Conclusions: Digital surveys through SwipeRx have potential to efficiently generate insights from pharmacies relevant to HIV program goals. Results indicate knowledge and attitudinal gaps as well as strong interest in offering HIV rapid tests and pharmacy-referrals to improve coverage and access to the full cascade of care for key populations in Southeast Asia.

EPD008
Trust, respect and reciprocity underlie the preferred ways of community engagement in HIV biomedical research: findings from a qualitative investigation in India

V. Loganathan[1], V. Chakrapani[1], T. Aurora[2], J. Narayan[2], C. Dewan[2], P. Saha[3], J. Mukherjee[3], D.L. Bose[3], S. Hadi[3]
[1]*Centre for Sexuality and Health Research and Policy (C-SHaRP), Chennai, India,* [2]*Quicksand Design Studio, New Delhi, India,* [3]*IAVI, New Delhi, India*

Background: Meaningful community engagement (CE) in HIV prevention research is crucial for the study's success and is an ethical obligation. We used data from a qualitative study to identify expressed and implicit reasons behind community representatives' preferred ways of CE in HIV biomedical research/trials.
Methods: This exploratory qualitative study was conducted in partnerships with seven NGOs and communtiy advocates. NGOs helped in recruiting a purposive sample (maximum variation sampling) of diverse participants from key populations such as men who have sex with men, transgender women, people who inject drugs and female sex workers, and general populations (adults, adolescents/youths). We conducted eleven virtual focus groups between July and October 2021. Data were explored from a critical realist perspective, using framing analysis (examining how the participants framed the narratives). The analytical focus was on 'why' the participants wanted particular kinds of CE.
Results: Participants' narratives unfolded both explicit and implicit reasons for the preferred types of CE. Trust was a central theme: trust on the sponsors based on their reputation/credibility, trust on the study as it was endorsed by trusted NGOs, and trust based on how the communities were engaged (as community advisory board/CAB members, and/or as field research staff). Trust seemed higher with diverse CAB (e.g., diversity in gender, socioeconomic status) as diversity was seen to allow/encourage diverse opinions. Participants' expectations regarding capacity building of CAB members (improving decision-making skills) and field research staff (community members co-producing knowledge) reflect actions that could increase trust. Other preferred CE activities seemed to symbolize respect and dignity: e.g., providing appropriate monetary compensation, constituting formal community review/monitoring mechanisms. Reciprocity was inferred by the importance placed on exploring communities' needs, sharing the findings with communities, and using the findings to inform policies/programs, in collaboration with communities. Transparent communication with communities was explicitly stated as critical for gaining and maintaining trust.
Conclusions: Trust, dignity, respect, and reciprocity underlie community representatives' preferred ways of CE. For researchers and sponsors, this means that CE is not to be seen as a checklist of activities to be done, but whether those activities convey dignity and respect, demonstrate reciprocity, and gain and maintain trust.

EPD009
Community consultation in designing a virtual HIV intervention for MSM in Mumbai, India: lessons from a series of workshops

S. K[1], J. Chaudary[1], S. Rawat[1], A. Dange[1], N. S Chopra[2], V. V.Patel[2]
[1]*The Humsafar Trust, Research, Mumbai, India,* [2]*Albert Einstein College of Medicine, New York, United States*

Background: In designing community-based interventions, best practices include holding community consultations to obtain insights for guiding programs and research design. However, little research is accessible on how best to integrate and center, especially in LMIC such as India. As part of *Project Chalo! 2.0* – our virtual multi-level intervention to increase HIV testing and status-neutral linkage to care among men who have sex with

men (MSM)– we conducted workshops with community stakeholders to guide intervention development and implementation.

Description: A series of four workshops were conducted at an LGBTQ+ community-based organization in Mumbai, India in February- May 2021to design a multi-level WhatsApp-based intervention incorporating messaging aimed to improve HIV testing uptake among MSM. Around14 MSM with varying field experiences – including community healthcare workers and HIV intervention beneficiaries– participated in the workshops.

We relied on user-centered design and open space technology processes to conduct these workshops. We applied the socio-ecological and information-motivation-behavior (IMB) frameworks to guide the selection of intervention components. The feedback related to study processes was sought online via video conferencing as India was experiencing the second wave of COVID-19. We used breakout rooms online to create two groups of participants and also used the polling option to reach a consensus.

Lessons learned: Through conducting these workshops, we found that a user-centered design and an open space technology process allowed for impactful discussion and dialogue between the community members and the intervention team. Stakeholders triangulated research findings and prioritized optimal targets for behavior change, informed recruitment, enrolment, retention, and incentive processes. Workshop participants also helped finalize the selection of digital content formats and the specific contents (e.g., word choice, design, and graphics).

Conclusions/Next steps: Integrating community- and front-line staff inputs into all aspects of intervention and research processes may help ensure successful participant engagement in virtual behavioral interventions. Using inclusive processes alongside rigorous theoretical models, we were able to successfully develop a community-centered, multi-level, multi-component virtual intervention. Our participatory intervention development approach can serve as a model for developing theoretically grounded and community-centered virtual behavioral interventions.

EPD010

Community-Based Participatory Research (CBPR): Lesson learned from a survey examining the impact of COVID-19 on access to STBBI-related health services among African, Caribbean and Black (ACB) people in Canada

A.J. Odhiambo[1], J. Etowa[2], S. Baidoobonso[3], C. Dabone[4], W. Tharao[5], A. Ogunleye[6], M.E. Etowa[7], A. Kaida[8], J. Osuji[9]

[1]Public Health of Canada, Centre for Communicable Diseases and Infection Control, Public Health Agency of Canada, Toronto, Canada, [2]University of Ottawa, School of Nursing, Faculty of Health Sciences, Ottawa, Canada, [3]Government of Prince Edward Island, Chief Public Health Office, Charlottetown, Canada, [4]University of Ottawa, School of Nutrition Science and Interdisciplinary School of Health Sciences, Ottawa, Canada, [5]Women's Health in Women's Hands, Toronto, Canada, [6]University of Prince Edward Island, Charlottetown, Canada, [7]University of Windsor, Faculty of Arts, Humanities and Social Sciences, Windsor, Canada, [8]Simon Fraser University, Faculty of Health Sciences, Burnaby, Canada, [9]Mount Royal University, School of Nursing and Midwifery, Calgary, Canada

Background: COVID-19, public health measures, and social determinants of health (SDOH) inequities have created unprecedented challenges in delivering and accessing sexually transmitted and blood-borne infections (STBBI), mental health, and harm reduction services for African, Caribbean, and Black (ACB) people.

The Public Health Agency of Canada (PHAC), in partnership with ACB researchers and community stakeholders, conducted a national anonymous online cross-sectional survey to understand the impact of the pandemic and SDOH on access to STBBI-related health services by ACB people. We describe the process and lessons learned.

Description: This Community Based Participatory Research (CBPR) initiative began in May 2020 to July 2021. In preparation for the survey, a partnership was established between PHAC and ACB researchers. An ACB-National Expert Working Group (ACB-NEWG) was created to ensure questionnaire development and survey implementation including promotion and recruitment and knowledge translation was culturally relevant, appropriate, and responsive. NEWG comprise of seven regional hubs made of researchers, service providers, community members, and leaders from the ACB community. Project team and the NEWG developed and validated survey questionnaire through several community consultations.

They also developed targeted recruitment and promotional strategies: use of existing networks of community-based organizations; Peer Research Assistants (PRAs); and social media. NEWG recruited and trained PRAs to promote the survey within their communities and among hard-to-reach populations, including youths, seniors, and the elderly.

Lessons learned: In total 1,556 participants completed the survey. Barriers to meaningful community engagement and successful CBPR that emerged and were addressed

through regular dialogues included limited funding; government policies; administrative procedures around data collection, analysis, ownership and sharing; and translation. Establishing and supporting a working group comprising of diverse and knowledgeable stakeholders and the authentic commitment of PHAC, project team and NEWG to the CBPR process throughout the various phases of the project design and implementation made the survey a major success.

Conclusions/Next steps: The ACB-NEWG has been a mechanism for generating creative ideas throughout the project design, and implementation of the survey on the impact of COVID-19. Authentic government and community collaboration is a promising approach for action-oriented CBPR that should be adapted to address equity data gaps and eliminate STBBI within marginalized communities.

Knowledge translation and dissemination of research and programme outcomes

EPD011

Knowledge translation of research findings: community interpretation of the results of the Positive Perspectives 2 survey of unmet treatment needs among people living with HIV in Australia

B. Allan[1], A. Maccarrone[2], A. McCarthy[3], H. Elis[4], D. Reeders[5], F. Drummond[2], B. Newham[3]

[1]Qthink Consulting, Malmsbury, Australia, [2]ViiV Healthcare Australia, Melbourne, Australia, [3]Living Positive Victoria, Melbourne, Australia, [4]Positive Women Victoria, Melbourne, Australia, [5]National Association of People Living with HIV Australia, Sydney, Australia

Background: By partnering community reviewers with the authors of a published manuscript from the Positive Perspectives 2 (PP2) survey of people living with HIV (PLHIV), we were able to demonstrate best practice in the co-creation of knowledge, create partnerships across professional domains, and promote greater access and equity to published peer reviewed journal articles.

Using aknowledgetranslationprocess, the product of a single plain English community accessible summary of an academic published manuscript brings published findings to a much larger audience and adds value to the process of publication while building community capacity in understanding the nuances of methodology, data and analysis.

Description: This project sought to bring community and research partners together to co-create a community accessible summary of the Australian cohort in the larger PP2 data set. The interpretation and analysis of this data set has been published in a peer reviewed journal which focuses upon a professional and academic audience in its tone and construction. By utilising community reviewers who each had their own interpretation of the manuscript, we were able to produce a short video which captured the key take home points of the journal article. The reviewers felt that a short video complimented by a written summary (for more information) would attend to those with lower literacy and ensure greater access to the findings.

Lessons learned: Far too often we forget that adult literacy is a barrier to knowledge development (Australia has on average a year 8 reading level across the adult population). By establishing a partnership between a journal author and a community member we were able to create a new relationship across professional boundaries, build capacity in the understanding of academic published research.

Conclusions/Next steps: This activity highlights the importance of making the research underpinning the academic publication more accessible to the community that it is intended to serve. It's also most important that the PLHIV that participate in such surveys can access the results of their participation and commitment.

EPD012

Barriers and facilitators to HIV Pre-Exposure Prophylaxis (PrEP) in the United Kingdom: a systematic review using the COM-B model

F. Coukan[1,2], H. Ward[3,2], C. Atchison[3], J. Saunders[4,5]

[1]Imperial College London, Department of Primary Care and Public Health, London, United Kingdom, [2]NIHR ARC Northwest London, London, United Kingdom, [3]Imperial College London, London, United Kingdom, [4]UK Health Security Agency, Blood Safety, Hepatitis, STI & HIV Division, London, United Kingdom, [5]University College London, Institute for Global Health, London, United Kingdom

Background: Early findings from British HIV Pre-Exposure Prophylaxis (PrEP) programmes in Wales, Scotland, and England have highlighted the inequitable delivery of PrEP in the United Kingdom (UK); while <50% new HIV diagnoses were in Men who have Sex with Men (MSM), they accounted for >95% PrEP users. We conducted a systematic review to identify barriers and facilitators (B&F) to PrEP access to facilitate equitable delivery of PrEP in the UK.

Methods: We searched conference/bibliographic databases using key words "HIV", "PrEP", "barriers", "facilitators", "underserved populations", and "UK". B&F were mapped along the PrEP Care Continuum (PCC) and domains of the Capability, Opportunity, Motivation and Behaviour (COM-B) model of behaviour change.

Results: Thirty studies were identified including 19 quantitative, 9 qualitative and 2 mixed-methods studies. Twenty studies exclusively recruited MSM, five recruited mixed populations (all included MSM as sub-population), and five were in other underserved populations (mostly ethnic minorities).

Of the twelve B&F identified (see tables), most related to the PrEP contemplation (n=6) and PrEParation (n=3) PCC steps, including some of the most commonly reported B&F: Lack of PrEP awareness, PrEP knowledge, and PrEP willingness and HIV testing history. Although B&F on those steps were mapped across COM-B domains, they were all at patient level

	Population studied (n=studies)	PrEP Care Continuum step	COM-B category	COM-B structural level
Lack of PrEP awareness	MSM (n=9), ethnic minorities (n=2), mixed populations (n=2), transgender women (n=1)	Step 2: PrEP contemplation	Psychological capability	Patient level
Lack of PrEP knowledge	MSM (n=8), ethnic minorities (n=2), mixed populations (n=4), transgender women (n=1)	Step 2: PrEP contemplation	Psychological capability	Patient level
Lack of PrEP willingness	MSM (n=9), ethnic minorities (n=1), mixed populations (n=2), transgender women (n=1)	Step 2: PrEP contemplation	Reflective motivation	Patient level
Lack of self-perception of HIV risk	MSM (n=4), ethnic minorities (n=1), mixed populations (n=2)	Step 2: PrEP contemplation	Reflective motivation	Patient level
Societal stigma of HIV	MSM (n=1), ethnic minorities (n=1), mixed populations (n=1)	Step 3: PrEParation	Societal opportunity	Patient level
Societal stigma of PrEP	MSM (n=5), ethnic minorities (n=1), mixed populations (n=2)	Step 3: PrEParation	Societal opportunity	Patient level
PrEP eligibility & guidelines	MSM (n=2), mixed populations (n=1)	Step 4: PrEP action and initiation	Physical opportunity	System level
Access to SSHS	MSM (n=10), ethnic minorities (n=1), mixed populations (n=2)	Step 4: PrEP action and initiation	Physical opportunity	System level
Adherence to PrEP	MSM (n=4), mixed populations (n=2)	Step 5: PrEP maintenance	Physical capability	Patient level

Table 1. PrEP access barriers in the UK

	Population studied (n=studies)	PrEP Care Continuum step	COM-B category	COM-B structural level
HIV testing history	MSM (n=9), transgender women (n=1)	Step 2: PrEP contemplation	Psychological capability & physical opportunity	Patient level & provider level
Good HIV knowledge	MSM (n=2), ethnic minorities (n=2), mixed populations (n=1)	Step 2: PrEP contemplation	Psychological capability	Patient level
Agency and self-care	MSM (n=5), ethnic minorities (n=2), mixed populations (n=1)	Step 3: PrEParation	Reflective motivation	Patient level

Table 2. PrEP access facilitators in the UK

Conclusions: While these findings offer insights on factors which prevent and facilitate PrEP access, the bulk of evidence focusses on MSM, and on patient-level attributes rather than structural/contextual factors. Future research should study other underserved communities (women, injecting drug users, transgender, and minority ethnicity individuals) and structural factors such as service availability to improve PrEP equity in the UK.

EPD013

Role of Female health workers during HIV/AIDS EPIDEMICS in Sindh Pakistan

N. Ahmed[1]

[1]*Shaheed Zulfiqar Ali Bhutto Institute of Science & Technology (SZABIST) Karachi, Public Health, Karachi, Pakistan*

Background: Pakistan is among the nations reporting the highest growth in HIV infections globally. Particularly in Sindh province, HIV has reached an alarming stage among vulnerable groups of society. The primary purpose of this study was to investigate female health professionals' HIV-related knowledge, attitudes, and behaviors in rural Pakistan. A general practitioner (GP) started seeing an unusually rise of cases in young children with HIV (AIDS) infection earlier this year.

There is a fault in the health care system because the women who are hired as female health workers have insufficient knowledge, awareness, and handling of HIV. Their poor attitudes, inappropriate practices related to HIV, are the key variables affecting the proper control of HIV/AIDS spread.

Methods: This current quantitative cross-sectional study was conducted on Female health workers age range between 18 to 60 years after taking proper training and at least three months of field experience to assess their KAPs on HIV/AIDS. Total 316 LHWs were selected who meet the inclusion criteria.

Results: It was found half of the LHWs were Matric passed with 50.9% of them being aware of HIV/AIDS as a viral disease. Interestingly 84.8% of LHWs had knowledge that HIV could be transferred by un-protective sexual intercourse, 73.7% of LHWs were aware that unchecked blood transfusion could result in HIV/AIDS.

57% of LHWs knew that needle stick injury might result in acquiring HIV/AIDS, while 37.3 % of LHWs had knowledge that it could be transmitted vertically from mother to baby. 69% of the LHWs had a positive attitude toward HIV/AIDS patients. Nearly half of the LHWs had an opinion of patients can work at their working place and the other half have an opinion of isolation and hospitalization.

The majority of the LHWs were agreed that every hospitalized patient and pregnant lady should be screened for HIV/AIDS. Regarding practices of the LHWs for HIV/AIDS, 75.3% had poor practice.

