strategies to increase uptake and support LA PrEP roll out.

OALBD0105

Assessing stigma as determinant of HIV and sexually transmitted infections among sexual minority men in the United States in 2021 from the American Men's Internet Survey (AMIS)

T. Carpino[1], J.M. Wiginton[2,3], O.W. Edwards[4], M. Hannah[4], S. Murray[1], T. Sanchez[4], S. Baral[1]

[1]Johns Hopkins University Bloomberg School of Public Health, Baltimore, United States, [2]San Diego State University School of Social Work, San Diego, United States, [3]University of California-San Diego, Department of Medicine, San Diego, United States, [4]Emory University Rollins School of Public Health, Atlanta, United States

Background: The American Men's Internet Survey (AMIS) is an annual electronic survey for sexual minority men (gay, bisexual, same-gender loving, and other men who have sex with men (MSM)) aged 15+ in the United States. Given a sustained rise in sexually transmitted infections (STI) in the US, we use stigma frameworks to characterize risk factors associated with HIV and any STI (gonorrhea, chlamydia, or syphilis) diagnosis.

Methods: Using AMIS data collected September 2021 to February 2022 and STATA 16.1, correlation matrices were developed to inform Pearson's chi-squared tests and model building. Multivariate logistic regression was used to assess associations between stigma-related factors and STI diagnosis in the past 12 months, while controlling for HIV status, age, education, race, and region.

Another model was developed for individuals not living with HIV infection, additionally controlled for PrEP use in the past 12 months.

Results: Overall, 9,061 individuals were included (13.1% Hispanic, 14.1% Black, 64.3% white, non-Hispanic) with mean age 44.3 years. HIV and STI prevalences were 14.3% and 13.0%, respectively. STI diagnosis was more common among those who experienced stigma from family, friends, and the general community ($\chi^2 > 23.0$, Pr<0.01). Adjusting for age, education, race, HIV status, and region, those with an STI diagnosis were twice as likely to have experienced general community stigma (aOR=2.0; 95% CI= (1.8, 2.3). Among 7,758 people not living with HIV, 2,652 (34.2%) used PrEP in the past 12 months and while controlling for this PrEP use, the association between general community stigma and STI diagnosis remained (aOR=1.8; 95% CI=(1.5,2.1)).

Conclusions: Given sustained HIV and STI epidemics among sexual minority men, these results highlight complex relationships between stigma, HIV, PrEP, and STIs. Stigma may be positively associated with STI diagnosis due to (1) screening or treatment-seeking delays, or (2) differences in outness and provider screening recommendations. If people experiencing stigma are more likely to be diagnosed with an STI, there are potential consequences with how stigma varies treatment behaviors.

Characterizing the mechanisms by which stigma increases odds of HIV and STIs is central to intervention development and ultimately, changing the trajectory of these epidemics in the US.

OALBE0102

SEARCH-Youth: a cluster randomized trial of a multilevel health system intervention to improve virologic suppression in adolescents and young adults living with HIV in rural Kenya and Uganda

F. Mwangwa[1], T. Ruel[2], L. Balzer[3], J. Ayieko[4], M. Nyabuti[4], W.E. Mugoma[4], J. Kabami[5], B. Kamugisha[1], D. Black[6], B. Nzarubara[1], F. Opel[4], J. Shrom[6], G. Agengo[4], J. Nakigudde[7], H. Nakato[1], J. Schwab[8], J. Peng[9], C. Camlin[10], S. Shade[11], E. Bukusi[4], B. Kapogiannis[12], E. Charlebois[13], M. Kamya[14], D. Havlir[6]

[1]Infectious Diseases Research Collaboration, Kampala, Uganda, [2]University of California, San Francisco, Pediatrics, San Francisco, United States, [3]University of Massachusetts – Amherst, Amherst, United States, [4]Kenya Medical Research Institute, Centre for Microbiology Research, Nairobi, Kenya, [5]Makerere University, Department of Medicine, Kampala, Uganda, [6]University of California, San Francisco, Department of Medicine, San Francisco, United States, [7]Makerere University, Department of Psychiatry, Kampala, Uganda, [8]University of California, Berkeley;, Division of Biostatistics, Berkeley, United States, [9]University of Washington, Department of Biostatistics, Seattle, United States, [10]University of California, San Francisco, Department of Obstetrics, Gynecology & Reproductive Sciences, San Francisco, United States, [11]University of California, San Francisco, Department of Epidemiology and Biostatistics, San Francisco, United States, [12]Eunice Kennedy Shriver National Institute of Child Health and Human Development, Maternal and Pediatric Infectious Diseases Branch, Bethesda, United States, [13]University of California, San Francisco, Medicine, San Francisco, United States, [14]Makerere University, Medicine, Kampala, Uganda

Background: Social and cognitive developmental events disrupt care and medication adherence among adolescents and young adults living with HIV in sub-Saharan Africa. We hypothesized that a dynamic multilevel health system intervention helping adolescents and young adults and their providers navigate life-stage related events would increase virologic suppression compared to standard care.

Methods: This was a cluster-randomized trial of 28 clinics and youth aged 15–24 years living with HIV in rural Kenya and Uganda. Participants in intervention clinics received life-stage specific assessment and counseling at the start of routine visits, choice of flexible clinic access and rapid viral load feedback. roviders had a secure mobile platform for inter-provider consultation. The primary endpoint was virologic suppression (< 400 copies/ml) two years from enrollment and compared by arm using targeted minimum loss-based estimation, adjusting for clustering by clinic.

Results: Among 1834 participants, median age was 21 years and 82% were female; 85% of intervention participants had life-stage assessments performed ≥ 4 times, 60% opted for phone visits at least once, and >87% of participants in 13/14 clinics received viral load feedback within 72 hours. The proportion of participants with virologic suppression was higher in the intervention arm [88% (95%CI: 85-92%)] than in the control arm [80% (95%CI: 77-84%)], for an adjusted risk ratio of 1.10 (95%CI: 1.03-1.16; p=0.002).

The intervention resulted in increased virologic suppression within subgroups of sex, age, and care-status at baseline, with greatest improvement among those re-engaging in care [adjusted risk ratio =1.60 (95% CI:1.00-2.55; p=0.03)] (Figure).

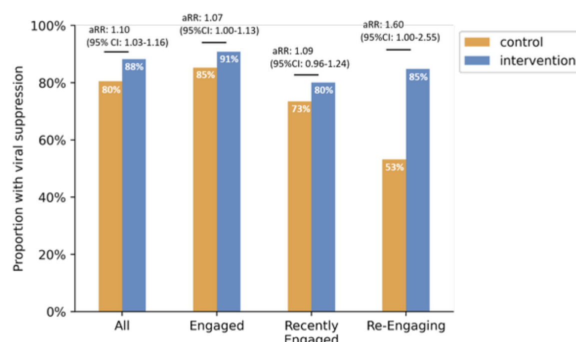

Figure. Proportion with virologic suppression at 2 years, overall and stratified by care status at enrollment

Conclusions: The multilevel SEARCH-Youth intervention resulted in increased virologic suppression compared to standard care, during a period of transition to dolutegravir and during the COVID19 pandemic.

Added to current efforts, systematic life-stage-based assessment and support could help bring adolescents and young adults living with HIV closer towards a goal of universal virologic suppression.

OALBE0103

A tale of two countries: assessing the transition, scale-up, and sustainability of HIVST introduction in India and Indonesia

P. Loh[1], L. Hicks[1], A.I. Sirait[1], A. Hegde[2], C. Laxmeshwar[2], K. Mariyappan[2], R.J. Magnani[3], K. Green[4]

[1]PATH, Seattle, United States, [2]PATH, New Delhi, India, [3]Depok, Faculty of Public Health, Depok, Indonesia, [4]PATH, Hanoi, Viet Nam

Background: Limited research is available to describe the key factors attributable to the introduction and scale-up of HIV self-testing products in India and Indonesia. The Unitaid-funded STAR-III initiative uses a multidisciplinary monitoring and evaluation (M&E) approach to introduce, evaluate, and transition HIV self-testing products in its implementing countries by partnering with government entities to strengthen policy and regulatory procedures, fortify monitoring and evaluation processes, and introduce communications and demand generation practices to increase uptake and use of HIV self-testing products.

Description: The STAR-III Initiative developed an M&E framework to track and monitor progress towards the transition, scale-up, and sustainability of HIVST across India, Indonesia, and its other implementing countries. This framework consists of 28-indicators across 6-domains:

1. Governance & Policies;
2. Funding Security;
3. Supply & Delivery;
4. M&E;
5. Supervision;
6. Scale-up.

Primary and secondary data for these indicators were collected through literature reviews and/or key informant interviews at the start (02/2020) and end (05/2022) of the program and compared to measure progress.

Lessons learned: Ourassessment found improved performance across the six evaluative domains, with scalability strongest across Funding Security and Supervision domains.This was largely due to several actions takento operationalize HIVST, including:

1. The development of training modules and processes by civil society organizations that have been endorsed by MoH,
2. The operationalization of HIVST delivery channels, and,
3. A standing HIVST agenda within the national HIV/AIDS Technical Working Groups.

The supporting infrastructure acrossGovernance & Policies, Supply & Delivery, and Scale-up domains remain a work in progress.

Conclusions/Next steps: Although STAR-III has built the foundation for institutionalization and sustainability of HIVST in Indonesia and India, the policy environment and supporting infrastructure remains a work in progress. HIVST implementation in these countries is being constrained by the unavailability of registered HIVST products which has had direct and indirect impacts on domains of Governance & Policy, Supply & Delivery, and Scale-up of HIVST. There is an urgent need to work with regulatory authorities to support the registration of HIVST products in India, Indonesia, and also other countries looking to introduce or scale-up HIVST.

OALBE0104

What women want - results from discrete choice experiment about preferred PrEP method from Khomas region of Namibia

E. Melese[1], E. Negumbo[1], M. Nur[1], C. Uakuramenua[1], B. Haufiku[2], M. Rubeni[1], S. David[1], M. Kakende[1], P. Kamanga[1], C. Makuyana[1], M. Shilomboleni[2], B. Harases[1], R. Indongo[1], S. Neri[1], M. Manyando[3], N. N Borse[4]

[1]*Project HOPE Namibia, Windhoek, Namibia,* [2]*IntraHealth, Windhoek, Namibia,* [3]*US Agency for International Development (USAID\Namibia), Windhoek, Namibia,* [4]*Project HOPE, Global Health Technical Unit, Washington, United States*

Background: Adherence to Pre-exposure Prophylaxis to reduce new HIV infection among Adolescent Girls and Young Women (AGYW) of age 10 to 24 years remains a critical challenge. Under the USAID/Namibia-funded DREAMS project, PrEP is offered as part of the package with limited continuation.

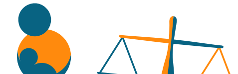
Besides daily oral PrEP, with recent positive results from HPTN-084 on Cabotegravir Long-Acting Injectable (CAB-LA) and WHO approval of Dapivirine Vaginal Ring (DAP-VR), this study had an objective to take end-user perspectives on their preferred PrEP method of choice.

Methods: A survey was conducted using a convenient sampling method with 1,675 active AGYW from the Khomas region. The interview questions included demographics, PrEP knowledge, attitude, practices, and preferred PrEP options. Before the PrEP preferred options section was administered, DREAMS Nurses used visual and narrative descriptions to educate AGYW on the attributes of PrEP options (i.e., oral, DAP-VR and CAB-LA). From April 26 to 28, 2022, DREAMS staff utilized the REDCap mobile application to collect data. Data was analyzed in STATAv15.

Results: Of the 1,656 respondents, 92% heard about PrEP for HIV prevention, and the primary sources of information were DREAMS staff (85%). Of these, 79% believed PrEP could reduce new HIV infection, and 68% knew PrEP could not prevent other STIs. Moreover, 97% knew where to get oral PrEP, 31% were current/previous users of oral PrEP, and 41% agreed/strongly agreed that PrEP has serious side effects.

Oral PrEP was well known to AGYW (85%), while 3% and 8% were aware of DVR and CAB-LA, respectively. If all three PrEP options are available, 83% (n=1262) of AGYW were willing to use any of them. Of these, 61% indicated a preference for CAB-LA, while 27% and 12% preferred oral and DVR. HIV prevention efficacy was a strong determinant of stated reason, followed by the desire for less frequent use and discreteness of the option.

Conclusions: The results from this study provide vital information for the successful introduction, scale-up, and continued use in the target population. CAB-LA injectable is the preferred PrEP option among AGYW mainly due to its efficacy, every eight-week administration instead of a daily pill, and its discreteness.



OALBE0105

The catalytic role of dual HIV/syphilis rapid diagnostic tests in accelerating national elimination of mother-to-child-transmission in Nigeria

C. Nwafor[1], O. Alintah[2], J. Nwi-ue[1], S. Igbiri[1], C. Stillson[3], A. Storey[2], O. Wiwa[1]

[1]Clinton Health Access Initiative, Syphilis Program, Abuja, Nigeria, [2]Clinton Health Access Initiative, Global MNH Program, London, United Kingdom, [3]Clinton Health Access Initiative, Global HIV Access Program, Boston, United States

Background: HIV and syphilis prevalence among pregnant women attending antenatal clinics in Nigeria is 1.4% and 0.7% respectively. The disparity between national maternal syphilis testing rates at 16% and maternal HIV testing at 66% represented an opportunity to leverage higher HIV testing coverage to increase syphilis testing coverage, thereby accelerating progress towards dual elimination targets. Dual HIV/syphilis RDTs allow providers to simultaneously screen clients for HIV and syphilis, eliminating the need for multiple tests.

Description: Between 2019 and 2021, CHAI collaborated with NASCP to pilot dual HIV/syphilis RDTs in 31 high volume ANC facilities across all health system tiers in Akwa Ibom, Anambra, and Rivers states. 1,678 healthcare workers were trained to counsel and test pregnant women using dual RDTs, administer Benzathine Penicillin-G for syphilis treatment, and manage syphilis program data. CHAI institutionalized the dual program within the priorities of existing HIV Technical Working Groups, leveraging the platform to share key learnings and advocate scale up.

Lessons learned: 45,413 pregnant women were tested for HIV and syphilis using dual RDTs (15,662 in Akwa Ibom, 13,369 in Anambra and 16,382 tested in Rivers state). HIV and syphilis positivity rates were 2.0% and 0.2% respectively. BPG treatment uptake was 90% and partner testing rate for syphilis-positive pregnant women was 80%. Analysis of HCW feedback from CHAI and MOH facilitated learning sessions revealed a 95% satisfaction rate with the implementation model and 15% improvement in pre- and post-training aptitude assessments. 100% of participants said they would recommend dual RDT scale-up.

Conclusions/Next steps: Evidence generated through these pilots informed national scale-up efforts, leading to the inclusion of dual RDTs in annual operational plans of not just the three states, but also NASCP and Nigeria's major HIV program funders– PEPFAR and Global Fund. Building on these lessons, the Nigerian Government directly procured 2.5million dual RDTs in late 2021, backed by an additional 1.2million and 350,000 RDTs funded by PEPFAR Nigeria in COP-22 and Global Fund respectively. The congenital syphilis burden in Nigeria is comparable to other LMICs and Health Ministries are encouraged to learn from this model to scale up such novel diagnostics in support of national dual elimination priorities.

OALBF0102

Canada's criminal injustice: new national community consensus on law reform to end HIV criminalization

R. Elliott[1,2,1,2]

[1]HIV Legal Network, Toronto, Canada, [2]Canadian Coalition to Reform HIV Criminalization, Toronto, Canada

Background: Canada has been a global 'hot spot' of HIV criminalization. There is no HIV/STI-specific offence; prosecution of alleged HIV/STI non-disclosure occurs through application of general Criminal Code offences. The charge most frequently used is *aggravated sexual assault*, following Supreme Court of Canada decisions that if there is a "realistic possibility of HIV transmission," non-disclosure amounts to "fraud" invalidating consent to sex. Prosecutors' and courts' interpretations of this legal test have led to prosecutions that perpetuate HIV stigma and are at odds with the international scientific Expert Consensus Statement (released at AIDS 2018), recommendations of the Global Commission on HIV & the Law, and the Global AIDS Strategy. Analyses by Justice Canada and NGOs highlight a disproportionate impact on Black, Indigenous and gay communities.

Description: In 2017, the Canadian Coalition to Reform HIV Criminalization, supported by 174 organizations nationwide, called on Parliament to legislate an end to sexual assault charges and limit any criminalization to cases of intentional, actual transmission. In 2019, a Parliamentary committee recommended reforms to limit HIV criminalization, but through the adoption of a new offence of transmitting an infectious disease. From 2019-2022, the Coalition explored options for reform, including through a national community consultation, which underscored widespread concern about the status quo and strong consensus in favour of reform. In July 2022, the Coalition is releasing its new Community Consensus Statement outlining detailed legislative proposals to limit HIV criminalization.

Lessons learned: As there is no existing HIV/STI-specific law in Canada to repeal or modernize, the Coalition's proposed legislative changes would (1) preclude sexual assault charges entirely, and (2) add provisions to the Criminal Code strictly limiting the use of any other, existing offences. The proposed amendments avoid the stigma of creating a new HIV/STI-specific offence, limit criminalization to purposely (and actually) transmitting HIV/STIs, and avoid expanding criminalization to other transmissible infections.

Conclusions/Next steps: The new national Community Consensus Statement is the result of extensive community consultation and reflection regarding the best options to limit HIV criminalization in Canada in line with international recommendations. It will be a key advocacy tool for engaging policymakers to enact necessary legislative reforms.

OALBF0103
Preliminary report on the provision of HIV care to war refugees living with HIV who are migrating from Ukraine - data from ECEE Network Group

A. Skrzat-Klapaczyńska[1], B. Lakatos[2], J. Kowalska[3], Euroguidelines in Central and Eastern Europe Network Group

[1]Hospital for Infectious Diseases in Warsaw, Warsaw, Poland, [2]South-Pest Central Hospital, Infectious diseases, AIDS and Clinical Immunology Center, Budapest, Hungary, [3]Medical University of Warsaw, Department of Adults' Infectious Diseases, Warsaw, Poland

Background: The armed conflict in Ukraine resulted in humanitarian crisis with over five million people migrating to neighboring countries and ten million being displaced within Ukraine.

The HIV epidemic in Ukraine is the largest in Europe with approximately 130 000 adult people on ART, half of them being women, and 2700 children.

It is important to understand the impact of war on continuum of HIV care for displaced people and the impact on national HIV programs, especially in countries from Central and Eastern Europe (CEE).

Methods: The ECEE Network Group consists of 47 experts in infectious diseases from 24 countries, actively involved in patients' care. The group was established in 2016 to endorse and disseminate the standards of care for HIV and hepatitis.

In March 2022, an online survey (28 questions) was created on MonkeySurvey® and disseminated by group members.

Results: 22 (75.9%) centers from 14 countries (Bulgaria, Croatia, Czech Republic, Estonia, Georgia, Greece, Hungary, Latvia, Lithuania, Malta, Poland, Republic of Moldova, Romania, Slovakia) were admitting war refugees from Ukraine as of 31 March 2022 and completed the survey.

Most centers (86%) organized promptly providing access to ARVs on the same day, for 30 days or longer in 77% of the centers.

Continuation of ART was manageable with brand or generic drugs in 64% centers, whereas 36% were switching ART (Table). 81.8% of respondents indicated that increased workload with could affect local HIV care.

Conclusions: CEE countries receiving war refugees implemented prompt measurements to provide continuity of HIV care including universal healthcare insurance, waiving most administrative requirements, providing same day doctor's consultations and ART disposal.

Barriers identified were lack of medical documentation, language barrier (shortage of translators) and psychological trauma.

Our study identifies gaps which should informs international stakeholders on how to assist countries in delivering undisrupted HIV care to war refugees from Ukraine.

Table. Survey question	N (%)
Patterns of migration and registration to HIV clinics	
Number of war refugees registered per week	
▪ <10	14 (63.6)
▪ 10-50	8 (36.4)
What is the most common patterns of migration you observe in your clinic	
▪ Refugees see my country as final destination	15 (68.2)
▪ Refugees are transiting to another destination in Europe	14 (63.6)
▪ Refugees prefer to go back to Ukraine	11 (50.0)
Do you have non-Ukrainian refugees reporting to your clinic	
▪ No	13 (59.1)
▪ Yes, but few	7 (31.8)
▪ Yes, many	2 (9.1)
Barriers experienced by healthcare workers and solutions adapted	
Please identify difficulties you face while working with refugees from Ukraine	
▪ No medical documentation confirming HIV ot any other diagnosis	17 (77.3)
▪ Language barrier and shortage of translators	14 (63.6)
▪ No information on current ARV regimen	10 (45.4)
▪ Administrative requirements	5 (22.7)
▪ Psychological trauma related to war and migration	4 (18.2)
What are the administrative requirements to provide ARVs for war refugees	
▪ Copy of a passport	16 (72.7)
▪ Refugee registration number or certificate from the competent foreign and immigration office	9 (40.9)
▪ Medical documentation that refugee is HIV positive and/or receives ARV	6 (27.3)
In case there is no documentation confirming patients HIV status, what is current practice at your center	
▪ Oral declaration from refugee	6 (27.3)
▪ Written declaration from refugee	7 (31.8)
▪ Testing for HIV	9 (40.9)
If the confirmation is needed which tests do you use	
▪ Rapid HIV testing	6 (27.3)
▪ Standard HIV serology (3rd or 4th generation test)	3 (13.6)
▪ Western blot or Immuno blot	2 (9.1)
▪ HIV RNA test	3 (13.6)
Healthcare and antiretroviral treatment strategy for refugees	
Which ARVs strategy is adapted at the moment for war refugees in your clinic	
▪ Continuation of the regimen received in Ukraine with substituting unavailable brand drugs with generic drugs	10 (45.5)
▪ Continuation of the regimen received in Ukraine with generic drugs	4 (18.2)
▪ Switching to regimen which is available in your national program	8 (36.4)
What is the timespan to issue ARVs for war refugees in your center	
▪ Same day delivery of ARVs within working hours	17 (86.4)
▪ Patient needs to come back to collect ARV on another day	3 (13.6)
▪ Immediate delivery of ARVs even during night shifts	2 (9.1)
For how long is your clinic providing ARVs	
▪ 30 days	10 (45.4)
▪ 60-90 days	7 (31.8)
▪ No restrictions	3 (13.6)
▪ Shorter time if refugee in transit	2 (9.1)
Is TB screening routinely performed for HIV positive war refugees in your center	
▪ Not routinely	7 (31.8)

OALBF0104
Education as an enabling factor to HIV prevention and adherence to treatment

C. Ouma[1], G. Giordana[1], I. Omondi[1], M. Hambayi[1], C. Barkatdaoud[2], R. Azizi[2]

[1]World Food Programme, Nairobi, Kenya, [2]World Food Programme, Djibouti Ville, Djibouti

Background: The World Food Programme, UNAIDS, the Ministry of Health and the Ministry of Solidarity and Social Affairs conducted a study in Djibouti Ville to better understand the relationship between basic education and HIV treatment and care outcomes among people living with HIV and TB patients.

Methods: This was a cross-sectional study with 805 PLHIV included in the analysis from a total of 9 ART and TB clinics. Sampling was based on the probability proportional to size model. Data collection was done by trained social workers and stored in the encrypted WFP cloud system. Descriptive analysis was done for PLHIV including those co-infected with TB. Levels of education and the associated HIV prevention and treatment adherence variables were the outcomes of interest.

Results: A high proportion of PLHIV have no formal education (47.6%; n=383) with 19.0% (n=153), 19.5% (n=157) and 10.1% (n=81) reporting highest level of education as

primary (grade 1-5), middle (grade 6-9) and secondary school (grade 10-13) respectively. Only 3.9% (n=31) of PLHIV attended tertiary school (college/university). An inverse linear relationship exists between one's level of education and skipping doses of ARV in the 30 days prior to the study. Out of a total of 251 PLHIV who reported missing doses of ARV medication in the 30 days prior to the study, 57% (n=143) did not have formal education while the lowest proportion was reported in those who had attended university/college (3.6%; n=9). A similar trend was observed with respondents' engagement with multiple sexual partners. The study found that from a total of 275 PLHIV who reported engaging with multiple sexual partners in the 12 months prior to the study, 49.8% (n=137) had no formal education.

Conclusions: An indirect relationship exists between the study participants' level of education and their propensity to engage in risky sexual behaviours and their likelihood of non-adherence to the ARV regime. Literacy coupled with an adequate knowledge of the effects of non-adherence as well as of the risks associated with risky behaviour are among some of the most effective HIV prevention means, preventing the spread of the virus and fostering treatment outcomes.

Strengthening TB/HIV human rights programming to overcome barriers to accessing TB services

J. Malar[1], T. Abdullaev[2], M. Sebayang[3], C. Nawina[4], B. Citro[5], V. Soltan[1], A. Herna Sari[6], A. Obiefuna[7]
[1]Stop TB Partnership - UNOPS, Geneva, Switzerland, [2]TBpeople, Tashkent, Uzbekistan, [3]JIP, Jakarta, Indonesia, [4]CITAM+, Lusaka, Zambia, [5]Consultant, Chicago, United States, [6]Rekat, Surubaya, Indonesia, [7]Afro Global Alliance, Accra, Ghana

Background: TB remains the biggest killer of PLHIV. Despite this, very little effort and investment has been directed to TB and TB/HIV human rights programming. To help build the evidence base, engagement and investment in TB and TB/HIV human rights programming, Between 2018 and 2021, 20 National Assessments of human rights and gender assessments were undertaken in countries in Asia, Africa and Europe in order to better understand human rights related barriers to accessing TB services and inform human rights programming. Significantly, these assessments were led by TB and TB/HIV affected communities and civil society in close partnership with the National TB Programme to ensure national ownership and sustainability.

Stop TB Partnership provided technical assistance in this USAID and Global Fund funded initiative.

Description: In a first for TB and TB/HIV programmes, national assessments of human rights and gender related barriers to accessing TB services were conducted in 20 countries and focused on:

1. identify legal, policy and programmatic human rights and gender related barriers to access;
2. Identify and prioritize TB key and vulnerable population;
3. Recommend priority interventions to strengthen human rights related TB and TB/HIV programming in country.

These three areas of investigation were guided by a Communities, Rights and Gender Protocol which included desk review, focus groups, and national validation.

Lessons learned: All 20 completed CRG assessments have subsequently been analysed using the right to health framework:

1. Accessibility, acceptability, affordability and quality of services;
2. Stigma and discimination;
3. Freedoms (information, privacy, confidentiality)
4. Gender
5. Key and vulnerable populations
6. Participation of key and vulnerable populations
7. Legal remedies.

Responses to these barriers has now been operationalised through costed TB CRG Plans in several countries.

Conclusions/Next steps: There is now unprecedented evidence on TB/HIV human rights programming that must be operationalized and implemented in order for countries to realize the UN HLM targets on human rights.

Next steps: develop costed CRG Action Plans; integrate recommendations into NSPs; human rights investments in national TB/HIV responses is increased; monitoring and evaluation of human rights investments in national TB/HIV is enhanced; and, community led monitoring of of rights is integrated into national responses.

Transcriptional programs of HIV silencing and cell survival in HIV-infected memory CD4 T cells under antiretroviral therapy

E. Boritz[1], I. Clark[2], P. Mudvari[1], S. Thaploo[3], S. Smith[1], M. Hamouda[1], M. Abu-Laban[1], S.H. Ko[1], D. Bunis[1], J. Lee[1], D. Kilam[1], S. Zakaria[1], S. Choi[1], S. Darko[1], A. Henry[1], M. Wheeler[3], R. Hoh[4], S. Deeks[4], F. Quintana[3], D. Douek[1], A. Abate[5]

[1]*Vaccine Research Center, National Institute of Allergy and Infectious Diseases, National Institutes of Health USA, Bethesda, United States,* [2]*University of California Berkeley, Department of Bioengineering, Berkeley, United States,* [3]*Brigham and Women's Hospital, Harvard Medical School, Ann Romney Center for Neurologic Diseases, Boston, United States,* [4]*University of California San Francisco, Department of Medicine, San Francisco, United States,* [5]*University of California San Francisco, Department of Bioengineering and Therapeutic Sciences, San Francisco, United States*

Background: Rare memory CD4 T cells harboring HIV under antiretroviral therapy (ART) represent an important barrier to HIV cure, but the infeasibility of isolating and characterizing these cells in their "natural" state has bred uncertainty about whether they possess distinctive attributes that HIV cure-directed therapies might exploit.

Methods: We developed a custom microfluidic process termed Focused Interrogation of cells by Nucleic acid Detection and Sequencing (FIND-Seq), which captures polyadenylated RNA and genomic DNA from millions of single cells within water-in-oil droplets and then sorts single-cell transcriptomes based solely on HIV DNA detection.

Using blood cells from people with HIV (PWH) who had initiated ART during chronic infection and experienced >1 year of virologic suppression (n = 6), memory CD4 T cell transcriptomes were sorted by FIND-Seq into HIV DNA^{+} and uninfected cell fractions and sequenced.

Host cell transcriptomic profiles of HIV DNA^{+} and uninfected memory CD4 T cells were compared by differential gene expression, co-expression network analysis, and gene ontology.

Results: HIV DNA^{+} memory CD4 T cells from ART-treated PWH consistently showed inhibition of six transcriptomic pathways including death receptor signaling, necroptosis signaling, and Gα12/13 signaling. Gene co-expression network analysis revealed two small gene clusters associated with HIV DNA^{+} cells. Gene ontology revealed significant enrichment of these clusters for factors related to epigenetic gene regulation, RNA processing, and the regulation of cell death signaling. Individual genes in these clusters included HIV transcriptional activators that were lower in HIV DNA^{+} cells and HIV silencing factors affecting both transcriptional and post-transcriptional steps in HIV gene expression that were higher in HIV DNA^{+} cells.

Remaining genes in these clusters not previously associated with HIV gene expression had roles in chromatin modification, RNA processing, and the survival and proliferation of CD4 T cells.

Conclusions: Whole transcriptome sequencing of unmanipulated HIV DNA^{+} memory CD4 T cells under ART reveals these cells as a highly selected population with distinctive gene expression patterns that can promote HIV persistence through HIV silencing, cell survival, and cell proliferation.

These findings help reconcile previous observations made in *ex vivo* and *in vivo* studies, and suggest important next steps in research towards an HIV cure.

OALBX0103

Doxycycline post-exposure prophylaxis for STI prevention among MSM and transgender women on HIV PrEP or living with HIV: high efficacy to reduce incident STI's in a randomized trial

A. Luetkemeyer[1], J. Dombrowski[2,3], S. Cohen[4,5], D. Donnell[2], C. Grabow[2], C. Brown[2], C. Malinski[2,3], R. Perkins[2], M. Nasser[4], C. Lopez[6], S. Buchbinder[4], H. Scott[4], E. Charlebois[5], D. Havlir[6], O. Soge[2], C. Celum[2]

[1]*Zuckerberg San Francisco General Hospital, University of California San Francisco, Division of HIV, Infectious Diseases and Global Medicine, San Francisco, United States,* [2]*University of Washington, Seattle, United States,* [3]*Public Heath - Seattle & King County, Seattle, United States,* [4]*San Francisco Department of Public Health, San Francisco, United States,* [5]*University of California San Francisco, San Francisco, United States,* [6]*Zuckerberg San Francisco General Hospital, University of California San Francisco, San Francisco, United States*

Background: With a sexually transmitted infection (STI) epidemic among men who have sex with men (MSM) and transgender women (TGW), interventions to reduce STIs are needed.

Methods: DoxyPEP is a randomized open-label trial among Seattle and San Francisco MSM/TGW living with HIV or on PrEP who had *N. gonorroheae* (GC), *C. trachomatis* (CT), or early syphilis in the past year. Randomization was 2:1 to 200 mg doxycycline hyclate within 72 hours of condomless sex or no doxycycline with STI testing at enrollment, quarterly, and when symptomatic. An independent committee adjudicated STIs. The trial had >80% power to detect a 50% reduction in STI incidence, assuming a 10% quarterly STI incidence. The intent to treat analysis compared relative risk of an STI per quarter.

A single interim analysis at ~50% of follow-up time occurred May 2022; the DSMB recommended stopping the control arm based on prespecified efficacy thresholds measured independently in PLWH and PrEP cohorts.

Results: Of 554 enrolled, 360 were on PrEP, 194 PWLH, 65% white, 8% Black, 10% Asian, 30% Latinx. 19 (3%) identified as TGW or nonbinary. Median sex partners in past 3 months was 9. In the past year 67% had GC, 58% CT, 20% syphilis;

at enrollment, 18% had GC, 10% CT, 2% syphilis. Among 360 on PrEP, 65 STI endpoints (29.5%) occured in controls and 47 (9.6%) in doxyPEP participants (RR 0.33; 95%CI 0.23-0.47; p<0.0001). Among 194 PLWH, 30 STI endpoints (27.8%) in controls and 31 (11.7%) in doxyPEP participants (RR 0.42; 95% CI 0.25-0.75; p=0.0014). GC, CT, and syphilis were each reduced. No serious or ≥ Grade 2 AEs were attributed to doxycycline.

	HIV uninfected MSM/TGW on PrEP		MSM/TGW living with HIV		Total	
	Doxy arm N=240	Control arm N=120	Doxy arm N=134	Control arm N=60	Doxy arm N=374	Control arm N=180
Follow up quarters	491	220	266	108	757	328
Participants with an incident STI (GC, CT or syphilis)	41	42	24	18	65	60
Primary STI endpoints	47 (9.6%)	65 (29.5%)	31 (11.7%)	30 (27.8%)	78 (10.3%)	95 (29.0%)
Gonorrhea	40 (8.1%)	45 (20.5%)	21 (7.9%)	20 (18.5%)	61 (8.1%)	65 (19.8%)
Chlamydia	7 (1.4%)	23 (10.5%)	12 (4.5%)	16 (14.8%)	19 (2.5%)	39 (11.9%)
Syphillis	1 (0.2%)	5 (2.3%)	3 (1.1%)	2 (1.9%)	4 (0.5%)	7 (2.1%)

Table. Quarterly STI incidence by HIV status and by randomization to doxyPEP & control arms.

Conclusions: Doxycycline 200 mg taken within 72 hours after condomless sex significantly reduced STIs in MSM/TGW. Effects on antimicrobial resistance, gut microbiome, and sexual behavior are being assessed as important considerations for this STI prevention strategy.

OALBX0105

Week 48 results of a Phase 3 randomized controlled trial of bictegravir/emtricitabine/tenofovir alafenamide (B/F/TAF) vs dolutegravir + emtricitabine/tenofovir Disoproxil Fumarate (DTG+F/TDF) as initial treatment in HIV/HBV-coinfected adults (ALLIANCE)

[1]HIV-NAT, Thai Red Cross AIDS Research Centre, Bangkok, Thailand, [2]Shanghai Public Health Clinical Center, Shanghai, China, [3]Department of Medicine, Kuala Lumpur General Hospital, Kuala Lumpur, Malaysia, [4]National Taiwan University Hospital, Taipei, Taiwan, Province of China, [5]Instituto Dominicano de Estudio Virologicos - IDEV, Santo Domingo, Dominican Republic, the, [6]Ramathibodi Hospital, Bangkok, Thailand, [7]Queen Elizabeth Hospital, Kowloon, Hong Kong, SAR of China, [8]Chiang Mai University, Chiang Mai, Thailand, [9]Beijing Ditan Hospital, Capital Medical University, Beijing, China, [10]Gilead Sciences, Foster City, United States, [11]Peking Union Medical College Hospital, Beijing, China

Background: The clinical course of HBV in individuals with HIV coinfection is marked by accelerated disease progression. A tenofovir-containing anti-retroviral regimen is recommended in most people with HIV-1/HBV-coinfection but there have not been randomized studies of TDF vs TAF in treatment-naïve HIV-1/HBV-coinfected individuals.

We report primary endpoint results from a phase 3 study comparing B/F/TAF vs DTG+F/TDF at Week (W) 48 in participants initiating treatment for both viruses.

Methods: Adults with HIV-1/HBV coinfection were randomized 1:1 to initiate blinded treatment with B/F/TAF or DTG+F/TDF (with placebo).

Primary endpoints were proportion of participants with HIV-1 RNA <50 copies/mL (FDA Snapshot) and plasma HBV DNA <29 IU/mL (missing=failure) at Week 48. Noninferiority was assessed with 95% CI (12% margin).

Secondary and other endpoints included change from baseline CD4 count, proportion with HBsAg and HBeAg loss/seroconversion, and ALT normalization (AASLD criteria).

Results: 243 participants were randomized and treated (121 B/F/TAF, 122 DTG+F/TDF) from 11 countries in Asia, Europe, North and Latin America. Baseline characteristics were median age 32 years, 4.5% female, 88% Asian, 30% HIV-1 RNA >100,000 c/mL, 40% CD4 <200 cells/mL, median HBV DNA 8.1 $\log_{10}$ IU/mL, 78% HBeAg+. At W48, B/F/TAF was noninferior to DTG+F/TDF at achieving HIV-1 RNA <50 copies/mL (95% vs 91%, difference 4.1%; 95% CI -2.5% to 10.8%, p=0.21), with mean CD4 gains of +200 and +175 cells/mL, respectively. B/F/TAF was superior to DTG+F/TDF at achieving HBV DNA <29 IU/mL (63% vs 43%, difference 16.6%; 95% CI 5.9% to 27.3%, p=0.0023). Participants treated with B/F/TAF vs DTG+F/TDF had numerically higher HBsAg loss (13%, 6%, p=0.059), HBeAg loss (26%, 14%, p=0.055), HBeAg seroconversion (23%, 11%, p=0.031), and ALT normalization (73%, 55%, p=0.066). Most frequent AEs were upper respiratory tract infection (17%, 11%), COVID-19 (13%, 11%), pyrexia (9%, 12%), ALT increase (7%, 11%), and nasopharyngitis (11%, 4%). ALT flares (elevations at ≥2 consecutive post-baseline visits) occurred in 11 participants (7 B/F/TAF, 4 DTG+F/TDF) which resolved.

Conclusions: In adults with HIV-1/HBV-coinfection starting antiviral therapy, both B/F/TAF and DTG+F/TDF had high HIV-1 suppression at year 1, with B/F/TAF resulting in superior HBV DNA suppression and significantly more HBeAg seroconversion. Safety findings were similar between groups.

Trends in PrEP inequity by race and census region, United States, 2012-2021

P.S. Sullivan[1], S. Whitby[1], P. Hipp[1], M. Juhasz[2], S. DuBose[1], P. McGuinness[3], D.K. Smith[4]

[1]Emory University, Rollins School of Public Health, Epidemiology, Atlanta, United States, [2]Saluda Analytics, Budapest, Hungary, [3]Gilead Sciences, Foster City, United States, [4]Centers for Disease Control and Prevention, Atlanta, United States

Background: PrEP was approved for HIV prevention in the US in 2012; uptake has been slow. Black and Hispanic people have higher rates of new HIV diagnoses than White non-Hispanic people in the US. We describe the inequitable use of PrEP by race within US regions from 2012-2021.

Methods: We used commercial pharmacy data to enumerate PrEP users by race and US Census region from 2012-2021. Race/ethnicity data were available for 124,835 (34%) of PrEP users; to estimate total PrEP users by race, we assumed that the racial distribution was the same in PrEP users with missing race data as in those with reported race data. The PrEP-to-Need Ratio (PnR), a metric of PrEP equity, was defined as the number of PrEP users in a group divided by the number of new diagnoses in that group in the same year.

Results: PnR increased from 2012-2021 for all races and regions, but levels of PrEP use were not consistent across regions (See Figure) and were not equitable (defined by differences in PnR by race/ethnicity). In all regions, PnR was highest for White and lowest for Black people. By region, the highest region- and race-specific PnR was for White people in the Northeast in 2021: the PnR was 48.7 and the absolute difference in White versus Black PnRs was 44.5 (White:48.7; Black:4.2).

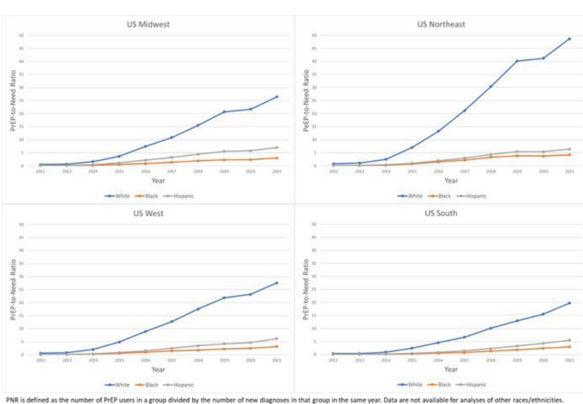

Figure.

Conclusions: Prevention programs should be guided by PrEP equity (use relative to epidemic impact), not PrEP equality (equal use in groups, regardless of HIV diagnosis proportion). By this measure, US prevention programs in all regions demonstrated decreasing PrEP equity over time (e.g., larger gaps in PnR by race/ethnicity). The US South lagged all regions in equitable PrEP use, with the lowest PnR overall compared to other US regions. Better programs are needed to provide PrEP to people at greatest risk for HIV infection.

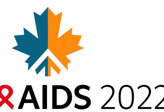
Background: HPTN 084 is an ongoing Phase 3 randomized, controlled trial that demonstrated the superiority of long-acting injectable cabotegravir (CAB) compared to daily oral TDF/FTC for HIV prevention in individuals assigned female at birth. The blinded portion of the trial was stopped at a planned interim review in November



2020. Participants were subsequently unblinded and continued on their original randomised study regimen pending a protocol amendment to offer open-label CAB.

Methods: We report on HIV infections detected in the 12-month period following trial unblinding (11/5/20-11/5/21, detected through 12/31/21) based on site and HPTN Laboratory Center testing. We estimated cumulative HIV incidence for the combined primary blinded and 12-month unblinded follow-up period, by study arm. Grade 2+ adverse events (AEs), injection site reactions (ISR), pregnancy incidence and outcomes are reported for the 12-month post-unblinding period only.

Results: Twenty-three incident infections (3 CAB, 20 TDF/FTC) were detected in the 12-month unblinded period. Of these, two (1 CAB, 1 TDF/FTC) were determined to have occurred during the blinded phase. Only one of the CAB cases (blinded phase case) had ever received an injection. Cumulatively, 62 incident HIV infections (6 CAB, 56 TDF/FTC) have been observed over 6626 person-years of follow up (HIV incidence 0.94%, 95% CI 0.72, 1.20). The superiority of CAB appears sustained (HR 0.11, 95% CI 0.05, 0.24). No new safety concerns were identified. For the 12-month unblinded period, 2.4% (32/1318) of participants in the CAB group reported a Grade 2+ ISR.

Overall, Grade 2+ AEs in this period were balanced by study group; 20% were assessed as related to study product (CAB 19%, TDF/FTC 21%). Two deaths occurred in the CAB group; both were assessed as unrelated to study product. An additional 83 confirmed pregnancies (43 CAB, 40 TDF/FTC) occurred in the unblinded period (incidence 3.20%, 95% CI 2.56, 3.98). No congenital anomalies were reported.

Conclusions: Reductions in HIV incidence were sustained. CAB continues to be superior to TDF/FTC in preventing HIV infection in individuals assigned female at birth. Pregnancy incidence was higher in the unblinded period highlighting the importance of ongoing evaluations of CAB safety in pregnancy.

Protective potential of non-neutralizing mAbs targeting immunodominant Env epitopes against tier-2 HIV-1

J. Klingler[1,2], X. Liu[1], C. Upadhyay[1], G. Li[3,4], L. Su[3,4,5], G. Hu[6], S. Wang[6], S. Lu[6], S. Zolla-Pazner[1], C.E. Hioe[1,2]

[1]ICAHN School of Medicine at Mount Sinai, Division of Infectious Diseases, Department of Medicine, New York, United States, [2]James J. Peters VA Medical Center, New York, United States, [3]University of Maryland School of Medicine, Laboratory of Viral Pathogenesis and Immunotherapy, Division of Virology, Pathogenesis, and Cancer, Institute of Human Virology, Department of Pharmacology, Baltimore, United States, [4]University of North Carolina, Lineberger Comprehensive Cancer Center, Department of Microbiology and Immunology, Chapel Hill, United States, [5]University of Maryland School of Medicine, Laboratory of Viral Pathogenesis and Immunotherapy, Division of Virology, Pathogenesis and Cancer, Institute of Human Virology, Departments of Pharmacology and Microbiology & Immunology, Baltimore, United States, [6]University of Massachusetts Medical School, Department of Medicine, Worcester, United States

Background: A robust non-neutralizing antibody (Ab) response to the immunogenic regions of the gp120 envelope (Env) protein was identified as an immune correlate for reduced risk of HIV acquisition in the RV144 vaccine trial, which showed a vaccine efficacy of 31%. Our initial study showed that mAbs against V3 (2219) with poor neutralizing activities displayed protective capacity upon passive transfer to humanized mice that received a rectal challenge of an infectious molecular clone (IMC) expressing a tier-2 Env of JRFL. To understand the immune functions contributing to protection, we examined the Fab- and Fc-mediated activities of 2219 and other mAbs targeting similarly immunogenic epitopes of Env.

Methods: To evaluate the Fab functions of vaccine-mediated mAbs against tier-2 HIV-1, we examined 1) ELISA reactivity of 2219 mAb from an infected individual versus two vaccine-induced mAbs with solubilized Env of JRFL and REJO IMCs, 2) their neutralization capacities. To investigate their Fc-mediated activities, we assessed 1) antibody-dependent cell-mediated cytotoxicity (ADCC), 2) antibody-dependent cell-mediated phagocytosis (ADCP), 3) Fc receptors binding, and 4) complement binding.

Results: Two vaccine-induced IgG1 mAbs with the highest ELISA reactivity were selected: RH16 (V3 mAb) and HH1G9 (conformational C2/C5 mAb), for comparison with 2219 (V3 mAb). These three mAbs had no neutralization activity, and all mediated ADCP. Interestingly, they displayed differential complement binding and ADCC. 2219 bound C1q and C3d but had undetectable ADCC, whereas RH16 did not bind complement but displayed ADCC. In contrast, HH1G9 bound complement and showed ADCC.

To examine the Fc functions of 2219 that contribute to protection, Fc mutations that affect complement binding and ADCP were introduced. Passive transfer of these Fc variants to humanized mice challenged rectally with HIV demonstrated that the KA mutation, which abrogated mainly complement binding, reduced protection to the same or greater levels as the LALA mutations, which reduced ADCP and complement binding. Currently, Fc mutations that enhance ADCC are being tested.

Conclusions: Antibodies against immunogenic regions of Env have Fc-mediated activities, especially complement binding, that can contribute to protection against mucosal HIV-1 infection, even though these antibodies have no neutralization activity.

Background: Whether the immune correlates of HIV-1 acquisition risk identified in the Thai HIV-1 vaccine efficacy trial of an ALVAC/gp120 pox-protein vaccine regimen (RV144) generalize to other at-risk populations is a critical question. Although the clade C-adapted vaccine regimen was not efficacious in preventing HIV-1 acquisition in South African participants, HVTN 702 (NCT02968849) provides a unique opportunity to answer this important question and to raise hypotheses regarding the observed lack of efficacy.

Methods: Among 3909 female vaccinees, 60 HIV-1-seropositive cases and 60 matched seronegative controls were sampled. HIV-1-specific CD4+ T-cell and binding antibody (bAb) responses were measured by intracellular cytokine staining and bAb multiplex assays 2 weeks post-fourth and fifth immunizations.

Three primary vaccine-matched immunological endpoints that were strong inverse correlates of HIV-1 risk in RV144 were assessed as predictors of HIV-1 acquisition among vaccinees using Cox proportional hazards models: Env-ZM96-specific CD4+ polyfunctionality score based on six markers and total IgG and IgG3 binding antibody responses to A244 and 1086.C V1V2.

Secondary endpoints included polyfunctional CD4+ T-cell responses to other Env vaccine inserts, IgG bAbs to gp120 and Env consensus antigens, and IgA bAbs. Interactions among pre-specified primary and secondary endpoints were also assessed using Cox models, with low/medium/high categories defined by tertiles.

Results: Although no significant association was observed between any T-cell or bAb response and HIV-1 acquisition, significant interactions were seen in pre-specified analyses (multiplicity-adjusted p-values <=0.03). Among those with highest tertile IgG A244 V1V2 bAb responses, vaccine-matched CD4+ T-cell endpoints (polyfunctional scores to Env-ZM96 and 1086, triple-functional cells expressing IFN-g, IL2, and CD40L to Env-ZM96) were associated with decreased HIV-1 acquisition risk with estimated hazard ratios=0.40-0.49 per 1-SD increase in the respective CD4+ T-cell endpoint.

Conclusions: Our study interrogated previously identified correlates of HIV-1 risk and their interplays for an ALVAC/gp120 vaccine in the South African population. We hypothesize that due to low IgG V1V2 bAb responses in HVTN 702 vs. RV144, Env-specific CD4+ T-cell responses were not confirmed as predictors of risk.

Higher bAb V1V2 responses in combination with polyfunctional CD4+ T-cell responses may be necessary to reduce HIV-1 acquisition.

Transcriptome analysis to identify the changes in microRNA expression profile and their targeted pathways in the cervicovaginal mucosa of HIV-infected women

K. Akolkar[1], S. Sonar[1], A. Rao[1], M. Mamulwar[1], H. Bal[2], R. Bagul[1], U. Ghule[1], A. Mane[1], M. Thakar[1], V. Saxena[1]
[1]National AIDS Research Institute, Pune, India, [2]D Y Patil University, Pune, India

Background: Cervicovaginal mucosa (CVM) plays a key role in HIV acquisition among females during heterosexual contact, hence understanding of immune mechanisms and their regulatory factors is warranted. MicroRNAs are important regulators of cellular events, however limited is known about their involvement at CVM. We performed a detailed transcriptome analysis to identify dysregulated microRNAs and their associated cell-signaling pathways at CVM during HIV infection.

Methods: Cervical samples collected from 25 HIV-infected and 33 HIV-uninfected women were tested for HBV, HCV, TV, BV, NG, CT and syphilis for screening other STIs. Cytobrush samples from STI-negative women were used for transcriptome analysis. Briefly, cervical cells isolated from cytobrush samples of 13 HIV-infected and 8 HIV-uninfected women were used for small-RNA sequencing. Dysregulated microRNAs were identified using log2fold changes and their targets using miRanda tool. Functional annotations of microRNA target genes were performed using KEGG Ortholog database and Gene Ontology.

Results: All the study participants tested negative for other STIs, except BV which was present in 28% HIV-infected and 10% in HIV-uninfected women. RNA sequencing yielded 12-13x10^6 total and >1-1.8x10^6 unique reads. Unique reads were mapped to human genome, annotated and classified into different categories of RNAs. HIV-uninfected participants had 2% higher proportion of microRNA reads than HIV-uninfected participants. Total 20410 microRNAs were identified, of which 314 known microRNAs were differentially expressed in HIV infected women. Using Fisher exact test, 19 known microRNAs were found to be significantly dysregulated among HIV-infected women. Their target genes were identified and functionally categorized for biological process, cellular component and molecular functions. Majority of these were involved in transcriptional regulation, signal transduction, binding of molecules etc. Pathway enrichment data showed their involvement in important immune pathways including TLR signaling, NLR signaling NF-κB signaling, MAPK signaling pathway as well as in HIV-1 infection.

Conclusions: We identified the profile of dysregulated microRNAs, their key targets and associated signaling pathways using *in silico* approaches in the cervical samples of HIV infected women. These are mainly associated with innate immune responses and inflammation, which are critical during HIV infection; hence their targeting may be helpful in devising immunotherapeutic strategies to combat HIV infection/ inflammation at CVM.

CD8 depletion and N-803 plus anti-SIV Env RhmAbs in ART-suppressed rhesus macaques

V. Singh[1], D. Burgess[1], A. Dashti[1], J. McBrien[2], H. King[3], R. Mason[3], J. Safrit[4], J. Lifson[5], M. Tuyishime[6], G. Ferrari[6], M. Roederer[3], G. Silvestri[2], A. Chahroudi[1]
[1]Emory University, Pediatrics/Infectious Disease, Atlanta, United States, [2]Emory University, Yerkes National Primate Research Center, Atlanta, United States, [3]NIAID/NIH, Vaccine Research Center, Bethesda, United States, [4]ImmunityBio, Infectious Diseases, Santa Monica, United States, [5]Frederick National Laboratory, AIDS and Cancer Virus Program, Frederick, United States, [6]Duke University, Surgical Sciences, Durham, United States

Background: Building upon the robust latency reversal with CD8+ cell depletion and IL-15 superagonist N-803 in SIV-infected, ART-suppressed rhesus macaques (RMs), we developed a cure strategy with these latency reversal agents (LRAs) plus a cocktail of four anti-SIV Env-specific rhesus IgG1 monoclonal antibodies (RhmAbs) targeting V2, CD4 binding site, CD4 binding site proximal, and membrane proximal external region (MPER) with the goal of reducing reservoir cells.

Methods: 28 adult RMs were infected with $SIV_{mac239}$and began ART at 8 weeks post infection (wpi). Study arms included ART controls (n=7), ART + RhmAbs controls (n=7), and intervention (ART + CD8a depletion + N-803 + RhmAbs, n=14). After 96 weeks of ART, RhmAbs were administered; three days later, the CD8a depleting MT807R1 was co-administered with N-803, followed by 3 additional weekly N-803 doses. During this period, on-ART viremia measured by qPCR of SIV*gag* RNA. CD8+ T cell depletion efficacy was assessed by flow cytometry and serum RhmAb concentrations were measured longitudinally by indirect ELISA. RhmAb effector functions were determined using infected cell Ab binding and infected cell elimination assays.

Results: We first demonstrated that the combination of four RhmAbs binds to SIV-infected cells and exerts ADCC *in vitro*.We next found that CD8a depletion was efficient (>99% in blood and ≥95% in lymph nodes)and circulating RhmAbs levels were high *in vivo*.During the first four weeks following MT807R1 + N-803, on-ART viremia >60 copies/ml was seen in 28 of 56 viral load measurements (50%) with 1/56 (1.8%) >1,000 copies/ml. In comparison, a historical comparison group of RMs that received MT807R1 + N-803 without RhmAbs experienced more frequent on-ART viremia of 73%, with 23% of measurements >1,000 copies/ml.

Conclusions: During latency reversal with CD8a depletion + N-803 in combination with RhmAbs, we demonstrate a similar but diminished magnitude of on-ART viremia compared to prior work by McBrien et al (*Nature*2020). This effect may result from RhmAb neutralization of virions released from infected cells and, combined with the additional antibody effector functions identified, supports a role for therapeutic RhmAbs as potential clearance agents in cure approaches.

Translational potency of the antisense protein ORF in the proviral DNA context

B. Barbeau[1,2], Y. Xiao[3]
[1]*Université du Québec à Montréal, Montreal, Canada,* [2]*Réseau Intersectoriel de recherche en santé de l'Université du Québec, Laval, Canada,* [3]*Université du Québec à Montréal, Montréal, Canada*

Background: Previous *in silico* analyses of HIV-1 isolates provided strong evidence of the existence of the antisense open reading frame overlapping the HIV-1 *envgene*, termed Antisense Protein (ASP). The detection of the resulting protein has been a challenge and, although we were successful in studying ASP in cells transfected with expression vectors, its detection and understanding of its regulation in the context of proviral DNA remain difficult.
Our objective was thus to test new proviral DNA-based constructs in which different reporter versions were inserted.
Methods: Proviral DNA NL4.3 and NL4.3 BaL were used to insert the Myc tag or the luciferase reporter gene at the amino/COOH end or other positions. The 11 HiBiT peptide of the split Luc-based Nano-Glo® HiBiT System was similarly inserted in proviral DNA. The 5'LTR was removed in certain constructs. Proviral DNA were transfected in HEK293T cells alone or with tat/rev expression vectors. Luciferase activity was measured and confocal microscopy analyses were performed.
Results: NL4.3-based proviral DNA in which the luciferase gene was inserted next to the ASP initiation codon (termed NL4.3LucASP) generated a significant signal in transfected cells, but, as expected, was lower than the classical NL4.3Luc+env- vector. Interestingly, signals were lost in versions of NL4.3LucASP deleted of its 5'LTR (no sense expression) or of a previously identified polyA signal.
Furthermore, Tat could importantly induce luciferase expression in 5'LTR-deleted proviral DNA. Insertion of the luciferase reporter gene or the short HiBiT tag (complemented with the large Luc subunit by co-transfection of an expression vector) at different positions in the ASP ORF showed similar luciferase activity, again suggesting that the ASP ORF is translated. Addition of the Myc tag in the ASP ORF also led to the detection of ASP signals in transfected cells by confocal microscopy.
Conclusions: These results further add to the growing evidence that the ASP protein exists and has functional relevance. Such proviral DNA constructs should also provide important tools to study transcriptional and post-transcriptional regulation of ASP expression and lead to novel approaches for ASP detection in infected cells.

Deep down in the gut: analyzing the connection between epithelial cells and ART-induced inflammation

G.G. Gornalusse[1], C. Levy[1], S.M. Hughes[1], U. Pandey[1], A. Yi[1], P.N. Vo[1], J. Porter[2], J. Smith[2], F. Hladik[1]
[1]*University of Washington, Obstetrics and Gynecology, Seattle, United States,* [2]*University of Washington, Microbiology, Seattle, United States*

Background: Despite virologically suppressive combination antiretroviral therapy (cART), people living with HIV are more likely than HIV-negative people to experience comorbidities, mainly due to chronic immune activation. Here, we focused on the gastrointestinal (GI) tract because it represents the largest HIV reservoir.
We tested the hypothesis that certain nucleoside/nucleotide reverse transcriptase inhibitors (NRTI) drugs, mainstay cART components, induce interferon-stimulated-genes (ISGs) in GI cells.
Our previous work suggested that chronic exposure to NRTIs induces the proliferation of microfold ("M") cells, a relatively rare type of enterocyte. Because M-cells have been shown to be immunologically active, we tested whether supernatants from cultures containing M-cells induce HIV reactivation in latently infected T cells.
Methods: We exposed colorectal and duodenal cell lines to tenofovir (TFV) and quantified by the level of three ISGs: *ISG15*, *IFI6* and *MX1* using digital droplet PCR. We used two models of the small intestinal epithelium:
i. A triple-coculture system containing colon carcinoma Caco-2, mucus-producing HT29, and Raji B cells and;
ii. An *ex vivo* duodenum and ileum organoid model, in which four differentiation factors (noggin, retinoic acid, LTα2β1 and sRANKL) generate functional M-cells.
We exposed HIV latently infected GFP-expressing J-Lat 11.1 cells to culture supernatants from both models (separately) and measured HIV reactivation by flow cytometry and RT-ddPCR.
Results:
- After 3 days of treatment, TFV induced *IFI6* mRNA in duodenal carcinoma cells (2.5-4-fold increase).
- Culture supernatants from the triple-coculture model but not from single cultures induced HIV reactivation (5-fold increase in % GFP$^+$ cells, 3-fold increase HIV-LTR-polyA RNA).
- By qPCR, both the duodenum and ileum organoids expressed the M-cell factors *SpiB*, *CCL20* and *GP2*. When tested separately, LTα2β1 but not noggin, retinoic acid or sRANKL induced HIV reactivation by ~10-fold.