Conclusions: keeping in view of the above finding it can be seen that these are the main hindrances in limiting the HIV/AIDS spread. Although LHWs had average knowledge and attitude related to HIV/AIDS and observed poor practice with some misconceptions regarding HIV/AIDS.

EPD014

Top-down approach: using community adult educators to disseminate HIV/AIDS information

M. Nangonzi[1]

[1]*Vvamutulo Womens' Group, Community Education, Kanoni Town, Uganda*

Background: An assessment of the level of willingness of adult and community educators to sensitize sexual minorities, with specific reference to LGBT people, about HIV/AIDS in Wakiso district of central Uganda.

Methods: A cross-sectional survey was carried out among (n-300) adult and community educators who had just graduated. Questionnaires with knowledge and attitude questions concerning sexual minorities particularly LGBT people and sexual workers were distributed to the participants during a week-long participatory workshop organized under the theme; Top down approach: Breaking the chain of HIV infection and drug use in sexual minorities, a community and adult educator's approach.

Results: Of the (n=300) more than 70% completed and returned the survey. 50% of the respondents acknowledged that they would not facilitate any HIV-health-related information session to LGBT people in the community compared to 20.0% that would pass the information to sex workers (χ^2= 24.06 p = 0.001). Respondents that had not attended any training session on stopping the stigma about HIV/AIDS and its spread in communities were less motivated to include sexual education activities addressing sexual minorities in the community (χ^2= 8.06;p = 0.06). Educators that had been affected by HIV/AIDS pandemic were more likely to facilitate information sessions to an exclusively sexual minority audience if the need arises.

Conclusions: The training knowledge about HIV/AIDS in relation to LGBT and sex workers was hugely influenced by attitudes and perceptions attached to these groups.

All those that didn't want to do anything with educating LGBT people and sex workers, blamed it on how the conservative community would perceive them. There is little or no training in this area on the curriculum for community and adult educators.

Therefore, there is a need for a more broader and liberal curriculum in the areas of HIV/AIDS and sexual minorities especially the hugely marginalized LGBT group in Uganda.

EPD016

Communicating truths: promoting HIV and stigma awareness through storytelling and devised performances inspired by the #MayStigmaBa? Project qualitative research

E. Figuracion[1], J. Fontilla[2], I.F. Alquiros[3], G.L. Bendicion[1], R. Pagtakhan[4], E. Bagasol, Jr.[5], M.C. Azarcon-Bolivar[6], V. Balanon II[6], V. Paguirigan[6], D.J. Dolot[6], T. Balensoy III[1], M.L. Farinas[1], B.I. Mendoza[1], M. Muyargas[7], A.H. Pamoso[1], J.L. Panaligan[1], V. Reyes[1], A.M. Robles[1], K.A. Sarmiento[1], A.P.V. Villasanta[1], J.E. Violago[1]

[1]*Culture and Arts Managers of the Philippines (CAMP) Pag-Ayo, Inc., Research Department, Mandaluyong, Philippines, the,* [2]*Australian Federation of AIDS Organizations, Sustainability of HIV Services for Key Populations in Asia Program, Bangkok, Thailand,* [3]*Culture and Arts Managers of the Philippines (CAMP) Pag-Ayo, Inc., Executive Department, Mandaluyong, Philippines, the,* [4]*LoveYourself, Inc., Taguig City, Philippines, the,* [5]*LoveYourself, Inc., Sustainability of HIV Services for Key Populations in Asia Program, Taguig City, Philippines, the,* [6]*Culture and Arts Managers of the Philippines (CAMP) Pag-Ayo, Inc., Performance & Art Pedagogy, Mandaluyong, Philippines, the,* [7]*University of the Philippines Visayas, Gender and Development Program, Miagao, Philippines, the*

Background: Stigma against HIV/AIDS and key populations are well-investigated in the social sciences. However, the endpoint of research is often publication in scientific journals, to which the public may have limited access. This project explored how art can translate scientific research into a widely accessible format.

Description: The project translated insights from the #MayStigmaBa qualitative research into performances. Using the Devising Method (Oddey, 1994; Heddon & Milling 2006), four performer-collaborators and the devising director performed the following in 11 days: dramatistic-thematic analysis; improvisation, storytelling, and scene studies exploration; live scriptwriting; output refinement; and filming. Five films (3 to 5 minutes each) were produced, each representing and communicating the following insights from the research: layers of stigma on LGBT persons; psychological distress experienced when considering an HIV test; difficulty of sex conversations; challenges of starting sex conversations; and media viewing as an aid for beginning challenging conversations. The videos were launched through a public Livestream and released on YouTube.

Lessons learned: The project demonstrated that devising can translate qualitative research data into a widely communicable medium within a short timeframe. The collaborative-reflective process enabled artists to reflect upon their own stigma experiences and deepen their understanding of stigma as a social issue.

Conclusions/Next steps: By translating research into a widely communicable medium, the arts may aid in disseminating scientific knowledge to audiences beyond the scientific community, which may be important for con-

sensus building for stigmatized communities and their allies. Devising may be a technique for deepening the commitment of individuals to combat stigma in their communities. Next steps entail formal evaluation on the reach and effectiveness of the stigma reduction campaign.
This will be used in HIV program development towards achieving the UNAIDS Global Strategy of having less than 10% of key populations experiencing stigma and discrimination.
Following the recommendations of the Human Rights Baseline Report Philippines (PA 1.4: Expansion of outreach activities to include specific attention to stigma and discrimination as barriers to access to services), the devising methodology, as well as the outputs, can be used to create information, education, and communication materials and outreach activities.

EPD017

Adolescents living with HIV from multiple countries being lead-partners in the co-production of research information and findings across global clinical trials

M. Shibemba[1], M. Conway[1], C. Kiganda[2], G.M. Ahimbisibwe[2]
[1]Fondazione Penta Onlus, Padova, Italy, [2]MU-JHU Care Ltd/ MU-JHU Research Collaboration, Kampala, Uganda

Background: As HIV community information is predominantly created by adults in formats decided by adults, children and young people living with HIV (C&YPLHIV) cannot meaningfully engage and 'follow the science'. Since 2017, Fondazione Penta ONLUS has developed a model of youth participation - Youth Trials Boards (YTBs) - to train and support C&YPLHIV (aged 15 -19) from RSA, Zimbabwe, Uganda, UK and Russia, supporting active participation participate in global paediatric studies (ODYSSEY, BREATHER+, D3, LATA, REACH).
Description: A key role of YTBs is translating and disseminating research for their peers. Using youth participation models, YTBs have produced:
- Patient Information Sheets in infographics/images (Breather+)
- DTG/NTD information through infographics (ODYSSEY)
- Additional information explaining trials through posters and videos (LATA, D3)
- Research findings through social media videos (ODYSSEY)
- Instagram carousel posts for bitesize findings in multiple languages (REACH)
- Instagram video interviews with lead paediatric and maternal health scientists

Lessons learned: A child rights/youth participation framework is essential in information production, which requires input from experienced workers.
Importantly, C&YPLHIV know how and where their peers consume information, and research dissemination should be led by them.
The process takes time building knowledge/understanding with researchers and C&YPLHIV.
Expectations and understanding of the process and outcomes of 'co-production' is paramount for all involved.
There is a lack of understanding and consistency within REC/IRBs. The same co-produced materials have been both accepted and rejected by different REC/IRBs, with no consistency in their feedback. Trials have had to revert to using information deemed 'inaccessible, too long and not ethical' by the C&YPLHIV who reviewed it.
Conclusions/Next steps: Involving C&YPLHIV in sharing research findings will increase knowledge and improve self-care in this cohort, as well as instilling hope for their future.
Co-production models ensure scientific findings are in the correct language and format for C&YPLHIV.
REC/IRBs need to engage to understand youth participation and how their decisions impact on the informed understanding and decision-making of C&YPLHIV.
Penta has produced Quality Standards for the ethical and meaningful participation of children and young people in clinical trials and research to support rolling-out of this practice.

EPD018

Could social media facilitate HIV services promotion among key populations in LMICs? Lessons from a crowdsourced randomized controlled trial

G. Marley[1,2], W.-K. Seto[3], J.D. Tucker[1,4,2,2], R.K.J. Tan[1,2], W. Yan[5], W. Tang[6,1,2], W.C.W. Wong[7,5]
[1]University of North Carolina, China-Project, Guangzhou, China, [2]SESH (Social Entrepreneurship to Spur Health) Global, Guangzhou, China, [3]University of Hong Kong-Shenzhen Hospital, Department of Medicine and State Key Laboratory for Liver Research, Hong Kong, Hong Kong, SAR of China, [4]London School of Health and Tropical Medicine, Faculty of Infectious and Tropical Diseases, London, United Kingdom, [5]Hong Kong University-Shenzhen Hospital, Department of Family Medicine & Primary Care, Hong Kong, Hong Kong, SAR of China, [6]Guangdong Second Provincial General Hospital, Guangzhou, China, [7]Hong Kong University-Shenzhen Hospital, Department of General Practice, Hong Kong, Hong Kong, SAR of China

Background: HIVservices like self-testing, pre-exposure prophylaxis, post-exposure prophylaxis and antiretroviral therapy are essential to global HIV prevention and control. They are however underutilized among key populations (KPs) in many lower/middle-income countries (LMICs) due to lack of awareness about services availability. Digital tools like social media are an inexpensive means of disseminating information to a broader audience and could facilitate publicizing HIV services availability in LMICs.
Description: We evaluated the capacity of four crowdsourced materials to encourage hepatitis B (HBV) and hepatitis C (HCV) testingamong primary care users in

Oral abstracts

Poster exhibition

E-posters

Late-breaker abstracts

Author Index

a randomized controlled trialfrom November 2019 until June 2021 (clinical trial reference: ChiCTR1900025771). Intervention materials were sent to participants using WeChat,the most popular mobile phone-based social media messaging app in China. Participants received one video or infographic weekly for four weeks and were encouraged to suggest improvements to the materials.

Lessons learned: A total of 376/750(50.1%) study participants were randomized to the intervention arm, and 310/376 (82.4%) were retained at follow-up. Overall, 230/310 (74.2%) participants saw all four materials which increased the odds of HBV (aOR=1.75, 95%CI:1.07-2.93) and HCV (aOR=1.89, 95%CI:1.25-2.88) testing compared to not seeing any (35/310;11.3%). Online dissemination was cheaper than printing and distributing, enabled easy sharing and participants retained unhindered access to the materials for one week.

Thus, this strategy could be an effective way to create HIV services awareness among KPs in LMICs with smartphone technologies accessibility.The platform enabled interactive particpant feedback and could facilitate anonymous engagement of KPs in tailoring HIV programmes without sexual orientation disclosure. Technological problems included limited phone memory, limited internet access, and unviewed materials could not be re-accessed after a week unless re-sent.

Also, participants deemed receiving the same materials more than twice per week a nuisance and successful dissemination did not necessarily translate to receipt, viewing, and application although we anticipated some participants may not see the materials.

Conclusions/Next steps: Social media could be an efficient means of publicizingHIV services and promoting service uptake among KPs in LMICs that value traditional gender norms.

Our future research will anticipate technological challenges and the lesson that successful dissemination of materials may not necessarily translate to application among target populations.

EPD019

The utility of the Continuous Quality Improvement (CQI) methodology in identifying and addressing gaps in the HIV Care Continuum: the case of USAID strengthening the Care Continuum

P. Yikpotey[1], H. Nagai[1], J.K. Tambil[2], S. Aidoo[2], T.A. Ayoumah[2], E. Adiibokah[1], Y. Ahmed Abdul Rahman[1], R. Yoon[1], M. Kowalski[1]

[1]JSI Research & Training Institute, Inc., USAID Ghana Strengthening the Care Continuum Project, Takoradi, Ghana, [2]Ghana Health Service, Effia Nkwanta Regional Hospital, Sekondi-Takoradi, Ghana

Background: In low prevalence and generalized epidemic contexts such as Ghana, effective and efficient case identification is critical in meeting the first 95% of the global 95-95-95 targets. However, structural and policy level challenges often inhibit utilization of all entry points for effective case identification. This abstract illuminates the power of the continuous quality improvement (CQI) methodology to test a change idea and convince reluctant policy actors to use blood banks as a feasible entry point for HIV testing and linkage to care in Ghana.

Description: As part of its CQI process in 2019, the USAID Strengthening the Care Continuum (Care Continuum) project implemented by JSI Research & Training Institute, Inc. collected retrospective baseline data from eight hospitals on blood donors in the Western Region (WR) of Ghana.

The analysis revealed that about one percent (40 out of 3,152) voluntary donors and over two percent (299 of 11,743) replacement donors were reactive to HIV. This prevalence was close to the national average of two percent.

However, due to stigma and fears of discouraging potential blood donors, these reactive donors missed the opportunity to know their HIV status and receive timely treatment. The Care Continuum project therefore used the largest hospital in WR, the Effia Nkwanta Regional Hospital (ENRH), to test an innovation by offering HIV testing services to blood donors as a test case. Two nurses from the blood bank received additional training on counseling to offer HIV tests to donors at the point of sample taking.

Additional key stakeholder engagement included convincing hospital authorities that with effective counseling, HIV positive donor results could be disclosed without negative consequences.

Lessons learned: The change idea was successful and offering HIV testing services to donors did not lead to a reduction in persons donating blood. From April 2020 to June 2021, 3,634 donors were offered HIV testing services and eleven positive cases were identified and linked to care.

Conclusions/Next steps:

- Harness the findings of this intervention for high-level policy engagement.
- Conduct more rigorous research studies in this area to inform policy and practice.
- Scale-up to other blood banks.

EPD020

Young people center design: implementation of a HIV Projet in Cameroon

L. Vartan Moukam[1], S.B. Seukam Kouenkap[2], M. Fofana-Diallo[3], I. Tchomago[1], W. Nloga[1]

[1]Cameroon Association for Social Marketing, Yaounde, Cameroon, [2]M&E PPSAC Consultant, Yaounde, Cameroon, [3]Population Services International, Yaounde, Cameroon

Background: Among young people aged 15 to 24 in Cameroon, only 11% use a condom during sexual intercourse and 12.3% have attitudes of tolerance towards people living with HIV (PLHIV).

Description: To meet the needs of the young population (15 to 24 years old), women (15 to 49 years old) and the vulnerable population in Cameroon, the HIV/AIDS Prevention Project in Central Africa aims both to fight against stigma of PLHIV and to promote the use of condoms through several channels. This concerns the promotion and distribution of condoms, the 100% Jeunes magazine, multimedia campaigns (TV and Web broadcasts, displays, 100% Jeunes Facebook live & radio broadcasts, green line) and non-media (capacity building, sensitization, empowerment, screening). Routine data is collected, entered, verified and analyzed in DHIS2, and qualitative and quantitative studies are conducted periodically during project implementation. This project is funded by KfW through OCEAC, and implemented in Cameroon by ACMS.

Lessons learned: On the basis of ten (10) Focus Group Discussions carried out with young people aged 15-24, the project's communication team readjusted the content of the messages of the "Shoes like never before" campaign, as well as the radio spots and TV according to the needs and orientations of the target.

The immediate effect of this campaign, which was broadcast during quarters 3 and 4 of 2021, was a renewed interest among young people in calls on the condom theme. DHIS2 data reveals that the number of calls on the Green Line increased from 222 to 471 between semester 1 and semester 2 2021, including 2 and 12 calls respectively for the condom theme.

Conclusions/Next steps: A rigorous process of intervention or implementation of activities aimed at young people that takes into account their opinions and perceptions through qualitative and quantitative studies can improve the performance of the project.

By including the voices of young people to refine our messages, we have enabled our target group to access information much more frequently via the Green Line.

EPD021

A Nurse-Led HIV Prevention Model of Care

H. Barker[1], R. Perkins[1]

[1]Country Doctor Community Health Clinics, Medical - HIV Care and Prevention, Seattle, United States

Background: To discuss implementation successes of a nurse-led HIV prevention model of care (NLHPMC) in alignment with the Centers for Disease Control Clinical Practice Guidelines and detail the more recent interventions employed to reduce barriers to access and care. Our aim is that other nursing teams may model similar nurse-led PrEP programs in a primary-care setting, regardless of funding.

Description: Country Doctor Community Health Centers (CDCHC) are a network of community-based health clinics located in Seattle, Washington, Country Doctor Community Clinic (CDCC) is located in Capitol Hill, the LGBTQ+ district of Seattle, and our other primary care site, Carolyn Downs Family Medical Center (CDFMC), is located in the heart of the Central District which is known to be one of the most racially and ethnically diverse communities in Seattle.