Conclusions: Soluble factors related to the differentiation and activation of the GI epithelium elicited HIV reactivation.
Furthermore, we show that NRTI can trigger the expression of inflammatory ISGs in duodenal cells. Collectively, this suggests that activation in the gut may influence the dynamics of the HIV reservoir.

EPLBA07

Host genetic variants regulates CCR5 expression on immune cells: a study in people living with HIV and healthy controls

J.C. dos Santos[1], Z. Zhang[2], L.E. van Eekeren[3], E.T. Fok[4], N. Vadaq[3], L. van de Wijer[3], W.A. van der Heijden[3], V.A.C.M. Koeken[3], H.J. Koenen[3], M. Mhlanga[4], M.G. Netea[3], A.J. van der Ven[3], Y. Li[5]

[1]Radboud University Medical Center, 6525 HP Nijmegen, the Netherlands, Internal Medicine, Nijmegen, Netherlands, the, [2]University of Groningen, University Medical Center Groningen,, Groningen, Netherlands, the, [3]Radboud University Medical Center, Nijmegen, Netherlands, the, [4]Radboud University, Nijmegen, Netherlands, the, [5]Hannover Medical School and the Helmholtz Centre for Infection Research,, Hannover, Germany

Background: CCR5 plays an important role in the acquisition of HIV and it is associated to immune activation in people living with HIV (PLHIV). Understanding the genetic regulation of CCR5 is crucial for HIV susceptibility and pathogenesis.

Methods: Quantitative trait loci (QTL) mapping analysis was performed to assess genetic variants associated with CCR5 expression on circulating immune cells in 209PLHIV using ART and 304 healthy controls, all Western European ancestry. The proportions of CCR5 positive cells and CCR5 mean fluorescence intensity (MFI) were assessed by flow cytometry in monocytes and CD4$^+$and CD8$^+$T cell subsets using flow cytometry.

Results: We identified distinct genetic variants that are associated with CCR5 cell proportions or mean fluorescence intensity in subpopulations of T cells with memory functions in both healthy and PLHIV (Figure 1).

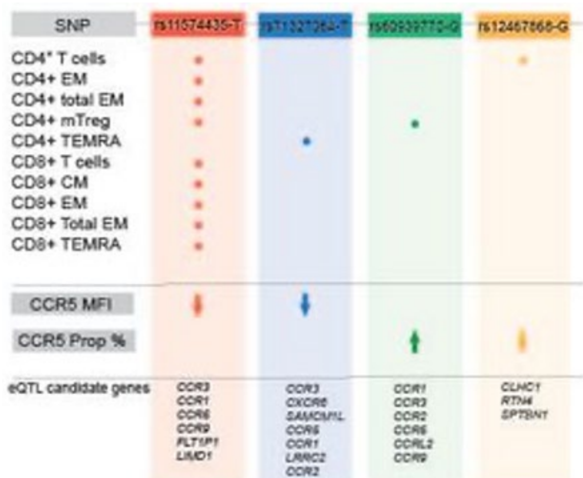

Figure 1. Genetic variations that regulates CCR5 expression in T lymphocytes

We identified the rs60939770, which is an intergenic variant in*cis*-region to *CCR5* gene not in linkage disequilibrium with *CCR5d32,* related to the proportion of CCR5$^+$memory T regulatory cells, both in PLHIV and healthy controls.Two genome-wide significant loci, in linkage equilibrium with *CCR5d32*, were found to be associated with CCR5MFI of-multiple subsets of mostly differentiated memory T cellsin both groups. The expression of nearby chemokines receptors (*CCR1*, *CCR2*, *CCR3*, *CCRL2*), existing in the same the same topologically associating domain, were also influenced by these genetic variants.

Furthermore, we show the genetic variants which modulate CCR5 surface expression affect the production of other inflammatory mediators, including monocyte- and lymphocyte-derived cytokines as well as CCL4 and IL-8.

Conclusions: We demonstrated that the genetic regulation of CCR5 expression is cell-type specific and may impact HIV susceptibility and disease progression.

EPLBA08

ILC3s in HIV-infected lymph nodes up-regulate inflammatory pathways linked to tissue fibrosis

N. Herbert[1], O.E. Asowata[1], Y. Zungu[1], C. Kummerlowe[2,3], A. Singh[1], N. Mthabela[1], D. Ramjit[1], F. Karim[1], F.G. Madela[1], V.T. Manzini[1], F. Anderson[1], A.K. Shalek[2,3], A. Leslie[1], H. Kloverpris[1]

[1]Africa Health Research Institute, Durban, South Africa, [2]Massachusetts Institute of Technology, Program in Computational and Systems Biology, Boston, United States, [3]Massachusetts Institute of Technology, Department of Chemistry, Boston, United States

Background: People living with HIV (PLWH) develop extensive fibrosis and collagen deposition throughout their lymphoid tissues not reversed by antiretroviral therapy (ART). Innate lymphoid cells (ILCs) play essential roles in tissue homeostasis and repair. However, no studies exist on ILCs in lymph nodes (LNs) during HIV infection.

We hypothesized that ILCs are modulated by HIV infection and participate in the subsequent immune response.

Methods: We obtained fresh mesenteric, celiac and hepatic LNs immediately after gastrointestinal surgery from patients recruited from areas in South Africa which were subject to flow cytometry (n=64), F-IHC (n=8) and scRNA-seq (n=7).

Results: LNs from PLWH receiving ART exhibited extensive collagen deposition and CD4 T-cell depletion compared to uninfected controls characteristic of HIV LN pathology. We found no correlation between CD4 T-cell levels and ILC subsets in LNs, but reduced CD4 levels in both blood and LNs of HIV suppressed PLWH.

Strikingly, we found no depletion of any of the ILC subsets in LNs, except a slight reduction of the dominant ILC3s in LNs located outside the germinal centers and close to HIV-infected cells.

In contrast, circulating ILC3s were severely depleted in PLWH and consistent with our previous work. Single-cell transcriptional profiling revealed activation of the dominant ILC3 subset during HIV infection, suggesting ILC3s are directly involved in the HIV response. HIV-infected LNs expressed more heterogenous ILC3 subsets, includ-

ing NK-like or 'ex-ILC3s' with cytotoxic potential, suggesting that HIV infection induces trans-differentiation away from conventional ILC3 subsets towards cytotoxic type I responses.

Moreover, we consistently found elevated levels of TGF-beta producing ILC3s. This subset was enriched in inflammatory pathways in PLWH, suggesting that these cells may play a central role in fibrosis formation through fibroblast-induced collagen deposition. Transcriptional profiling of the myeloid populations from matched LNs identified macrophages as the dominant source of IL1-B production and, therefore, may serve as innate sensors and drivers of ILC3 activation and differentiation in HIV-infected LNs.

Conclusions: Here, we performed the first single-cell analysis of ILCs in HIV-infected LNs and identified ILC3s as potential contributors to lymph node fibrosis, a major pathological consequence of HIV infection that warrants further investigation.

Antibody-mediated prevention of vaginal HIV transmission is dictated by IgG subclass in humanized mice

J. Brady[1], M. Phelps[1], S. MacDonald[1], E. Lam[1], A. Nitido[1], D. Parsons[1], C. Boutros[1], C. Deal[1], W. Garcia-Beltran[1], S. Tanno[1], H. Natarajan[2], M. Ackerman[2], V. Vrbanac[1], A. Balazs[1]

[1]*The Ragon Institute of MGH, MIT and Harvard, Cambridge, United States,* [2]*Dartmouth College, Department of Microbiology, Hanover, United States*

Background: HIV broadly neutralizing antibodies (bNAbs) are capable of both blocking viral entry and recruiting innate immunity to HIV-infected cells through their fragment crystallizable (Fc) region. Vaccination or productive infection results in a polyclonal mixture of class-switched IgG antibodies comprised of four subclasses, each encoding distinct Fc regions that differentially engage innate immune functions.

Despite evidence that innate immunity contributes to protection, the relative contribution of individual IgG subclasses is unknown.

Methods: We constructed Adeno Associated Virus (AAV) vectors expressing VRC07, a potent CD4-binding site direct bNAb, as each of the IgG1-4 heavy chains. In vitro testing was performed to assess the functionality of each IgG subclass against multiple HIV strains. Vectored ImmunoProphylaxis (VIP) was administered to bone-liver-thymus (BLT) humanized mice to interrogate the efficacy of individual IgG subclasses during low-dose repetitive vaginal HIV challenge by the REJO.c transmitted molecular founder strain of HIV.

Results: In vitro studies revealed that each IgG subclass exhibited distinct patterns of innate cell function. In vivo studies found that although IgG1, IgG3 and IgG4 exhibited similar protective efficacy, IgG2, which lacked Fc-mediated functionality, exhibited significantly reduced protection. A Cox proportional hazards model found that IgG2 was 5.6-fold less effective at preventing infection than IgG1 when controlling for antibody concentration. Interestingly, these studies also found that concentrations of VRC07-IgG1 as low as 2 µg/mL yielded substantial protection against vaginal challenge.

Conclusions: Our results suggest that antibody dependent cellular cytotoxicity may be dispensable for protective efficacy in BLT humanized mice, but antibody dependent cellular phagocytosis may contribute substantially to prevention at low bNAb concentrations.

As such, interventions capable of eliciting modest titers of functional subclasses may provide meaningful benefit against infection.

PELBA02

First-in-human evaluation of safety and pharmacokinetics of intravenous or subcutaneous infusions of PGT121.141.LS, an anti-V3 HIV-1 broadly neutralizing antibody in healthy volunteers without HIV

S. Edupuganti[1], C. Hurt[2], K. Stephenson[3], Y. Huang[4], C. Paez[4], T. Gamble[5], C. Yu[4], C. Yen[6], S. Regenold[6], W. Chege[6], R.J. Landovitz[7], K.H. Mayer[8], M. Siegel[9], M.E. Sobieszczyk[10], S.R. Walsh[11], J. Heptinstall[12], K. Seaton[12], D. Montefiori[1], G. Tomaras[12]

[1]*Emory University, Medicine, Atlanta, United States,* [2]*University of North Carolina at Chapel Hill, Medicine, Chapel Hill, United States,* [3]*Beth Israel Deaconess Medical Center, Harvard Medical School, Center for Virology and Vaccine Research, Boston, United States,* [4]*Vaccine and Infectious Disease Division, Fred Hutchinson Cancer Center, Seattle, United States,* [5]*FHI 360, Durham, United States,* [6]*National Institute of Allergy and Infectious Diseases, Rockville, United States,* [7]*UCLA Center for Clinical AIDS Research & Education, Los Angeles, United States,* [8]*Boston-Fenway Health, Harvard Medical School, Boston, United States,* [9]*George Washington Medical Faculty Associates, Washington, DC, United States,* [10]*Columbia University Irving Medical Center, New York, United States,* [11]*Brigham and Women's Hospital, Harvard Medical School, Boston, United States,* [12]*Duke University, Durham, United States*

Background: Multiple broadly neutralizing antibodies (bnAbs) targeting domains of gp120 are in development for prevention of HIV-1. PGT121.414.LS, a modification of the anti-V3 glycan bnAb PGT121, potently neutralizes multiple HIV-1 clades *in vitro*.

Methods: The ongoing, phase 1 HVTN 136/HPTN 092 trial assesses the safety, tolerability, and pharmacokinetics (PK) of PGT121.414.LS in 13 healthy adults without HIV. We evaluated IV dose-escalation and SC infusion in four groups: 3 mg/kg IV (group T1, n=3), 10 mg/kg IV (T2, n=4), 30 mg/kg IV (T3, n=3) and 5 mg/kg SC (T4, n=3). Serum con-

centrations of PGT121.414.LS were measured on days 0, 1, 2, 3, 6, 14, 28, 56 and 112 after a single infusion. Non-compartmental PK analyses were performed.

Results: The median participant age was 30 years; 77% were assigned female sex at birth; 15% Black and 85% White. IV and SC infusions were safe and well-tolerated, with no related serious adverse events or dose-limiting toxicities. Peak concentrations after IV infusions were observed on day 1, increasing linearly with higher doses (median = 525.8 in T3 vs 164.7 µg/mL in T2). Peak concentrations after SC infusion occurred on day 14. On day 112 (trough visit), T1 and T4 concentrations were similar (12.1 and 13.7 µg/mL); T2 concentrations (31.3 µg/mL) were lower than those predicted for T3 (78.8 µg/mL). Day 112 concentrations for T3 are in progress. PGT121.414.LS estimated clearance was 0.06-0.12 liter/day in T1-T4. PGT121.414.LS estimated elimination half-lives were 3 times longer than its precursor, PGT121, with medians of 53.6 -74.3 days in T1-T4. The estimated bioavailability of SC PGT121.414.LS was 70%, twice the bioavailability of its precursor.

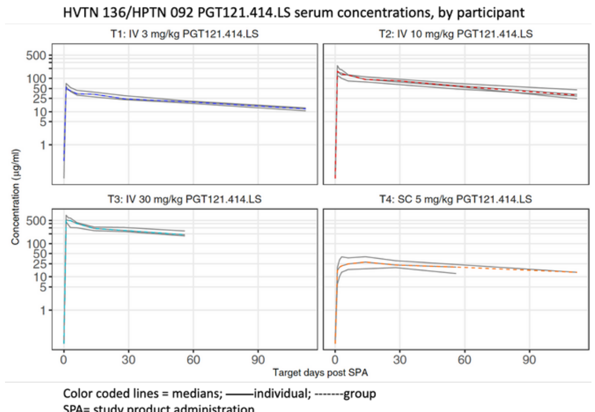

Figure. HVTN 136/HPTN 092 PGT121.414.LS serum concentrations, by participant.

Conclusions: PGT121.414.LS was safe and well-tolerated following IV or SC infusion in healthy US adults. These preliminary safety and pharmacokinetic findings support further development of PGT121.414.LS in combination with other bnAbs for global HIV-1 prevention.

PELBA03

In-vitro/ ex-vivo contribution of antiretroviral drug and alcohol exposure to blood-brain barrier disruption: relevance to the pathogenesis of HIV-1 associated neurological disorder

S.(. Huang[1], M.T. Hoque[1], R. Bendayan[1]
[1]*University of Toronto, Pharmaceutical Sciences, Toronto, Canada*

Background: HIV-1-associated neurological disorder (HAND) and alcohol use disorder (AUD) are common among people living with HIV/AIDS and significantly compromise their quality of life. Lines of evidence suggest that the toxicity induced by alcohol and antiretroviral drugs (ARVs) in the central nervous system (CNS) can potentially contribute to the pathogenesis of HAND. We aimed to investigate the effect of several recommended first-line ARVs and alcohol in inducing blood-brain barrier (BBB) dysfunction using human and mouse*in-vitro* and *ex-vivo* BBB models.

Methods: Brain Microvascular endothelial cells of human (hCMEC/D3) and mouse (primary cultures) origin, and isolated mice brain capillaries were used as in-vitro and ex-vivo models of the BBB and treated with alcohol or ARVs at clinically relevant plasma concentrations. Gene expression of tight junction proteins, drug efflux transporters, pro-inflammatory cytokines and oxidative stress marker were analyzed by qPCR using TaqMan gene expression assays.

Results: We observed a significant downregulation of TJP1/ZO-1, OCLN and CLDN5 mRNA expression following efavirenz, dolutegravir and emtricitabine exposure, and upregulation of pro-inflammatory cytokines (IL6, IL1β, IL8) and oxidative stress marker (NOS2/iNOS) by efavirenz, dolutegravir, emtricitabine, bictegravir and abacavir treatment in hCMEC/D3 cells. The mRNA expression of drug efflux transporters, P-glycoprotein (ABCB1/P-gp), Breast Cancer Resistant Protein (ABCG2/BCRP), and glucose transporter1 (SLC2A1/Glut-1) was altered by efavirenz, dolutegravir, emtricitabine, bictegravir and abacavir. In mouse brain microvessel endothelial cells, alcohol, efavirenz and dolutegravir exposure significantly downregulated Tjp1, Ocln and Cldn5, upregulated Il6, and altered Abcb1a, Abcg2 and Slc2a1 gene expression. Experiments using mouse brain capillaries further confirmed the significant effect of efavirenz and dolutegravir in disrupting Tjp1, Ocln, Cldn5, inducing Il1β and downregulating Abcb1a, Abcg2 and Slc2a1 mRNA expression.

Conclusions: Our studies demonstrated the effect of alcohol and ARVs in dysregulating TJ proteins, drug efflux transporters and pro-inflammatory cytokines at the BBB. By assessing the CNS toxicity of first line ARVs, our research reveals the potential contribution of ARVs in the pathogenesis of HAND and provides insights into optimal use of such ARVs in AUD population.(Supported by CIHR and OHTN).

EPLBB01

Standard versus double dose dolutegravir in patients with HIV-associated tuberculosis: a phase 2 non-comparative randomized controlled trial

R. Griesel[1,2], Y. Zhao[3,2], B. Simmons[4], Z. Omar[2], A. Hill[4], G. Meintjes[3,2], G. Maartens[1,2]

[1]University of Cape Town, Division of Clinical Pharmacology, Department of Medicine, Cape Town, South Africa, [2]University of Cape Town, Wellcome Centre for Infectious Diseases Research in Africa, Institute of Infectious Diseases and Molecular Medicine, Department of Medicine, Cape Town, South Africa, [3]University of Cape Town, Department of Medicine, Cape Town, South Africa, [4]University of Liverpool, Department of Pharmacology and Therapeutics, Liverpool, United Kingdom

Background: Rifampicin reduces the exposure of co-administered dolutegravir. This can be overcome with a supplemental dose of dolutegravir, which is difficult to implement in high burden settings. Dolutegravir trough concentrations of standard dosing with rifampicin were above the protein-adjusted IC_{90} in a healthy-volunteer study – this finding, coupled with the long dissociative half-life of dolutegravir from integrase, suggests supplemental dosing of dolutegravir with rifampicin may be unnecessary.

We hypothesize that virologic suppression with standard dose dolutegravir-based antiretroviral therapy (ART) will be acceptable in patients on rifampicin-based antituberculosis therapy (ATT).

Methods: We conducted a phase 2, non-comparative, randomised, double-blind, placebo-controlled trial of standard versus double dose dolutegravir among adults living with HIV on rifampicin-based ATT who were ART-naïve or had interrupted ART in Khayelitsha, Cape Town, South Africa. Participants were commenced on tenofovir/lamivudine/dolutegravir (TLD) and randomised to supplemental dolutegravir or placebo.

The primary endpoint was the proportion virologically suppressed (HIV-RNA viral load <50 copies/mL) at 24 weeks analyzed according to modified intention-to-treat using the FDA snapshot algorithm.

Results: We enrolled 108 participants: median age 35 years (IQR 32 to 41), 38% female, median baseline CD4 cell count 184 cells/mm³ (IQR 145 to 316) and HIV-RNA viral load 5.2 $\log_{10}$copies/mL (IQR 4.6 to 5.7). Baseline characteristics were similar between arms. Proportions with virologic suppression at weeks 12 and 24 were similar between arms (*Table 1*). No participants developed dolutegravir resistance. Grade 3 and 4 adverse events occurred at similar rates in both arms. Insomnia developed in more participants in the double dose arm (n=12) than in the single dose arm (n=4).

	TLD + Dolutegravir arm (n=53)	TLD + Placebo arm (n=55)
Week 12		
mITT, n (% [95%CI])	42/53 (79% [66-89%])	46/55 (84% [71-92%])
PP, n (% [95%CI])	42/53 (79% [66-89%])	46/54 (85% [73-93%])
Week 24		
mITT, n (% [95%CI])	43/52 (83% [70-92%])	44/53 (83% [70-92%])
PP, n (% [95%CI])	43/51 (84% [71-93%])	44/52 (85% [72-93%])
TLD = tenofovir/lamivudine/dolutegravir, mITT = modified intention-to-treat, PP = per protocol		

Table 1: Proportions with viral load <50 copies/mL

Conclusions: Virologic outcomes in both arms were acceptable. Our findings should be confirmed by adequately powered randomised controlled trials before implementation.

EPLBB02

Chronic/latent viral infection prevalence and estimated all-cause mortality risk among women living with HIV and HIV-negative women participating in the British Columbia CARMA-CHIWOS Collaboration (BCC3) study: preliminary findings

T. Povshedna[1,2], S.L. Levy[1,2], A.R. Campbell[3,4], S.A. Swann[3,5], D. Pang[6], E.M. King[3,7], V. Nicholson[6,8], A. Kaida[3,6], M.C. Murray[3,4,9], H.C. Cote[1,2,3], the BCC3 (CIHR, CTN 335) study team

Background: Women living with HIV (WLWH) have shorter life expectancy compared to HIV-negative women, which suggests accelerated/accentuated aging. Healthy aging is affected by chronic inflammation caused by HIV and other persistent viral infections, as well as socio-structural stressors that disproportionately affect WLWH.

Methods: The BCC3 cohort takes a holistic approach to examine healthy aging and enrolls WLWH and HIV-negative women living in British Columbia, Canada. Prevalence of 8 chronic viral infections was assessed by serology (hepatitis B and C viruses (HBV, HCV), herpes simplex viruses (HSV-1, HSV-2), Epstein-Barr virus (EBV), human herpesvi-

rus-8 (HHV-8), and cytomegalovirus (CMV)), or self-report (varicella-zoster virus (VZV)). The Veterans Aging Cohort Study (VACS) index, which estimates 5-year all-cause mortality risk based on clinical and demographic parameters, was calculated based on data from the BCC3 survey. The groups were compared by Fisher's, Chi-Squared, and Mann-Whitney tests, as appropriate.

Results: Table 1 describes demographic characteristics of the study participants. WLWH were more likely to harbor CMV (77% vs 53%, p<0.001), HSV-2 (73% vs 27%, p<0.0001), HCV (37% vs 7%, p<0.0001), and HBV (23% vs 4%, p<0.001), but not EBV (98% vs 91%, p=0.06), HSV-1 (72% vs 63%, p=0.17), VZV (74% vs 80%, p=0.3), and HHV-8 (8% vs 18%, p=0.04). After excluding participants with missing data, WLWH (n=90) had significantly higher VACS scores compared to controls (n=96) 8.2 [3.7-23.1]% vs 4.2 [3.7-10.7]%, p<0.001.

	WLWH (n=100)	Controls (n=100)	P-value
Age (years), median [IQR] (range)	51 [42-58] (20-73)	47 [27-56] (17-80)	**0.01**
African / Caribbean / Black / White / Indigenous / Asian / other, %	13 / 38 / 29 / 9 / 11	3 / 53 / 3 / 24 / 7	**<0.001**
Graduated high school, %	69	96	**<0.0001**
Currently employed, %	36	57	**0.003**
Individual income <$20.000, %	64	33	**<0.0001**
Have experienced homelessness, %	51	21	**<0.001**
Current smoking, %	45	21	**<0.001**
Current substance use, %	48	38	0.15
Current opioid use, %	27	11	**0.004**

Table 1.

Conclusions: In this interim analysis, WLWH were more likely to have 4/8 chronic/latent viruses and almost twice the estimated risk of mortality within 5 years compared to controls. These observed differences may be partially mediated through biological variables, age, and/or socio-structural factors.

This type of analysis can shed light on the factors that affect aging in WLWH, to ultimately inform action(s) to improve quality of life and close the health gap between WLWH and HIV-negative women.

EPLBB03

Cervical cancer screening outcomes among women living with HIV In Malawi

C. Trapence[1], O. Kumwenda[1], A. Abubakar[1], C. Mhango[1], A. Mtimuni[1], A. Worku[1], C. Lau[1], J. Gama[1], T. Van Boven[1], V. Kanje[1]

[1]*USAID, Lilongwe, Malawi*

Background: In comparison to HIV-negative women, women living with HIV (WLHIV) are six times more likely to develop persistent precancerous lesions that advance to cervical cancer, with more aggressive forms and higher mortality. Since 2018, PEPFAR Malawi has helped the Ministry of Health integrate cervical cancer screening and treatment into high-volume ART clinics, increasing the number of facilities from 39 to 129. PEPFAR Malawi used a "screen and treat" strategy that included visual examination with acetic acid (VIA) and treatment of precancerous lesions with thermocoagulation, cryotherapy, and LEEP (for lesions covering more than 75% of the cervix).

All PEPFAR-supported sites have skilled providers, a continuous supply of critical goods, and at least one thermal coagulator.

Our objectives is to describe patterns of cervical cancer screening using VIA testing among WLHIV in Malawi from 2020 to 2021.

Description: We retrospectively analyzed 2020-2021cervical cancer program data. Our analysis focused on 116,023 women (20–49 years). Chi-square test for bivariate analysis, and proportional tests were used to analyze independent association between individual-level factors and women who have had VIA. Statistical significance was set at p < 0.05.

Lessons learned: Using program data, we calculated descriptive statistics and proportion tests to test statistical significance differences in VIA-positivity by age and screening type. Between October 2020 and September 2021, the program conducted 116,023 cervical cancer screenings. Proportion of WLHIV who tested VIA-positive was 3% (3,621/116,023).

Among 3621 women who screened VIA-positive, positivity was 4% (2,382/67744) from first time screening, 2% (1170/47283) from rescreening and 7% (69/996) from follow up screening. By age, positivity was 4% for women aged 20-34 years, 3% for ages 35-44 years and 1% for ages above 39 years. Although the age range 20-24 years is outside the PEPFAR targeted population, we noticed a positivity of 4%.

Conclusions/Next steps: There is a need to discuss the possibility of including ages 20-24 years in the PEPFAR targeted population for cervical cancer screening. This group had a positivity of 4% which is higher than positivity reported for other age categories.

In addition, the positivity for follow up screens was 7% which implies a need to evaluate the effectiveness of treatment.

Background: DTG/RPV 2-drug regimen was studied in virologically suppressed switched subjects with no prior treatment failure history or resistance. Viruses with NNRTI resistance mutation K103N retain in-vitro susceptibility to RPV. Potential to maintain viral suppression with DTG/RPV in subjects with documented K103N currently suppressed on other regimens was investigated.

Methods: This is a European, open-label, multi-centre, exploratory study randomised 2:1 over 48 weeks of switch to DTG/RPV vs continuing current suppressive regimen (CSR) in treatment experienced, HIV-1 subjects with documented, prior K103N mutation. Prior PI and NRTI mutations were permitted. Mutations known to reduce susceptibility to RPV or DTG, INSTI failure history, or contraindications to DTG or RPV were exclusions.

Results: Results were available for all 140 randomised subjects (DTG/RPV: 95, CSR: 45), well matched for baseline characteristics, median age was 52yr, 82% male, 73% white and median CD4 570 c/uL. Baseline regimens included NRTIs 77%, PI/b 63%, INSTI 48%.

Proportion of subject with treatment success (HIV-RNA<50 copies/mL) by ITT FDA Snapshot at week 48 was DTG/RPV 90.5% vs CSR 88.9% (-1.5%, 95% CI -12.3 to +9.8). One CSR (2.2%) and three DTG/RPV (3.2%) subjects were confirmed virological failures (2x ≥50copies/ml >2weeks apart). All virological load failures were <200 copies/ml.

Adverse event occurred with DTG/RPV 80.0% vs CSR 73.3%. Drug-related AE rate was 23.2% for DTG/RPV (mostly grade 1, and one grade 3) with none in the CSR group. Three DTG/RPV subjects out of 13 discontinuations (8 DTG/RPV; 5 CSR) were withdrawn for AEs (Aggressive behaviour; fatty faeces and flatulence; sleep disorder). There were no significant differences in changes to weight, lipids, or renal parameters.

Conclusions: In subjects with archived K103N currently suppressed on standard regimens, switch to DTG/RPV maintains virological suppression in the majority of subjects through week 48. Higher rates of mainly grade 1 AEs were observed, consistent with other switch studies.

Safety and effectiveness outcomes from the Carisel study: phase 3b hybrid-3 implementation study integrating cabotegravir + rilpivirine long-acting into European clinical settings

C. Jonsson-Oldenbüttel[1], J. Ghosn[2,3], M. van der Valk[4], E. Florence[5], F. Vera[6], M. Ait-Khaled[7], G. Bontempo[8], C. Latham[8], C. A. Gutner[8], S. Iyer[9], R. DeMoor[10], M. Gill[7], M. Czarnogorski[8], J. van Wyk[7]

[1]MUC Research GmbH, München, Germany, [2]Université de Paris, INSERM UMR 1137 IAME, Paris, France, [3]Hôpital Bichat–Claude Bernard, Service de Maladies Infectieuses et Tropicales, AP-HP, Paris, France, [4]Amsterdam UMC, Amsterdam, Netherlands, the, [5]Instituut voor Tropische Geneeskunde, Antwerp, Belgium, [6]Hospital General Universitario de Santa Lucía, Murcia, Spain, [7]ViiV Healthcare, Brentford, United Kingdom, [8]ViiV Healthcare Research Triangle Park, Durham, United States, [9]GlaxoSmithKline, Bangalore, India, [10]GlaxoSmithKline, Collegeville, United States

Background: Cabotegravir + rilpivirine long-acting (CAB+RPV LA) dosed every 2 months (Q2M) is a recommended regimen in European and US treatment guidelines for virologically suppressed people living with HIV-1 (PLWH) with no known CAB/RPV resistance. CARISEL is the first study in which all participants switched from daily oral therapy to CAB+RPV LA Q2M. Key safety and effectiveness Month 12 endpoints are reported.