In 2014, CDCHC developed an NLHPMC program to increase access to preexposure prophylaxis (PrEP) for patients who may be vulnerable to HIV/STIs. This model of care centers the nurse as a clinician to screen, educate, initiate, and follow-up with patients who may benefit from PrEP. The program has streamlined PrEP guidelines into a structured clinical workflow, created conversion visits to provide a safety net for patients with primary care concerns, and received the Ending the HIV Epidemic-Primacy Care HIV Prevention (PCHP) grant to expand our efforts to deliver HIV prevention services. To date the program services nearly 300 patients, 82% male, 20% non-white, and 18% Hispanic.

Lessons learned: We continue to appreciate an increase in patients on PrEP at CDFMC; this may directly reflect our efforts to expand service access to the After-Hours Clinic (AHC), an urgent care clinic on the CDFMC campus with a drop-in format to ensure low barrier care for individuals who may not typically access primary care services.

Conclusions/Next steps: We have developed a successful NLHPMC to deliver HIV prevention services. As part of our program expansion, we now have evening and weekend coverage which has been a tremendous support to expand service hours and advance sexual health access. Many of the new PrEP initiations have occurred on the weekend, a potential missed opportunity if not for the PCHP funding.

EPD022

Predicators of uptake of high impact HIV services by adolescents and young women. Findings from Eswatini

D. Kisyombe[1], C. Hulett[2], S. Ginindza[3], N. Gwebu Storer[4]

[1]Pact Inc, Results and Measurements, Washington DC, United States, [2]Pact Inc, HIV Prevention, Mbabane, Eswatini, [3]Pact Inc, Strategic Information, Mbabane, Eswatini, [4]Pact Inc, Management, Mbabane, Eswatini

Background: Pact implements the DREAMS (Determined, Resilient, Empowered, AIDS-free, Mentored and Safe) program in Eswatini to reduce HIV vulnerability and new infections among Adolescent Girls and Young Women (AGYW). Once assessed and enrolled in the program, AGYW have access to interventions across health, education, protection and livelihoods based on needs and mentorship plans. The uptake of services (HTS, FP, PrEP, Condoms), however, has not been consistent among participants. To increase coverage, the program conducted analysis of programmatic data to understand predictors of these service uptake.

Methods: A cross-sectional analysis was conducted using Stata for the April 2018 – September 2021 implementation period. Researchers analyzed data from vulnerability as-

Author Index

sessments and access to service. Bivariate analysis was conducted using Logistic Regression to predict the uptake of HTS, FP, PrEP, and Condoms (dependent variables), against age-groups, education, duration in DREAMS program, vulnerability criteria (independent variables).

Multicollinearity was tested using spearman command with less than 0.7 result. Postestimations of margins were also plotted at sample means with age-groups and duration in DREAMS as covariates.

Results: The Logistic Regression model revealed that duration in DREAMS program predicts uptake of PrEP, FP, and condoms but not HTS. Education predicted HTS and condoms while vulnerability criteria (pregnancy) was a predictor for HTS uptake. Age group predicted PrEP and condoms but not HTS and FP Commodities.

HIV Service	Predictors	Odds ratio	95% Confidence Interval	p- value
HTS	Pregnancy	.669	.510- .878	0.004
	Education (Primary)	.800	.67 - .94	0.010
	Education (College)	1.90	1.05– 3.93	0.032
	HIV status (undisclosed)	.732	.610- .87	0.001
	HIV status (Positive)	.269	.217- .334	0.000
PrEP	Age (20 – 24 years)	5.85	2.3 – 14.64	0.000
	Duration in DREAMS (0 -6 months)	1.12	1.02– 1.22	0.011
	Duration in DREAMS (13-24 months)	1.12	1.04– 1.20	0.002
FP commodities	Duration in DREAMS (0 -6 months)	1.16	1.08– 1.24	0.000
	Duration in DREAMS (7-12 months)	1.14	1.06– 1.21	0.000
	Duration in DREAMS (13-24 months)	1.14	1.06– 1.21	0.000
Condoms	Age (15 – 19 years)	1.41	1.11– 1.79	0.004
	Duration in DREAMS (13 -24 months)	8.79	3.86– 20.03	0.000
	Duration in DREAMS (25+ months)	2.90	1.17- 7.16	0.021
	Education (Primary)	.631	.553- .721	0.000
	Education (out of school)	1.19	1.02– 1.39	0.019

Table.

Conclusions: The results suggest that service delivery should be sensitive to increased chances of uptake or attrition based on socio demographic characteristics of participants. This means designing interventions to ensure increased access to PrEP and FP commodities at the first six months of enrolment.

The design should also consider HTS validation to eliminate confirmatory retests of known positives. Flexible approaches that consider needs and constraints of participants to incentivize retention.

EPD023

Knowledge syntheses of stigma: a needed umbrella review

S. Hempel[1], L. Ferguson[2], N. Fu[1], N. Christie[1], S. Yagyu[1], M. Bolshakova[1], M. Rozelle[1], A. Motala[1], S. Gruskin[2]

[1]*University of Southern California, Southern California Evidence Review Center, Los Angeles, United States,* [2]*University of Southern California, USC Institute on Inequalities in Global Health, Los Angeles, United States*

Background: Despite strong global commitments to eliminate HIV-related stigma and discrimination, mitigation efforts need to improve further. To facilitate learning across global and local strategies, we conducted an umbrella review of systematic reviews on stigma in HIV to provide context as part of *Getting to the Heart of Stigma*, an IAS-funded initiative.

Methods: We searched PubMed, PsycINFO, and Web of Science from 2008 to May 2021 without language restriction. Two independent reviewers included reviews if people living with or disproportionally affected by HIV were a target population, and stigma and/or discrimination were part of the search, eligibility criteria, prespecified analyses, or key results. Reviews were categorized according to main content themes.

Results: In total, 194 reviews met inclusion criteria. Bibliometric analysis shows increasing interest in HIV-related stigma and discrimination. Included reviews varied in scope, with some focused exclusively on stigma while others combined multiple factors.

Reviews addressed: Associations and effects of stigma/discrimination (n=28), Access to care (n=26), HIV testing (n=26), Country-specific exploration of stigma/discrimination (n=18), Treatment adherence (n=20), HIV experiences (n=14), Stigma/discrimination reduction in the community (n=13), HIV disclosure (n=9), Stigma/discrimination in healthcare (n=9), Rights and regulations (n=7), Intersectionality (n=6), Measuring stigma (n=6), HIV prevention (n=4), Stigma reduction in low income countries (n=4), Self-stigma (n=2), Other (n=2). The umbrella review shows the range of HIV stigma research components that have been targeted, highlighting the continued emphasis on exploring the effects of stigma, systemic issues with access to care, and slow progress in HIV testing. The evidence map visualizes the research volume and content of the included systematic reviews.

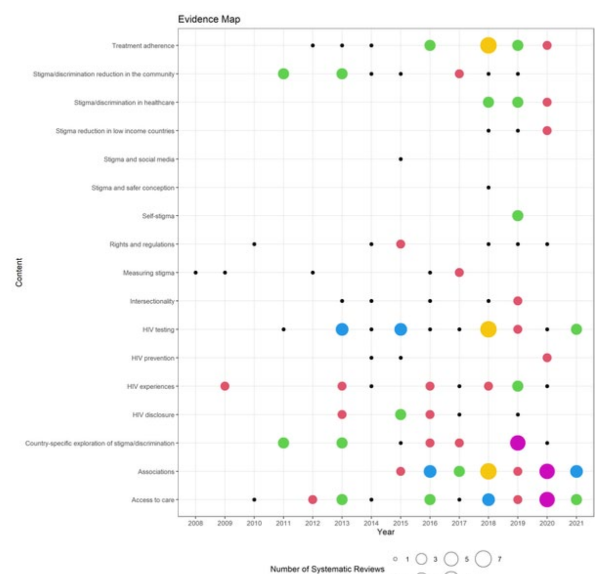

Figure.

Conclusions: This umbrella review provides a comprehensive overview of the existing evidence base on HIV stigma and discrimination and points out existing research gaps. It provides context for future knowledge generation needed to better support people living with HIV or disproportionally affected by HIV.

EPD024

The Cedar Project: Evaluation of a culturally safe case management approach in supporting hepatitis C treatment among Indigenous people who use(d) drugs in B.C

A. Mazzuca[1], S. Pooyak[2], D. Zamar[3], M. Pearce[1], K. Jongbloed[4], V. Thomas[5], E. Yoshida[6], M. Schechter[1], P. Spittal[1]

[1]University of British Columbia, School of Population and Public Health, Vancouver, Canada, [2]Aboriginal HIV/AIDS Community-Based Research Collaborative Centre, Saskatoon, Canada, [3]Children's Hospital Research Institute, Vancouver, Canada, [4]University of Victoria, School of Public Health & Social Policy Faculty of Human & Social Development, Victoria, Canada, [5]University of British Columbia, School of Population and Public Health, Prince George, Canada, [6]University of British Columbia, Faculty of Medicine, Vancouver, Canada

Background: Direct-acting antiviral therapies work to improve the health and wellbeing of people living with hepatitis C (HCV). Yet, for Indigenous peoples in Canada, systemic racism continually imposes barriers to this life saving treatment. The Blanket Program, conceptualized by Cedar Project's Indigenous governance, was developed to mitigate barriers by providing culturally safe case management support before, during, and after treatment.

In this study, we examined program's impact on HCV treatment, reinfection, and contextual factors disrupting adherence.

Methods: Blanket Program is a two-site pilot study nested in an Indigenous governed cohort in Vancouver and Prince George, BC. Main outcomes were sustained virologic response (SVR) at 12 weeks post-treatment and HCV RNA within 9 months post-treatment.

Adherence was measured through self-report scale. *A priori* non-inferiority margins, based on HCV specialists' recommendations, were set at: >80% SVR12 and <20% HCV RNA. Logistic regression was used to assess factors associated with imperfect adherence (>5% missed doses). Results were adjusted for location, age, and sex.

Results: Between 2017-2019, 60 participants enrolled in the program. Fifty-three percent were female, 32% HIV coinfected, and 78% recently used injection drugs. Intention to treat proportion reaching SVR12 was 92% (55/60) remaining above non-inferiority margin of 80% (*p*=0.012, 95%CI: 0.833, 1.000). HCV RNA post-treatment was 9% (5/55) remaining below non-inferiority margin of 20% (*p*=0.025; 95%CI: 0.000, 0.116). Forty-two percent (25/60) demonstrated imperfect adherence.

In adjusted regression analysis, housing instability (aOR: 11.01; 95%CI: 2.22, 54.57; *p*= 0.003) and living in Vancouver (aOR: 5.30; 95%CI: 1.39, 20.25; *p*= 0.015) were associated with imperfect adherence.

Recent overdose (aOR: 4.04; 95%CI: 0.91, 17.99; *p*= 0.067) was marginally associated with imperfect adherence. Older age (aOR: 0.90; 95%CI: 0.83, 0.99; *p* = 0.025) was associated with strong adherence and recent access to traditional food (aOR: 0.32; 95%CI: 0.09, 1.10; *p*=0.070) was marginally associated with adherence.

Conclusions: Findings demonstrate a culturally safe case management approach supports high HCV cure rate and mitigates reinfection risk among Indigenous people who use(d) drugs.

EPD025

Research gaps in a sample of studies on people with HIV and key populations, with a view to proposing the sustainability of services in Latin America

A. De Leon[1]

[1]International Treatment Preparedness Coalition Latin American and Caribbean, Guatemala, Guatemala, Guatemala

Background: Within the framework of the grant Promoting better living conditions and human rights of people with HIV and other key populations, financed by the Global Fund to fight HIV/AIDS, tuberculosis and malaria. Grant that is led by the Positive Leadership Alliance and Key Populations (ALEPPC) launched the Diagnosis of identification of existing gaps on research in People with HIV and key population based on the sustainability of services

Methods: The research had a regional scope and focused on 11 Latin American countries: Bolivia, Colombia, Costa Rica, Ecuador, El Salvador, Guatemala, Honduras, Nicaragua, Panama, Paraguay and Peru.

A methodology composed of five work phases described below

1. Definition of the central axis of the investigation and review of input information,
2. In-depth documentary review of 383 documents in the last 10 years,
3. Participatory Consultation Process,
4. Identification of research gaps or knowledge gaps and
5. Design of the regional plan and national advocacy plans.

Results: Based on the implemented research process, 5 types of gaps were established, described below:

A: Critical information gaps for the sustainability of HIV-AIDS services from a focused and selective approach

B: Deficits in the modes of collaborative production of knowledge between the entities involved in the scientific-academic world, civil servants from the public sector, international cooperation and People w/ HIV/key populations.

C: Factors that affect the appropriation and use of available knowledge on HIV-AIDS by decision-makers and People w/ HIV/key populations.

D: Knowledge deficits that affect the monitoring and evaluation of public policies and programs on HIV-AIDS

E: Gaps in knowledge about the ecosystem of international and national financing to provide sustainability of services.

Conclusions: There are gaps in strategic information related to HIV, especially regarding the social determinants of HIV and community aspects, including the evaluation of the impact of community interventions. These gaps are opportunities to address strategic information to promote the sustainability of the response to HIV.

Mixed methods, integrated approaches and synergies in HIV research and intervention

EPD026

Understanding user engagement with an mHealth intervention supporting adolescents with HIV in South Africa

M.I. Mulawa[1,2], B. Mtukushe[3], E.T. Knippler[1], M. Matiwane[3], M. Al-Mujtaba[1], K.E. Muessig[4], J. Hoare[3], L.B. Hightow-Weidman[5,4]

[1]Duke University, School of Nursing, Durham, United States, [2]Duke University, Duke Global Health Institute, Durham, United States, [3]University of Cape Town, Department of Psychiatry and Mental Health, Cape Town, South Africa, [4]University of North Carolina at Chapel Hill, Gillings School of Global Public Health/Health Behavior, Chapel Hill, United States, [5]University of North Carolina at Chapel Hill, Medicine/Infectious Diseases, Chapel Hill, United States

Background: Understanding and supporting user engagement with HIV-related mHealth interventions is needed to maximize intervention effectiveness. Paradata (back-end system data automatically collected as users interact with mHealth interventions) can provide detailed metrics of user engagement, but they remain underexplored, particularly in formative phases of research where user feedback is sought to make enhancements.

Our team has developed *MASI*(*MAsakhane Siphucule Impilo Yethu*) Xhosa for „Let's empower each other and improve our health")), an mHealth intervention to improve treatment adherence among adolescents with perinatally-acquired HIV in Cape Town, South Africa.

We conducted this study to quantify and contextualize initial levels of participant engagement across*MASI*features.

Methods: This convergent mixed methods study was conducted between August – December 2021. Enrolled participants (n=12) received access to*MASI*for 3 weeks. Semi-structured in-depth interviews were conducted prior to app installation and after 1-2 weeks of app testing. Engagement with*MASI*was quantified through analysis of paradata and in-depth interview guides were tailored to each participant based on their app use.

Results: Participants (6 males, 6 females; ages 16-19 years) spent an average of 22 minutes (range: 1-51 minutes) using *MASI*. Varied patterns of engagement across features were observed. Participants who prioritized resources and activities explained that the features helped keep their minds busy. Those who used the health tracker to track adherence often also tracked meals and mood, noting that they sometimes forgot to eat and appreciated being asked about their feelings.

Participants had high expectations for the forum, though active engagement (e.g., posting) was limited due to participants feeling shy. Those active in the forum appreciated the warm response from peer mentors, highlighting their important role.

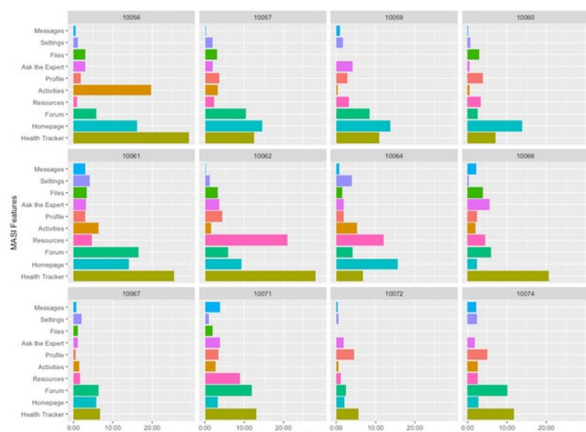

Figure. Total time spent in MASI features for each participant

Conclusions: Systematically analyzing paradata and using the findings to qualitatively explore participant experiences allowed us to gain richer insights into patterns of participant engagement, enabling our team to further enhance MASI.