Methods: This single-arm study enrolled virologically suppressed PLWH to receive CAB+RPV LA Q2M. Clinics with no prior experience with CAB+RPV LA were preferentially selected. Effectiveness endpoints were the proportion of participants with plasma HIV-1 RNA ≥50 copies/mL and <50 copies/mL at Month 12 (FDA Snapshot algorithm, intention-to-treat exposed population). Safety outcomes were also reported.

Results: Thirteen of 18 clinics (72%) had no experience with administering CAB+RPV LA at study start. 430 enrolled and treated participants were included; 25% were female (sex at birth), 18% were Black, with a mean baseline age of 44 years (30% >50 years). At Month 12, 87% (n=373/430) of participants maintained HIV-1 RNA <50 copies/mL, and the proportion with HIV-1 RNA ≥50 copies/mL was 0.7% (n=3/430). One participant had confirmed virologic failure (n=1/430; 0.23%) with E138A+M230L RPV resistance-associ-

ated mutations (RAMs) and no INSTI RAMs detected in the suspected virologic failure sample at Month 10; the E138A RPV RAM was present at baseline (retrospective testing of Day 1 peripheral blood mononuclear cell pro-viral DNA). Most AEs and drug-related AEs were Grade 1 or 2 (86% and 94%, respectively). Injection site reactions (ISRs) were reported in 86% of participants; 98% were mild or moderate in severity. The median ISR duration was 3 days, with >80% resolving within 7 days. Few participants (6%) discontinued due to ISRs (Table).

	CAB+RPV LA (n=430) n (%)
Any AEs*	420 (98)
Drug-related AEs	389 (90)
Grade 3–5 drug-related AEs	25 (6)
AEs leading to treatment withdrawal	42 (10)
Recorded ISRs leading to treatment withdrawal	24 (6)
SAEs†	15 (3)

*No Grade 5 AEs or deaths were reported; most common AEs were injection site pain (80%);
COVID-19 infection (16%); injection site induration (10%); injection site discomfort (9%); pyrexia (9%).
†One SAE was reported as drug related and led to study treatment discontinuation.
AE, adverse event; CAB, cabotegravir; ISR, injection site reaction; LA, long-acting; RPV, rilpivirine; SAE, serious adverse event.

Table. Adverse Events Outcomes (Including ISRs)

Conclusions: Across diverse European clinical settings and participants, CAB+RPV LA Q2M was well tolerated and highly effective in maintaining virologic suppression with a low rate of virologic failure.

Suboptimal lopinavir exposure in infants 1-12 months on rifampicin treatment receiving double-dosed or semi-superboosted lopinavir/ritonavir; results from the EMPIRICAL trial

T.G. Jacobs[1], V. Mumbiro[2], C. Moraleda[3], A. Colbers[1], A. Passanduca[4], S. Domínguez-Rodríguez[3], M. Chitsamatanga[2], A. Tagarro[3], A. Ballesteros[3], K.J. Nathoo[2], L. Madrid[3], N. Namuziya[5], B. Nduna[6], W.C. Buck[4,7], C. Chabala[5,8], H.A. Mujuru[2], D.M. Burger[1], P. Rojo[3], EMPIRICAL study team

[1]Radboud university medical center, Clinical Pharmacy, Nijmegen, Netherlands, the, [2]University of Zimbabwe Clinical Research Centre, Harare, Zimbabwe, [3]Hospital 12 de Octubre, Madrid, Spain, [4]Universidade Eduardo Mondlane Faculdade de Medicina, Maputo, Mozambique, [5]University Teaching Hospitals-Children's Hospital, Lusaka, Zambia, [6]Arthur Davidson Children's Hospital, Ndola, Zambia, [7]University of California Los Angeles, David Geffen School of Medicine, Pediatrics, Los Angeles, United States, [8]University of Zambia, School of Medicine, Lusaka, Zambia

Background: Double-dosing of lopinavir/ritonavir (LPV/r) in infants and young children receiving rifampicin resulted in subtherapeutic LPV trough concentrations (<1.0mg/L) in 60% of children. However, only four infants <12 months old participated in that study while activity of LPV metabolism through CYP3A4 changes greatly during the first year of life. Super-boosted LPV/r to a 1:1 ratio is recommended for infants being co-treated with rifampicin. In clinical practice, however, double-dosed LPV/r is frequently given to infants receiving rifampicin due to limited availability of single formulation ritonavir syrup.

We evaluated plasma LPV concentrations in infants with HIV receiving LPV/r according to local dosing guidelines with or without rifampicin-based TB-treatment.

Methods: This is a 2-arm pharmacokinetic sub-study of the EMPIRICAL randomized controlled trial (#NCT03915366) for severe pneumonia in infants with HIV. Eligible infants aged 1-12 months, weighing ≥ 4kg, receiving LPV/r with or without (control) rifampicin-based TB-treatment, were recruited from hospitals in Mozambique, Zambia, and Zimbabwe. Infants received double-dosed or semi-superboosted LPV/r (adding a ritonavir 100mg crushed tablet to the evening LPV/r dose) during rifampicin co-treatment. Six blood samples were taken over 12 hours. This project is part of the EDCTP2 programme supported by the European Union RIA2017MC-2013.

Results: In total, 13/15 included infants had evaluable pharmacokinetic curves; 8/13 had rifampicin co-treatment (5 received double-dosed and 3 semi-superboosted LPV/r). The median (IQR) weight was 5.7kg (5.3-6.7) and age 6.6 months (5.5-9.7), 9/13 were male. 5/8 infants in rifampicin arm had LPV C_{trough} <1.0mg/L (equally divided over those receiving double-dosed and semi-superboosted LPV/r); median (IQR) AUC_{0-12h} and C_{trough} were 47.6 (7.7-96.1) h*mg/L and 0.25 (0.06-2.8) mg/L, respectively.

In the control arm, 1/5 infants had C_{trough} <1.0mg/L; AUC_{0-12h} and C_{trough} were 64.2 (61.8-237.2) h*mg/L and 3.4 (1.6-15.8) mg/L, respectively. LPV apparent oral clearance was 4-fold higher for infants receiving rifampicin.

Conclusions: Double-dosed or semi-superboosted LPV/r for infants 1-12 months old receiving rifampicin resulted in substantial proportions of subtherapeutic LPV levels.

There is an urgent need for data on alternative ARVs in infants with HIV/TB co-infection, such as twice-daily dolutegravir which is being evaluated in an ongoing EMPIRICAL pharmacokinetic substudy.

EPLBB07

A point-of-care triage test for HIV virological failure: filling the gaps in viral load coverage

A. Saura-Lázaro[1], P. Bock[2], E. van den Bogaart[3], J. van Vliet[3], L. Granés[4], K. Nel[2], V. Naidoo[2], Y. Saunders[2], M. Scheepers[2], R. Paulussen[3], D. Naniche[1], E. López-Varela[1,2]
[1]Barcelona Centre for International Health Research (CRESIB), Hospital Clinic-Universidad de Barcelona, Barcelona, Spain, [2]Desmond Tutu TB Centre, Department of Paediatrics and Child Health, Faculty of Medicine and Health Sciences, Stellenbosch University, Cape Town, South Africa, [3]Mondial Diagnostics, Amsterdam, Netherlands, the, [4]Hospital Clínic de Barcelona, Barcelona, Spain

Background: Viral load (VL) monitoring in antiretroviral treatment (ART) patients is challenging, especially in high-burden settings. Access to an accurate, affordable point-of-care test (POCT) could greatly enhance ART outcomes.IFN-γ-induced protein 10 (IP-10) is a chemokine strongly correlated with human immunodeficiency virus (HIV) VL that could serve to predict virological failure (VF) and to triage patients requiring VL testing.

This study aimed to evaluate the field performance of a semi-quantitative prototype lateral flow IP-10 POCT as a screening test for VF in South Africa.

Methods: Finger prick capillary blood was collected from patients attending a primary health clinic in the Western Cape for direct application by trained nurses onto the IP-10 POCT (index test) and compared with a plasma VL result taken ≤1 month prior (reference test) amongst adult patients on ART for ≥ 1 year. Logistic regression with penalized likelihood was used to build an IP-10 POCT reading values-based model able to identify individuals with VF (VL > 1,000 copies/mL).

The area under the receiver operating characteristic curves (AUC) was calculated to evaluate model prediction. Testing cost saving was estimated assuming a unit cost of 2 USD for IP-10 POCT, 22 USD for VL test plus 60% of test-associated costs.

Results: Among the 209 participants (median age 38 years and 88% female), 18% had VF. Median IP-10 POCT reading values were higher among individuals with VF compared to those without (24.0 vs. 14.6; $p < 0.001$).

The IP-10 POCT predicted VF with an AUC = 0.76 (95% confidence interval (CI), 0.67–0.85). The model identified VF with 91.9% sensitivity (95% CI, 78.1%–98.3%) and 35.1% specificity (28.0%–42.7%).

Projecting a VF prevalence of 18% in a simulated cohort of 1,000 ART patients, an IP-10 screening POCT would avert > 30% of the routine VL monitoring tests and associated costs.

Conclusions: The IP-10 POCT is an effective triage test for routine VL monitoring. Combining a highly sensitive, low-cost IP-10 POCT-based screening with VL testing in a two-step decision algorithm could provide a greatly needed monitoring tool in settings with low VL coverage, and result in significant savings for health systems.

Background: Viremia rebounds rapidly in most people living with HIV upon ART cessation. Early ART initiation is associated with ART-free virologic control, and broadly neutralizing anti-HIV-1 antibodies (bnAbs) may modulate immune responses to HIV. Durable ART-free virologic control has been observed in 20-25% of African women in some cohorts, significantly higher than in other populations. The HVTN 703/HPTN 081 AMP trial evaluated VRC01 bnAb-mediated HIV-1 prevention among African women; those who acquired HIV were linked to early ART. With African community, investigator, ethics and regulatory collaborators, an AMP ATI (HVTN 805/HPTN 093/A5390) was designed to evaluate whether early ART +/- VRC01 circulating at HIV acquisition is associated with virologic control post-ATI and to assess underlying immunologic and virologic dynamics.

Methods: AMP ATI eligibility includes African women with an estimated HIV acquisition date within 8 weeks of receiving VRC01 or placebo in AMP, early ART initiation and ≥1

year of viral suppression. Participants complete an NNRTI switch, as needed, then stop ART and receive frequent viral load (VL) and CD4+ T-cell count monitoring. ART re-initiation criteria include CD4<250, VL>1,000 for 4 weeks without 0.5log decline, or participant/clinician request to restart ART.

Results: Nine participants from South Africa, Malawi, Botswana and Zimbabwe have enrolled, thus far; 7/9 met ART re-initiation criteria (n=5 for VL; n=2 for participant/clinician request). One participant requesting ART re-initiation had tenofovir levels consistent with ART use during ATI. Median time to confirmed VL>200 was 7.3 weeks (range 2.7-20.9+). Median time to meet virologic ART re-initiation criteria was 17.1 weeks (11-21.3). ART was reinitiated a median of 7 days later; all re-suppressed. No SAEs or Grade ≥2 related AEs were reported. See Figure 1.

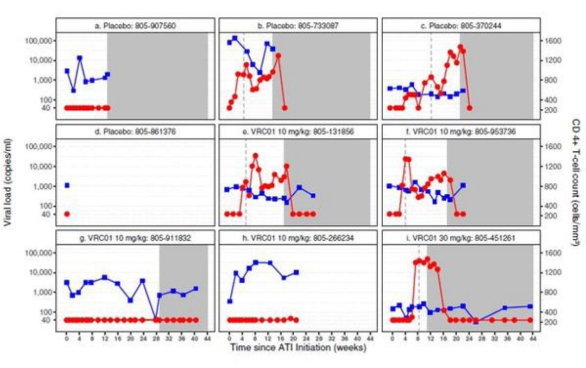

Figure 1. *Individual participant viral load (blue squares) and CD4+ T-cell counts (red circles) over time during analytical treatment interruption (ATI).* The treatment each participant received in the pre-ATI AMP study (i.e., Placebo or VRC01 10 mg/kg or 30 mg/kg) is indicated above each panel. Time of first viremia is indicated with the gray dashed line. Time of meeting ART re-initiation criteria is indicated by the beginning of the gray shaded areas. ART re-initiation criteria met are: viral load (805-733087, 805-451261, 805-953736, 805-131856, 805-370244), participant request (805-911832 and 805-907560), and CRS clinician request (805-907560) due to participant relocation. Participant 805-911832 had tenofovir levels in Dried Blood Spots that were consistent with ART use during ATI.

Figure 1.

Conclusions: In a safe and well-tolerated ongoing ATI developed with local stakeholder engagement, African women with early ART initiation +/- prior VRC01 exhibit evidence of viral rebound and control.

EPLBB09

Risk factors and prognoses for low-level HIV-1 viremia: a long-time observational study

X. Duan[1,2], X. Song[1], W. Lv[1], Y. Li[1], Y. Han[1], Z. Qiu[1], W. Cao[1], T. Li[1,3]

[1]*Peking Union Medical Hospital, Department of Infectious Diseases, Beijing, China,* [2]*Chinese Academy of Medical Sciences & Peking Union Medical College, School of Clinical Medicine, Beijing, China,* [3]*Tsinghua University, Medical College, Beijing, China*

Background: The risk factors and optimal management of low-level viremia (LLV) in HIV infection is still controversial. Here, we studied the risk factors for LLV in treated HIV patients, and the impact of viral load (VL), CD4 counts, and ART modification during LLV on virological and immunological prognoses.

Methods: We reviewed all outpatients at the HIV clinical center of Peking Union Medical College Hospital in Beijing, China during 2010-2020. Patients who aged 18-65, ever achieved virological suppression (VS), and had at least two documented VLs and CD4 counts were included in the study. A case-control study was designed to figure out the risk factors for LLV. Patients with LLV were then studied to learn the impact of viral load, CD4 counts, and strategies of ART modification on the clinical outcomes including virological failure (VF, VL > 200 copies/ml) and poor CD4 recovery (CD4 counts < 350 cells/mm³).

Results: The case-control study showed that the modification of ART regimens (OR =2.309, 95% CI [1.302-4.191], p =0.005) and higher zenith VL (OR = 1.331, 95% CI [1.091-1.623], p= 0.005) were independent risk factors for LLV. In the second part, of 43 patients with LLV, 2 (7.9%) had a subsequent VF and 17 (44.4%) showed poor CD4 recovery. Immunological suboptimal responder during LLV (HR =3.015, 95% CI [1.000-9.094], p =0.050) and higher zenith CD4 (HR = 0.995, 95% CI [0.991-0.999], p =0.012) were respectively independent risk and protective factors.

However, LLV did not dramatically alter the dynamic of CD4 changes before and after LLV. Modification of ART regimens during LLV did not help to reverse either virological or immunological outcomes.

Conclusions: These findings suggested that a powerful and sustainable initial ART regimen to avoid frequent adjustment of suboptimal regimens may be key to preventing LLV. The incidence of VF post LLV was relatively low but poor CD4 recovery was common. Modification of ART regimens during LLV had no necessity or help for reversing the virological and immunological outcomes post LLV.

PELBB01

Final week 192 results from the ADVANCE trial: first-line TAF/FTC/DTG, TDF/FTC/DTG vs TDF/FTC/EFV

W.D.F. Venter[1], B. Bosch[1], S. Sokhela[1], G. Akpomiemie[1], N. Chandiwana[1], A. Tembo[1], A. Qavi[2], B. Simmons[3], K. McCann[4], A. Hill[5]

[1]*Ezintsha, University of the Witwatersrand, Johannesburg, South Africa,* [2]*Imperial College London, London, United Kingdom,* [3]*London School of Economics and Political Science, London, United Kingdom,* [4]*University of Connecticut, Connecticut, United States,* [5]*University Of Liverpool, Liverpool, United Kingdom*

Background: Current World Health Organization guidelines recommend first-line treatment with tenofovir disoproxil fumarate (TDF)/lamivudine (or emtricitabine (FTC)) and dolutegravir /(DTG) for HIV-1 infection.Tenofovir alafenamide (TAF) is listed as an alternative to TDF for patients with osteoporosis or impaired renal function.

Methods: 1,053 treatment-naïve participants in South Africa were randomized to either TAF/FTC+DTG, TDF/FTC+DTG, or TDF/FTC/EFV and followed up to week 192 under a trial extension. HIV-1 RNA, vital signs and renal and bone adverse events were assessed prospectively.

Results: BMI was balanced between arms at baseline. At 192 weeks, HIV-1 RNA <50 copies/mL was confirmed in 218/351 (62.3%) in the TAF/FTC+DTG arm, 204/351 (58.1%) in

the TDF/FTC+DTG arm, and 177/351 (50.4%) in the TDF/FTC/EFV arm. In the on treatment analysis, HIV RNA <50 copies/mL was 218/226 (96%) for TAF/FTC+DTG, 204/209 (98%) for TDF/FTC+DTG, and 177/179 (99%) for TDF/FTC/EFV.

By Week 192, body weight increased by +8.9kg for TAF/FTC+DTG, +5.8kg for TDF/FTC+DTG, and +3.3kg for TDF/FTC/EFV participants (observed data analysis). By Week 192, 29% of patients on TAF/FTC+DTG, 21% on TDF/FTC+DTG and 15% on TDF/FTC/EFV had developed clinical obesity. The risk of clinical obesity was significantly higher if taking TAF/FTC/DTG (p<0.001), female patients (p<0.001) and those with higher baseline BMI (p<0.001).

Among the women enrolled, 43% on TAF/FTC+DTG developed clinical obesity by Week 192 versus 27% on TDF/FTC+DTG and 20% taking TDF/FTC/EFV (p<0.001). Bone fracture and Grade 3 or 4 renal adverse events were rare and similar across arms.

Treatment arm	TAF/FTC/DTG N=351	TDF/FTC/DTG N=351	TDF/FTC/EFV N=351
HIV RNA <50, ITT	62%	58%	50%
HIV RNA, on treatment	96%	98%	99%
Weight gain	+8.9kg	+5.8kg	+3.3kg
% Clinical obesity	29%	21%	15%
% Obesity: women	43%	27%	20%
Bone fractures	n=5	n=4	n=5
Grade 3 / 4 Renal	n=1	n=2	n=3
Grade 3 / 4 Cardiac	n=1	n=0	n=0
Grade 3 / 4 Diabetes	n=0	n=1	n=0
Grade 3 / 4 Adverse birth outcomes	n=4	n=1	n=1

Table. ADVANCE trial: week 192 results

Conclusions: In the ADVANCE trial, participants taking TAF/FTC+DTG experienced greater weight gain and clinical obesity than TDF/FTC/DTG by Week 192, particularly in women, but no significant differences in HIV RNA suppression or renal or bone-related adverse events.

Both TAF/FTC/DTG and TDF/FTC/DTG had significantly higher rates of HIV RNA suppression than TDF/FTC/EFV at Week 192 in the main ITT analysis.

PELBB02

Update on neural tube defects with antiretroviral exposure in the Tsepamo Study, Botswana

R. Zash[1,2], L.B. Holmes[3], M. Diseko[2], D. Jacobson[4], G. Mayondi[2], J. Mabuta[2], M. Mmalane[2], T. Gaolathe[5], S. Lockman[6,2], J. Makhema[2], R. Shapiro[4,2]

[1]*Beth Israel Deaconess Medical Center, Boston, United States,* [2]*Botswana Harvard AIDS Institute Partnership, Gaborone, Botswana,* [3]*MassGeneral Hospital for Children, Boston, United States,* [4]*Harvard TH Chan School of Public Health, Boston, United States,* [5]*University of Botswana, Gaborone, Botswana,* [6]*Brigham and Women's Hospital, Boston, United States*

Background: After reporting a possible association between neural tube defects (NTDs) and exposure to dolutegravir (DTG) from conception in 2018, yearly updates from the Tsepamo study have been increasingly reassuring. We report updated data collected through March 2022.

Methods: The Tsepamo Study conducts birth outcomes surveillance study at government hospitals throughout Botswana, covering ~70% of all births. Midwives perform surface examinations of all live births and stillbirths and describe abnormalities. Research assistants photograph major abnormalities after maternal consent, which are reviewed by a birth defects expert blinded to exposures. Prevalence of NTDs was determined by maternal HIV and antiretroviral (ARV) exposure status (95% CI by Wilson method) and the primary analysis evaluated prevalence differences by exposure status (95% CI by Newcombe method).

Results: Since April 2021, 32,819 additional births were recorded, including 3,780 additional DTG conception exposures. Since August 2014, there have been a total of 224,251 deliveries; 223,797 (99.8%) had an evaluable infant surface exam, with 156 (0.07%, 95% CI 0.06%, 0.08%) NTDs identified (100 with photo, 56 by description only). Among women on DTG at conception, 10/5860 NTDs occurred (0.11%; 95%CI 0.06%, 0.19%): 4 myelomeningoceles, 2 anencephaly, 3 encephaloceles, and 1 iniencephaly. In comparison, NTDs occurred in 25/23,664 (0.11%; 95%CI 0.07%, 0.16%) women on any non-DTG ARVs from conception, 11/14,432 (0.08%; 95%CI 0.04%, 0.14%) on efavirenz from conception, 4/6,551 (0.06%; 95%CI 0.02%, 0.16%) on dolutegravir started in pregnancy, and 108/170,723 (0.07%; 95%CI 0.05, 0.08%) among women without HIV. NTD prevalence did not differ between DTG and any non-DTG ARVs from conception (0.00% difference; 95%CI -0.07%, 0.10%).

Exposure group vs. comparison group	Prevalence difference (%) (95% CI)
DTG at conception vs. Non-DTG at conception	0.00 (-0.07, 0.10)
DTG at conception vs. EFV at conception	0.03 (-0.05, 0.12)
DTG at conception vs. DTG started in pregnancy	0.04 (-0.06,0.14)
DTG at conception vs. non-DTG started in pregnancy	0.04 (-0.07,0.13)
DTG at conception vs. women without HIV	0.04 (-0.01, 0.13)

Table. Prevalence Difference of Neural Tube Defects by ARV and HIV Exposure Categories

Conclusions: The prevalence of NTDs among infants born to women on DTG at conception has declined to 0.11% and does not substantially differ from other exposure groups.

Mapping and estimating the size of virtual key populations: potential approaches

r. adhikary[1], A. Rao[2], S. Talwar[3]
[1]WHO India Country Office, HIV, Hepatitis and STIs unit, Communicable Diseases, New Delhi, India, [2]National AIDS Research Institute, Pune, India, [3]Actions Research Centre, Mumbai, India

Background: The dynamics of key population is changing very fast all over the world including India. More and more of them shifting increasingly from traditional physical hotspots to the virtual space due to rapid development in information technology as well as other underlying factors. Some discreate efforts are being made across some countries to map the virtual sites as well as estimate the size of key populations operating from there.

However, no sound, reliable and convincing methodology is yet to be available to map and estimate the size of virtual key populations for designing appropriate interventions among them.

Methods: National AIDS Research Institute of India and World Health Organization undertook an in-depth assessment in 2019-2020 to develop few potential approaches based on extensive literature review and informal consultations with key experts, program managers and key population communities.

Results: The in-depth assessment recommended three alternative potential approaches for mapping and estimating the size of key populations, particularly of men who have sex with other men, transgenders and female sex workers:

1. Virtual mapping and respondent driven sampling surveys;
2. Virtual mapping and online surveys, and;
3. Physical mapping and respondent sampling surveys.

All required adjustment factors could be calculated from any of these approaches.

Conclusions: The assessment concluded that the recommended three potential approaches need to be field tested for identifying the best approach for a particular key population group in a specific context.

Currently, the team is gearing up to field test these approaches as the COVID pandemic is now under control in India.

Opioid-agonist therapy in Ukraine has a large potential for expansion and demonstrates significant reduction of risky injection practices and overdose among people who inject opioid drugs

R. Kulchynska[1], Y. Sazonova[1], N. Podolchak[1], R. Keating[1], I. Ivanchuk[2], I. Titar[2], M. Azarskova[1], E.J. Barzilay[1]
[1]CDC-Ukraine, Overseas Strategy & Management Branch, Division of Global HIV & TB, Centers for Disease Control and Prevention, Kyiv, Ukraine, [2]Public Health Center of the MOH of Ukraine, Kyiv, Ukraine

Background: Opioid-Agonist Therapy (OAT) in Ukraine is the largest program of its kind in the Eastern Europe and Central Asia (EECA) region, with current coverage of nearly 17,000 clients. Ukraine's OAT program provides methadone or buprenorphine in combination with counseling and social services.

We investigated the reduction in unsafe injection practices and drug overdoses among clients who receive OAT but continue to inject drugs.

Methods: We analyzed the 2020 Integrated Biobehavioral Survey (IBBS) survey data among people who inject drugs (PWID) in Ukraine. Respondent-driven sampling was used to recruit 6,001 those who injected drugs in the past 30 days across 12 cities. The questionnaire captured sociodemographics, OAT awareness, eligibility, and participation, and risk behaviors among PWID who inject opioids (n=3,681). We ran four multivariate logistic models to estimate the preventive effect of OAT on usage of non-sterile syringes, syringe or needle sharing, use of prefilled syringes, and experience of non-fatal overdoses.

Results: In a weighted analysis, 62% of respondents were aware of the OAT program and 19% reported being on OAT. While 24% of respondents expressed interest in OAT, 49% were not planning to ever enroll in it. Other PWID had current or past OAT experience (24%) or failed to provide an answer (2.4%). In adjusted logistic models, current (n=745) OAT users were 25% less likely to report non-sterile syringe use. OAT users had 45% lower odds of sharing syringes than non-OAT users (2,936), and they had 43% lower odds of using drugs in pre-filled syringes. Additionally, OAT clients experienced half the risk of non-fatal overdose compared to non-OAT clients.

Conclusions: In this large PWID survey, OAT was associated with reduction of unsafe injection behaviors and non-fatal overdose, regardless of drug cessation. Allowing clients to enroll in OAT regardless of continuing injection practices would remove barriers to enrollment in OAT programs and potentially increase the benefits of OAT in Ukraine.

These results could be further used to inform a lower threshold of enrollment requirements for OAT among PWID in Ukraine as well as to increase PWIDs' awareness of the program.

Jitegemee (rely on yourself): acceptability and feasibility of a personal savings intervention to reduce HIV risk among female sex workers in Kisumu and Siaya Counties, Kenya

K. Agot[1], L. Odeny[1], J. Arasa[1], O. Okumu[1], M. Ochillo[1], R. Bosire[1], N. Okeyo[1], J. Onyango[1], H. Thirumurthy[2]

[1]Impact Research and Development Organization, Research, Kisumu, Kenya, [2]University of Pennsylvania, Center for Health Incentives and Behavioral Economics, Pennsylvania, United States

Background: Female sex workers (FSWs) in Kenya bear a disproportionate burden of HIV, mainly due to a high premium attached to unprotected sex with partners of unknown HIV status. Jitegemee (rely on yourself) intervention aims to support FSWs to build a small reserve from their earnings for use when sex work business is not doing well or when they want to decline unsafe sex.

Methods: We conducted a cross-sectional survey on acceptability and feasibility of Jitegemee – an intervention that aims to support FSW to put aside small savings from their earnings to fall back on to avoid situations of HIV risk. Eligible FSW were aged ≥18 years living in Kisumu and Siaya Counties. We explored HIV risk-taking behaviours; earnings, savings, and spending practices; views on and concerns over Jitegemee; plans to leave sex work; how to improve savings, among other topics.

To ensure representation of different FSW typologies, we enrolled participants from entertainment joints, brothels, streets, homes and beaches.

Results: Between 01/Feb/2022-02/Apr/2022, we enrolled 370 FSWs (208 in Kisumu, 162 in Siaya); average age 31 years; 55% primary and 40% secondary education; 22% married/cohabiting; 56.5% joined sex work ≤5 years; average monthly income US$1,227; 86% reporting sex work as primary income. Median monthly savings was US$95 (mainly in mobile money and table banking) while expenditures consumed US$1,860; current loans was US$67. Expenditures-plus-loan was higher than income-plus-savings by US$351. To augment their income in order to save, FSWs would seek other sources of income (62%), get more customers (29%) or work longer hours (20%).

Jigetemee intervention was acceptable to 95% of participants; however, 8% had concerns, of whom 42% perceived it as forcing sex workers out of sex work, 35% as disapproval of sex work, and 19% as a scheme to disappear with savings/use FSWs as a source of income.

Conclusions: Jitegemee is acceptable to almost all FWS and would be a sustainable approach to reduce their risk of HIV.

However, in order to reduce the risk of HIV by joining a savings intervention, FSW would need to cut down on non-essential expenses and/or diversity income without engaging in riskier sex.