EPD027

Rapid or immediate ART, HIV stigma, medical mistrust, and retention in care: an exploratory mixed methods pilot study in New York City

O. Mgbako[1], C. Loughran[2], R. Mathu[3], J. McLean[4], D. Castor[4], S. Olender[4], P. Gordon[4], M.E. Sobieszczyk[4], R.H. Remien[5]

[1]NYU Langone Health, Medicine, New York, United States, [2]NYU Rory Meyers College of Nursing, New York, United States, [3]Columbia ICAP, New York, United States, [4]Columbia University Medical Center, New York, United States, [5]HIV Center for Clinical and Behavioral Studies, New York, United States

Background: Rapid or immediate antiretroviral therapy (iART) after HIV diagnosis, which improves linkage to care and shortens time to viral suppression, has become standard of care globally. The United States HIV epidemic is marked by racial, ethnic, gender and sexual minority disparities partly due to HIV stigma and medical mistrust. This mixed methods pilot study examines iART's psychosocial costs/benefits for a diverse, newly diagnosed patient population and explores associations between iART, HIV stigma, medical mistrust and visit adherence (VA).

Oral abstracts

Poster exhibition

E-posters

Late-breaker abstracts

Author Index

Methods: Participants (n=30) were recruited from an HIV clinic in New York City (October 2020 - June 2021). A convergent parallel design combined
1. Quantitative data comprising electronic records, demographic survey, the HIV Stigma Survey (HIVSS) and Medical Mistrust Index (MMI), and
2. Qualitative data from a semi-structured in-depth interview six months post-diagnosis.
We divided the sample into three groups by time to iART initiation based on New York's iART goal (within 3 days of diagnosis).
Survey and chart review data were triangulated/analyzed using descriptive statistics. HIVSS and MMI were scored using Likert scale. For qualitative data, we used a priori and emergent codes, calculated inter-coder agreement (Kappa 0.91), and conducted thematic analysis. We integrated quantitative and qualitative findings.
Results: The 0-3 day group (mean age 34.8, SD 8.7) was mostly English-speaking, Black and gay-identified, with more substance use diagnoses. The 4-30 day group (mean 34.5, SD 9.3) had more mental health diagnoses, and lower CD4 at presentation. The >30 day group (mean 39.4, SD 22.1) was mostly Spanish-speaking, male, and less educated. HIVSS, MMI, VA and themes were integrated (Table 1).

Demographics	Themes	Representative Quotes	Mean HIVSS Score*	Mean Medical Mistrust Index Score**	Visit Adherence
0-3 Days (n=8)					
Mean age (SD) = 34.8 (8.7) 75% Male 63% Gay 50% Black/African American 63% Hispanic	iART as stigma prevention	My cousin and his wife were heroin addicts. They were a beautiful couple…They found out they had HIV, it was the early 80s. Everybody had that stigma. And they didn't live long…I was offered [ART] when I went to speak to my doctor, she sent me straight to the ER. And an HIV specialist told me what was available, I think I took two pills. I felt hopeful. It was promising, to know that I was able to get my viral load under control - Participant 3	96.4	43.38	0.86
4-30 Days (n=17)					
Mean age (SD) = 34.5 (9.3) 76% Male 53% Gay 53% Other Race 59% Hispanic	Alleviation of Internalized Stigma	You know people who got HIV have a really difficult life. Not because of the sickness itself, but around their lives, everything changes. Their career, their future, their relationship with their families. They become, isolated. They don't have a chance to succeed. Maybe that's the image I got when I was young. And, then, when they told me that I was HIV positive, of course, your mind goes to all those memories. I said, okay, I'm gonna take the pill. I'm gonna do whatever it takes in order to be as normal as possible. - Participant 4	92.1	44.06	0.91
30+ Days (n=5)					
Mean age (SD) = 39.4 (22.1) 100% Male 60% Straight 60% Other Race 60% Hispanic	Exacerbation of perceived or anticipated stigma	At the pharmacy, at first, I was ashamed when I had to go to get the medicines. Everybody looks at you when you go to the pharmacy if there are new employees... I thought that in this country it was different because it is such a developed country, but even here they still look at that.Even at my job, that hasn't happened to me. - Participant 24	95.4	44.8	0.85
Total			93.7	44.0	0.89

Table 1.

Conclusions: iART was protective against stigmatizing experiences and alleviated internalized feelings of stigma for those who started iART within 30 days, while it exacerbated anticipated stigma for those who started beyond 30 days. iART universally established trust in providers. iART implementation requires equitable strategies that address HIV-stigma and mistrust.

EPD028
Mobility and HIV transmission across three urban communities in Zambia: using qualitative data to interpret phylogenetics in a mixed methods analysis of HPTN 071 (PopART) data

M. Simuyaba[1], L. Abeler-Dorner[2], M. Hall[2], C. Fraser[2], A. Sibutali[1], F. Moyo[1], K. Shanaube[3], P. Bock[4], S. Fidler[5], R. Hayes[6], H. Ayles[3,7], M. Simwinga[1], J. Seeley[8], V. Bond[1,8]
[1]Zambart, Social Science, Lusaka, Zambia, [2]University of Oxford, Big Data Institute, Li Ka Shing Centre for Health information and Discovery, Nuffield Department of Medicine, Oxford, United Kingdom, [3]Zambart, Lusaka, Zambia, [4]University of Stellenbosch, Desmond Tutu TB Centre, Department of Paediatrics and Child Health, Cape Town, South Africa, [5]Imperial College, London, Imperial College NIHR BRC, Department of Infectious Disease, London, United Kingdom, [6]London School of Hygiene and Tropical Medicine, Department of Infectious Disease Epidemiology, Faculty of Epidemiology and Population Health, London, United Kingdom, [7]London School of Hygiene and Tropical Medicine, Department of Clinical Research, Faculty of Infectious and Tropical Diseases, London, United Kingdom, [8]London School of Hygiene and Tropical Medicine, Department of Global Health and Development, Faculty of Public Health and Policy, London, United Kingdom

Background: Population mobility (permanent resettling, transient and circular movements) between neighbourhoods contributes to HIV transmission. This analysis uses qualitative research describing mobility factors to understand phylogenetics data estimates of HIV transmission patterns within and across three of nine HPTN 071-02 (PopART Phylogenetics) study sites in southern Zambia, selected based on socio-economic linkages between communities located in adjacent districts and with high HIV incidence.
Methods: Qualitative data originated from formative research (2013), study and intervention uptake documentation (2014–2018) and a qualitative cohort of 13 individuals in one community (2017-2018). Data were analysed using thematic and narrative approaches describing factors influencing mobility. Blood samples were collected from HIV-positive individuals at health facilities and in the community between 2016-2018. HIV sequences were identified by whole-genome viral sequencing. Phylogenetic analysis identified likely transmission pairs in which at least one partner was enrolled in one of the three study communities.

Results: Qualitative findings showed that cross-border trading, tourism and labour migration contributed to mobility in all three communities. Two communities are in a tourist area near international borders, promoting cross-border trading and in-migration from tourists and transient groups, including female sex workers and cross-border traders. Labour migration (both temporary and permanent) between two adjacent districts increased in 2012 when the provincial capital was relocated. Temporary migration linked to trading in farm products and seasonal migration linked to fish and charcoal trading was common across the three communities.

HIV sequences were obtained from 1,340 women and 773 men, aged 18-79 (709, 569 and 835 sequences from respective communities). Phylogenetic analysis identified 108 transmission pairs, in which at least one individual in the pair was from one of the three communities. Of these, 87 (80.6%) occurred within the same communities, while 21 (19.4%) occurred between different communities.

Conclusions: Mobility centred on livelihood options may contribute to HIV transmission across these three study communities. HIV prevention efforts with mobile populations are critical to manage HIV-infections locally. Future mixed methods research could have a stronger focus on mobility and socio-economic characteristics of individuals in sexual relationships to provide insights on HIV transmission.

EPD029

Effects of HIV-integrated TB interventions on care continuum outcomes for active TB: a systematic review and meta-analysis

G. Marley[1,2], J. Nie[3], X. Zou[4], J.D. Tucker[1,5,2], D. Wu[5], R. Chou[6], J. Ong[5], W. Tang[1,7,2]

[1]University of North Carolina, China-Project, Guangzhou, China, [2]SESH (Social Entrepreneurship to Spur Health) Global, Guangzhou, China, [3]Guangzhou Concord Cancer Center, Guangzhou, China, [4]Guangdong Health Research Center, Guangdong Provincial People's Hospital, Guangdong Academy of Medical Sciences, Guangzhou, China, [5]London School of Health and Tropical Medicine, Faculty of Infectious and Tropical Diseases, London, United Kingdom, [6]Oregon Health & Science University, Portland, United States, [7]Guangdong Second Provincial General Hospital, Guangzhou, China

Background: Programmatic interventions have been extensively applied in enhancing TB care continuumoutcomes (testing, diagnosis, linkage-to-care, treatment completion, cure, and treatment success). This systematic review examined the impact of non-pharmaceutical interventions on care continuum outcomes for active TB among persons living with HIV (PLWH).

Methods: Studies published in English that evaluated TB interventions till April 2021 were retrieved from Pubmed, Embase, CINAHL, and Cochrane Controlled Trials Registry. In a sub-analysis focused on PLHIV and HIV-TB integration, we evaluated the impact of integrated interventions and non-integrated TB interventions on care continuum outcomes compared to standard-of-care. Studies with similar interventions and comparator arms were pooled using random-effects model, and the quality of evidence was assessed using GRADE.

Results were reported as odds ratio with 95% confidence intervals (CI), number of studies (k) and heterogenity (I^2).

The study was registered on PROSPERO (CRD42018103331).

Results: Of 14,922 citations, 149 eligible studies were included. Most studies (123/149) were from low-and middle-income countries, 28 had HIV-TB integration of which 13 were randomized controlled trials (RCTs) and 66 were not integrated.

Among HIV-TB integrated interventions, active case finding was associated with testing (5.92, 95%CI:4.12-8.51;k=2,I^2=93.9%), and diagnosis (1.37, 95%CI:0.77-2.43; k=2,I^2=48.3%); and counseling and education was also associated with testing (10.06, 95%CI=1.69-59.78; k=4,I^2=98.9%), and diagnosis (1.25, 95%CI:1.09-1.44; k=2,I^2=0%).

Among non-integrated interventions, counseling and education was associated with all defined care continuum outcomes. Implementing multiple interventions concurrently and using incentives (financial and non-financial) were each associated with four care continuum outcomes, and digital intervention was associated with TB cure (3.01, 95%CI:0.88–10.29; k=6,I^2=96.7%) and treatment success (3.08, 95%CI:0.82-11.56; k=4,I^2=75.3%).

These findings remained salient when studies were limited to RCTs.

Conclusions: Several non-HIV integrated TB interventions were associated with more TB care continuum outcomes than HIV-integrated interventions. However, most HIV-TB integrated studies solely evaluating and reporting on TB interventions' capacity in improving single TB outcomes among PLWH (like testing) may have accounted for this finding.

Therefore, more research is needed to evaluate HIV-TB integrated intervention effects on other continuum outcomes. Researchers should also consider incorporating more strategies that span the entire care continuum in HIV-TB integrated interventions to facilitate holistic TB care for co-infected PLWH.

EPD030

Development and usability testing of *iTransition:* an mHealth intervention to support patients' movement from pediatric- to adult-oriented HIV care

A.E. Tanner[1], N. Dowshen[2,3], S. Lee[2], M. Goldstein[4], K. Doraivelu[5], K. Knowles[2], S. Moore[6], A. Pather[5], C. Chaudhury[5], M. Jibriel[1], S. Mertus[1], B. Loabile[7], S. Hussen[5,4]

[1]University of North Carolina Greensboro, Greensboro, United States, [2]Children's Hospital of Philadelphia, Philadelphia, United States, [3]University of Pennsylvania, Philadelphia, United States, [4]Emory University School of Medicine, Atlanta, United States, [5]Emory University School of Public Health, Atlanta, United States, [6]Centers for Disease Control and Prevention, Atlanta, United States, [7]University of Pennsylvania Health System, Philadelphia, United States

Background: In the United States (US),health care transition (HCT) from pediatric to adult-oriented HIV care is associated with disruptions to care retention, medication adherence, and viral suppression for youth living with HIV. However, no evidence-based interventions exist to improve HIV-related HCT outcomes.

Accordingly, the purpose of this project was to develop *iTransition* – a mobile health (mHealth) intervention for youth living with HIV with a corresponding web console for their providers to support HCT outcomes in the US.

Description: *iTransition* development included an iterative process with our Design Team comprised of diverse stakeholders: nine youth living with HIV, eight health care providers/staff representing US-based pediatric and adult-oriented clinical sites in Atlanta, Georgia and Philadelphia, Pennsylvania.

The Design Team met regularly with study investigators and our technology development partner to provide feedback on *iTransition's*content, aesthetics, and functionality.

The resultant *iTransition* intervention included:

1. A youth-facing native mobile phone app with educational tools, medication reminders, and readiness assessments and;
2. A provider/staff-facing web console with educational content, opportunities to track youth progress, and a private chat option.

Lessons learned: We conducted usability testing and an ongoing process evaluation before implementation of *iTransition* in the clinical sites. Usability testing demonstrated that the app was appealing and easy to navigate. Process evaluation data demonstrated high levels of acceptability and perceived need for *iTransition* among youth and clinical providers/staff.

Additionally, frequent reminders (e.g., push notifications of in-app activities and/or direct reminders from staff) are being used to sustain engagement. To date, there has been varying levels of *iTransition* usage among the youth and provider/staff intervention participants.

Conclusions/Next steps: The collaborative design process of *iTransition* resulted in an mHealth tool to support HCT that is relevant to both youth and providers. In the ongoing pilot implementation trial, the historical control group (N=20) has been recruited and enrolled and active recruitment of the intervention group (goal N=50) of transition-eligible youth across the two sites are underway.

The development and pilot implementation trial of *iTransition* fills an important need for interventions to support HCT outcomes for youth living with HIV in the United States.

EPD031

Strategies to recruit and retain a cohort of MSM and transgender women living with HIV: experiences from virtual implementation of a three-wave longitudinal cohort study

F.R. Gulfam[1], A. Ahlawat[1], A. Gupta[1], D.V. Patel[2]

[1]India HIV/AIDS Alliance, Strategic Information, New Delhi, India, [2]Albert Einstein College of Medicine, Division of General Internal Medicine, Bronx, New York, United States

Background: Implementing community-based longitudinal studies can be challenging due to significant participant burden, time requirements, and costs associated with both recruitment and repeated in-person assessments. However, there is a dearth of accessible knowledge about effective strategies for recruiting and retaining people living with HIV into prospective virtual studies, particularly in low resource settings.

Description: We conducted a longitudinal cohort study (assessments at baseline, 3, and 6-months) in 2020-2021–entirely during the ongoing COVID-19 pandemic. Trained Peer-interviewers telephonically screened 727 individuals and enrolled N=367 (227 MSM- and 140 transgender women [TGW] newly diagnosed with HIV). Peers entered telephone survey data directly into a secure web-based database. Community stakeholders and Peer-interviewers provided inputs throughout the study inception and implementation, which resulted in use of several different strategies to support recruitment/retention.

Lessons learned: It was feasible to remotely train Peer-interviewers, and for them to telephonically recruit/retain MSM/TGW participants. Retention was high: 96.5% at 3-months and 92.4% at 6-months. Certain strategiesincludingcoaching and refresher trainings for Peer-interviewers focusing on recruitment/retention, developing customized recruitment and retention strategies with each peer interviewer, and regular engagement of local community organizations and leaders supported recruitment.

Timely incentive remuneration to participants through e-cash/mobile payments, sending regular reminders to participants, scaling-down demands of study requirements (e.g. breakdown the interview duration, flexible scheduling*)* among others proved to be helpful in virtually retaining participants.

Retention approaches were also tailored to participant risk-levels for attrition, which was based on participant concern that their circumstances could interfere with fulfilling study requirements, reluctance to schedule follow-up appointments, concerns about their treatment in the study, canceling appointments frequently without rescheduling, and unresponsiveness to contacts. These helped us anticipate participants' potential risk of dropping out and take appropriate measures to address concerns.

Conclusions/Next steps: We found that participant-centered and mobile-phone based strategies were feasible to implement and supported recruitment and retention of marginalized populations into a longitudinal cohort study, despite the challenges posed by COVID-19. These strategies could be used by agencies conducting community based research to efficiently implement studies. Process used and results from implementing this study will be manualized for dissemination to other organizations.

EPD032

Innovation for improved viral load suppression among children with a virological failure in Uganda: a pair-matched randomized intervention trial

S. Sensalire[1], J. Nabwire Ssali[2], C. Nabasumba[2], D. Kiragga[2], M. Muhire[2]

[1]*University Research Co., LLC USAID RHITES-N, Acholi Activity, Quality Improvement, Kampala, Uganda,* [2]*University Research Co., LLC USAID RHITES-N, Acholi Activity, Kampala, Uganda*

Background: Whereas the current evidence base provides a portfolio of effective HIV care interventions, a significant proportion of persons with HIV do not consistently receive required services often due to poor engagement in long-term clinical care. For patients who interrupt Antiretroviral-Therapy (ART) or miss essential services, the effects of ART are rapidly reversed, and additional harms can accrue through the emergence of drug resistance mutations, which limits future drug options and increase mortality. This trial examined the effects of innovation on viral-load suppression (VL) involving HIV-service audit-tool to track at the frontline if the client is receiving all eligible services.

Methods: This was a one-year pair-matched randomized trial conducted at ART clinics. We assessed the VL outcomes for the active children in care aged 0-19 years, who had non-suppressed VL at baseline to determine the added effect of using HIV-service audit-tool on HIV-services and VL-outcomes. Our intervention was implemented against the standards of HIV care. Multivariate tests using MANOVA estimated the mean differences in HIV-care variables in the intervention and control arms simultaneously and examined any variability in VL outcome in the control and intervention arms.

Results: There is variability in the control and intervention arms in VL-suppression in the multivariate analysis of variance derived estimate ($p<0.05$). Provision of eligible HIV-services improved significantly in intervention ($p<0.05$) than control arms ($p>0.05$) due to the added effect of the HIV-care audit tool. Significant differences existed between baseline and endline for optimization of ARV regimen, Tuberculosis preventive therapy and screening for Orphans and Vulnerable Children (OVC) services in intervention arm ($p<0.05$).

Results show that that 86% ($\eta 2=0.862$) of the variability in the control and intervention arms across variables in the multivariate analysis of variance derived estimate is due to the use of HIV-service audit-tool.

Conclusions: The results provide a strong rationale to apply innovations to achieve improvements in virologic-suppression and demonstrate the benefits of using the HIV-service audit-tool as an effective strategy for improving service delivery to children. Strategies such as this one, if adopted more widely, will contribute to the larger efforts for sustaining the third 95 and combat child-related mortality and morbidity due to AIDS.

EPD033

Integration of chlamydia/gonorrhea testing with HIV services among female sex workers in China: a cluster randomized controlled trial and cost analysis

W. Tang[1,2], Y. Xie[3], M. Xiong[4,5], D. Wu[6], G. Marley[1,7], H. Zheng[4,5], B. Yang[4,5], C. Wang[4,5]

[1]*The University of North Carolina China-project, Guangzhou, China,* [2]*Guangdong Second Provincial General Hospital, Guangzhou, China,* [3]*Duke University, Duke Global Health Institute, North Carolina, United States,* [4]*Dermatology Hospital of Southern Medical University, Guangzhou, China,* [5]*Southern Medical University Institute for Global Health and Sexually Transmitted Diseases, Guangzhou, China,* [6]*London School of Health and Tropical Medicine, Faculty of Infectious and Tropical Diseases, London, United Kingdom,* [7]*SESH (Social Entrepreneurship to Spur Health) Global, Guangzhou, China*

Background: Integration of chlamydia/gonorrhea testing with HIV services is critical for key populations, especially female sex workers (FSWs). However, most HIV services are vertical, siloed programs. One way to facilitate integration is pay-it-forward where an individual receives a gift (free chlamydia/gonorrhea testing) and then asks whether they would like to give a gift to another person. This cluster randomized controlled trial examined the effectiveness and cost of pay-it-forward chlamydia/gonorrhea testing compared to the standard of care among FSWs in China.

Methods: This pragmatic trial examined how a pay-it-forward approach could be integrated into HIV outreach services. FSWs aged 18 or above were invited by an out-

reach team for free HIV testing. The four clusters were randomized into the two study arms in a 1:1 ratio: a pay-it-forward arm (offered gonorrhea/chlamydia testing as gifts); and a standard of care arm (out-of-pocket for testing). The primary outcome was gonorrhea/chlamydia test uptake ascertained by administrative records. The trial was registered(ChiCTR2000037653).

Results: Overall, 480 FSWs recruited from four cities (120/city) were included in the analysis. Most FSWs were ≥30 years old (65.2%, 313/480), married (59.0%, 283/480), and had a middle school or below education level (82.3%, 395/480). The majority of women had an annual income <$9,000 USD (62.7%, 301/480). Three-fifth (290/480) of women had never been tested for HIV. Gonorrhea and chlamydia test uptake in the pay-it-forward and standard of care arms was 82% (197/240) and 4% (10/240), respectively.

The main finding was robust when adjusting for marital status, income, condom use, and HIV testing experience. Among 197 women who received gonorrhea and chlamydia tests in the pay-it-forward arm, 99 (50.3%) donated money for others to test.

The total donation amount was $326, the median donation amount per donor was about $1.54 (IQR:0.77-1.54). The financial cost required to gain an additional person being tested for gonorrhea and chlamydia was 14.60 USD and 75.84 USD to identify an additional positive gonorrhea or chlamydia case.

Conclusions: Pay-it-forward strategy can increase gonorrhea and chlamydia testing among Chinese FSWs and may be a useful tool for scaling up preventive services. Pay-it-forward can enhance the integration of chlamydia/gonorrhea testing within HIV outreach services.

Qualitative and ethnographic methods in HIV research

EPD034

Can a "positive living" framework in HIV care programs perpetuate stigma in tumultuous contexts? Ethnographic lessons from post-conflict Uganda

S. O'Sullivan[1]
[1]*University of Toronto, Department of Anthropology, Toronto, Canada*

Background: HIV care interventions that employ the "positive living" (PL) framework have shown to address stigma as a barrier to testing and treatment adherence. Yet, impacts of this framework in tumultuous contexts remains poorly understood.

This paper fills this gap by exploring the limits of the adaptation of PL for addressing HIV-related stigma in the post-conflict setting of northern Uganda.

Methods: Data are derived from 18 months of ethnographic fieldwork between 2017 and 2019 in the Acholi subregion of northern Uganda. In addition to extensive participant observation within community groups, HIV support meetings, and NGO programs, methods included 67 semi-structured interviews in English and Luo with NGO employees, clinicians, people living with HIV, aid beneficiaries, and community leaders. Analyses were guided by the iterative process of grounded theory.

Results: Research revealed heterogeneous understandings of PL and associated expectations of individual behaviour change across actors involved in these interventions in a post-conflict setting. Clinicians emphasized ARV adherence, disclosure, a marked positive change in attitude, and HIV-related empowerment.

For people living with HIV and others, many of whom were beneficiaries of post-conflict development aid interventions, additional meanings of PL included economic self-sufficiency, productivity, and a disposition towards hard work.

Across findings, living in a post-conflict setting uniquely expanded the meaning of PL to encompass both original notions of HIV self-care and newer notions of self-responsibility/financial independence in a context where achieving such aspirations were difficult. Participants with HIV reported experiencing stigmatization when they failed to meet these expectations, what they described as "failing to live positively".

Conclusions: Findings highlight the changing meaning of PL in post-conflict environments, whereby values associated with post-conflict economic recovery become intertwined with long-standing guidelines for HIV self-care. Ethnographic engagement reveals that PL guidelines are not fixed, instead assuming additional meaning depending on the context in which they exist.

This research calls on policy makers to consider context when building HIV care programs that use individual behaviour change efforts such as PL. It also demonstrates the potential stigmatizing effects of PL in the transitional period between war and peace, characterized by the oversaturation of development aid projects targeting economic and social recovery.

EPD035

Dynamic considerations for acceptability and likely use of an MPT vaginal ring: a grounded theory model

D. Watnick[1], L. Bauman[1]
[1]*Albert Einstein College of Medicine, Pediatrics, Bronx, United States*

Background: Multipurpose prevention technologies (MPTs) are being developed to simultaneously protect women from unwanted pregnancy, STIs and HIV. Although intravaginal ring (IVR) MPTs may appeal to some women, data on acceptability and potential are limited.

Oral abstracts

Poster exhibition

Late-breaker abstracts

Author Index

Using multiple qualitative methods and grounded theory methodology, we elaborated on existing models of microbicide acceptability and adherence to develop a conceptual model of acceptability and IVR MPT use, which we call The Dynamic Considerations Model (Figure 1).

Methods: Participants included 18-45 year old women in the United States, sampled from 30 subjects enrolled in a Phase 1 trial of an antiretroviral-only (ARV) IVR, worn continuously for 14 days. Women in this sub-study (N=23) participated in in-depth interviews (N=18 at 2 timepoints), focus groups (N=3, 18 women, 13 of whom were interviewed) and individual card sorts (N=17, all were interviewed).

The goal was to explore acceptability and use experiences of an ARV IVR with hypothetical contraceptive properties.

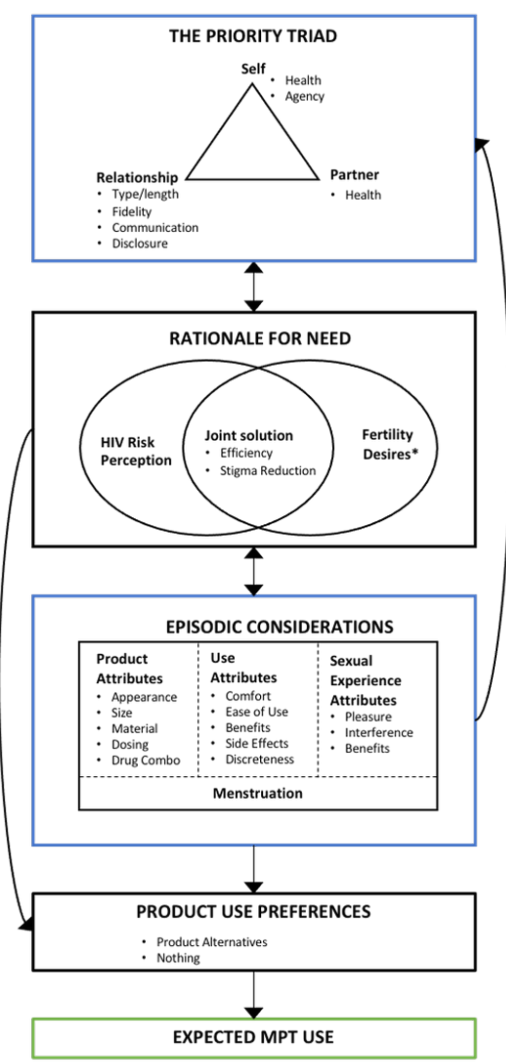

Figure 1. Dynamic considerations for acceptability & expected use of an MPT Ring: A grounded theory model.

Results: Women described multiple acceptability factors impacting likely use, including product and use attributes (e.g., dosing and side effects), effect on sexual experiences and menstruation. These episodic considerations were both dictated and reinforced by an emergent construct, "The Priority Triad", which identified how women prioritized relationship, partner and individual factors.These priorities changed over time and required active rebalancing efforts.

Within this dynamic context, women assessed their rationale for MPT need, based on combinations of HIV risk perception and/or fertility desires, generally identifying an MPT as a contraceptive with "bonus" HIV prevention.

Conclusions: The Dynamic Considerations Model elucidates IVR MPT acceptability and use factors, expanding considerably on the importance of risk perception.These findings underscore the need to develop a suite of sexual and reproductive health products to accommodate women in different contexts with changing needs.

This model provides a preliminary theoretical underpinning to guide future product development, user experience and implementation research efforts.

EPD036

Characterizing the "HIV care and treatment adherence journey" for persons living with HIV in the Philippines: empirical foundation for intervention design

R. De Torres[1,2], D. Operario[3]

[1]University of the Philippines Manila, College of Nursing, Manila, Philippines, the, [2]The LoveYourself Inc., Mandaluyong, Philippines, the, [3]Brown University, School of Public Health, Providence, United States

Background: As one of the world's fastest growing HIV epidemics, the Philippines experienced rapid growth in HIV cases and AIDS-related deaths between 2010 and 2020. Current national reports show suboptimal levels of adherence to care and treatment among Filipinos living with HIV. No culturally informed interventions to promote HIV care and treatment adherence in the Philippines have yet been designed.

Given the cultural context, HIV care and treatment adherence programs for persons living with HIV (PLHIV) in the Philippines must consider the multifaceted "journey" related to the patient's experiences, rather than isolate pill-taking as the sole focus.

Methods: Using a qualitative method, we conducted individual online interviews with PLHIV to characterize patient experiences and develop a culturally informed model of the multiple domains contributing to HIV care and treatment adherence. Maximum variation sampling was implemented to recruit and select 15 participants including PLHIV who were:

1. Filipinos aged at least 18 years,
2. currently on ART for at least six months,
3. able to read and understand Filipino and English,
4. able to complete online audio-recorded interviews, and
5. competent to provide consent, as well as care providers working with PLHIV.

Thematic analysis was used to identify themes and subthemes.

Results: We developed a model of the "HIV Care and Treatment Adherence Journey" characterizing the events, situations, challenges, and achievements that influence care and treatment for PLHIV in the Philippines. The

model describes how PLHIV integrate and manage their care and treatment into their daily lives. Components include care access and delivery, client management, care provider competence, psychological concerns, stigma, support system, and adherence outcomes. Adherence journey changes continuously in line with PLHIV's state of health and their community, healthcare, and support system.

Conclusions: Further evaluation of this model can help support PLHIV who are at risk of disengaging in care and require further types of support. Conceptualizing the dynamic and multifaceted patient journey can impact how PLHIV initiate, engage, and retain in care and treatment compared to models that focus on discrete actions such as pill taking or appointment attendance.

EPD037

Photovoice with key populations and people living with HIV: acceptability and feasibility of online, asynchronous data collection

V. Earnshaw[1], J. Cox[1], W. Pui Li[2], R. Saifi[2], I. Azwa[2], S. Faridah Syed Omar[2], Z.K. Collier[2], S. Walters[3], A. Binti Amir Hassan[2], L.S. How[2], M.S. Haddad[4], F.L. Altice[5], A. Kamarulzaman[2]

[1]University of Delaware, Newark, United States, [2]University of Malaya, Kuala Lumpur, Malaysia, [3]New York University, New York, United States, [4]Community Health Center, New Britain, United States, [5]Yale University, New Haven, United States

Background: Photovoice is a qualitative research method that empowers individuals to represent their communities through photographs and stories. Photovoice is increasing in popularity because it can be leveraged for research, intervention, and advocacy.

Photovoice is typically conducted in person and synchronously: Participants attend a photography workshop and then take photographs. Yet, this format may not be acceptable by stigmatised populations due to confidentiality concerns and/or may not be feasible due to participant locations and the COVID-19 pandemic.

The current study evaluates the acceptability and feasibility of online, asynchronous photovoice, a promising alternative to in person photovoice.

Methods: Thirty-four members of key populations and people living with HIV completed a photovoice study in Malaysia from October-November 2021.

The project was facilitated by a website where participants were introduced to the project, learned photography and visual literacy skills, and uploaded photovoice data. The website was available in Malay and English, and included a series of videos featuring Malaysian clinicians and a photographer.

Participants responded to validated scales and open-ended questions regarding acceptability and feasibility of the project. Data were analyzed using descriptive statistics and rapid qualitative analysis.

Results: Participants rated the acceptability and feasibility of the project very highly [respective scores on 5-point scales: M(SD)=4.65(0.46) and M(SD)=4.56(0.56)]. Ratings of video and website quality were strongly correlated with project acceptability and feasibility ratings.

Participants enjoyed expressing themselves through photography ("I love it because it gives me the opportunity to convey my heart and words through pictures, in a unique way") and anonymously (appreciating "expressing who we are without revealing ourself"). There was a high level of engagement: All participants responded to all photovoice prompts, resulting in 204 unique submissions.

Conclusions: Results suggest that online, asynchronous photovoice is both acceptable and feasible for communities affected by HIV. Conducting photovoice online has the potential to substantially enhance the scale of this unique and powerful form of participatory action research, ultimately better contributing to qualitative research, interventions, and advocacy, particularly in communities where people living with HIV and key populations are highly stigmatised.

EPD038

Developing a virtual reality serious game for prevention-oriented qualitative HIV social research

D. Gredig[1], S. Korkut[2], P. Weber[1], J. Bogdanovic[1], D. Bigoni[1]

[1]University of Applied Sciences and Arts Northwestern Switzerland, School of Social Work, Olten, Switzerland, [2]University of Applied Sciences and Arts Northwestern Switzerland, School of Business, Basel, Switzerland

Background: A major methodological challenge of prevention-oriented HIV social research lies in addressing the interactive nature of sexual encounters and protection. This research project explores how men having sex with men (MSM) negotiate their protection against HIV with non-steady partners. In the ongoing methodological discussion, the use of digital technologies was proposed in order to increase participants' engagement and overcome the flaws of retrospective self-reports.

We developed a Virtual Reality Serious Game (VR-SG) to immerse participants in situations similar to those they might encounter and explored its use in qualitative in-person interviews.