EPLBC04

Transgender women (TGW) in HPTN 083: an evaluation of safety, efficacy, and gender affirming hormonal therapy (GAHT) interactions with long-acting cabotegravir (CAB-LA)

B. Grinsztejn[1], B. Hanscom[2], Z. Wang[2], D. Donnell[2], P. Richardson[3], P. Sullivan[3], S. Eshleman[3], A. Jennings[4], K. Gomez-Feliciano[4], K. Samitpol[5], E. Jalil[1], N. Cardozo[6], B. Maia[7], T. Khan[8], Y. Singh[9], J. Franks[10], J. Valencia[11], C. Psaros[12], S. Safren[13], N. Sanchez[14], J. Lucas[4], C. Blanchette[4], J. Rooney[15], A. Rinehart[16], S. Ford[17], A. Adeyeye[18], M. Cohen[19], M. McCauley[4], R. Landovitz[20], M. Marzinke[3]

[1]FIOCRUZ, INI, Rio de Janeiro, Brazil, [2]Fred Hutch, Seattle, United States, [3]Johns Hopkins University, Baltimore, United States, [4]FHI 360, Durham, United States, [5]Institute of HIV Research and Innovation, Bangok, Thailand, [6]Fundaction Huesped, Buenos Aires, Argentina, [7]University of Sao Paulo, Faculdade de Medicina, Sao Paulo, Brazil, [8]Fenway Health, Boston, United States, [9]Desmond Tutu HIV Centre, Cape Town, South Africa, [10]Columbia University, New York, United States, [11]IMPACTA-Peru, Lima, Peru, [12]Harvard Medical School, Cambridge, United States, [13]Miami University, Miami, United States, [14]University of Pennsylvania, Philadelphia, United States, [15]GILEAD, Foster City, United States, [16]ViiV Healthcare, London, United Kingdom, [17]GlaxoSmithKline, Brentford, United Kingdom, [18]NIH, DAIDS, Bethesda, United States, [19]University of North Carolina, Chapel Hill, United States, [20]UCLA, Los Angeles, United States

Background: HPTN 083 demonstrated a 66% reduced risk of HIV acquisition for long-acting injectable cabotegravir (CAB-LA) vs. daily oral TDF/FTC. As transgender women (TGW) remain a priority group for HIV prevention, we report the safety, prevention efficacy, and pharmacokinetics (PK) of CAB-LA in TGW during the blinded phase of HPTN 083.

Methods: Participant characteristics, including history of interpersonal violence, HIV risk perception, and grade 2+ adverse events, were compared between TGW and the larger study cohort. CAB drug concentrations were measured in a subset of TGW with and without gender-affirming hormonal therapy (GAHT) to evaluate the potential impact of GAHT on CAB PK.

Results: Of 4566 participants enrolled in HPTN 083, 570 (12.5%) were TGW (United States 21.9%, Latin America 36.0%, Asia 39.5%, and Africa 2.6%).During the study, 330 (57.9%) TGW reported GAHT use, with estradiol valerate (44.5%) and spironolactone (32.4%) most frequently reported. HIV incidence among TGW was 1.80% (TDF/FTC) and 0.54% (CAB-LA) during the blinded phase of HPTN 083 (hazard ratio: 0.34, 95%, CI 0.08-1.56).

When compared to the larger HPTN 083 cohort, TGW experienced an increased frequency of sexual (56.7% vs. 45.4%), physical (30.2% vs. 19.2%), and emotional (47.4% vs. 36.4%) interpersonal violence, and lower self-perceived HIV acquisition risk (53.3% vs. 66.5%). CAB-LA was well tol-

erated in TGW; the frequency of grade 2+ adverse events did not differ between TGW receiving CAB-LA or TDF/FTC (92.5% vs. 88.8%). CAB drug concentrations were measured in a subset of TGW who received on-time CAB injections (23 not taking GAHT, 30 taking GAHT).CAB drug concentrations were comparable between the two groups, suggesting the lack of a GAHT effect on CAB PK (*Figure 1*).

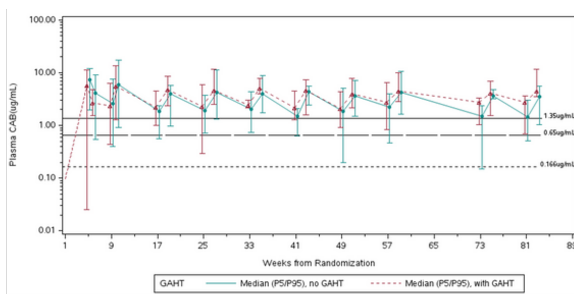

Figure 1. Comparison of CAB concentrations in TGW taking and not taking GAHT.

Conclusions: CAB-LA is a safe and effective HIV prevention strategy for TGW. Initial findings suggest there is no impact of GAHT on CAB concentrations.

[1]Jhpiego/Johns Hopkins University, Maternal Newborn Health, Washington, United States, [2]MWRI/UPMC, Microbicide Trials Network, Pittsburgh, United States, [3]Makerere University - Johns Hopkins University (MU-JHU) Research Collaboration, Kampala, Uganda, [4]Wits RHI, Shandukani Research Centre, Johannesburg, South Africa, [5]University of Zimbabwe, Clinical Trials Research Centre, Harare, Zimbabwe, [6]Queen Elizabeth Central Hospital, Obstetrics and Gynaecology, Blantyre, Malawi, [7]FHI 360, Science Facilitation, Durham, United States, [8]Magee-Womens Hospital, University of Pittsburgh Medical Center, Obstetrics and Gynecology, Pittsburgh, United States, [9]Statistical Center for HIV/AIDS Research and Prevention, Seattle, United States, [10]Fred Hutchinson Cancer Research Center, Seattle, United States, [11]University of Washington, Biostatistics and Global Health, Seattle, United States, [12]Fred Hutchinson Cancer Research Center, Division of Vaccine and Infectious Disease Research, Seattle, United States, [13]NIAID/National Institutes of Health, Division of AIDS, Bethesda, United States, [14]NICHD/National Institutes of Health, Rockville, United States, [15]University of Washington School of Public Health, Epidemiology, Seattle, United States

Background: World Health Organization (WHO) guidance supports provision of oral pre-exposure prophylaxis (PrEP) for breastfeeding people at substantial risk of HIV acquisition. In January 2021, WHO recommended the dapivirine vaginal ring (VR) as an additional HIV prevention choice as part of combination prevention approaches. In March 2022, the VR was approved by the South African Health Products Regulatory Authority. However, data are lacking on VR safety during breastfeeding, a period of increased HIV acquisition risk.

Methods: MTN-043 was a phase 3b, randomized, open-label trial, with 12 weeks exposure to VR or oral 200 mg emtricitabine/300mg tenofovir disoproxil fumarate tablet. Healthy, HIV-negative, exclusively breastfeeding mother-infant pairs enrolled from September 2020 to July 2021 at sites in Malawi, South Africa, Uganda, and Zimbabwe and randomized in a 3:1 ratio (VR: tablet). Adverse events (AEs) were collected throughout product exposure and two weeks following product discontinuation. Primary safety outcomes for mothers and infants included serious adverse events (SAEs) and Grade 3 or higher AEs in both arms.

Results: Across sites, 197 mother-infant pairs enrolled (VR: 148, oral PrEP: 49). Median age of infants was 9 weeks. Among VR arm participants, two (1%) mothers experi-

enced an SAE and three (2%) an AE of Grade 3 or higher; four (3%) infants experienced an SAE, and 10 (7%) an AE of Grade 3 or higher (*Table*). No SAEs or Grade 3 or higher events in mothers or infants were deemed related to study product.

	Mothers				Infants			
	Serious Adverse Events		Grade 3 or Higher Adverse Events		Serious Adverse Events		Grade 3 or Higher Adverse Events	
	n/N	% (95% CI)	n/N	% (95% CI)	n/N	% (95% CI)	n/N	% (95% CI)
Dapivirine Vaginal Ring	2/148	1% (0, 5)	3/148	2% (0, 6)	4/148	3% (1, 7)	10/148	7% (3, 12)
FTC 200 mg/ TDF 300mg oral tablet	0/49	0% (0, 7)	2/49	4% (1, 14)	0/49	0% (0, 7)	1/49	2% (0, 11)

Table. Primary safety outcomes among breastfeeding mothers and infants enrolled in MTN-043

Conclusions: In this first evaluation of VR safety during breastfeeding, few SAEs or AEs of Grade 3 or higher occurred among mothers and infants in either study arm; most AEs were mild or moderate, and all infant AEs were unrelated to study product. This favorable safety profile, along with previous data demonstrating low drug transfer to breastmilk, support updates of WHO and other guidelines to include breastfeeding people when recommending the VR as an additional HIV prevention choice.

iSTAMP: Implementation of HIV self-testing among Black and Hispanic MSM recruited online in 11 States, 2020-2021

R. Mac Gowan[1], P. Chavez[1], R. Dana[2], M. Hannah[2], J. Caldwell[2], J. Johnson[1], L. Hightow-Weidman[3], J. Jones[2], J. Raiford[1], T. Sanchez[2], A. Sharma[4], A. Smith[1], R. Stephenson[5], S. Sullivan[5], P. Sullivan[2]

[1]CDC, Division of HIV Prevention, Atlanta, United States, [2]Emory University, Rollins School of Public Health, Atlanta, United States, [3]University of North Carolina at Chapel Hill, Institute for Global Health and Infectious Diseases, Chapel Hill, United States, [4]University of Michigan, Department of Health Behavior and Biological Sciences, Ann Arbor, United States, [5]University of Michigan, Department of Systems, Population and Leadership, Ann Arbor, United States

Background: In the US, Black/African American and Hispanic/Latino men who have sex with men (BMSM & HMSM) account for a disproportionate number of new HIV infections. Providing HIV self-tests (HIVST) allows users to learn their HIV status, thereby contributing to achieving the "Ending the HIV Epidemic in the United States" (EHE) goal of diagnosing all people with HIV as early as possible.

Methods: This HIV self-testing study evaluated the effectiveness of marketing strategies in which advertising materials were specifically developed to recruit BMSM and HMSM through 3 media channels (general-interest social media, LGBT interest websites, gay dating apps). Eligibility included: $\geq$18 years old, not taking PrEP, no prior HIV diagnosis, completing online screener survey, baseline survey and providing contact information. Participants were mailed two HIVST. After completing a 4-month (4M) survey, participants who did not opt-out were sent another HIVST and a dried blood spot (DBS) kit.

Participants could report HIVST results online before, during or after their 4M survey. We report test results from participants and their social network associates (SNA).

Results: We enrolled 2,093 participants (55% BMSM, 45% HMSM); 22% had never tested for HIV. Eighty-five percent of BMSM were recruited from dating apps and 52% of HMSM from general-interest social media apps; 1,742 participants provided a HIVST result online before the 4M survey, and 80% (1,668/2,093) completed the 4M survey. 457 participants gave HIVSTs to SNA.

During the intervention period, positive results were reported by 9% (156/1,806) of all participants who reported at least one HIVST result, and 15% (61/396) of those never tested before enrollment.

The highest percentage of all positive HIVST results were reported from participants recruited from dating sites, 12% (133/1,110). 1396 DBS kits were mailed, 515 were tested, of which 6% were reactive for HIV. Additionally, 10 SNA had a positive HIVST result.

Reporting source	Total	General-interest social media	LGBT interest websites	Dating sites	Unknown source
Positive HIVST result reported during 4 month intervention period, by race/ethnicity	**156/1806 (8.6%)**				
Black/AA MSM	108/982 (11.0%)	5/101 (5.0%)	0/3	102/826 (12.4%)	1/52 (1.9%)
Hispanic/Latino MSM	48/824 (5.8%)	24/434 (5.5%)	0/12	23/284 (8.1)	1/94 (1.1%)
Positive HIVST result reported during 4 month intervention period, by history of testing at enrollment	**156/1806 (8.6%)**				
Never tested before enrollment	61/396 (15.4%)	9/152 (5.9%)	0	51/210 (24.3%)	1/34 (2.9%)
Ever tested	95/1410 (6.7%)	20/383 (5.2%)	0/15	74/900 (8.2%)	1/112 (0.9%)
Positive HIVST result from DBS card	**29/515 (5.6%)**				
Black/AA MSM	21/262 (8.0%)	1/26 (3.8%)	0/2	20/215 (9.3%)	0/19
Hispanic/Latino MSM	8/253 (3.1%)	4/125 (3.2%)	0/7	4/88 (4.6%)	0/33
Result of HIVST given to first SNA partner (N=457)	N (Col %)	N (Col %)	N (Col %)	N (Col %)	N (Col %)
Negative	223 (48.8%)	77 (51.0%)	5 (55.6%)	122 (47.1%)	19 (50.0%)
Positive	10 (2.2%)	2 (1.3%)	0	8 (3.1%)	0
Don't know	27 (5.9%)	11 (7.3%)	0	15 (5.8%)	1 (2.6%)
No response	197 (43.1%)	61 (40.4%)	4 (44.4%)	114 (44.0%)	18 (47.4%)
Did SNA know of prior positive result*					
No	9	1	0	8	0

Abbreviations: ST, Self-Testing; RCT, randomized controlled trial; SNA, Social Network Associate, LGBT, Lesbian, Gay, Bisexual, and Transgender; DBS, Dried Blood Spot
*One respondent did not answer whether their SNA had previously tested positive for HIV
[a] Includes all reported infections by participants in surveys or online reporting system.

Table: Reported positive HIV self-test results by iSTAMP participants by recruitment source.

Conclusions: The use of population-specific ads and specific media channels, especially MSM dating and general-interest social media sites could enable programs to remotely provide HIVST to BMSM & HMSM, including those who are not using traditional services.

This approach will increase awareness of HIV status among BMSM and HMSM and contribute to achieving EHE goals.

Number of pregnancies and its impact on adherence to ART during pregnancy in women living with HIV, followed up in 2020 in a specialized health center in São Paulo, Brazil

C. Ferreira Lima[1], W. Cesar Ribeiro Campos[2], N. Zanon Narchi[3]

[1]Universidade de São Paulo, Escola de Enfermagem / Faculdade de Medicina, São Paulo, Brazil, [2]Universidade de São Paulo, Faculdade de Medicina, São Paulo, Brazil, [3]Universidade de São Paulo / EACH-USP, Obstetricia, Sao Paulo, Brazil

Background: Being a woman and living with HIV brings enormous challenges: the need to maintain treatment with ART chronically, and the concern with the planning of reproductive life, in order to reduce the risks of maternal and child morbidity and mortality.

The objective of this study was to analyze adherence to ART among women living with HIV (WLHIV) who discovered pregnancy in 2020, according to the number of previous pregnancies, assisted in a Specialized Health Care Center (SAE).

Methods: Descriptive data analysis from cross-reference table in SPSS software, version 26. The sample was composed of all WLHIV (n=15), with onset of pregnancy between 01/01/2020 and 12/31/2020, who knew the previous diagnosis, until the conclusion of the pregnancy process, assisted in a SAE, in São Paulo. Data were collected from the prenatal records and medical records. CEP 3.139.029 - SMS/SP and 3.081.173 - EEUSP/SP.

Results: Analyzing the variables number of pregnancies x use of ART prior to pregnancy, we identified that the group with only one pregnancy (n=4), 75% made irregular use or no use of ART, in the groups with two or three pregnancies (n=7) and four pregnancies or more (n=4), 28.6% and 25% were in the same situation.

In the analysis of the variables number of pregnancies x ART use during pregnancy, analyzing the same groups, we find respective rates of 50%, 0%, and 25% in the category irregular use or no use of ART.

Conclusions: Pregnancy was an important factor in stimulating adherence among WLHIV, promoting a reduction in the rates of irregular use and non-use of ART, especially among women with up to 3 pregnancies. However, it highlights the maintenance of irregular use and non-use of ART among the group of 4 pregnancies or more.

Excessive family responsibilities, psychosocial vulnerabilities and the belief that the child will not acquire HIV due to the negative diagnosis history of previous children are among the justifications reported by WLHIV in medical records for this situation.

Reflection on these data denotes the need for improvement in WLHIV monitoring, adjusting strategies, with opportunities for dialogue about reproductive planning in the assistance.

Population trends in HIV service delivery, viral suppression, and incidence before and during the COVID-19 era in Rakai, Uganda

V. Ssempijja[1,2], K. Grabowski[2,3], A. Ndyanabo[2], R. Ssekubugu[2], L. Chang[4,2], H. Nakawooya[2], F. Nalugoda[5], G. Kigozi[5], J. Kagaayi[6], D. Serwadda[7,8], M. Wawer[9,7], R. Gray[9,7], T. Quinn[4,10], J. Kabanda[11], S. Alamo[11], L. Nelson[11], L.A. Mills[11], D. Kabatesi[11], S.J. Reynolds[7,10,4]

[1]Leidos Biomedical Inc, Clinical Monitoring Research Program Directorate,, Frederrick, United States, [2]Rakai Health Sciences Program, Statistics unit, Kalisizo, Uganda, [3]Johns Hopkins University, Pathology, Baltimore, United States, [4]Johns Hopkins University, School of Medicine, Baltimore, United States, [5]Rakai Health Sciences Program, Research Coordination Office, Kalisizo, Uganda, [6]Rakai Health Sciences Program, Executive Directors Office, Kalisizo, Uganda, [7]Rakai Health Sciences Program, Kalisizo, Uganda, [8]Makerere Univerisity, Kampala, Uganda, [9]Johns Hopkins University, Blook, Bloomberg School of Public Health, Department of Epidemiology, Baltimore, United States, [10]National Institutes of Health, Division of Intramural Research, National Institute of Allergy and Infectious Diseases, Bethesda, United States, [11]U.S. Centers for Diseases Control and Prevention, Division of Global HIV and TB, Centers for Global Health, Kampala, Uganda

Background: There are limited data on the impact of COVID-19 on African HIV programs. Using data from the Rakai Community Cohort Study (RCCS), we evaluated trends in use of Combined HIV Interventions (CHI) and HIV incidence in southcentral Uganda from 2015 to 2022. During COVID-19 lockdown, HIV services were provided through community outreach and multi-month ART prescriptions.

Methods: Participants aged 15-49 years were surveyed in three surveys before COVID-19 (February 2015– January 2020) and one survey during COVID-19 (February 2021 – March 2022). Participants were classified as HIV prevalent (HP; HIV-positive from prior survey), HIV incident (HI; HIV seropositive with prior seronegative result) or newly diagnosed (ND, HIV seropositive without prior survey result). Participants self-reported HIV testing within 12 months, knowing their HIV status, current use of anti-retroviral therapy (ART) and being circumcised. Viral loads (VLS) (<1,000 cps/ml) were consider as suppressed. Interrupted time series analysis assessed changes in HIV services before and during COVID-19.

Results: 19,390 (52.8% female) participants were included. HIV testing decreased during COVID-19, whereas it had increased before COVID19 ($p<0.001$ change in trend) *(Figure 1).*

Knowledge of HIV positive status was stable for both HP ($p=0.582$) and HI/ND ($p=0.134$). During COVID-19, ART use continued increasing in both HP ($p<0.213$) and in HI/ND ($p<0.242$). VLS was unchanged during COVID19 in both HP

(p=0.296) and HI/ND (p=0.667). MC significantly increased during COVID19 (p<0.001). HIV incidence declined from 1.17/100 person-years(pys) to 0.48/100 pys before COVID-19, to 0.35/100 pys during COVID-19 (p<0.066).

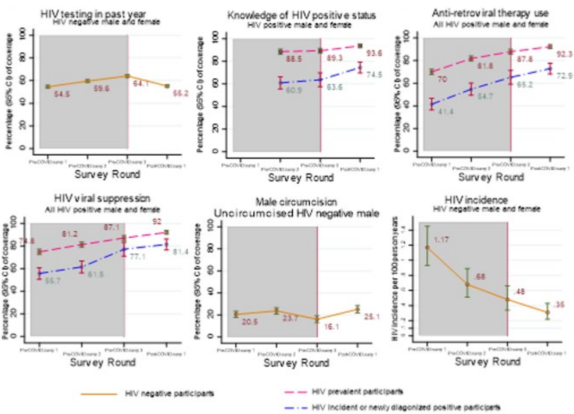

Figure 1. Trends in HIV treatment and prevention key metrics pre and during Covid 19 emergence response.

Conclusions: We were concerned that the COVID-19 pandemic and associated lockdown would negatively affect CHI services, but we did not observe such effects, potentially because of intensified/enhanced new outreach approaches. MC uptake increased possibly because post-operative time off work during lockdown prevented income loss.

EPLBC09

Effectiveness of COVID-19 vaccines in people living with HIV in British Columbia: a test negative design

H. Samji[1,2], A. Fowokan[3], J. Puyat[4], N. Janjua[3,4], J. Wilton[3], J. Wong[2,4], T. Grennan[3], C. Chambers[5], A. Kroch[5], C. Costiniuk[6], C. Cooper[7], A. Burchell[8,5], A. Anis[4]

[1]Simon Fraser University, Faculty of Health Sciences, Burnaby, Canada, [2]British Columbia Centre for Disease Control, Clinical Prevention Services, Vancouver, Canada, [3]British Columbia Centre for Disease Control, Vancouver, Canada, [4]University of British Columbia, School of Population and Public Health, Vancouver, Canada, [5]University of Toronto, Dalla Lana School of Public Health, Toronto, Canada, [6]McGill University, Division of Infectious Diseases, Montreal, Canada, [7]University of Ottawa, Department of Medicine, Ottawa, Canada, [8]St. Michael's Hospital, Toronto, Department of Family and Community Medicine and MAP Centre for Urban Health, Toronto, Canada

Background: The efficacy of COVID-19 vaccines against severe disease, hospitalizations, and deaths were rapidly established in drug approval trials. Less is known, however, about their effectiveness among immunocompromised individuals such as people living with HIV (PLWH). We therefore sought to estimate the effectiveness of Pfizer-BioNTech (BNT162b2), Moderna (mRNA-1273) and AstraZeneca (ChAdOx1) vaccines in a population-based cohort against laboratory confirmed SARS-CoV-2 infections and hospitalizations among PLWH.

Methods: We used the British Columbia (BC) COVID-19 Cohort (BCC19C), which integrates data on SARS-CoV-2 tests, COVID-19 cases, hospitalizations, and immunization with provincial health administrative data. PLWH status was assessed using an adapted version of a previously validated case-finding algorithm. All PLWH who were living in BC, ≥19 years old, and tested for SARS-CoV-2 between December 15, 2020 (when vaccines became available in BC), and November 21, 2021 (time before Omicron variant), were eligible.

Vaccine effectiveness (VE) was estimated by the test-negative design using multivariable logistic regression to compare the odds of vaccination between test-positive "cases" and test-negative "controls", adjusting for age, sex, area-level income, health authority, number of COVID-19 tests 3 months prior to study period, Elixhauser comorbidity index, and bi-weekly testing periods. We used the formula (1-AOR) x100% to compute VE.

Results: There were 9,116 PLWH in the dataset, 2,657 (29.1%) of whom tested for SARS-CoV-2 during the study period and were considered eligible. Of the eligible PLWH, 357 (13.4%) tested positive (cases), while 2300 (86.6%) tested negative (controls); 68 (19.0%) of test positive cases and 254 (11.0%) of test negative controls were unvaccinated. Adjusted VE against SARS-CoV-2 symptomatic infection was 78.7% (95% CI = 63.6, 87.5) ≥ seven days after two vaccine doses. VE was preserved until the period four to six months following receipt of two vaccine doses after which slight waning was observed (VE = 66.4% (95% CI = 21.6, 85.6). Adjusted VE against hospitalizations was 88.4% (95% CI= 19.9, 98.3) ≥ seven days after two vaccine doses.

Conclusions: Findings suggest that receipt of two COVID-19 vaccines doses is effective against SARS-CoV-2 infections. Future efforts will focus on the impact of variants of concern on VE and comparing VE estimates with a matched HIV-negative cohort.

EPLBC10

Using lessons learnt from the implementation of HIV self-testing in decentralized community settings to increase the uptake for community-based COVID-19 Antigen testing in Johannesburg, South Africa

M. Majam[1], V. Msolomba[1], P. Akugizibwe[2]

[1]University of the Witwatersrand, Ezintsha, Johannesburg, South Africa, [2]FIND, Kigali, Rwanda

Background: HIV self-testing (HIVST) has been a successful strategy used in South Africa, to test hard-to-reach individuals and communities. Experience from HIVST points to several barriers that low-income segments of the population face when trying to access services. These include long wait times at testing facilities, the opportunity cost of time away from their places of work, price sensitivity, and

unfriendly services. Accessing target populations in high density community settings such as taxi ranks, plays a vital role in bridging the testing gap. For COVID-19, access to affordable, time sensitive testing required a similar approach to reach those not accessing testing services.

Description: During the third wave of COVID-19 infections in South Africa between July and October 2021, community based screening for COVID-19 using point-of-care Antigen RDT's was employed in three high-density taxi ranks in Johannesburg. The intervention, which was initially successfully employed during the roll out of HIV self-testing in the country, sought to reach populations who may not otherwise access testing services

Lessons learned: A baseline evaluation conducted in the taxi ranks prior to the intervention showed that only 21% of respondents had previously tested for COVID-19 using either PCR or Antigen based testing.

Similar to HIV, community members cited:

1. Lack of access,
2. Price of testing,
3. Long queues at facilities, as the main reasons for not testing.

During the intervention, 15 443 participants were enrolled and screened using a digital risk determination tool. Approximately 33% of all individuals screened were deemed to be at risk of having COVID-19 and referred for testing. Testing was completed in 3997 cases, with 238 positives (6%) identified. 84% of positives completed 2 weeks of phone-based follow up. In the general end-line survey conducted, testing for COVID-19 increased to 67% of the surveyed population.

Conclusions/Next steps: Lessons from HIVST can be applied to implementation of community based Antigen testing for COVID-19 in order to reach individuals not accessing services. With the scale up of COVID-19 self-testing initiatives, utilization of decentralized approaches such as taxi ranks will be required. Coupling of COVID-19, HIV, and other self-care approaches has the potential to maximize screening efficiency in community settings.

Botswana achieved the Joint United Nations Programme on HIV/AIDS (UNAIDS) 95-95-95 targets: results from the Fifth Botswana HIV/AIDS Impact Survey (BAIS V), 2021

M. Mine[1], K. Stafford[2], R.L. Laws[3], R. Marima[4], P. Lekone[5], D. Ramaabya[1], K. Makhaola[5], P. Mapondera[4], F. Wray-Gordon[3], C. Agbakwuru[2], L. Okui[4], E. Onyadile[6], J. Ngidi[1], A. Abimiku[2], K. Bagapi[5], B. Nkomo[1], S. Bodika[3], S.Y. Hong[5], S. Matroos[6], M. Charurat[2], R. Selato[7], A.C. Voetsch[3], BAIS V group

[1]Ministry of Health and Wellness, Gaborone, Botswana, [2]Ciheb, School of Medicine, University of Maryland Baltimore, Baltimore, United States, [3]Division of Global HIV and TB, Centers for Disease Control and Prevention, Atlanta, United States, [4]Ciheb, MGIC-Botswana an affiliate of University of Maryland Baltimore, Gaborone, Botswana, [5]Division of Global HIV and TB, Centers for Disease Control and Prevention, Gaborone, Botswana, [6]Statistics Botswana, Gaborone, Botswana, [7]National AIDS and Health Promotion Agency, Gaborone, Botswana

Background: In 2002, Botswana was the first African country to offer free HIV treatment to citizens. Since then, Botswana has expanded treatment coverage and adopted evidence-based practices, including test-and-start and dolutegravir treatment.

The BAIS V survey was used to measure national progress toward UNAIDS 95-95-95 targets (percent of persons living with HIV (PLHIV) aware of status, on treatment, virally suppressed).

Methods: BAIS V used a two-stage cluster design to obtain a nationally representative sample of adults 15–64 years. During March–August 2021, survey teams consented 14,763 participants in their households, administered questionnaires, and tested blood specimens for HIV. Viral load and presence of antiretrovirals (ARVs) in blood were measured.

The first and second 95 estimates were based on self-report and adjusted for detectable ARVs. Viral load suppression (VLS) was defined as HIV RNA <1,000 copies per milliliter. Data were weighted to account for complex survey design, and jackknife methods were used to estimate variance.

Results: National HIV prevalence was 20.8% (men: 15.2%; women: 26.2%). Among PLHIV, 95.1% (men: 93.0%; women: 96.4%) were aware of their status, 98.0% (men: 97.2%; women: 98.4%) of those aware were on ART, and 97.9% (men: 96.6%; women: 98.6%) of those on ART achieved VLS (Table).

Among PLHIV 15–24 years, 84.5% were aware of their status, 98.5% of those aware were on ART, and 91.6% of those on ART achieved VLS. VLS among all PLHIV was 91.8% (men: 88.1%; women: 94.0%).

	Aware of Status N; Weighted % (95% CI)		On Treatment N; Weighted % (95% CI)		Virally Suppressed N; Weighted % (95% CI)	
Men, 15–64 years	989	93.0 (90.8–95.2)	920	97.2 (95.7–98.8)	899	96.6 (95.2–98.0)
15–24 years	39	89.1 (77.3–100.0)	34*	100.0 (100.0–100.0	34	91.8 (83.9–99.8)
25–44 years	360	88.7 (85.0–92.5)	315	94.2 (90.4–98.0)	302	94.9 (91.5–98.4)
45–64 years	590	96.4 (93.6–99.2)	571	99.2 (98.4–100.0)	563	98.0 (97.2–98.8)
Women, 15–64 years	2,428	96.4 (95.0–97.7)	2,342	98.4 (97.5–99.2)	2,309	98.6 (98.0–99.2)
15–24 years	118	82.3 (70.1–94.5)	99	97.8 (94.4–100.0)	96	91.5 (84.2–98.8)
25–44 years	1,302	97.1 (95.9–98.2)	1,256	98.4 (97.7–99.1)	1,235	98.8 (98.2–99.4)
45–64 years	1,008	97.0 (95.0–99.0)	987	98.3 (96.3–100.0)	978	99.1 (97.9–100.0)
Total, 15–64 years	3,417	95.1 (93.8–96.5)	3,262	98.0 (97.2–98.7)	3,208	97.9 (97.2–98.6)

Table.

Conclusions: BAIS V is the first population-based survey to confirm achievement of UNAIDS 95-95-95 goals, overall and among women. Men have achieved the second and third 95 targets and surpassed 90% for the first. Gaps remain in awareness among men 25–44 years and younger adults, particularly young women. Botswana has made tremendous progress in 20 years and is well-positioned to end the AIDS epidemic by 2030.