Description: We conducted problem-centred interviews with five MSM and expert interviews with five sexual health advisors exploring how MSM negotiate HIV protection. Using qualitative content analysis, we identified exemplary courses of negotiations. Drawing on these insights, the VR-SG immersed participants in a dating platform chat and subsequently a date in the virtual partner's (VP) apartment. We designed ten Petri nets for all possible interactions with the VP, leading to nine different plots with 34 authentic dialogues. We filmed using a 360-degree camera mimicking the participants' perspec-

Oral abstracts

Poster exhibition

E-posters

Late-breaker abstracts

Author Index

tive in conversation with the VP (played by an actor) and loaded it onto a custom-built game engine. As the story unfolded, the VP asked a question, and the participant had to chose the most suitable answer from a list of options. The response led to the next scene and ultimately to a pre-determined ending. We conducted a usability experiment with five MSM and pre-released the VR-SG on the Oculus Rift headset used for the research project.

Lessons learned: The Virtual Reality Serious Game took centre stage in the qualitative interviews and led the participants to share their lived experiences more extensively and in-depth. They recalled episodes they had not mentioned before the game, complemented their pre-game narratives and introduced new topics.

Conclusions/Next steps: The use of this Virtual Reality Serious Game was productive and led to the desired engagement and more in-depth insights into participants' interactions. Our reserach supports the use of VR-SG features in exploring interactive processes.

EPD039

HIV oral history – why do it?

W. Rickard[1]

[1]*CHIVA, Bristol, United Kingdom*

Background: Oral histories of HIV have been carried out in a range of countries, with people living with HIV, their families, politicians, religious leaders and health/social care workers, particularly doctors. From South Africa to the UK, from the Sahel to New York, mainstream and grassroots HIV oral history projects across the globe capture the experiences of those most hidden from history and deepen understanding.

Description: This paper comprehensively reviews the range and depth of recorded oral histories of HIV across the world, mining reports of those who ran projects for ideas to inform future generations about what HIV oral history achieves. It considers parallel oral history work around Ebola and SARS, seeking lessons from these contemporary concerns. It draws on earlier recorded histories of viruses, such as the 1918 Influenza pandemic, to understand oral history's role in HIV, how we can best shape advances in what we know about our HIV past and what we still need to collect.

Lessons learned: Oral history has a radical purpose to disrupt historical narratives and expose hidden voices. It helps to remember individuals experiences, to understand change over time and to clearly locate HIV within a life span. We bear witness to evolving national HIV stories, when government documents showing how policy decisions were made and changed in our recent history remain secret. We can transmit lived experience to younger generations, bring marginal voices to historical attention, increase the diversity of people with HIV who have a voice and use oral history as an inter-generational development tool. Oral history can also increase the resilience of HIV organisations, binding people through collective purpose. Ethical challenges are many and gaps in our HIV oral historical knowledge are shown.

Conclusions/Next steps: Covid-19 has shone new light on how we record and utilise the history of viruses to understand our past, present and future. The longer-term impacts of the recording, archival and analytical oral historical processes around HIV are profound, but also fraught with ethical dilemmas. Urgent additional grass roots HIV oral history projects are needed before those whose memories are longest pass away.

EPD040

Lessons learnt from using asynchronous online focus group discussions to garner Malaysian clinicians' perspectives on a tele mentoring stigma reduction intervention

R. Saifi[1], W. Pui Li[1], V. Earnshaw[2]

[1]*University of Malaya, CERiA, Centre of Excellence for Research in AIDS, Kuala Lumpur, Malaysia,* [2]*University of Dewlaware, Human Development and Family Sciences, Newark, United States*

Background: Virtually mediated synchronous and asynchronous focus groups are crucial developments in qualitative research methods, both of which have been designed, and implemented as a sustainable and alternative option to mainstream face-to-face (FTF) focus group discussions (FGD). The overall objective of this paper is to document the step-by-step process of conducting asynchronous online FGDs which were conducted to comprehend clinician's perception towards implementation of evidence-based stigma reduction tools via a popular tele-training platform. We specifically

1. Describe the rationale behind selecting an asynchronous online methodology to examine Malaysian clinician's perspectives on a tele-mentoring program

2. Identify the facilitators of virtual focus group method and examine the acceptability

3. Document the lessons learnt from conducting virtual FGDs among Malaysian clinicians practicing in different states of Malaysia.

Description: Our paper draws on a collaborative project by University of Delaware, Newark, US; Yale University, New Haven, CT, and University of Malaya, Kuala Lumpur Malaysia. We conducted 4 asynchronous online FGDs, each lasting for 3 days with 8-10 general practitioners and family medicine clinicians. We used FocusGroupIt; an easy, quick and free software to generate multiple online group discussions moderated by a facilitator. 'Who could give us the best information' – was our guiding principle to enroll clinicians to the digital discussion.

Each of the group discussions consisted of clinicians experienced and knowledgeable on a specific key population group at risk of HIV. Our moderator followed the bulletin board method and posted brief sets of questions every morning and evening.

Lessons learned: Our experience of using FocusGroupIt interface demonstrates its promise as an effective qualitative data collection method, particularly during a pandemic. When the family health physicians and general practitioners were overwhelmed with their clinical responsibilities, asynchronous techniques enabled us to bring-in clinicians from a diversified geographical distance of Malaysia. The remote nature of the FGDs provided respondents a relaxing environment to share, discuss and exchange views on all of the questions posted on the bulletin board.
Conclusions/Next steps: Although in our FGDs, we missed the non-verbal signals, the design of our internet-mediated online data collection technique was acceptable among physicians in Malaysia.

EPD041
Using qualitative feedback from end-users in mhealth application development: differentiated HIV service delivery for anti-retro viral drug refills in Uganda

E. Nakibuuka[1], M. Balaba[1], J. Beinomugisha[1], O. Namusoke[1], D.M. Byonanebye[1], B. Castelnuovo[2], R. King[3], R. Parkes-Ratanshi[1,4]
[1]*Infectious Diseases Institute, Makerere University, Academy for Health Innovations, Kampala, Uganda,* [2]*Infectious Diseases Institute, Makerere University, Research, Kampala, Uganda,* [3]*University of California, Global health sciences, San Francisco, United States,* [4]*University of Cambridge, Institute of Public health, Cambridge, United Kingdom*

Background: Mobile health (mHealth) innovations have potential of accelerating achievement of the UNAIDS 95-95-95 goals**.** Using the WHO strategy of differentiated HIV service delivery models, people living with HIV (PLHIV) and stable on treatment at government health facilities in Kampala are accessing medication refills at community (private) pharmacies. We developed a web-based application (*ARTAccess*) to determine eligibility and facilitate efficient ART delivery without additional staff needs in these pharmacies.
Methods: From October – December 2018, we conducted a qualitative study to document the development process of *ARTAccess*. Using participatory action research and human-centered design theoretical frameworks, we undertook structured and unstructured observations of application development review meetings. Three observers attended each meeting and independently drafted reflective transcript narratives including analyses. Areas explored included: user requirements, impressions, and interaction between developers and end-users.
Results: We conducted observations at 12 development meetings with health facility staff, community pharmacy staff and application developers. The application was iteratively upgraded five times (version 5.0) against the two originally anticipated. Perceived usefulness improved with upgrades.
Three main themes emerged on the interactions between study team and end users.
1. The importance of gaining trust and rapport building; inconsistency in building rapport resulted in some end users' hesitation to participate in the App discussions. End users provided constructive feedback for creating rapport, which led to subsequent improvement in stakeholder interaction.
2. Understanding views of different categories of stakeholders.
3. Live demonstrations of *ARTAccess* highlighted gaps and needs for improvement.
Overall, the end users had mixed reactions to the tool. Most appreciated its importance in saving time, "*....it is an improvement to the refill program", but*few expressed job insecurity fears while others perceived it as additional work .
Conclusions: The study provided evidence that participatory action research in a human-centered design approach can enhance the development process for an mhealth tool. Multiple interactions after each iteration of design are required to improve perception.
Job insecurity fears and perceived workload can create barriers to end user engagement in design; detailed explanation of the application's intended role reduced this concern and led to increased engagement.

Role of social and behavioural science in biomedical responses

EPD042
Factors associated with viral non-suppression among HIV positive children and adolescents enrolled to the orphans and vulnerable program in Uganda

J. Nakawesi[1], G. Kabunga[1], B. Muwanguzi[1], D. Opolot[1], M. Namakula[1], A. Nabatanzi[1], B. Bukenya Nambuusi[1], C. Senyimba[1], S. Nantume[2], B. Mukasa[1]
[1]*Mildmay Uganda, Programs, Kampala, Uganda,* [2]*Centers for Disease Control and Prevention, Division of Global HIV and TB, Kampala, Uganda*

Background: The orphans and vulnerable children (OVC) program is an intervention supported by the U.S. President's Emergency Plan for AIDS Relief to prevent and mitigate the impact of HIV among children and adolescents C/ALHIV aged 0-19 years. Mildmay Uganda has been implementing the OVC program in Mubende region of rural Uganda since April 2017 to address the social factors that hinder adherence among C/ALHIV. However, the viral load (VL) suppression rate of these C/ALHIV is 85%, which is below the expected 95%. The aim of this assessment was to determine the factors associated with viral non-suppression among C/ALHIV on the OVC program.

Oral abstracts

Poster exhibition

E-posters

Late-breaker abstracts

Author Index

Methods: We conducted a cross sectional review of data for C/ALHIV on the OVC program in the supported districts. We included C/ALHIV with VL results within 6 months. We collected data on VL status, patient ART regimen and demographic characteristics, VL non-suppression was defined as any VL> 1000 copies/ml. We performed logistic regression analysis for association of VL non-suppression. Data analysis was carried out using STATA version 15.0.

Results: Of the 2048 C/ALHIV in the program, 1627 (79%) had a VL result within 6 months. Of these, 877 (53.9%) were female, 1106 (68%) were aged 5 – 14 years and 692 (42.5%) received care from a low-level health facility (HC III). The mean duration on ART was 5.7 years (s.d. 2.9 years, range 0.5 to 18 years) and mean duration in the OVC program was 1.5 years (s.d. 1 year, range 0.2 - 4.5 years).

A total of 248 (15.2%) individuals were virally non-suppressed. Factors associated with VL non suppression included living in Kiboga district (OR (Odds ratio) =1.97; 95% CI (Confidence Interval): 1.22,3.19), receiving care from a lower-level health facility (HC III) (OR=1.65; 95% CI: 1.15,2.36), being male (OR=1.5; 95% CI: 1.12,1.99) and taking ART regimen containing a protease inhibitor (OR= 3.05; 95% CI: 2.15,4.33).

Conclusions: The assessment recommends strengthening of the capacity of lower health facilities-to provide ART to children and adolescents, use of a more effective ART regimen containing dolutegravir and finding innovative interventions to support VL suppression for the male child.

EPD043

Three-year follow-up of PositiveLinks: higher use of mHealth platform associated with sustained viral suppression

C. Bielick[1], J. Schwendinger[2], A.L. Waldman[2], C. Canan[3], R. Dillingham[1]

[1]University of Virginia, Infectious Diseases and International Health, Charlottesville, United States, [2]University of Virginia, Charlottesville, United States, [3]Virginia Department of Health, Richmond, United States

Background: PositiveLinks (PL) is a mHealth platform to support care engagement by people with HIV (PWH). It is offered as usual care at our academic clinic. Among other features, self-monitoring is a key activity on PL. Daily reminders prompt the user to report mood and stress levels as well as medication adherence. Response rate to check-ins on PL has been associated with better suppression of viral load over 6-18 months. We present an analysis of all PL users over three.

Methods: We conducted a retrospective chart review between the time period of July 1, 2017 and June 30, 2021 and collected any available data for a minimum of 6 months and a maximum of 36 months after enrollment date. We collected demographic information and all viral loads obtained in usual patient care. We performed time-to-event survival analysis until first unsuppressed viral load stratified by high PL usage (≥48% check-in completion) and low usage with a Kaplan-Meier curve and multivariate Cox Proportional Hazards Model.

Results: There were 485 participants, predominately male (77.4%). About half (48.7%) were white, and 43.3% were black/African-American with a median FPL (federal poverty level) of 104.0 (IQR 0.0-243.5). A Kaplan-Meier curve showed that high PL use was associated with better viral load suppression (VLS) over time (p<0.0001((aHR) of 0.437 (95% CI 0.290-0.658, p<0.001)) after adjusting for age and FPL. Age (aHR of 0.969 (95% CI 0.953-0.984)) and FPL (aHR of 0.9966 (0.9949-0.9983, p <0.001) were also independently associated with VLS.

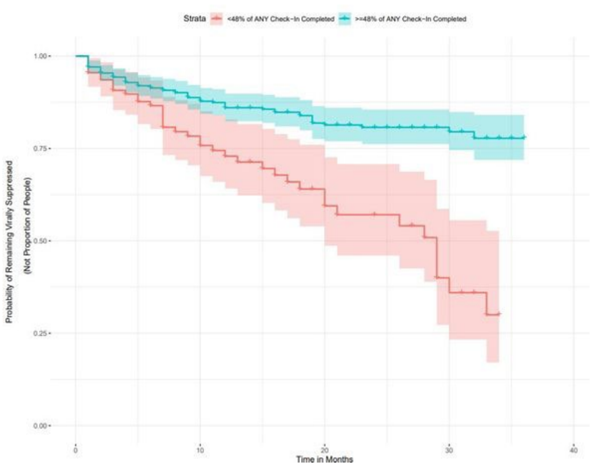

Figure.

Conclusions: High check-in response rate on the PL app, older age, and higher income are associated with sustained viral load suppression over time. mHealth-supported self-monitoring of mood, stress, and medication adherence may be an important tool to promote long-term viral suppression. Lack of response to check-ins may signal an early need for additional support.

Social and behavioural concepts and theories

EPD044

Conceptualising engagement with HIV care for people on treatment: the Indicators of HIV Care for AntiRetroviral Engagement (InCARE) framework

C. Keene[1], A. Ragunathan[2], M. English[1], J. McKnight[1], C. Orrell[3], InCARE Stakeholder Group
[1]University of Oxford, Health Systems Collaborative, Oxford, United Kingdom, [2]University of Oxford, Oxford Centre for Tropical Medicine and Global Health, Nuffield Department of Medicine, Oxford, United Kingdom, [3]University of Cape Town, Department of Medicine, Faculty of Health Sciences, Cape Town, South Africa

Background: As the crisis-based approach to HIV care evolves to lifelong chronic disease management, engagement is increasingly critical to achieve long-term treatment success. However, 'engagement' is a complex concept, and ambiguous definitions limit its evaluation. The proposed framework aimed to identify critical, measurable dimensions of engagement with HIV care for people on treatment, from a health service-delivery perspective, to guide evaluation and interventions to improve outcomes.

Methods: We used a pragmatic, iterative approach, combining insights gained from:
1. Researcher experience,
2. Narrative literature review and framework mapping,
3. Expert stakeholder input and
4. Formal scoping review of measures of engagement.

These inputs contributed to refining the inclusion and definition of critical elements of engagement behaviour that could be evaluated by the health system.

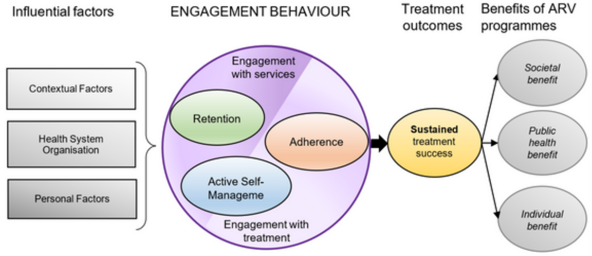

Figure 1. Indicators of HIV care for antiretroviral engagement (InCARE) framework.

Results: The final framework describes 'engagement' (Figure 1) as a dynamic behaviour: people can practice full engagement or not over their treatment journey. It posits that engagement is the product of wider contextual, health system and personal factors. Maintenance of engagement with HIV care is reflected by three measurable dimensions: 'retention' (interaction with services), 'adherence' (pill-taking behaviour), and 'active self-management' (ownership and self-management of care). While retention and adherence may lead to treatment success at a particular time-point, this framework suggests active self-management sustains treatment success, and thus is critical to evaluate to realise the full benefits of antiretroviral treatment programmes.

Conclusions: This framework distils a complex concept into three core, measurable dimensions critical for the maintenance of engagement, and presents them for use in practice. It characterises elements that the system might assess to evaluate engagement more comprehensively at individual and programmatic levels, and suggests that active self-management is an important consideration to support lifelong optimal engagement. This could guide the development of more nuanced interventions that improve long-term treatment success and help maintain momentum in controlling a changing epidemic.

EPD045

Behavioral Economic Incentives to Support HIV Treatment Adherence (BEST): one-year results of a randomized controlled trial in Uganda

S. Linnemayr[1], Z. Wagner[1], U. Saya[2], C. Stetcher[3], P. Wabukala[4], L. Lunkuse[4], B. Anchilla, A. Banegura[4], M. Odiit[4], B. Mukasa[4]
[1]RAND, Santa Monica, United States, [2]Office of Evaluation Sciences, Washington DC, United States, [3]Arizona State, Pheonix, United States, [4]Mildmay Uganda, Kampala, Uganda

Background: A growing number of people who have been on ART for several years experience treatment fatigue contributing to incomplete treatment adherence, a major cause of HIV disease progression and death.

This study tests whether small incentives based on insights from behavioral economics are effective at improving adherence and increasing the likelihood of viral suppression, and compares two ways of implementing incentives: one linked to daily behaviors (medication adherence) and one linked to clinic indicators (timely clinic visits and viral suppression) as a less costly approach to incentivization.

Methods: We enrolled 329 clients at Mildmay Hospital who had been on ART for at least two years and showed recent signs of adherence problems. Participants were randomized into three groups: participants in the first intervention group (MEMS-linked incentives; n=111) were eligible for prize drawings based on electronically measured adherence; those in the second group (EHR-linked incentives; n=109) were eligible based on timely clinic visits and showing viral suppression after 12 months and after 24 months. The control group (n=109) received the usual standard of care. Small prize drawings occur at every clinic visit (every 2-3 months) and large prize drawings occur once per year. Prizes consist of small in-kind gifts worth roughly $1.50 (small prizes) and $10 (large prizes).

Results: The intervention did not significantly effect adherence on average but improved adherence for participants with baseline adherence of less than the 25th per-

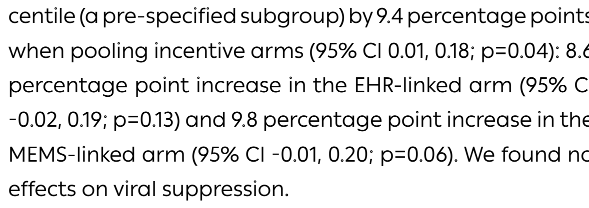
Author Index

centile (a pre-specified subgroup) by 9.4 percentage points when pooling incentive arms (95% CI 0.01, 0.18; p=0.04): 8.6 percentage point increase in the EHR-linked arm (95% CI -0.02, 0.19; p=0.13) and 9.8 percentage point increase in the MEMS-linked arm (95% CI -0.01, 0.20; p=0.06). We found no effects on viral suppression.

Conclusions: Small in-kind incentives based on insights from behavioral economics improved ART adherence during the first year, but only for clients with adherence problems at baseline. The EHR-based version of this intervention could be scaled-up to clients with adherence problems using existing data sources.



EPD046
Comparison of STI risk perception and condom use: a global MIT survey finds behavioral gaps

G. Hakim[1], E. Cuevas[1], D. Goswami[1], E. Roche[1], B. Deperthes[2], N. Steele[1], M. Gray[1], R. Rasalingam[1]
[1]Massachusetts Institute of Technology (MIT), Cambridge, United States, [2]The United Nations Population Fund (UNFPA), New York, United States

Background: Condom use is low globally (4%-52.4%), while >1 million Sexually Transmitted Infections (STI) are transmitted daily. We hypothesize that there is a behavioral gap between the perceived personal risk of STIs and the actual use of condoms during sex.

Methods: Massachusetts Institute of technology (MIT) and The United Nations Population Fund (UNFPA) distributed a global 31-question electronic survey between July-November 2021 to better understand the barriers to condom use and to test interest, and guide development of a novel condom design. Data was analyzed via cluster analysis and compared to similarly-scoped surveys for consistency.

Results: 560 respondents in 79 countries completed the survey. The median age was 30-39 years; 49.5% men, 47.3% women, 1.3% nonbinary/gender fluid; 75.5% Heterosexual, 5.4% Homosexual/Gay, 8.1% Bisexual; 22.5% Non-Hispanic White, 42% Black/Afro-Caribbean/African American, 11% Asian/Pacific Islander, 10% Latinx, 10.8% other.

73% of respondents indicate STI prevention is a concern. Out of that group, 55% use condoms ≤50% of the time during sex. Conversely, most respondents (62%) indicate they use condoms in ≤50% of sexual encounters, yet 64% cited STI prevention as a concern for themself or their partner(s).

90% of respondents predict they would likely use a condom when having sex with a new partner, yet 48% of respondents who are not monogamous report to use condoms ≤50% of the time during sex.

Of respondents who are not monogomous, who predict they would likely use a condom when having sex with a new partner, and who report that STI prevention is a concern, 39% still use condoms ≤50% of the time during sex. Of this group, one in five report that negotiating condom use feels easy ≤50% of the time.

Conclusions: Despite the majority (73%) of respondent's STI concern, respondents predict they will use condoms with new sexual partners more frequently than practiced in reality. Discordance between perceived risk and behavior persists even for non-monogamous individuals, for whom STI risk may be highest.

These findings suggest that STI risk awareness alone does not motivate condom use, and other important factors such as negotiation prior to sex, impact condom use.

Strengthening social and behavioural data collection and analysis

EPD047
Insights from implementing an innovative data infrastructure to empower integrated care and program planning, community engagement, program evaluation, research and public advocacy

Y. Ismail[1], D. Murcia[1], C. Murray[2], D. Pugh[2], M. Ricker-Wilson[2], A. Buttar[3], J. Sleath[3], A. Bisignano[1], R. Wannamaker[3], L. Hodge[4]
[1]Casey House Hospital, Program Evaluation & Knowledge Translation, Toronto, Canada, [2]Casey House Hospital, Day Health Program, Toronto, Canada, [3]Casey House Hospital, Day Health Program Nursing Clinic, Toronto, Canada, [4]Casey House Hospital, Strategic Initiatives, Toronto, Canada

Background: In Canada, at highest risk for HIV diagnosis/treatment failure are those facing intersecting, systemic barriers to healthcare. As Canada's HIV-speciality hospital, Casey House utilizes a care-model based on the social determinants of health (SDOH) to help clients mitigate these barriers. Challenges to SDOH-based responses include the lack of data related to systemic barriers impacting clients' lives and the perception that data-collection is burdensome.

To overcome these challenges, the hospital's measurement and evaluation (M&E) team collaborated with its interdisciplinary care-team to create the *Multipurpose Resilience Assessment* (MRA).

Description: Utilizing the principles of *Transformative*, *Empowerment*and *Actionable* evaluation approaches, the MRA is an integrated client engagement guide, data-collection tool and data-infrastructure. As co-owners of the MRA, the care-team conducts SDOH-informed care-conversations at multiple points in time, capturing these conversations as data.

By integrating data-collection into care-conversations, the burdens of collecting data using conventional patient questionnaires is mitigated. Insights from the data are made available across interdisciplinary teams in almost real time using dashboards, making it available for multiple purposes, including care-planning, programming,

Oral abstracts

Poster exhibition

E-posters

Late-breaker abstracts

Author Index

engagement, and, to evaluate improvements/deteriorations in clients' health *within* each and holistically *across*SDOHs, between any given points in time.

Lessons learned: In under a year, the tool has influenced change—the hospital's health-equity data completion rate improved from 19% to 92%, and there are comprehensive SDOH baselines for 80% of clients. Given the tool's health-equity focus, it is improving the care-team's ability to effectively work with an increasingly diverse roster of clients presenting complex health needs during a global pandemic. At the aggregate level, the use of the dashboard is improving the ability to offer relevant, needs-driven programming, to target engagement with at-risk communities and to identify emerging trends in the data for further evaluation.

Conclusions/Next steps: Despite the myth that data-collection is burdensome, the MRA demonstrates the value of interdisciplinary, data-driven decision-making for addressing the needs of people facing systemic barriers to care and are at higher risk of HIV diagnosis/treatment failure. Validating the tool for broader utilization and exploring its use to inform research and advocacy priorities are imminent next steps.

EPD048

Responding to high prevalence of sexualised drug use among MSM in East and South East Asia requires consistency in construct definition and measurement: results from systematic review and meta-analysis

L. Nevendorff[1], S. Schroder[1], A. Pedrana[2], A. Bourne[3], M. Stoové[2]

[1]Monash University / Burnet Institute, Public Health, Melbourne, Australia, [2]Burnet Institute, Behaviours and Health Risks, Melbourne, Australia, [3]La Trobe, Australian Research Centre in Sex Health and Society, Melbourne, Australia

Background: Concerns regarding sexualised drug use (SDU) among men who have sex with men (MSM) in Asia have emerged in the context of ongoing high rates of HIV diagnoses, emphasising a need for targeted interventions to addresses the intersection of drug use and sex. In light of the distinctive nature of SDU in Asia, we conducted a systematic review of studies measuring the regional prevalence and patterns of SDU to assist programme resourcing, advocacy, and planning and identify priorities for further research.

Methods: We conducted a systematic review, searching six databases for publications that measured SDU among MSM in East and South Asian countries (E-SEAC), published from 1990 to 2020. Narrative synthesis and random pooled effects estimated SDU prevalence and its association with condomless sex (CS) and HIV status among MSM. Subgroup meta-analyses, sensitivity analysis, and publication bias examined potential sources of heterogeneity in pooled SDU prevalence estimates.

Results: Thirty-seven out of 2680 publications retrieved met the selection criteria and fourteen studies were able to be included in meta-analyses. The pooled prevalence of recent SDU was 14% (95%CI= 10%-17%;I^2=97.6), but was higher in studies that asked participants about specific drug types (17%, 95%CI= 14%-20%, p=.05). SDU was associated with greater odds of CS (pooled odds ratio (OR)= 3.21; 95%CI= 1.82–5.66) and positive HIV status (OR= 4.73; 95%CI= 2.27–8.21). SDU definitions and drug types used in E-SEAC differed from other regions (e.g., European Chemsex discourse), and our findings highlight a need to greater consistency in SDU construct definition and measurement within the region.

Conclusions: Studies inE-SEAC show high rates of SDU among MSM and narrative synthesis and meta-analyses indicate an association between SDU and sexual risk. While distinct drug markets and patterns of use demand a bespoke approach to measuring SDU inE-SEAC, the ability to develop a coherent body of evidence on SDU to inform programmes is hampered by definitional and methodological inconsistencies.

EPD049

Digital chat-based focus groups discussions among Chinese MSM: lessons learned and implications for qualitative research

T. Wang[1], R. K J Tan[1], M. Elizabeth Holly[2], G. Marley[1], C. Li[2], T. Hlatshwako[2], D. Wu[1], N. Prajwol[2], R. Ramaswamy[2], J. D Tucker[2], W. Tang[2]

[1]UNC Project-China, Guangzhou, China, [2]UNC, Chapel Hill, United States

Background: COVID-19 has made offline engagement activities challenging in HIV/STI research and have forced many focus groups discussions (FGDs) online. However, few studies have explored the acceptability and feasibility of digital chat-based platforms as a means of engaging Chinese MSM for research, and the implications of such technology for data generation.

Description: We organized six digital chat-based (n=48) FGDs with Chinese MSM from November to December 2021. Each FGD included asynchronous text chat through an instant messaging application known as WeChat. Participants could provide anonymous comments through instant messaging in a facilitated group chat on topics that changed daily across four days.

We generated field notes and sought feedback on participants' experience of the digital FGDs through an exit survey. Data were analyzed through content analysis and descriptive statistics.

Lessons learned: A total of 46 participants completed the survey, of whom 33 (71.7%) used their mobile phones (71.7%) to participate, 3 (6.5%) used desktop, and 10 (21.7%) used both. A total of 26 (61.9%) participants had never participated in in-person LGBTQ+ activities before. On a five-point Likert scale, 36 (78.3%) and 6 (13.0%) rated their experience as 'very good' and 'good', respectively, while

Oral abstracts

Poster exhibition

E-posters

Late-breaker abstracts

Author Index

42 (91.3%) felt that the instant messaging application was a 'very suitable' platform for the focus group. When asked about positive aspects, participants described chat-based FGDs as being convenient, was less socially awkward, and allowed them to speak more freely due to greater anonymity compared to in-person qualitative research.

On the other hand, negative aspects included a lack of in-depth exploration for certain topics and a lack of perceived enthusiasm due to the online nature of discussions compared to in-person methods.

While the totally anonymous nature of the discussion allowed for unfettered sharing of viewpoints, this may have also led to lower barriers in sharing differing opinions that resulted in interpersonal tension in several situations, which were resolved swiftly by facilitators.

Conclusions/Next steps: The anonymous nature of these FGDs could be especially useful for obtaining opinions among online key populations who may be unable to, or hesitant to join in-person studies. Digital FGDs may be especially useful for designing digital interventions.

EPD050

Male partners' influence on adolescent girls and young women's use of combination HIV prevention: insights from analysis of HIV-prevention cascade data collected in a general-population survey in Manicaland, Zimbabwe

L. Moorhouse[1], R. Schaefer[1], J.W. Eaton[1], T. Dadirai[2], R. Maswera[2], T. Museka[2], P. Mandizvidza[2], F. Dzamatira[2], B. Tsenesa[2], T.B. Hallett[1], C. Nyamukapa[1,2], S. Gregson[1,2]

[1]Imperial College London, MRC Centre for Global Infectious Disease Analysis, London, United Kingdom, [2]Biomedical Research and Training Institute, Harare, Zimbabwe

Background: Adolescent girls and young women (AGYW) are a priority population for HIV prevention. Their capacity to effectively use prevention methods is influenced by their male partners' attitudes towards prevention.

We used a novel HIV prevention cascade (HPC) approach to investigate the contributions of male attitudes to gaps in AGYWs' prevention utilisation.

Methods: Data from a general-population survey (2018-19; N=9803) in Manicaland, Zimbabwe were used to measure sexual risk-behaviours and construct HPCs for male condom, PrEP, VMMC (men only) and combination prevention use among HIV-negative sexually-active AGYW (15-24-years) and potential male partners (15-29-years). Logistic regression was used to estimate odds ratios (OR) for male partners' lack of support as a barrier to AGYW's prevention method use. HPCs for potential male partners were analysed to understand factors contributing to men's motivation to use combination prevention.

Results: 51.7% (95%CI:46.0%-57.4%) of AGYW and 42.5% (37.0%-48.2%) of potential male partners who had started sex reported any partner in the last 12 months; 13.7% (11.8%-15.8%) and 32.0% (29.1%-34.9%) reported at least one non-regular partner, respectively. Lack of capacity to use prevention methods—due to partner resistance, low self-efficacy and/or limited negotiation skills—was a large gap in the HPC for AGYW (Figure 1A).

Perceived male partner resistance was associated with reduced odds of PrEP (OR=0.06, 95%CI: 0.03-0.11) and male condom use for women in regular partnerships (OR=0.55, 0.35-0.87). 35.2% (95%CI: 27.3%-44.0%) of male partners (Figure 1B) reported lack of motivation, with perceived consequences (including reduced sexual pleasure), and lack of risk perception being common barriers to motivation for male condoms, VMMC and PrEP.

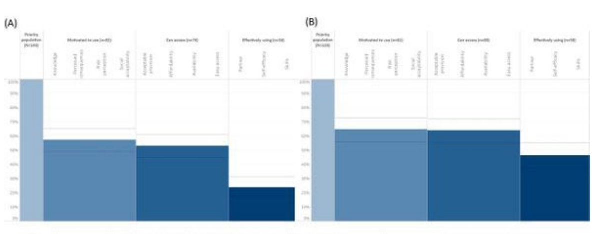


Figure 1 - HIV prevention cascade for use of at least one of VMMC, PrEP or male condoms in HIV negative (A) women aged 15-24 years and (B) men aged 15-29 years, reporting at least one sexual partner in the last 12 months. Barriers to each cascade step were assessed in cascades for individual prevention method use.

Figures 1A and 1B.

Conclusions: Even if AGYW are motivated and have access to prevention, barriers in their capacity to use methods remain including resistance from their male partners. The HPC framework indicates targets for interventions in male partners including increasing motivation to use prevention methods.

EPD051

HIV stigma among people living with HIV in Uganda: a psychometric evaluation and a framework test of the HIV Stigma Mechanism Scale

A. Almeida[1,2,3], R. Wanyenze[4], K. Crockett[5], M. Ediau[5], R. Naigino[5], I. Ogbonnaya[6], C.-D. Lin[7], S. Kiene[5]

[1]San Diego State University, Social Work, San Diego, United States, [2]University of California San Diego, Department of Medicine, San Diego, United States, [3]Fundação Oswaldo Cruz, Programa de Computação Científica, Rio de Janeiro, Brazil, [4]Makerere University, Department of Disease Control and Environmental Health, School of Public Health, Kampala, Uganda, [5]San Diego State University, Division of Epidemiology and Biostatistics, San Diego, United States, [6]Arizona State University, School of Social Work, Phoenix, United States, [7]San Diego State University, Department of Mathematics & Statistics, San Diego, United States

Background: Despite the local efforts to fight HIV, it is estimated that 1.4 million people were living with HIV (PLHIV) in Uganda (2021). HIV stigma is a critical barrier to HIV prevention and care. The HIV Stigma framework describes the HIV stigma association with health outcomes and proposes a scale to measure HIV stigma among PLHIV.