PELBC02

Identifying women at highest risk for HIV acquisition across sub-Saharan Africa: a risk assessment tool based on machine-learning methods

N.E. Rosenberg[1], A. Young[2], M. Liu[2], B.E. Shook-Sa[2], N.A. Sam-Agudu[3], L. Stranix-Chibanda[4], M. Yotebieng[5], M.E. Charurat[6], J.E. Justman[7], B.H. Chi[8]

[1]University of North Carolina at Chapel Hill, Health Behavior, Chapel Hill, United States, [2]University of North Carolina at Chapel Hill, Biostatistics, Chapel Hill, United States, [3]University of Maryland School of Medicine, Institute of Human Virology, Baltimore, United States, [4]University of Zimbabwe Faculty of Medicine, Child and Adolescent Health Unit, Harare, Zimbabwe, [5]Albert Einstein College of Medicine, Bronx, United States, [6]University of Maryland School of Medicine, Institute for Human Virology, Baltimore, United States, [7]Columbia University, New York, United States, [8]University of North Carolina at Chapel Hill, Obstetrics and Gynecology, Chapel Hill, United States

Background: Women in sub-Saharan Africa disproportionately acquire HIV. Effective HIV prevention interventions are available, but identification of women in greatest need of these interventions remains a challenge.
To date, HIV risk scores to identify those at highest risk of HIV have been based on non-representative populations, have limited geographic applicability, and have demonstrated sub-optimal performance with area under the receiver operating characteristic curve (AUC) <0.80.
Methods: We sought to develop a regionally representative risk assessment tool to identify women at highest risk of HIV-1 acquisition across multiple high-burden African countries. We pooled, weighted, and analyzed data from Population-based HIV Impact Assessment surveys (PHIAs) from 13 countries in Southern, Eastern, and West/Central Africa. The population comprised 15-49 year-old women who were HIV-uninfected or had recent HIV-1 infection characterized by HIV-Limiting Antigen Avidity enzyme immunoassay, HIV-1 viral load, and antiretroviral drug concentrations. Least absolute shrinkage and selection operator (LASSO) regression models were implemented to create a predictive model for recent HIV-1 infection based on 23 potential variables.
The model was trained in 70% of the sample and tested in the remaining 30%. Model performance was evaluated using AUC. Optimal sensitivity and specificity were reported.
Results: Among 164,935 participants, representing 82.2 million women, 200 had evidence of recent HIV-1 infection. Twelve variables were retained in the LASSO model and were predictive of elevated risk:
1. Age 25-34 years,
2. Any educational attainment,
3. Divorce/separation or widowhood,
4. Age at first sex <18 years,
5. >2 recent sexual partners,
6. Partner with unknown HIV status,
7. Relationship entered for financial support,
8. Receipt of money/goods from sexual partner,
9. Recent condom use,
10. Use of short-acting contraception,
11. Past pregnancy, and,
12. Sub-national male HIV prevalence.
Model AUC was 0.81 (95% confidence interval (CI): 0.77-0.85) in the training sample and 0.80 (CI: 0.75-0.85) in the testing sample. The optimal threshold had 80.0% (CI: 67.7%-89.2%) sensitivity and 71.0% (CI: 70.6%-71.4%) specificity.
Conclusions: Using national surveys representing 82.2 million women, our machine learning tool outperformed earlier models and identified a set of characteristics that was highly predictive of HIV risk, identifying women who would benefit most from prevention interventions.

HIV status disclosure and related factors among children aged 6-14 years living with HIV in Kilimanjaro region, Tanzania

B. Mtesha[1], I. Swai[1], L. Masika[1], R. Maro[1], K. Ngowi[1], M. Sumari-de Boer1[1]
[1]Kilimanjaro Clinical Research Institute, Data Management Unit, Moshi, Tanzania, The United Republic of

Background: In Tanzania, disclosure of the HIV status to children remains a challenge despite the recommendation from the World Health Organization (WHO) which states that children should be informed about their HIV status between the ages of 6 to12 years.

The aim of this study is to determine factors associated with HIV status disclosure to children living with HIV in Kilimanjaro, Tanzania.

Methods: A cross sectional study using mixed-methods was conducted from September 2021 to February 2022 among children aged 6-14 years receiving HIV care in Kilimanjaro region. Semi-structured questionnaires were used to collect socio-demographic data and reasons of non-disclosure. We in-depthly interviewed twenty caregivers of children who had disclosed and not disclosed the status to their children; we also interviewed children who's HIV status had been disclosed. Bivariate and multivariate Logistic regression analysis was performed to identify factors associated with HIV status disclosure. P<0.05 was considered statistically significant. We did thematic content analysis for qualitative data

Results: Out of 121 children,51 (42%) had been told they were living with HIV. Eighty-six percent of children aged above 12 years were told their HIV status compared to 28% among children aged 6-12 years (P<0.001). The percentage of disclosure among girls was 43% and 41% among boys (P=0.8).

Among children<5years on ART treatment, it was 30% while it was 53% among does on treatment more than 5 years (P=0.01). Lastly, for those with a treatment supporter, the disclosure were 57% and 28% among those without (p=0.002).In the final multivariate model, HIV disclosure was more likely to children aged above 12 years compared to those aged 6-12 years (OR= 13.5; 95%CI= 4-46)and children who have a treatment supporter (OR=2.8; 95%CI=2-7).Through IDI, we revealed the following themes:

1. Challenges of disclosure to children,
2. Importance of early disclosure,
3. Risks of delayed disclosure,
4. Feelings when finding out about HIV and,
5. Accidental disclosure.

Conclusions: HIV status disclosure to children living with HIV in Kilimanjaro region was associated with higher age and having a treatment supporter. New strategies should be introduced in Health facilities to make sure that children know their HIV status as recommended by the WHO.

EPLBD02

Risky business: gender, sexual risk behaviors and vulnerability to HIV infection among South African youth

P. Burns[1], J. Ncayiyana[2]
[1]University of Mississippi Medical Center, Population Health Science, Jackson, United States, [2]University of Kwa-Zulu Natal, Department of Public Health Medicine, Durban, South Africa

Background:
Globally, adolescents and young people account for the largest number of people living with HIV. In 2020, 410,000 young people (ages of 10 to 24) were newly infected with HIV. The 10-19 year category represents the largest proportion of the population in sub-Saharan Africa.

Methods: Utilizing the South African National HIV Prevalence, HIV Incidence, Behaviour and Communication Survey (SABSSM), we conducted a cross-sectional analysis the association of socio-demographics and HIV risk behaviors among youth (n=13,454) aged 10–24 years in South Africa. Frequencies and their respective percentages were determined for categorical variables and stratified by biological sex. Chi-square analysis was used to compare categorical variables and multiple logistic regression to assess associations on two HIV-related risk behaviorial outcomes. All data were analyzed using SAS software.

Results: Results: Of the 13,456 respondents, 3.75 (n=504) were HIV-positive. The data showed 41.9 (n=3,599) had ever had sexual intercourse. The majority had their sexual debut (70.3%, n=2,977) between the ages 15-20 years, 42.5% (n=2,869) had 3 or more lifetime sexual partners; 14.5% (n=209) had 3 or more sexual partners in the last 3 months; 18.4% (n=371) had condomless sex and 53.1% (n=169) had concurrent sexual partners in the last 12 months.

Next, we assessed the role of social-demographicphic characteristics (i.e., age, sex, race, marital status, school status), HIV risk perception, and substance disorder (i.e., alcohol, dagga use) on condom use. We found women and girls were less likely to use a condom (IRR=0.66; C.I. .54-.81) and being married increased the likelihood of using a condom (IRR-1.12, C.I. 1.06-1.28).

We ran the same model for the outcome number of sexual partners in the last 12 months with similar results. Being female (IRR-0.64; C.I. .55-.80. and marital status (IRR-1.18, C.I. 1.07-1.28. were consistently statistically significant.

Conclusions: We found South African youth suffer high rates of HIV prevalence (3.75) and being female increases your HIV vulnerability. There is an urgent need to implement programs and policies that address gender and cultural norms which sustain gender inequities, gender-based violence and economic disparities between men and women, particularly as it relates to condomless sex and multiple sexual partners

EPLBD03

Socio-structural challenges and solutions to PrEP in rural communities: patient and provider perspectives

M. Teti[1], L. Pichon[2]
[1]University of Missouri, Public Health, Columbia, United States, [2]University of Memphis, Public Health, Memphis, United States

Background: Pre-exposure prophylaxis (PrEP) is an effective HIV prevention tool that remains underused among many at-risk rural Americans. Improving PrEP delivery in non-metropolitan areas is essential. HIV cases are rising in the rural U.S., alongside the opioid epidemic, compromised access to healthcare, and high rates of HIV stigma also occurring in these regions.

Methods: In-depth interviews about PrEP knowledge, attitudes, and perspectives were conducted with 47 providers and 40 patients in non-metropolitan Missouri, a state identified by U.S public health agencies as having a substantial rural HIV burden. Theme analysis was used to identify key challenges and solutions to improve PrEP access and uptake.

Results: Patient participants included young people (ages 18-30) from rural or small-town Missouri who recently visited a health clinic. Five themes were present in their interviews: low HIV risk awareness despite risk behaviors, false belief in monogamy as HIV protection, low PrEP-related health and financial literacy, and concern that PrEP conversations were not normative in small towns. Providers included infections disease (ID), primary care (PCP), and AIDS Service Organization (ASO) providers from similar areas in Missouri.

Themes included varying PrEP prescribing beliefs by provider type – ID doctors believed their expertise was important, PCPs wanted to prescribe PrEP but lacked correct information, and ASO providers believed anyone could prescribe PrEP; lack of formal PrEP training; hesitancy to treat high risk patients; desire for help from PrEP "experts" via telehealth; and need for patient awareness of prevention options to facilitate uptake.

Conclusions: Patients and providers need solutions relevant to their rural and small-town context. Patients need information about HIV risk and PrEP through broad, normative, and less personal channels because it is not always safe to ask for it (e.g., incorporating into health education classes, posters in waiting rooms and clinic offices that are visible to all who enter). Providers also said it was easier to address PrEP when patients asked. Providers need education that is tailored to provider type.

Telehealth has introduced a potential PrEP care model by which national experts can support both providers and patients in real-time who have PrEP concerns that cannot be answered locally.

EPLBD04

Gender differences in sexual experience and condom use among in-school adolescents: a multi-country study using the global school-based health survey

M.A. Maruf[1,2], Y.-W. Chiu[1,3], H.-Y. Chiou[1,4]
[1]Taipei Medical University, Global Health and Health Security, Taipei, Taiwan, Province of China, [2]Universitas Muhammadiyah Jakarta, Faculty of Public Health, Jakarta, Indonesia, [3]Kaohsiung Medical University, Department of Public Health, Kaohsiung, Taiwan, Province of China, [4]National Health Research Institutes, Institute of Population Sciences, Miaoli, Taiwan, Province of China

Background: Adolescents are one of the groups that are vulnerable to early and risky sexual behavior. Previous studies have shown that gender plays a role in shaping differences in sexual and reproductive health behavior so that it has the potential to affect an individual's ability to make decisions regarding safe sexual behavior.

This study aims to determine gender differences in sex and condom use in adolescents and their relationship on the Human Development Index and the Gender Equality Index.

Methods: This study is a multi-country study using data from the Global School-based Student Health Survey involving 267,545 global participants to identify adolescent sexual behavior and condom use. We calculated the odds ratios (OR) with 95% confidence intervals for males versus females' sexual experience and condom use.

The regression analyses were examined to look at whether gender differences in sexual experience and condom use are related to gender inequality and human development indices.

Results: The findings revealed significant gender differences in adolescent sexual behavior and condom use. Boys are more likely than girls to have had sex and use condoms at last sex. The effect of gender differences in sex and condom use on the Human Development Index was not found in this study. However, there is a significant effect between gender differences in condom use on the Gender Inequality Index.

Conclusions: The results of this study indicate the importance of sexuality education and the provision of reproductive health services for adolescents in order to minimize the consequences of risky sexual behavior, especially for women.

Focusing on the health condition of adolescents by considering a gender perspective can have an impact on reducing the gap in health conditions based on gender in adulthood.

EPLBD05

Beyond HIV stigma reduction: effects of the CHAMPs-In-Action inervention on stress and coping during COVID-19

J.P.-H. Wong[1], A.T.-W. Li[2], K. Prabakaran[2], L. Brown O'Sullivan[3], T. CHAMPs-In-Action Alliance[4]

[1]Toronto Metropolitan University, Daphne Cockwell School of Nursing, Toronto, Canada, [2]Committee for Accessible AIDS Treatment, Toronto, Canada, [3]Committee for Accessible AIDS Treatment, Toronot, Canada, [4]CHAMPs-In-Action Alliance, Toronto, Canada

Background: Racialized groups in Canada bear a disproportionate burden of HIV. Their vulnerability to HIV is elevated by structural violence of racism, sexism, homophobia, transphobia, and HIV related stigma. To address these complex challenges, five community HIV/AIDS organizations in Toronto formed an Alliance and secured resources to carry out CHAMPs-In-Action (2017-2022), an evidence-based intervention that consisted of 4-day in-person experiential learning to promote psychological flexibility and reduce HIV related stigma. Implementation was disrupted midway by COVID-19; the intervention was converted to six weekly online modules in 2020 to enhance access.

Methods: CHAMPs-In-Action applied psychological and group empowerment processes to reduce stigma. We engaged participants who self-identified as: aged $\geq$ 16, a service user/volunteer of an Alliance organization, living with or vulnerable to HIV, or a service provider serving people living with HIV (PLHIV). Validated scales were used pre-, immediate post- and 3-month post- intervention to assess effectiveness. Focus groups were used to explore participants' experiences and assess the acceptability, feasibility and sustainability of the program.

Thematic analysis was used with the focus group data. Inferential statistics and analyses of variance were used to determine the effectiveness of CHAMPs-In-Action over time in reducing stigma and increasing psychological flexibility.

Results: A total of 362 participants graduated from CHAMPs-In-Action: 139 (38.4%) service providers; 87 (24%) PLHIV; 38 (10.5%) gay men and MSM, and 98 (27.1%) racialized persons vulnerable to HIV. Survey results indicated significant increase in resilience, mindfulness, empowerment readiness and confidence to engage others to address HIV related stigma.

Focus group results indicated that participants who graduated before the pandemic were able to apply mindfulness and defusion techniques during COVID-19 to cope with social isolation, anxiety, stigma and stress. Participants who engaged in the online intervention during the pandemic also reported improved coping, reduced stress and better social connection.

Conclusions: CHAMPs-In-Action is effective not only in reducing stigma, but also in promoting resilience and mental health. Racialized PLHIV experience intersecting stigma and increased social isolation during a pandemic. Online programs are critical in reducing social isolation among PLHIV. Pandemic preparedness needs to address the digital divide and build mutual support networks that tap into community strengths.

EPLBD06

Factors associated with mental health outcomes among people living with HIV co-infected with SARS-CoV-2 in France: results from COVIDHIV study

I. Yaya[1,2], L. Yombo-Kokule[1,2], G. Roucoux[1,2], F. Thonon[1,2], D. Zucman[3,4], C. Duvivier[5], K. Lacombe[6], M. Preau[7], A. Cheret[8], M. Duracinsky[1,2,8]

[1]URC ECO - Hôpital Hôtel-Dieu, Paris, France, [2]Patient-Reported Outcomes Research (PROQOL), UM1123; University de Paris, Inserm, Paris, France, [3]Foch Hospital, Suresnes, France, [4]Trait d'Union – Strasbourg University Hospitals, Strasbourg, France, [5]AP-HP - Necker-Enfants Malades Hospital, Infectious Diseases Department, Necker-Pasteur Infectiology Center, Paris, France, IHU Imagine, Paris, France, [6]Saint Antoine Hospital, Paris, France, [7]Inserm Unit 1296 « Radiations : Defense, Health, Environment » ; Lyon 2 Lumière University, Lyon, France, [8]Internal Medicine Unit, Le Kremlin Bicêtre Hospital, Bicêtre, France

Background: The 2019 pandemic of the coronavirus disease (COVID-19) was found to have a negative impact on vulnerable people, including people living with HIV (PLHIV).

This study aimed to investigate the mental health among PLHIV co-infected with SARS-CoV-2 in France.

Methods: COVIDHIV is a cohort of PLHIV co-infected with SARS-CoV-2 followed-up in France. Socio-demographic, clinical data and those on mental health were collected. The depression and anxiety symptoms, and post-traumatic stress disorder (PTSD) were assessed by the Hospital Anxiety and Depression Scale (HADS) and PTSD Checklist (specific version) (PCL-S), respectively. Multivariable logistic regression analysis was performed to identify factors associated with mental health outcomes at the baseline.

Results: A total of 397 participants were included, with a mean age (±SD) of 52 ±12.0 years. About two-thirds of the participants (64.0%) were male, 61% were employed and half of them lived in a couple.

Rates of mental health symptoms were 22.6% for depression, 34.2% for anxiety, 53.9% for insomnia, and 12.7% for PTSD. In multivariable regression adjusted for age and duration between COVID-19 confirmation and enrolment, female gender (adjusted odds ratio (aOR) = 1.95, 95% CI: 1.13-3.38), being professionally active (aOR = 0.52, 95% CI 0.30-0.90), fatigue (aOR = 3.17, 95% CI 1.75-5.75), and cannabis use (aOR = 2.73, 95% CI 1.03-7.26) were associated with anxiety; being professionally active (aOR = 0.32, 95% CI 0.18-0.59) and fatigue (aOR = 2.04, 95% CI 1.07-3.88) were associated with depression; and fatigue (aOR = 3.15, 95%

CI 1.24-7.98) and self-perceived as vulnerable to COVID-19 (aOR = 2.16, 95% CI 1.03-4.52) were found as associated factors for PTSD.

Conclusions: This study highlighted the high prevalence of mental health outcomes at the baseline, and these symptoms should be part of the management of PLHIV with SARS-CoV-2.

EPLBD07

The COVID-19 health crisis has disproportionately impacted sex workers compared to other key populations: preliminary results from the multi-country community-based EPIC research program

N. Lorente[1,2,3], R.M. Delabre[1], L. Riegel[1], C. Folch[2,3], O. Apffel Font[1,4], G. White[5,6], J. Castro Avila[1], R. Diagne[6], O. Bourhaba[7,6], L. Kretzer[8,6], M. Magassouba[9,6], J.M. [1]Coalition PLUS, Community- based Research Laboratory, Pantin, France, [2]Centre d'Estudis Epidemiològics sobre les Infeccions de Transmissió Sexual i Sida de Catalunya (CEEISCAT), Departament de Salut, Generalitat de Catalunya, Badalona, Spain, [3]Centro de Investigación Biomédica en Red de Epidemiología y Salud Pública (CIBERESP), Madrid, Spain, [4]Coalition des organismes communautaires québécois de lutte contre le sida (COCQ-SIDA), Montréal, Canada, [5]PILS, Saint-Louis, Mauritius, [6]Coalition PLUS, Community- based Research Laboratory, Dakar, Senegal, [7]Association de Lutte Contre le Sida (ALCS), Casablanca, Morocco, [8]Corporación Kimirina, Quito, Ecuador, [9]ANCS, Dakar, Senegal, [10]ANSS, Bujumbura, Burundi, [11]REVS PLUS, Bobo-Dioulasso, Burkina Faso, [12]Aix Marseille Univ, Inserm, IRD, SESSTIM, Sciences Economiques & Sociales de la Santé & Traitement de l'Information Médicale, ISSPAM, Marseille, France, [13]Santé Publique France, Saint-Maurice, France, [14]AIDES, Pantin, France, [15]GAT, Lisbon, Portugal, [16]ARCAD Santé PLUS, Centre Integré de Recherche, de Soins et d'Action Communautaire (CIRSAC), Bamako, Mali, [17]Instituto para el Desarrollo Humano (IDH), Cochabamba, Bolivia, Plurinational State of, [18]Fundación Huésped, Buenos Aires, Argentina

Background: To describe the impact of the Covid-19 health crisis on specific key populations (KPs): people living with HIV (PLHIV), sex workers (SWs), men who have sex with men (MSM), and people who use drugs (PWUD), in 27 countries.

Methods: Coalition PLUS, an international network of community-based organisations fighting against HIV and hepatitis, initiated the multi-country and community-based research program EPIC to document the impact of the Covid-19 health crisis on KPs and community health workers. Quantitative data were collected among N=10583 respondents from KPs, between June 2020 and March 2022, in 28 countries, mainly from Africa, Latin America, and Europe. We present preliminary data comparing PLHIV (n=3932), PWUD (n=1383), MSM (n=2965) and SWs (n=2303), using Chi-square tests.

Results: Median[IQR] age of respondents was 32[26-41], 39% self-identified as female, 55% male, 6% transgender person. Overall, 16% of foreign-born respondents were undocumented (22% and 25% in PWUD and SWs, respectively, vs. ≤12% in other KPs; p<0.001), and 28% were in unstable housing (60% in PWUD vs. ≤26% in other KPs). The negative impact of the crisis on quality of life was more often reported in SWs and PLHIV (48% and 47%, respectively) than in other KPs (≤39%, p<0.001). SWs also reported more often: a deterioration of their financial situation (85% vs. ≤75% in other KPs; p<0.001) and a negative impact on their personal and professional lives (83% and 84%, respectively, vs. ≤74% and ≤73%, respectively, in other KPs; p<0.001) since the beginning of the health crisis.

Having asked/received support from the organisation that implemented EPIC in their country was less often reported in SWs (36%) than in other KPs (>46%, p<0.001). A significant proportion of SWs reported they felt more at risk of HIV infection with clients and non-clients (28% and 23%, respectively), than before the crisis.

Conclusions: This preliminary analysis highlights the disproportionate impact of the COVID-19 health crisis on SWs compared to other KPs, although all were highly affected by the health crisis.

Deeper analyses are needed to identify possible levers for community health and other health workers to better support KPs in time of health crisis, and especially SWs.

EPLBD08

Limited awareness of HIV status hinders uptake of treatment among female sex workers and sexually exploited adolescents in Wau and Yambio, South Sudan

A. Bolo[1], P. Ochira[2], A.J. Hakim[3], J. Katoro[4], S. Bunga[5], H. Pasquale[6], V. Anib[7], G. Caesar Arkangelo[8], B. Nyokani[9], A.G. Okiria[10]

[1]US Centres for Disease Control, Global Health, Juba, South Sudan, [2]IntraHealth International, Strategic Information, Juba, South Sudan, [3]US CDC, Surveillance Branch, Atlanta, United States, [4]US CDC, Laboratory, Juba, South Sudan, [5]US CDC, DGHT, Juba, South Sudan, [6]Ministry of Health, HIV/STI, Juba, South Sudan, [7]Ministry of Health, Health, Juba, South Sudan, [8]MOH, Surveillance, Juba, South Sudan, [9]IntraHealth, Surveillance, Juba, South Sudan, [10]IntraHealth, Health, Juba, South Sudan

Background: HIV prevalence in Female Sex Workers (FSW) is high, approximately 2.2% globally and 29.3% in Sub-Saharan Africa. Several factors determine uptake of HIV testing services (HTS) by female sex workers (FSW) including knowledge of their HIV status. HTS provided entry into the UNAIDS 95-95-95 cascade of care. Data regarding HIV burden and access to HIV services among FSW in South Sudan are limited. We conducted a cross-sectional bio-

Author Index

behavioural survey (BBS) to determine HIV prevalence and progress towards UNAIDS 95-95-95 cascade among this population in Wau and Yambio towns in South Sudan in 2019.

Methods: Respondent-driven sampling (RDS) was used to recruit women and sexually exploited girls aged 13-18 years who exchanged sex for goods or money in the past 6 months and resided in the town for at least 1 month. Consenting participants were interviewed using questionnaire programmed in Open Data Kit tablets and then tested for HIV. Those found HIV positive were tested for viral load (VL). Data were weighted in RDS Analyst and analyzed with Stata 13.

Results: A total of 1,284 participants were recruited, 679 in Wau and 605 in Yambio. HIV prevalence was 6.7% in Wau and 13.6% in Yambio. Table 1, presents the HIV cascade for Wau, Yambio and overall for both towns.

Participant location	HIV Prevalence	Self-reported HIV-positive status (1st 95)	Self- reported on ART (2nd 95)	VLS for self-reported HIV-positives on ART (3rd 95)	VLS for all participants testing HIV-positive
Wau	52 (6.7%) 4.1%-9.4%	23 (35.4%) 15.9%-51.9%	23 (100.0%)	19 (91.3%) 6.4% – 100.0%	37 (65.0%) 45.0%-80.8%
Yambio	94 (13.6%) 10.6%-16.5%	68 (73.0%) 62.5% -83.4%	62 (89.8%) 81.0%-98.5%	55 (93.2%) 88.5%-97.9%	77 (86.2%) 77.6%-91.8%
Wau and Yambio	146 (11.2%) 9.3%-13.4%	91 (64.8%) 55.0%-73.6%	85 (91.0%) 80.1%-96.2%	74 (93.0%) 85.9%-96.6%	114 (81.6%) 73.2%-87.7%

Table 1: Participants HIV Cascade
n (%) 95% CI where "n" is absolute number.

Conclusions: Being unaware of HIV-positive status, limits the uptake of HIV treatment among FSW in South Sudan. This underscores the importance of optimised case-finding approaches to increase HTS among FSW and sexually exploited minors.

EPLBD09
Fathering a child with a female sex worker: the experience of male intimate partners of female sex workers in Kampala, Uganda

M. Mbonye[1], G. Siu[1], J. Seeley[2]
[1]Makerere University, Child health and Development Centre, Mulago Hospital complex, Kampala, Uganda, [2]London School of Hygiene and Tropical Medicine, London, United Kingdom

Background: The number of women in sub-Saharan Africa who become pregnant, often unintentionally, while engaging in sex work is high. We examine the meaning of fatherhood to men in relationships with FSW, the significance of children, and how these men navigate the economic and cultural challenges of providing for their families, juxtaposed with the social stigma associated with sex work.

Methods: In 2019, we conducted repeat in-depth interviews with thirteen men who were involved in relationships with female sex workers (FSW). These data were augmented by observations in the different settings of the 13 men and with information from focus group discussions with FSW who had children with non-commercial partners.

Results: Accepting the role of a `father' was a challenge for many men because of the circumstances under which they had become fathers. It was a struggle against the ideal way to become a father. Women reported how easy it was for men to shun their responsibilities when they found out about a pregnancy.

Once a FSW became a mother, men who could not severe the relationship, with time, thought about the best way to integrate the sex workers into their extended families. Men were aware that this would not be an easy task given the strong social stigma against sex workers and the moral questions involved. Women's access to money and other opportunities ensured that they were in a strong position to receive approval of the partners' relatives.

Children became a focal point for the men that helped establish and cement relationships. Children conveyed different social meanings to the men such as leading to transitioning to adulthood and were an important resource for constructing a desired masculinity. Being a provider was perceived by the men as the most important of all the roles of a father, and this narrative, often overshadowed the discussion about other parameters of fatherhood.

Conclusions: Men who have children with sex workers face hurdles fitting within the social construction of ideal fatherhood and masculinity. However, when, they come to embrace fatherhood they may wish to deal with the social and economic challenges of raising children, as a couple.

PELBD01
#SafeHandsSafeHearts: a randomized waitlist-controlled trial of an eHealth intervention to increase COVID-19 knowledge and protective behaviors and reduce psychological distress among LGBTQ+ people in India and Thailand

P. Newman[1], V. Chakrapani[2,3], S. Tepjan[4], P. Akkakanjanasupar[4], S. Rawat[3], N. Massaqoui[5], C. Williams[1], S. Waewklaihong[6], B. Mohan[3], G. Carl[6], S. Pengnonyang[6], S. Roungprakhon[7], N. Phanuphak[6]
[1]University of Toronto, Factor-Inwentash Faculty of Social Work, Toronto, Canada, [2]Centre for Sexuality and Health Research and Policy, Chennai, India, [3]The Humsafar Trust, Mumbai, India, [4]VOICES-Thailand Foundation, Chiang Mai, Thailand, [5]University of Toronto Scarborough, Department of Health and Society, Scarborough, Canada, [6]Institute of HIV Research and Innovation (IHRI), Bangkok, Thailand, [7]Rajamangala University of Technology Phra Nakhon, Computer Technology, Bangkok, Thailand

Background: Lesbian, gay, bisexual, transgender, queer, and other sexual/gender minority (LGBTQ+) people are at heightened vulnerability for COVID-19 morbidity and mortality due to adverse social determinants of health,

and pervasive health and mental health disparities. We tested a theory-based, culturally-tailored, peer-delivered eHealth intervention to increase COVID-19 knowledge and protective behaviors and reduce psychological distress among LGBTQ+ people in Bangkok and Mumbai.

Methods: #SafeHandsSafeHearts is a multisite, pragmatic, randomized waitlist-controlled trial with 1:1 (immediate intervention group [IIG]: waitlist control [WLC]) allocation (ClinicalTrials.gov NCT04870723). Eligibility criteria: self-identified LGBTQ+, ≥18-years-old, resident in Bangkok or Mumbai. Participants recruited from LGBTQ+ listservs and social media completed mobile-optimized baseline, 2-week post-intervention, and 2-month follow-up surveys. The motivational interviewing- and psychoeducation-based intervention was implemented in 3 biweekly 45-minute online sessions by trained peer counselors. Primary outcome measures: COVID-19 knowledge and protective behavior (e.g., masking, physical distancing) scores based on US CDC items, PHQ-2 (depressive symptoms), and GAD-2 (anxiety symptoms). We used multilevel models, accounting for clustering at participant- and country-levels, to estimate outcomes.

Results: From August 2021 to February 2022, participants (n = 650; median age=29.0 years; IQR=10) completed the baseline assessment and were randomized to IIG (n = 320; 49.2%) and WLC conditions (n = 330; 50.8%). 531 (81.7%) completed post-intervention and 452 (69.5%) completed follow-up assessments. Compared to WLC, the IIG had statistically significant improvements in COVID-19 knowledge scores at post-intervention (b=.34; 95% CI .18, .50; p<.001) and follow-up (b=.28; 95% CI .04, 51; p=.01), and COVID-19 protective behavior scores at post-intervention (b=1.12; 95% CI .39, 1.85; p<.01) and follow-up (b=1.00; 95% CI .51, 1.49; p<.001). Compared to WLC, the IIG had a statistically significant reduction in depression scores at post-intervention (b=-.18; 95% CI -.22, -.14; p<.001) and follow-up (b=-.23; 95% CI -.35, -.10; p<.001), with no significant reduction in anxiety scores.

Conclusions: Among LGBTQ+ adults in Bangkok and Mumbai, a tailored, peer-delivered eHealth intervention is effective in increasing COVID-19 knowledge and protective behaviors and reducing depression.

The pragmatic multisite trial design and implementation during a pandemic supports the ecological validity of the findings and suggests #SafeHandsSafeHearts may be effective among LGBTQ+ adults in other middle- and high-income countries.

Implementation of the first PrEP counseling and adherence protocol in a country with high need for and low access to biomedical HIV prevention

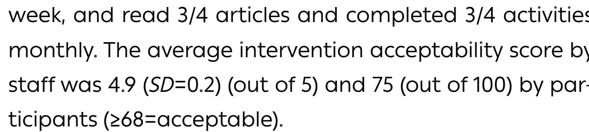
C. Lelutiu-Weinberger[1,2], M. Filimon[1,2], M. Lixandru[3], R. Jipa[4], C. Fierbințeanu[3], I. Filipescu[5], M. Bora[5], L. Hanu[3], S. Luculescu[6], L. Hightow-Weidman[7], S. Golub[8], A. Rochelle[7], N. Buckner[9], A. Streinu-Cercel[4], C. Jianu[5], J. Pachankis[10]
[1]Rutgers University, Rutgers Biomedical and Health Sciences, Newark, United States, [2]Columbia University, School of Nursing, New York, United States, [3]The Romanian Association Against AIDS, București, Romania, [4]The National Institue of Infectious Diseases Matei Balș, București, Romania, [5]University of Medicine and Pharmacy Iuliu Hațieganu, Cluj-Napoca, Romania, [6]The Romanian Association Against AIDS, Cluj-Napoca, Romania, [7]University of North Carolina, Department of Medicine, Chapel Hill, United States, [8]Hunter College, Department of Psychology, New York, United States, [9]One Cow Standing, Durham, United States, [10]Yale University, School of Public Health, New Haven, United States

Background: PrEP is not prescribed in Romania, yet the country demonstrates increasing HIV incidence, primarily driven by gay and bisexual men (GBM). Romania displays some of the highest levels of homophobia in Eastern Europe, and high PrEP demand among GBM.

This study evaluates PrEP implementation rollout within the Romanian national healthcare system.

Methods: In Phase 1, the ADAPT-ITT Model was used to tailor and integrate two US evidence-based interventions for pre-exposure prophylaxis (PrEP) implementation (SPARK, brief sex-positive motivational counseling, and P3 [Prepared, Protected, emPowered], social networking gamified app with text-based adherence counseling) to the local context with physicians, psychologists, and GBM. In Phase 2, *PrEP Romania* was theater-tested in clinics in Bucharest and Cluj-Napoca with 10 high risk GBM for 1-month. In Phase 3, *PrEP Romania* was pilot-tested with 20 GBM in a single-arm pilot for *feasibility* (medical visit attendance), *acceptability* (protocol feedback, app usability), and PrEP *uptake* (filled prescriptions), *adherence* (self-reported and dried blood spot samples [DBS]) and *persistence* (still on PrEP) after 3-months.

Results: All 30 PrEP candidates (biological males; *M* age = 29.17; *SD* = 9.28; range = 19-53) attended medical visits and initiated PrEP, and 29/30 continued PrEP through follow-up. All participants tracked medication use on the app (average 4/week dosing), and 98% daily PrEP adherence on the Timeline Followback. All 30 DBS samples were collected and frozen adequately (at -20 degrees Celsius) at baseline; 10/10 DBS samples were collected at the 1-month and 18/20 at 3-month follow-ups. DBS blood plasma concentration indicating ≥4/week dosing (TFVdp concentrations ≥1,000 fmol) were found in 100% of 1-month and 83% of 3-month samples. On average, participants accessed the app once daily, 6 times/week, for 13 minutes/



week, and read 3/4 articles and completed 3/4 activities monthly. The average intervention acceptability score by staff was 4.9 (*SD*=0.2) (out of 5) and 75 (out of 100) by participants (≥68=acceptable).

Conclusions: *PrEP Romania* is an acceptable and feasible hybrid in-person + mHealth PrEP uptake and adherence program, which may empower GBM and healthcare systems in stigmatizing settings to adopt biomedical prevention. Upon future efficacy testing, this protocol blueprint can support PrEP rollout in countries with similar levels of unpreparedness for biomedical prevention.

Scaling up integrated HIV service delivery for key and priority populations in catholic health facilities in Kampala and Wakiso districts, Uganda

J. Muhangi[1], J. Nyakato[1], L. Ocen[1], C. Nandago[2], J. Ekong[1], C. Ajulong[3], F. Arthur G[3], R. Kamara[1], S. Orach[1]

[1]*Uganda Episcopal Conference, Uganda Catholic Medical Bureau, Kampala, Uganda,* [2]*Uganda Empowerment Mission, Kampala, Uganda,* [3]*US Centers for Disease Control and Prevention, Division of Global HIV & TB, Division of Global HIV & TB, Kampala, Uganda*

Background: HIV prevalence among key and priority populations (KP/PPs) in Uganda remains higher than the national prevalence, yet these populations are stigmatized, discriminated against, and excluded from some mainstream HIV programming. Catholic healthcare networks are key partners in the HIV epidemic but are perceived as non-inclusive to KP/PPs, so we used a multi-pronged approach to improve KP/PP service delivery in Catholic facilities in Uganda's Kampala and Wakiso districts.

Description: Uganda Catholic Medical Bureau (UCMB) integrated pre-exposure prophylaxis (PrEP), sexual and reproductive health, HIV care, and gender-based violence services into the KP/PP services package available through Catholic facilities.UCMBtrained and mentored health workers (HWs) on stigma-free screening and conducted Continuing Medical Education to improve HW attitudes and perceptions towards KPs. HWs conducted routine screening with KPs to identify their needs, provided psychosocial support and behavior change communication, and operationalized flexi-hour clinics to improve access and privacy. UCMB partnered with the KP-led Uganda Empowerment Mission (UGEM) for behavior change dialogue meetings and hotspot outreaches, engaging KP peer leaders to mobilize KPs, distribute commodities, scale up partner testing and PrEP and HIV treatment initiation, screen and treat sexually-transmitted infections and TB, and strengthen facility referrals.

The numbers of KPs receiving comprehensive HIV prevention, testing, and treatment initiation services increased 9.7-fold from 746 served in 4 facilities in the first quarter (Oct-Dec 2020) to 7,255 in 21 facilities in the fourth quarter (Jul-Sep 2021). PPs served increased 8.8-fold (874 to 7,700); PrEP distribution to KP/PPs increased 9.0-fold (101 to 907). Served KPs comprised 69% female sex workers, 10% men who have sex with men, 10% transgender persons, and 11% persons who inject drugs. PPs comprised adolescent girls and young women (48%), fisher-folks (23%), migrant workers (23%), truck drivers (23%), and discordant couples (5%).

Lessons learned: Despite Catholic teachings on sexuality, Catholic health facilities have maintained a tradition of compassionate care. They effectively provide KP/PP services if guided by KP/PP peers and sensitized about stigmatizing and discriminatory attitudes and practices.

Conclusions/Next steps: UCMB will continue providing services to KP/PPs and stigma/sensitivity education to Catholic health facilities and solicit client feedback, KP-led civil society monitoring to ensure stigma-free services.

EPLBE02

Assessing fidelity of mobile service provision of PrEP to adolescent girls and young women and female sex workers within decentralized priority population programming in South Africa

A. Varnauskas[1], C. Singh[2], L. Shipp[1], K. Meek[1], M. Mcingana[2], J. Mcloughlin[2], B.A. Nonyane[1], S. Baral[1], H. Hausler[2], S. Schwartz[1]
[1]Johns Hopkins University, International Health, Baltimore, United States, [2]TB HIV Care, Cape Town, South Africa

Background: Decentralized, mobile van delivery of pre-exposure prophylaxis (PrEP) is increasingly used to reach priority populations. We assessed the extent to which mobile van PrEP provision is being implemented as planned for female sex workers (FSW) and adolescent girls and young women (AGYW) within a large South African non-profit service provider.

Methods: We assessed PrEP implementation across 13 TB HIV Care program sites from May 2021-April 2022. An observational checklist was used to assess fidelity to standard operating procedures (SOP) and quality of service delivery, including patient-centeredness, amongst a random sample of 116 provider-patient visits.

Weighted fidelity scores were calculated as a proportion of SOP steps completed for each observational visit, upweighting 'essential steps' as identified by program implementers. Scores were assessed per checklist adherence and moderators to fidelity. Case audits among a stratified sample of 1160 user records further measured the proportion of clinical and counseling steps recorded in client files.

Results: The weighted average fidelity score for FSW initiation and follow-up visits was 0.52 and 0.51, respectively, and for AGYW initiation and follow-up visits was 0.60 and 0.56, respectively. In both programs, total visit length was associated with higher fidelity; urban sites were associated with lower fidelity compared to rural sites in the FSW program. The case audits and observations indicated that essential clinical steps such as HIV testing and safety bloods were consistently completed.

Quality of service delivery was high on almost all measures across programs, with over 80% of all service users scoring moderate to high on patience, empathy, and friendliness, except for at AGYW follow-up visits where at least 50% of providers scored moderate to high.

Conclusions: Fidelity across programs was moderate, but critical clinical steps related to safety were followed. Other activities related to building patient comprehension and self-efficacy to use PrEP were minimal, which stresses the urgency for programs to target social, behavioral and cultural barriers to PrEP use.

While mobile PrEP provision shows promise, urgent modifications are needed to better address the persistence gap on PrEP and to have a substantial impact on HIV prevention.

Maintaining patient care in the context of major and prolonged socio-political turmoil in Haiti through community care centers for antiretroviral therapy distribution and viral load testing

P. Joseph[1], R. Sun[2], J.E. Mathon[1], Y. Macius[1], M.A. Jean Juste[1], C. Guiteau[1], S. Koenig[3], J.W. Pape[1,4]
[1]GHESKIO, Port-au-Prince, Haiti, [2]Harvard University, Department of Government, Cambridge, United States, [3]Brigham and Women's Hospital, Boston, United States, [4]Weill Cornell Medical College, New York, United States

Background: Persistent and violent civil conflict in Haiti has continued to challenge HIV care provision for patients. To support patient retention, GHESKIO transitioned essential services from its main facilities to community care centers (CCCs), providing antiretroviral therapy (ART) refills, adherence support, and collection of viral load specimens for stable patients in remote locations in and around Port-au-Prince.

Methods: CCC services were offered beginning in May 2019 to patients with at least 6 months of ART treatment. Data on all ART refills in 5/1/2019-12/31/2021 from GHESKIO's electronic health records were analyzed. Patients were defined as on-time if they picked up their ART prescription within 30 days of their scheduled refill date. Viral load (VL) results were analyzed using the latest test for all patients who received valid VL tests in the last 12 months. VL suppression was defined as <1,000 copies/ml.

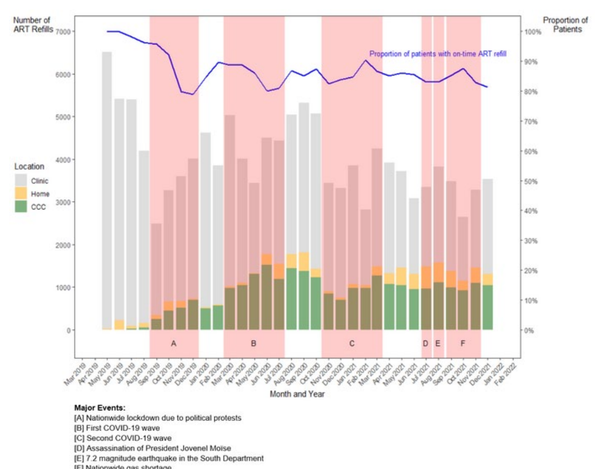

Figure.

Results: 18,625 patients completed ≥1 drug refill visit during the 32-month study period (41.3% male, mean±SD age 44.0±13.3 years). 51.9% of patients had ≥1 non-clinic ART refill. Patients attended 128,740 refill visits (6.9±3.6 per patient), 21.1% and 4.9% of which were CCC and home

Oral abstracts

Poster exhibition

E-posters

Late-breaker abstracts

Author Index

visits, respectively. The proportion of ART refills occurring at CCC and home visits increased from 0% to 39% between May 2019 and June 2020, remaining between 23% and 45% thereafter. Every month, ≥75% of patients were able to receive on-time ART prescriptions throughout the study period, despite persistent obstructive gang violence beginning in 2019 and increased frequency of kidnapping beginning in 2020. Among 12,252 patients who received a VL test in 2021, 92.3% were on-time for ART refill. Overall VL suppression among patients with a VL test was 83.4%.

Conclusions: Transitioning basic care services from facility-based to community-based can support health systems resilience in geographic regions prone to political instability and civil unrest.

A novel qualitative assessment tool tracking progress towards sustainability of Zimbabwe's voluntary medical male circumcision program

B. Pindiwe[1], S. Xaba[2], G. Ncube[3], D. Rama[1], N. Zwangobani[1], A. Svisva[1], N. Shoko[4,5], T. Kanyenda[5], Y. Katanda[5], L. Nyazema[3], S. Nyaude[3], P. Kunaka[3], F. Gwarazimba[3], B. Nachipo[3], T. Makoni[3]

[1]Clinton Health Access Initiative, Zimbabwe, Harare, Zimbabwe, [2]Ministry Of Health and Child Care, AIDS & TB Unit, Harare, Zimbabwe, [3]Ministry of Health and Child Care, AIDS & TB Unit, Harare, Zimbabwe, [4]Clinton Health Access Initiative, Boston, United States, [5]Clinton Health Access Initiative, HIV Prevention, Boston, United States

Background: Since 2009, Zimbabwe has implemented voluntary medical male circumcision (VMMC) as a high-impact, one-time HIV prevention intervention. While the initial goal of the program was to scale VMMC services, stakeholders recognized that scale up and sustainability must be simultaneously pursued in response to differences in sub-national performance. This led to the development of the Sustainability Transition Implementation Plan in 2019 which outlined sustainability goals for the VMMC programme. The VMMC Transition Assessment Dashboard (VTAD) assessments were developed to track progress towards country-defined sustainability goals and to identify health system barriers and enablers to transitioning to sustainability.

Methods: The VTAD assessment is designed to collect data on key processes in the VMMC program while tracking progress towards the development of program characteristics necessary for sustainability by programmatic pillar[1]. Data is collected through a consultative process guided by the Ministry of Health and Child Care that prioritizes understanding the qualitative structure and implementation of VMMC activities. Findings from the assessment are incorporated into the district, provincial, and national program planning.

[1] Leadership, management, and coordination (LMC); Service delivery (SD); Programme Quality (Q); Demand Generation (DG); Strategic Information (SI) and Financing

Results: Progress towards sustainable LMC1 was driven by increased programme coordination, clearly defined roles and responsibilities, and district level program ownership. Lack of integrated VMMC plans and sub-optimal engagement of stakeholders were identified as barriers to sustainable LMC1. Modified service delivery models to support program continuity during the COVID-19 pandemic contributed to a more sustainable SD1. However, vertical and siloed VMMC programming at service delivery points impeded the integrated HIV prevention programming necessary for sustainability.

Under the Q1 pillar, integrated and standardised quality assurance activities managed by the district personnel and timely detection and management of VMMC adverse events accelerated sustainability progress. SI and DG1 remained relatively stagnant after adoption of new HMIS tools and updated global guidance on the priority age group requiring new strategies to engage older VMMC clients.

Conclusions: The VTAD facilitates structured discourse about VMMC sustainability for all stakeholders while promoting greater district-level program ownership, data-driven planning, and identification and monitoring of barriers to and enablers of program sustainability.

Community and health services together to avoid interruption of HIV treatment during COVID-19 restrictions – a person-centered and a low-cost initiative for antiretroviral delivery in Florianópolis, Brazil

F.d.B. Perini[1,2], M.d.S. Silveira[3], F.B. Gastaldi[4], M. Pacheco de Freitas[5], A.P. da Silva[6], A.S. Cardoso[6]

[1]Municipal Health Secretary of Florianópolis, Care Integration Department, Florianópolis, Brazil, [2]Santa Catarina Federal University, POSTGRADUATE PROGRAM IN COLLECTIVE HEALTH, Florianópolis, Brazil, [3]AIDS Prevention Support Group - GAPA/SC, Florianópolis, Brazil, [4]Acontece LGBTI+ (Happens - LGBTI+ art and politics), Florianópolis, Brazil, [5]National Network of People Living with HIV and AIDS (RNP+ Brasil/SC), Florianópolis, Brazil, [6]Municipal Health Secretary of Florianópolis, Care Integration Department - Pharmaceutical Assistance, Florianópolis, Brazil

Background: Avoiding treatment interruption (TI) is among the main challenges in HIV care. COVID-19 pandemic has exacerbated TI by decreasing health services access. In this context, Florianópolis, a 500,000 inhabitants capital in southern Brazil, with antiretroviral medication (ARV) centralized in 4 municipal pharmacies, joined forces with the community to create new free options for accessing ARV: the ARV Delivery Support Project (ADSP).

Description: ADSP was a partnership between the Municipal Health Department of Florianópolis (MHS) and 3 local non-governmental organizations (NGO), GAPA/SC, Acontece LGBTQI+, and RNP+Brasil/SC. ADSP happened from

April 2020 to March 2021, and was publicized by means of local radio, TV, press, and social media. Users, with difficulty in getting their ARV, got in contact with NGO volunteers and had their basic data and request registered. PLHIV also informed how many days of ARV they still had, or if they run out of medication, and could select a nearby primary health care service (PHCS) to withdraw their ARV. This information was shared in a secured digital color coded spreadsheet with the MHS that, subsequently, organized the logistics to send ARV from the pharmacies to one of the 49 capillarized PHCS. NGO volunteers would then contact back PLHIV users to inform that ARV were available for withdraw.

Lessons learned: ADSP helped 297 PLHIV; 63% male, median age 40 yo (18-76); to retrieve their ARV during COVID-19 restrictions, representing 5% of total PLHIV in treatment in Florianópolis. Without new expenditures, the project carried out 573 distributions in 12 months; a median of 2 (1-5) distributions per person, 42% of them in the first 3 months. When contacting the NGO, 45% of PLHIV still had up to 7 days of ARV, 22% more than 7 days, but 33% were already without medication. People with long-term TI (2%) were identified and linked to treatment. Also, NGOs got more visibility and had their staff renewed.

Conclusions/Next steps: With innovative initiatives, community engagement, and political will, it was possible to address part of TI challenge. The project and its results have served as the basis for the new MHS ARV home delivery, in partnership with CDC and PEPFAR support.

EPLBE06

The National Inuit Sexual Health Network - an engagement model for effective health systems transformation across Inuit Nunangat

S. Scott[1,2]

[1]*Pauktuutit Inuit Women of Canada, Health, Ottawa, Canada,* [2]*University of Calgary, Calgary, Canada*

Background: Pauktuutit Inuit Women of Canada (PIWC) is the national representative organization of Inuit women in Canada. We advocate for the social, cultural, political, and economic betterment of Inuit women and their families. Most Inuit in Canada live in 53 communities across four Inuit Regions of Inuit Nunangat, which means "the place where Inuit live:"

Sexual health programming has always, and continues to be a cornerstone of PIWC's Health department since the late 1980's.*Tavva – the National Inuit Sexual Health Strategy* was developed by a group of experts representing each of the Inuit Regions and across provincial, territorial governments, and Inuit governance organizations. Following the development of Tavva, the National Inuit Sexual Health Network (NISHN) was created to implement Tavva.

Description: Objectives of the NISHN include:

- Identifying strengths and promising practices within Inuit regions;
- Supporting collaboration among the regions, so efforts are not being duplicated and resources can be shared;
- Providing opportunities for professional development, knowledge transfer and peer support;
- Identifying new trends, emerging issues and infections;
- Clearly identifying priority activities and expectations for the Network.

Lessons learned: *Tavva* provided insight to a holistic conception of sexual health beyond combatting STBBIs. As such, PIWC shifted and expanded the scope of outreach to connect with potential members such as midwives, youth, and other Inuit.

Lessons learned in the past year have been published by the NISHN on the Pauktuutit website:

- *Uuktuutit* brings conversations on healthy Inuit sexuality closer to the lived realities. Listed components of healthy Inuit Sexuality include positive body image, self-determination, and intergenerational communication.

- *Ikajurniq*recommended 12 unique policies and practices to policymakers and healthcare providers, such as implementing strict confidentiality practices and using peer educators for health promotion.

Conclusions/Next steps: Upcoming activities include:

- Supporting the launch of an Inuit-specific lactation clinic.
- Working with territorial governments on a mobile testing clinic to address confidentiality concerns.
- Facilitating a land-based retreat in the Western Arctic to explore how the pandemic has disrupted relational foundations at a community level.

The NISHN has inspired next steps to include maternal health considerations and build up the relational foundations that uphold sexual health such as intergenerational communication.

reengaging people living with HIV into treatment and care. Community-led monitoring (CLM) is an important approach for improving the quality of healthcare services through social empowerment and political accountability. Driven by increasing support from donors, a growing number of countries are implementing CLM, creating an optimal time to identify early best practices in CLM implementation.

Methods: Participants were recruited using a screening tool, disseminated by email and social media.Projects that met inclusion criteria participated in a quantitative survey and an individual interview. Surveys and interviews focused on developing a global mapping of CLM projects, identifying implementation arrangements and activities, and understanding best practices and challenges. Projects monitoring HIV, tuberculosis, malaria, human rights, and/or COVID-19 were included in the sample.

Results: Thirty-five projects, representing 23 countries, completed the survey, of which 25 additionally participated in an interview. Projects most commonly monitored indicators related to HIV (82% of projects) and TB (74%), and most countries represented were in Sub-Saharan Africa (77%). The most commonly-reported donor was the Global Fund (61%), followed by PEPFAR (37%). Among projects' reported achievements were an increased capacity for local organizations to conduct advocacy (63%), collect data (60%), and more frequent and productive engagement with governments (60%).

Respondents described challenges around COVID-19 disruption (57%), sustainability of funding (54%), and human resources (46%). Additional challenges identified during interviews included funding levels and on-time disbursement, challenging funding models, project independence and data ownership, difficulties with timely data analysis, and the need for strengthened advocacy.

Best practices included early and continuous engagement with communities, host governments, and service users, hiring dedicated and paid teams, reducing funding intermediaries and ensuring on-time disbursements, and strengthening technical assistance for data use and advocacy.

Conclusions: With the rapid expansion of CLM, this study serves as a practical guide for CLM implementers, donors, and technical assistance providers. Successful implementation of CLM requires prioritizing community ownership and leadership, donor commitment to sustainable and reliable funding, and strengthened support of projects across the data collection and advocacy lifecycle.

A modified quality improvement approach yields high TB case-finding rates in newly diagnosed HIV-positive patients in a district health setting in KwaZulu-Natal province, South Africa

M.F. Tshabalala[1], M. Youngleson[1], J. Ngozo[2], P.N. Zulu[1], N. Kamoga[1], Z. Linda[1], S.-s. Tettey[3], P. Barker[4]

[1]*Institute for Healthcare Improvement, Pietermaritzburg, South Africa,* [2]*KwaZulu-Natal Provincial Department of Health, Pietermaritzburg, South Africa,* [3]*Institute for Healthcare Improvement, Accra, Ghana,* [4]*Institute for Healthcare Improvement, Boston, United States*

Background: Covid-19 adversely affected TB case finding in South Africa from 2020. A TB case finding quality improvement (QI) project aimed to rapidly restore TB case finding to pre-Covid-19 levels in five districts in KwaZulu-Natal province (September 2020 - June 2022) through Targeted Universal TB Testing (TUTT) in three HIV-positive facility groups (HIV positive pregnant women at 1st antenatal visit, HIV newly diagnosed clients and ART patients at their annual viral load (VL) visit).

In addition, two sputum samples were taken simultaneously to increase secondary sputum culture for HIV-positive GeneXpert negative clients.

Description: A modified QI approach was used, including single A4 implementation worksheets to support testing in each of the four groups. Worksheets included a description of the change, names of staff responsible for implementation and measurement, and a data table for recording monthly progress including the number needing investigation, number investigated, and number TB confirmed. Worksheets were introduced over time, updated monthly by facility QI teams, and posted on a district QI WhatsApp group from which the QI project team collated and shared the TB case finding data.

Lessons learned: 125 facilities participated in the project. Over 12 months (April 2021 – March 2022), 85% of the HIV newly diagnosed clients were tested, with a TB yield of 8.1% (1190/14779) compared with yields of 1.1% (126/11317) and 1.4% (555/39762) in the ANC and VL visit groups respectively. An additional yield of 1.6% (322/20014) was obtained with culture. Culture data was not disaggregated by the HIV-positive group so the specific culture yield for the newly diagnosed HIV group is unknown. However, assuming an equivalent yield across all groups, an overall TB yield of 9.7% may be achievable in HIV newly diagnosed patients in a district setting (range 14.3% - 6.2% between the five districts).

Conclusions/Next steps: While all patients diagnosed with TB are required to have an HIV test, the standard of care currently requires that only TB symptomatic HIV newly diagnosed clients are tested for TB.

These data suggest TUTT and "double-sputum" sampling for this group, supported by a simplified QI approach, is an effective way to increase TB case finding and improve HIV/TB integration.

EPLBE09

Impact of SARS-CoV-2 pandemic on routine HIV care and treatment outcomes in Kenya: a nationally representative analysis

D. Kimanga[1], V.N. Makory[2], A.S. Hassan[3], F. Ngari[2], M.N. Mwakala[1], K.J. Muthoka[4], L. Odero[5], G. Omoro[6], A. Aoko[1], L. Ng'ang'a[1]

[1]Centers for Disease Control and Prevention, Division of Global HIV and TB (DGHT), Nairobi, Kenya, [2]Ministry of Health, Kenya, National AIDS and STI Control Program, Nairobi, Kenya, [3]KEMRI/Wellcome Trust Research Programme, Kilifi, Kenya, [4]Palladium Group, Nairobi, Kenya, [5]United States Agency for International Development (USAID), Nairobi, Kenya, [6]Military HIV Research Program/Walter Reed Army Institute of Research (MHRP/WRAIR), Nairobi, Kenya

Background: The COVID-19 pandemic adversely disrupted global health service delivery. We aimed to assess impact of the pandemic on same-day HIV diagnosis/ART initiation, six-months non-retention and initial virologic non-suppression (VnS) among individuals starting antiretroviral therapy (ART) in Kenya.

Methods: Individual-level longitudinal service delivery data hosted at a national repository were analysed. Random sampling of individuals aged >15 years starting ART between Apr'18 and Mar'21 was done. Date of ART initiation was stratified into pre-COVID-19 (Apr'18–Mar'19 and Apr'19–Mar'20) and COVID-19 (Apr'20–Mar'21) pandemic periods.

End-points included:

i. Same-day HIV diagnosis/ART initiation,

ii. Six-months non-retention, defined as either dead or lost-to-follow-up (missed scheduled appointments plus three months grace period), and;

iii. Initial VnS (first viral load test done within 12-months of ART initiation), defined as HIV RNA>1000 copies/ml.

Mixed effects generalised linear, survival and logistic regression models were used to determine the effect of COVID-19 pandemic on same-day HIV diagnosis/ART initiation, six-months non-retention and initial VnS respectively.

Results: Of the 7,046 individuals sampled, 35.0%, 37.1% and 27.9% started ART during Apr'18– Mar'19, Apr'19–Mar'20 and Apr'20–Mar'21, respectively. Compared to the pre-COVID-19 period, the COVID-19 pandemic period had higher same-day HIV diagnosis/ART initiation (adjusted risk ratio [95% CI], p-value: 1.4 [1.2–1.6], p<0.001) and lower six-months non-retention (adjusted hazard ratio [95% CI], p-value: 0.7 [0.6–0.8], p<0.001). Of those sampled, 3,174 (45.7%) had a viral load test done at a median 6.2 (IQR, 5.3–7.4) months after ART initiation. Compared to the pre-COVID-19 period, there was no significant difference in initial VnS during the COVID-19 pandemic period (adjusted odds ratio [95% CI], p-value: 0.8 [95% CI: 0.5–1.2], p=0.238).

Conclusions: Impact of the COVID-19 pandemic on HIV care and treatment outcomes has been less adverse in Kenya. Timely, strategic and sustained COVID-19 response may have played a critical role in mitigating adverse effects of the pandemic and point towards maturity, versatility and resilience of the HIV program in Kenya.

Continued monitoring to assess long-term impact of the COVID-19 pandemic on HIV care and treatment program in Kenya is warranted.

EPLBE10

Expanding viral load coverage in the pursuit of HIV epidemic control in Lualaba province in the Democratic Republic of Congo

B. Kabongo[1], G. Fatti[2], R. Mohammed[2], J.M. Kanyinda[1], B.M. Banzua[1], A. Grimwood[2]

[1]Kheth'impilo-DRC, Kolwezi, Congo, Democratic Republic of the, [2]Kheth'impilo, Cape Town, South Africa

Background: Lualaba, DRC's copper and cobalt-mining hub, with industrial mining attracting regional business people and a vibrant artisanal mining trade of "entrepreneurs" of small and medium industries leading to in-migration from rural areas and neighboring countries including truckers with associated CSW and SUD.

Viral Load testing (VL) and coverage are important indicators of HIV epidemic control. Coverage and suppression of VL are long-standing challenges in Lualaba. A long-term turnaround strategy was implemented using a threefold approach: pre-lab demand generation, intra-lab swift sample analysis and post-lab electronic results delivery system, with optimal patient support for VL suppression.

Kheth'Impilo-DRC (KI-DRC) is a local Non-Governmental Organisation supporting 77 sites in Lualaba in 14 Health Zones (HZs) with a current cohort of 26452 patients in care.

Methods: Demand for VL testing was increased through a micro-management approach that included identifying eligible patients in supported sites, improving support to providers with communication credits for phone calls in following up patients for VL collection appointments, driving community VL sample collection while increasing the frequency of collection between communities, facilities and main laboratory Hubs. Additional personnel were extended to the laboratory to support internal processes and shorten result turnover time through electronic results delivery while individual IEC support was reinforced to patients with unsuppressed VL.

Results: This strategy resulted in an increase of VL uptake from 53% of an active cohort of 19922 in Mar2021 to 99% of an active cohort of 25017 in Dec2021. The viral suppression rate increased from 86% to 95% over the same period. Progress in VL suppression rate registered accross all age groups and gender.

Conclusions: Community VL collection combined with a singularised reinforcing approach to adherence of each patient with individualized follow-up by peer educators of poorly adherent patients are key to improving VL coverage and suppression in pursuit of HIV epidemic control.

Pre-exposure prophylaxis for people who inject drugs: opportunities to expand the program in Ukraine

I. Sazonova[1], R. Kulchynska[1], I. Doan[1], R. Keating[1], S. Ohorodnik[2], S. Salnikov[2], I. Titar[2], M. Azarskova[1], E.J. Barzilay[1]

[1]CDC-Ukraine, Overseas Strategy and Management Branch, Division of Global HIV & TB, U.S. Centers for Disease Control and Prevention, Kyiv, Ukraine, [2]Center of Public Health of the Ministry of Health of Ukraine, Kyiv, Ukraine

Background: HIV has a disproportionate burden on people who inject drugs (PWID) in Ukraine. HIV prevalence in the PWID population is 20 times higher than the national estimate. Rough estimates suggest that 275,000 HIV-negative PWID are at risk of HIV acquisition due to continuing injecting practices. Pre-exposure prophylaxis (PrEP) is an effective biomedical intervention that prevents sexual transmission of HIV and reduces HIV incidence. The World Health Organization recommends that PrEP be offered to PWID with increased sexual risk behavior.

This study explored PrEP awareness, willingness, and eligibility among PWID in Ukraine.

Methods: We analyzed data from a 2020 PWID bio-behavioral surveillance (BBS) survey conducted in 12 cities in Ukraine. The BBS used a cross-sectional study design and a respondent-driven sampling (RDS) approach to recruit 6,001 participants who were PWID. We assessed their sexual risks, their awareness, use, and willingness for PrEP. In addition, using existing PWID population size estimates, we assessed the number of PWID eligible for PrEP and willing to enroll in the program.

Results: Nearly 80% of the PWID participants were HIV-negative. Among them, 10% had previously heard about PrEP, and 1.4% had experience using PrEP. 35.1% of the HIV-negative PWID reported having either increased sexual risk behavior in the past 30 days (i.e., multiple sexual partners or condomless sex with casual or exchange partners) or diagnosis of a sexually transmitted infection (i.e., syphilis, chlamydia, gonorrhea, herpes, papillomavirus). Among this group of PWID with increased sexual risk behavior or diagnosis of an STI, 34.7% expressed willingness to use PrEP. PrEP willingness varied substantially by geography (ranging from 3.3% in Odesa to 22.6% in Kyiv city). Female sex, unmarried status, a low level of education, and stimulant drug use were associated with greater PrEP willingness. We estimate that at least 33,000 active PWID are eligible for PrEP and have expressed interest in participating in the program.

Conclusions: There is a considerable opportunity to expand the PrEP program among PWID in Ukraine. HIV community testing programs might benefit from the development of more efficient pathways to refer and link eligible HIV-negative PWID to PrEP services.

PELBE02

Community led monitoring in PEPFAR Vietnam - innovation and lessons learned

H. Hoang[1]

[1]PEPFAR Coordination Office, Vietnam, U.S. Department of State, Hanoi, Viet Nam

Background: In 2020 PEPFAR Headquarters required all PEPFAR bilateral and regional programs to initiate in fiscal year 2021 community led monitoring (CLM). However there was very little of guidance from OGAC and no concrete example of a commonly considered „successful CLM model". Taking a serious and comprehensive research of available examples of community monitoring models and an innovative and inclusive approach that ensured the „community led" principle, the PEPFAR program in Vietnam worked closely with community representatives to launch a unique and unprecedented CLM model that now turns out to be an efficient mechanism for community feedback of PEPFAR supported services, highly appreciated by OGAC, and closely watched by regional and international civil society alliances.

Description: A year before CLM actually started, in coordination with in-country stakeholders, the PEPFAR team gathered a task-force of 15 community leaders who had rich experience in service delivery, advocacy and quantitative and qualitative research and a comprehensive understanding of the PEPFAR program. They worked out a comprehensive CLM protocol, together with concrete data collection tools for PEPFAR supported sites which were then presented in a stakeholder workshop for feedback and mutual understanding and agreed implementation principles. The model was then finalized and budgeted in COP20 for implementation in fiscal year 2021.

Lessons learned: The approach up to now is proved to be an efficient mechanism, securing the „community led" nature. While in most other PEPFAR programs, the independence nature of CLM is a concern, the Vietnam model is gradually and increasingly acknowledged by the host government, in-country stakeholders, OGAC, and regional alliances. The concept of a PEPFAR funded yet independent CLM model is now widely understood by both government offices, healthcare workers, program managers, and beneficiaries.

Conclusions/Next steps: Available CLM data is currently at an extent that provides only snap-shot of surveyed sites, and not representational enough to tell stories of provinces, regions, and national trends. At the global level, OGAC is supposed to draw and share widely CLM lessons from countries, particularly approaches, granting mechanisms, cost norms, and data sharing and usage. There is also expectation for CLM to be taken up in the Global Fund and national programs.

Community-led humanitarian and HIV/TB interventions in the emergency response to the war in Ukraine

V. Rachynska[1], D. Sherembei[1], A. Iovita[2], D. Lohman[2]
[1]All-Ukrainian Network of PLWH, Kyiv, Ukraine, [2]The Global Fund to Fight AIDS, Tuberculosis and Malaria, Geneva, Switzerland

Background: Community-led organizations in Ukraine play a significant role in the country's response to HIV and TB through provision of prevention services, linkages to ARV and opioid substitution treatment, and persistent efforts to remove human rights barriers such as stigma and discrimination that impede communities' access to services.
Russia's February 24th invasion of Ukraine dramatically changed the operating environment for these organizations as conflict disrupted normal operations in large parts of the country and sent millions of Ukrainians fleeing for their lives.
Description: Community-led organizations quickly adapted their operations to these new conditions. Embracing a "first-save-lives" approach, they used their deep connections in communities to evacuate members of key and vulnerable populations in areas of active combat to safety; organized temporary shelter and nutritional support; facilitated access to emergency medical services; and linked them to HIV, TB and drug treatment services in their new locations. These efforts were closely coordinated with and supported by the government, donors and other partners.
As a result, key and vulnerable populations have been able to continue to receive HIV and TB services with limited disruptions despite the devastating impact of the conflict.
Lessons learned: Our preliminary analysis suggests that a number of key factors facilitated these community-led organizations' ability to respond rapidly. First, these groups generally tend to have light, horizontal organizational structures allowing them to quickly adapt to ever changing local circumstances. Their embeddedness in communities allows them to quickly pick up on changing needs.
Second, the COVID-19 pandemic gave community-led organizations ample practice in adaptability as it forced numerous and substantial change to their operations. It also resulted in innovations such as simplified procedures for ART and substitution treatment, development of security protocols, and psychological interventions that have proven highly relevant during the conflict.
Finally, the Global Fund, the main funder of community-led programs, quickly facilitated the reprogramming of activities allowing organizations to meet the evolving needs of their communities.

Author Index

Conclusions/Next steps: Ukraine's experience may hold broader lessons for challenging operating environments. Community organizations can be an important resource in adapting the response to HIV and TB during armed conflicts and other major disruptive events.

The Venezuelan migration phenomenon and the response to HIV and TB in Colombia, Ecuador and Peru

A. Mejia[1], A. Luna[2], S. Jaramillo[3], M.A. Torres[3]
[1]*Vía Libre, LAC Platform, Lima, Peru,* [2]*Via Libre, LAC Platform, Lima, Peru,* [3]*ICASO, Toronto, Canada*

Background: Venezuela has faced a humanitarian crisis of significant impact in recent years. As of November 2021, more than6 million migrants and refugees from Venezuela have been forced to leave their country, of which about 5 million reside in Latin America. According to UNAIDS, at least 8,000 Venezuelans living with HIV have left the country to continue their treatment; this number could increase given that it corresponds to 14% of people who require antiretroviral therapy.
This study documents the response to HIV and TB by governments, civil society and the Global Fund in Colombia, Ecuador and Peru, countries with the highest number of Venezuelan migrants.
Methods: A case study methodology was developed with mixed methods and information from primary and secondary sources. In 2021, the team conducted interviews with key actors in response to HIV/TB and related documents were reviewed, the results of which were systematized and analyzed.
Results: Governments have maintained or improved their supportive policies to guarantee access to health services for Venezuelan migrants. International cooperation agencies have a growing interest in directly or indirectly addressing the response to HIV and TB in these countries, including the Inter-Agency Coordination Platform for Refugees and Migrants from Venezuela (R4V).TheGlobal Fund in Colombia and Peru has plans to include services for migrants. Civil society organizations have contributed significantly to the response, mainly to HIV, they have articulated regionally with each other and with the international cooperation agencies. However, they have limited resources and require strengthening to achieve a more significant impact.
The study identified technical assistance needs to improve the response of this sector, as well as barriers to access health services for migrants and gaps in the response.
Conclusions: The results allow us to have an overview of the response to HIV and TB in the framework of Venezuelan migration in the countries studied and the challenges that stakeholders have to improve access to services. It describes access barriers, gaps in response, and technical assistance needs for civil society organizations and provides recommendations for action. The results are also helpful in guiding the response of the Global Fund and other stakeholders.

EPLBF03

A study on association between legal environments, society tolerance, family support and alcoholism, high-risk substance abuse, HIV risk perception among TGE communities, post decriminalization of IPC section 377, India

V.S. Prasad[1], E. Michael[1], K. Prasanna[1], L. Honig[2], T. Ford[2], M. Wienstein[2], A.S. Benzaken[3], J. Vandenhombergh[4]
[1]*AIDS Healthcare Foundation India, New Delhi, India,* [2]*AIDS Healthcare Foundation, Los Angeles, United States,* [3]*AIDS Healthcare Foundation, Sao Paulo, Brazil,* [4]*AIDS Healthcare Foundation, Amsterdam, Netherlands, the*

Background: Gender Based Violence on (TGE) -Transgender and Gender Expansive communities continue to be existing and seems to be accepted and perceived as NORMAL among the general population of India. Decriminalization of Same Sex relationships and repeal of section 377 from the Indian Penal Code opened the public discourse and added visibility of the TGE communities in India.
The study was intended to explore the association between legal environments, society tolerance, family acceptance and alcoholism, high risk substance abuse, HIV risk perception and Unsafe Sexual behaviors among TGE communities.
Description: 876 TGE living with HIV and enrolled for Anti-Retroviral Therapy (ART) from the "THE PEOPLE'S CLINIC" New Delhi, India, were recruited and a questionnaire was shared via social media and responses collected over a period of nine months. Logistic regression was employed to test Associations between Protective environments and high-risk substance abuse, High risk Sexual behaviors and HIV positivity and Self rated Health outcomes.
Lessons learned: Overall, (18%) reported support of their TGE identity by at least one close family member. Due to fear of stigma and discrimination only (3%) revealed HIV positivity status to a close family member. Owners of rental residences and housing societies exhibited most intolerance (85%) in urban areas and refused letting out their premises to TGE communities. Housing instability further pushed communities to indulge in high-risk substance abuse (36%), alcoholism (63%) leading to High-risk behaviors including unprotected multi-partner SEX (89%) and leading to acquiring HIV infections. Even with repeal of punitive homophobic laws - violence, abuse and body shaming was reported especially from law enforces and police (34%).
Conclusions/Next steps: Decriminalization of punitive laws against sexual minorities without sensitization of general population and law enforcement agencies including Police, does not necessarily bring Protective environments, Societal acceptance or gender-based violence.

The need for revised National level strategies to break structural barriers and promote protective environments for TGE communities are reflected as major findings of this study.
Framing strict laws, in treating violence meted out to TGE communities as a culpable offence, would help create more tolerant and accommodative societies, reduce violence and lead to better health outcomes for the TGE communities.

EPLBF04
Right to quality HIV care for children in trauma and rescue centers in Kenya

N. Mugao[1], C.A. Opinde[2], P.T. Kadir[1]
[1]Frolics of Hope Africa, Nakuru, Kenya, [2]The NGO Whisperer™, Manchester, United Kingdom

Background: The United Nations-led Sustainable Development envisioned a future free of fear and violence. Governments and non-government entities are putting structures that ensure the peaceful coexistence of the communities globally. Kenya is one of the many governments that has policies and mechanisms to curb all forms of violence.
However, despite having these policies and guidelines in place, gender-based violence (GBV) and Human Immune Virus (HIV) prevention services are still offered perpendicularly (Edwards, etal, 2022).
Description: The recent challenges of COVID-19 have compounded this gap. Rescue and Trauma Centers for abused children and women do not have a legal framework to govern their existence and service delivery to this vulnerable group. According to the research, the crossing of HIV and GBV proves that violence against women and children exponentially raises their vulnerability to HIV (Meffert, etal, 2021). The World Health Organization report states that one in five girls and one in ten boys have gone through one or more forms of violence before they are 18 (Bhatia, etal, 2020).
Currently, this figure has risen to three in five girls and two in five boys who report to have experienced sexual violence before they are adults (Annor, etal, 2022). Rescue and Trauma Centers such as Frolics of Hope Africa requires capacity building, and resources to effectively rescue, report, rehabilitate, reintegrate, and repatriate victims of GBV and human trafficking violence due to their HIV status.
Lessons learned: In Kenya, only about 12 per cent of the 50 Trauma and Rescue Centers have the capacity to refer or serve women and children who have gone through violence and abuse due to their HIV status.
Data has shown that Intimate Partner Violence (IPV) raises a woman's chances of HIV infection due to rape by an infected partner, negligible opportunities for compromise on safer sex, and high-risk adverse tendencies (Ndungu, 2019).
Conclusions/Next steps: Integration of HIV and GBV is critical, especially within the safe houses that offer rescue services for GBV survivors.
The integration will reduce HIV transmission from mother to child, teen, and youth infection rates and help the survivors access the much-needed care and support.

EPLBF05
Post-test and TB survivor grassroots-based CBOs leverage HIV/TB care at The Last Mile; a case of 7 expert PWD-led mobilization HIV prevention groups in Uganda, August 2021-May 2022

T. Muyunga-Mukasa[1,2,3]
[1]Advocacy Network Africa (AdNetA), Strategic Public Health Advocacy, Los Angeles, United States, [2]Joyful Hope Resource Platform Center (JHRPC), Livelihood and Entrepreneurship Among the Youth, Nairobi, Kenya, [3]Most At Risk Populations' Society in Uganda (MARPS In Uganda), Strategic Public Health Advocacy, Kampala, Uganda

Background: People living with HIV, key populations, and people at risk of HIV grasp such concepts like Public-Private Mix (PPM), Communities of Practice (CoP), Integrated Service Delivery (ISD), human rights, equality, and dignity, action against harmful practices, stigma, and discrimination when there is deliberate, strategic action to take them through participatory training sessions.
This study followed groups from August 2021 to May 2022 and it aimed at gauging TB/HIV-related Prevention campaigns by CBOs which were formed as PWD-led Post-Test and TB Survivor Support Clubs in Uganda.
Description: A 9 month cross-sectional study, using contacts to regularly check compliance to strategic plans, updates of record books, checklists and minutes to track community outreach events promoting prevention.
Lessons learned: The report indicates that the CBOs connected beneficiaries to HIV testing, access to treatment, promoting care, referrals for non-communicable diseases care, attending clinic checkups for viral suppression and uptake of integrated services including addressing vertical HIV transmission, SRH services, dental and ear, Family planning, spacing cancer screening, paediatric AIDS and other services. It is clear that the 7 CBOs were the constant reminders and motivation to adherence during the COVID-19 lockdown and during the easing for 784 Persons Living with HIV and 54 Living with TB. Through constant visibility and mobilization, they maintained a food supply-chain, checked in on each other and mobilized money which sustained 48 who would have faced housing instability and food insecurity.
Conclusions/Next steps: Grassroots-based systems can be leveraged as health and social protection continuum spaces. This in turn supports wellness, livelihood, and enabling environments for people living with, at risk of, or affected by HIV to reduce inequalities and allow them to live and thrive.

EPLBF06

Provision of sexual and reproductive health services to adolescents and young people with disabilities living with HIV (AYPWDSLWHIV): observations from Chipinge district in Zimbabwe

C. Ndanga[1]
[1]*REPSSI, Programmes, Harare, Zimbabwe*

Background: Despite the existence of the eloquent and sound United Nations Convention on the Rights of People with Disabilities (UNCRPWD) (2008) which articulates on inclusion people with disabilities in all development initiatives and improvement on their access to key welfare resources, it remains disheartening to pick the provision of sexual and reproductive health services (SRHS) to AYPWDLWHIV in a piecemeal worrisome state.
Cultural connotations which place a taboo labelling on the provision of SRHS to AYPWDS remains the most outstanding barrier among other key issues observed.
Description: Inclusion of AYPWDLWHIV in discourses and platforms spearheading provision of SRHS in Chipinge district, Zimbabwe is yet to be implemented. Programming and discussion on the SRHR needs of AYPWDS remains absent in the district. The community holds negative attitude marked with some taboo connotations towards the provision of SRHS to AYPWDLWHIV. Shocking and disturbing from the human personnel of expected high integrity and ethical conduct, health workers at clinics in the district frown at AYPWDLWHIV when they seek condoms and other critical information regarding SRHR. As if that is not enough for the plight of AYPWDS, there are no evident efforts to improve their conducive physical access to SRH services.
Lessons learned: According to district data, over 45% of sexual harassment cases recorded in marriages and other sexual relations in the district involves AYPWDLWHIV as they lack empowerment on their sexual and reproductive health. It is against this background compounded by other factors already observed, that a lot of AYPWDLWHIV are engaging in unprotected sex which is leading to unintended pregnancies, STIs, and HIV spreading.Unplanned children and poor health are exacerbating their entrenchment in the circle of poverty
Conclusions/Next steps: There is need for communities to come up with a home-grown local policy which fosters inclusion of AYPWDLWHIW in all discourses pertaining their SRH needs and also unpacking the UNCRPD article 25 to the communities.
It is also important that public educational interventions are designed and implemented to demystify prevailing beliefs and practices, improve public understanding of the sexual and reproductive health needs of AYPWDLWHIV and ways the public could support AYPWDLWHIV to lead safe and satisfying sexual lives.

EPLBF07

Advancing HIV prevention research in pregnant and breastfeeding populations (PBFP): priority advocacy objectives and next steps

K. Sullivan[1], M. Chatani[2], B. Lesnar[3], D. Nhamo[4], A.D. Lyerly[1]
[1]*University of North Carolina at Chapel Hill, Center for Bioethics, Department of Social Medicine, Chapel Hill, United States,* [2]*AVAC, New York, United States,* [3]*AVAC, Grand Rapids, United States,* [4]*Pangaea Zimbabwe AIDS Trust (PZAT), Harare, Zimbabwe*

Background: Growing consensus around the ethical and public health imperative for the responsible inclusion of PBFP in HIV research has gained critical momentum. Milestones include Ethics Guidance from the PHASES Working Group and the WHO/IMPAACT Call to Action to accelerate the study of new HIV drugs for pregnant and breastfeeding populations (PBFP), though much work to realize this vision remains.
To this end, AVAC, supported by the Coalition to Accelerate and Support Prevention Research (CASPR), and the PHASES Project convened a think tank in April 2022 to identify priority advocacy objectives, informed by consensus recommendations, and develop an action plan to accelerate HIV prevention research with PBFP.
Description: Significant stakeholder engagement guided the development of the think tank, in alignment with the Good Participatory Practice Guidelines. This included consultations with researchers and a pre-meeting, co-convened with Pangaea Zimbabwe Aids Trust, with advocates and former trial participants. Sixty-three global stakeholders, including researchers, industry representatives, trial participants, civil society, regulators, and funders attended a half-day virtual workshop which utilized facilitated planning sessions to identify advocacy and action priorities. Think Tank members provided input on a report and action plan and were further engaged for additional information.
Lessons learned: Priority action areas included the need to: strengthen advocates' knowledge about the inclusion of PBFP in research; develop guidance specific to engaging stakeholders in the design and conduct of trials with PBFP, with particular attention to centering PBFP throughout; frame the responsible inclusion of PBFP in research as a reproductive justice issue and align with a broader coalition of advocates and allies; and support the advancement of regulatory authority to require data on PBFP.
Additional priorities raised included development of resources to support ethics review boards to consider responsible inclusion of PBFP; integration of the experiences and needs of adolescents and trans and gender-diverse PBFP in HIV prevention research; harmonization across regulatory agencies, and consistent metrics for trial outcomes.
Conclusions/Next steps: Assessing and implementing this action plan is ongoing. Key accomplishments to date include funder commitment to harmonize outcome mea-

sures and AVAC commitment to the development of an advocacy toolkit, and training resources. Further status updates will be provided.

EPLBF08

The Brazilian response to HIV/AIDS & COVID-19: double standards and rights violations

M. Malta[1,2]
[1]*Centre for Addiction and Mental Health, Institute for Mental Health Policy Research, Toronto, Canada,* [2]*University of Toronto, Department of Psychiatry, Toronto, Canada*

Background: The Brazilian response to HIV/AIDS is frequent cited as best practice. Brazil threatened to break patents, issued a compulsory license for Efavirenz and negotiated large discounts to acquire antiretroviral therapy (ART). These strategies allowed free/universal access to ART for all people living with HIV/AIDS (PLWHA) in Brazil since mid 90s'. The country was also a pioneer in offering HIV self-testing, HIV pre- and post-exposure prophylaxis (PrEP/PEP). Why was all this expertise not adapted during COVID-19 pandemic?

Description: The COVID-19 pandemic exposed Brazil to an unprecedented health, social and economic challenge. The country had the third-highest death toll in the world: over 660,000 COVID-related deaths recorded. During COVID-19 wave peaks, hospitals experienced shortages of oxygen and sedatives to intubate patients, ICU and hospitals were working at capacity. In spite of a well stablished immunization program, the country struggled with COVID-19 vaccine rollout.

Lessons learned: Brazilian HIV/AIDS response was guided by scientific and public health evidence, developed in close collaboration with civil society and PLWHA. Policy makers, government, researchers and affected communities worked together to assure that strategies were adequate, feasible and responsive. Open dialogue was key to review problems and address concerns. Conversely, Brazilian COVID-19 response highlighted a completely lack of dialogue with the federal government. The absence of a centrally coordinated strategy and misalignment between federal and local governments regarding COVID-19 response, together with Brazilian president denial of scientific evidence, promotion of ineffective treatments and insufficient vaccination efforts, have led to uncontrolled spread of COVID-19, the near-total collapse of the health system and excess deaths. Overwhelmed by COVID-19, health services reduced their availability of PrEP and PEP, while PLWHIA experienced difficulties in receiving their ART and scheduling follow up exams/appointments. During president Bolsonaro's ultra conservative government, several HIV prevention materials and campaigns were also censored.

Conclusions/Next steps: Decades of effective response to HIV/AIDS have demonstrated the essential relationship between human rights and public health. Countries should build their pandemic responses rooted in respecting science, public health and human rights principles, while hearing and working with populations most at risk. During the COVID-19 pandemic, the current Brazilian president choose to do the opposite, with tragic consequences

PELBF01

HIV criminalization laws, public health trust, and uptake of COVID-19 vaccine among people living with HIV in the United States

T. Mckay[1], J.C. Henne[2], N. Kari[1], T. Haught[3], S. Strub[3]
[1]*Vanderbilt University, Department of Medicine, Health, and Society, Nashville, United States,* [2]*The Henne Group, Inc., San Francisco, United States,* [3]*The Sero Project, Milford, United States*

Background: HIV criminalization creates significant tensions in public health practice. The negative effects of HIV criminalization on HIV stigma, disclosure, testing, and engagement in care are well documented.

In this study, we examine the effects of HIV criminalization laws on trust in public health and uptake of COVID-19 vaccination among people living with HIV (PLWH) in the US.

Methods: We use the 2021 National HIV Criminalization Survey conducted by The Sero Project and community partners (N=610). Participants were recruited via community organizations by and for PLWH and invited to participate in an online survey from 18 August 2021 to 31 December 2021.

We restrict analyses to PLWH who are 18 and older, reside in the United States, and provided information on COVID-19 vaccination status (N=554).

Results: Just over half (54.6%) of PLWH lived in states with an HIV-specific criminalization law. Over one-third (36.7%) endorsed the statement "Public health professionals care more about enforcing laws that criminalize HIV transmission than they do about my health," with endorsement higher among PLWH in states with HIV criminalization laws (40.4% vs 32.3%; χ^2=4.226, *p*<.05).

PLWH living in a state with HIV criminalization laws were significantly more likely to have heard of anyone in the state being arrested for nondisclosure of HIV status to a sexual partner (46.8% vs 28.2%; χ^2=22.742, *p*<.001) and to personally know anyone accused, threatened, or arrested on an HIV-related charge (40.1% vs 18.7%; χ^2=32.996, *p*<.001).

Uptake of COVID-19 vaccination among PLWH was high at 90.3%, but we observe significantly lower uptake in states that had HIV criminalization laws (87.4% vs 93.7%; χ^2=6.203, *p*<.05).

In a logistic regression model adjusting for differences in vaccine uptake across individual characteristics (gender, race, age, diagnosis year, employed or volunteer in HIV work), survey timing, and geographic region, PLWH in states with HIV criminalization laws were more than 50% less likely to be fully vaccinated for COVID-19 (OR= 0.478; 95% CI=0.233-0.982).

Oral abstracts

Poster exhibition

E-posters

Late-breaker abstracts

Author Index

Conclusions: Preventing HIV and COVID-19 require trust in public health measures and practitioners. HIV-specific criminalization laws jeopardize trust in public health and are associated with lower uptake of COVID-19 vaccination among PLWH in the US.

PELBF02

Follow the science - addressing resistance to comprehensive sexuality education: lessons from five African countries

P. Machawira[1], R. Lovich[2], D. Blanc[1]
[1]*UNESCO, Harare, Zimbabwe,* [2]*Consultant, Fairfield, United States*

Background: Every week, 4200 girls and women aged 15-24 in sub-Saharan Africa acquire HIV (UNAIDS). Each one of these infections could be prevented if young people had accurate information about how HIV is transmitted, alongside the services they need to make empowered choices. In recent years, countries within the African region have experienced escalating levels of controversy and opposition surrounding Comprehensive Sexuality Education (CSE). Local concerns from religious and socially conservative entities related to the content covered and debates about the information that young people should have. CSE aims to empower young people to build agency, develop skills, knowledge and attitudes required for preventing HIV, reducing early and unintended pregnancies, and eliminating gender-based violence.
Driven by the need for understanding the arguments of the opposition, UNESCO commissioned a study to document the experiences of five countries; Ghana, Namibia, South Africa, Uganda and Zambia with the objective to provide recommendations for governments and partners to respond to it.
Description: A mixed-methods approach was used to gather information to inform the development of five case studies, consisting of a desk review, KIIs, and stakeholder analysis. Background information was gathered through a questionnaire completed by key stakeholders. Data was also collected using social listening methods from open access social media sites. Feedback sessions with case study participants were conducted to validate findings and probe for additional detail when needed. Findings were released in April 2022.
Lessons learned: Opposition tactics include disinformation; use of media to amplify reach of internationally generated materials; personalize attacks and politization of CSE; coordination of messages with specific events. Country response was efficient when:
1. Government is supported and takes firm ownership of CSE,
2. CSOs are engaged and contribute to build public support,
3. Contextually relevant and timely communications strategy is in place,
4. Mobilization of youth voices by CSOs.

Conclusions/Next steps: Focus on ensuring a government-led response where they "take charge of the narrative" was essential. It is key to anticipate opposition and prepare for a coordinated response. Engage stakeholders, formulate common messaging on CSE, share evidence, develop a robust communication strategy using positive stories how CSE has helped learners, plan when and how to disseminate messages.