This study aims to evaluate the psychometric properties of the HIV Stigma Mechanism Measure (HIV-SMM) in central Uganda and test the proposed framework.

Methods: The PATH (Providing Access To HIV Care)/Ekkubo Study, a cluster-randomized controlled trial designed to enhance the linkage to HIV care, enrolled participants from November/2015 to July/2021. PATH interviewed 804 Ugandan PLHIV, asking about demographics, health, and stigma due to their HIV status. The analyses of the psychometric properties of the HIV-SMM assessed:

i. Face and content validity,

ii. Reliability,

iii. Construct validity (factor analysis, item response theory), and

iv. Convergent validity (CES-D10).

Multiple regressions tested the HIV Stigma framework considering a set of health outcomes covering the affective, behavioral, and physical consequences of HIV.

Results: Our findings pointed to a more specific stigma structure than the original model, where the Anticipated and Enacted Stigma should decouple into two sub-constructs each: Family and Healthcare workers.

All sub-scales suggested by the 5-factor model have correlations ranging from 0.19-0.47 (p-value<0.01), reinforcing their independent nature. The reliability of the (new) 5-factor model of HIV stigma amongst PLHIV was high (Cronbach's Alpha=0.92-0.98).

The correlations of each HIV stigma mechanism and depressive symptoms (CES-D-10) supported the convergent validity (r=0.12-0.42). The expected relationship between HIV stigma mechanisms and health outcomes was particularly strong for the Internalized stigma. Anticipated and Enacted-Family mechanisms showed a partial agreement with the hypothesized health outcomes. Anticipated and Enacted-Healthcare Workers showed no significant association with health outcomes.

Conclusions: The HIV-SMM efficiently measured HIV stigma amongst PLHIV in Uganda. The face, content, and convergent validity, as well as the reliability, indicated a proper measurement of HIV stigma. The hypothesized associations between HIV-SMM and health outcomes were similar to the seminal study (based in the USA). Challenges to testing the HIV Stigma framework suggest the need for longitudinal data.

Gay men and other men who have sex with men

EPD052

Geographic disparities in availability of Spanish-language PrEP services among Latino sexual minority men in South Florida

C.-H. Shrader[1], J. Stoler[2], J. Arroyo-Flores[3], S. Doblecki-Lewis[4], A. Carrico[5], S. Safren[6], S. Fallon[7], M. Kanamori[5]

[1]Columbia University, ICAP, New York, United States, [2]University of Miami, Geography and Regional Sciences, Coral Gables, United States, [3]Fors Marsh Group, Arlington, United States, [4]University of Miami, Medicine, Miami, United States, [5]University of Miami, Public Health Sciences, Miami, United States, [6]University of Miami, Psychology, Miami, United States, [7]Latinos Salud, Wilton Manor, United States

Background: Despite pre-exposure prophylaxis (PrEP) being available in the US for 10 years, Latino sexual minority men (LSMM) continue to experience barriers in accessing PrEP, such as lack of proximate and accessible, culturally-sensitive navigation services. Little is known about disparities in the availability of PrEP navigation services in Spanish-language in the US HIV epicenter of South Florida's Miami-Dade County, where 83% of new HIV diagnoses among Latinos are among foreign-born Latinos.

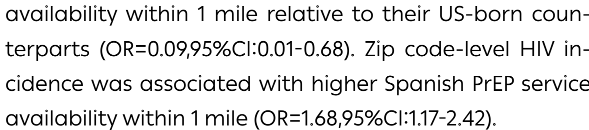
This study examined the relationship between LSMM's immigration and zip code-related characteristics and the availability of Spanish-language PrEP navigation services.

Methods: From October 2018–August 2019, our community partner, an LSMM-centric HIV prevention organization, recruited 11 sociocentric networks of 13 LSMM, ages 20-39 years and clinically indicated for PrEP, in South Florida using respondent-driven sampling (n=143).

Participants completed an interviewer-administered survey focused on demographic/address and immigration-related characteristics. PrEP services were identified using the CDC PrEP Provider Directory and stored in a geographic information system (GIS). We used bivariate analyses to assess the associations between demographic characteristics and immigration and discrimination stress using bivariate analyses.

Hierarchical logistic modeling was used to examine associations of individual-level characteristics nested within zip codes, and the availability of PrEP navigation services in Spanish within 1, 2, and 5 miles from participants' home addresses. GIS was used to create maps of PrEP service availability.

Results: A total of 130 participants were grouped into 60 zip codes (ICC=0.969). Of participants, 51% reported birth in the US and 49% in Latin America. Immigration and discrimination stress were significantly higher among LSMM born in Latin America. Latin American-born LSMM were 91% less likely to have Spanish PrEP navigation service



availability within 1 mile relative to their US-born counterparts (OR=0.09,95%CI:0.01-0.68). Zip code-level HIV incidence was associated with higher Spanish PrEP service availability within 1 mile (OR=1.68,95%CI:1.17-2.42).

Conclusions: Spanish-language PrEP navigation services were in high HIV incidence zip codes where LSMM reside, signifying a geographically matched service need, particularly along Miami-Dade's eastern seaboard municipalities.

However, LSMM may experience barriers preventing access, possibly related to immigration and discrimination stress. Opportunities to increase access to culturally-sensitive PrEP navigation services are discussed.

EPD053

Factors associated with PrEP use among men who have sex with men in Guangdong, China: results from a PrEP demonstration project

Y. Sha[1], C. Li[2], N. Wu[1], A. Hazra[3], J. Lio[3], I. Jiang[3], J. Kerman[3], L. Li[4], Q. Li[4], D. Gong[4], R. Sherer[3], J. Tucker[1], W. Tang[1]

[1]University of North Carolina Project-China, Guangzhou, China, [2]University of North Carolina at Chapel Hill, Department of Health Behavior, Chapel Hill, United States, [3]University of Chicago, Department of Medicine, Chicago, United States, [4]Guangzhou Number Eight People's Hospital, Department of Infectious Diseases, Guangzhou, China

Background: Men who have sex with men (MSM) in China are disproportionately affected by HIV, with prevalence rising from 1.5% in 2005 to 7.0% in 2018. Pre-exposure prophylaxis (PrEP) is highly effective for HIV prevention, but the number of PrEP users in China remains extremely low.

This study summarizes baseline characteristics of an ongoing PrEP demonstration project in China and examines factors associated with previous PrEP use.

Methods: Since September 24, 2021, people 18 years or older who meet the US CDC guidelines for PrEP eligibility and are HBV negative may access PrEP for free at a local infectious disease hospital in Guangzhou, China. Before counseling and prescription, interested participants fill out an online baseline survey that collects data including socio-demographics, sexual behaviors, PrEP and PEP experiences, and PrEP stigma (characterized by individual attitudes toward using PrEP and perceived social network evaluation of PrEP).

Multivariable logistic regression adjusting for age, income, PEP use, substance use and PrEP stigma is used to identify factors associated with previous PrEP use. Odds ratio is reported with 95% confidence intervals.

Results: As of January 23, 2022, 197 participants were screened, among whom 194 completed the baseline survey (age mean=28, SD=7). Among the 194 participants, all are assigned male at birth, 185 (95.4%) self-identify as cismen, 143 (73.7%) self-identify as gay, 130 (67.0%) have an annual income higher than 9445USD, 57 (29.4%) ever used PEP, and 67 (34.5%) used PrEP. In the multivariable model adjusted for age, income, PEP use, substance use, and PrEP stigma, being older (aOR 1.07, 95%CI 1.01-1.14) and PEP use (aOR 4.62, 95%CI 2.27-9.73) are associated with higher likelihoods of ever using PrEP. Not using any illicit substance (aOR 0.47, 95%CI 0.24-0.92) and higher level of PrEP stigma (aOR 0.90, 95%CI 0.82-0.98) are associated with lower likelihoods of ever using PrEP.

Conclusions: PrEP uptake is associated with older age, PEP use, not using any illicit substances, and a lower level of PrEP stigma among this sample of MSM in southern China. Targeted approaches to younger MSM as well as those who use illicit substances will be critical to PrEP scale-up in China.

EPD054

Adaptation of a theory-based clinic-affiliated smartphone app to improve HIV testing and pre-exposure prophylaxis uptake among gay, bisexual, and other men who have sex with men in Malaysia

A.O. Rosen[1], J.A. Wickersham[2], F.L. Altice[2], A. Khati[1], J.R. Luces[3], Z. Ni[2], X. Zhou[2], I. Azwa[4], A. Kamarulzaman[4], M.A. Ab Halim[4], R. Shrestha[1]

[1]University of Connecticut, Department of Allied Health Sciences, Storrs, Connecticut, United States, [2]Yale School of Medicine, Department of Internal Medicine, Section of Infectious Diseases, New Haven, Connecticut, United States, [3]University of the Philippines, College of Allied Medical Professions, Manila, Philippines, the, [4]University of Malaya, Centre of Excellence for Research in AIDS (CERiA), Faculty of Medicine, Kuala Lumpur, Malaysia

Background: HIV disproportionately affects gay, bisexual, and other men who have sex with men (GBMSM). Recent estimates report a high incidence and prevalence of HIV among Malaysian GBMSM. Both homosexuality and substance use are criminalized in Malaysia, making GBMSM bear multilevels of social stigma and discrimination, including in healthcare. mHealth, particularly smartphone applications, are a promising and cost-effective strategy to reach stigmatized and hard-to-reach populations, like GBMSM, and link them to HIV prevention services (e.g., HIV testing, pre-exposure prophylaxis; PrEP). Therefore, this study aimed to adapt the HealthMindr app, developed with GBMSM in the United States to improve HIV testing and PrEP uptake for GBMSM in Malaysia.

Methods: We conducted online focus group discussions (FGDs) between August and September 2021 with 23 GBMSM and 16 community stakeholders (e.g., doctors, nurses, pharmacists, NGO staff). Using in-depth semi-structured interviews, participants were asked questions to assess their preferences for functions and features in mHealth apps among GBMSM, and how to best adapt the HealthMindr app to the Malaysian context. Each session was digitally recorded and transcribed. Transcripts were inductively coded using Dedoose software and analyzed to identify and interpret emerging themes.

Results: Overall, the interviews with GBMSM stated preferences for interfacing with apps to access HIV testing, PrEP, and counseling services. Clinical stakeholders showed strong interest in using the app-based platform to deliver integrated care (e.g., HIV, mental health).
Key themes mostly focused on adaptation and refinement for the Malaysian context and were related to cultural and stylistic preferences (e.g., design, user interface), engagement strategies (e.g., reward systems, marketing campaigns, reminders), recommendation for new functions (e.g., enhanced communication options via chat, discussion forum), a one-stop-hub for all HIV prevention needs (e.g., HIV self-testing, PrEP, post-exposure prophylaxis), and minimizing privacy and confidentiality risks.
Conclusions: Our data suggest that a tailored HIV-prevention app would be acceptable for GBMSM in Malaysia. The findings further provided detailed recommendations for successful adaptation and refinement of the existing platform for optimal use in the Malaysian context.

EPD055

Temporal changes in attitudes towards adopting new biomedical HIV-prevention strategies: an attitude network analysis

H. Zimmermann[1,2], U. Davidovich[2,3], F. van Harreveld[3,4]
[1]*Maastricht University, Department of Work and Social Psychology, Maastricht, Netherlands, the,* [2]*Public Health Service Amsterdam, Department of Infectious Diseases, Amsterdam, Netherlands, the,* [3]*University of Amsterdam, Department of Social Psychology, Amsterdam, Netherlands, the,* [4]*National Institute for Public Health and the Environment, Bilthoven, Netherlands, the*

Background: The uptake of biomedical HIV-prevention strategies (BmPS) is slowly increasing among men having sex with men (MSM). Using a temporal attitude network analysis, we investigated which beliefs are related to uptake of pre-exposure prophylaxis (PrEP) and viral load sorting (VLS; i.e. Treatment as Prevention).
We examined this at different time points to investigate the temporal dynamics of the network of interrelated variables.
Methods: HIV-negative MSM reporting anal sex during the previous six months were drawn from four six-monthly data waves of the Amsterdam Cohort Study during 2017 to 2019. We estimated weighted, undirected networks for each time point, where we included pairwise interactions of PrEP and VLS uptake and related beliefs.
Results: From T1 to T4, PrEP use significantly increased from 10% to 31% (p<0.001), while VLS uptake remained stable over time and was reported by 7-10%. At each time point, the uptake of both BmPS was directly related to the perceived impact of the strategy on one's quality of sex life and perceived supportive social norms (Figure 1).
The overall network structure changed over time, specifically regarding PrEP uptake. At earlier time-points, perceptions of efficacy and affordability were closely related to PrEP uptake, while at later time-points recently social (e.g. gay friends using PrEP) and health-related (e.g. less expected side-effects) concerns were more important.

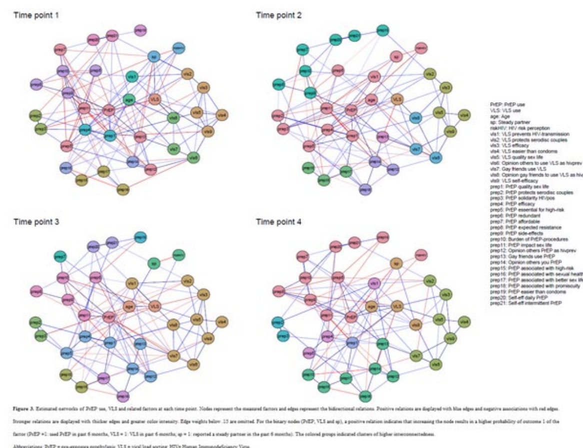


Figure 1.

Conclusions: Our findings suggest that emphasizing the perceived positive impact on one's quality of sex life, and not only increased perceived safety, may improve BmPS uptake. Addressing specific health-related considerations and supportive social norms can also improve PrEP uptake at later stages of implementation.

EPD056

Predictors of drug type and sexualized use in men who have sex with men (MSM) and transgender people in France

A. Léobon[1], E. Samson-Daoust[2]
[1]*Centre National de la Recherche Scientifique, Sciences Humaines et Sociales, Paris, France,* [2]*CRIUSMM, Montréal, Canada*

Background: The use of psychoactive drugs in a sexual context, also known as *chemsex*, has gained mediatic attention in recent months, especially in France where quantitative data is lacking. What types of drugs are involved and whether the phenomenon is truly increasing in popularity depends largely on the country studied.
We sought to investigate predictors of a sexualized use of uncommon drugs by comparing three groups, in a sample of men who have sex with men (MSM) and trans people.
Methods: Data was collected through an online questionnaire completed by 10,853 French participants (Net Gay Barometer, 2018). Amongst 3,563 drug users (32.8%), 1,796 (50.4%) were users of common drugs (cannabis, poppers, or Viagra) exclusively [Group 1]. The remainder of drug users, thus having used at least one uncommon drug (cocaine, amphetamines, MDMA, methamphetamines, cathinones, GHB, opioids, etc.) in the past year, were separated in two groups: those that used drugs in a sexual context at least once (N=880) [Group 3] and those that did not (N=887) [Group 2]. Group 1 was the reference group in univariate and multivariate logistic regressions.

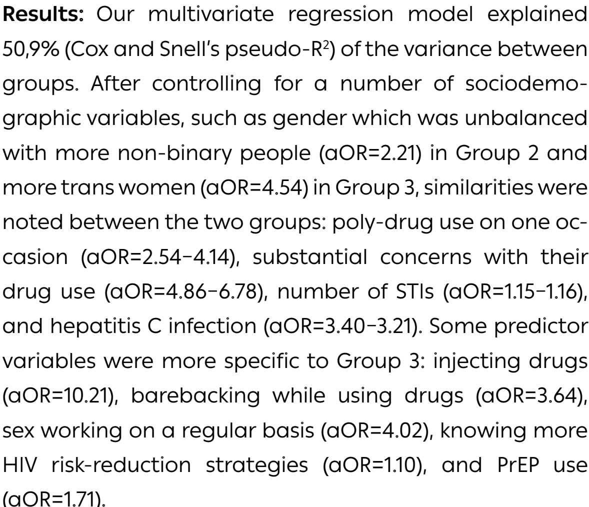
Oral abstracts

Poster exhibition

E-posters

Late-breaker abstracts

Author Index



Results: Our multivariate regression model explained 50,9% (Cox and Snell's pseudo-R^2) of the variance between groups. After controlling for a number of sociodemographic variables, such as gender which was unbalanced with more non-binary people (aOR=2.21) in Group 2 and more trans women (aOR=4.54) in Group 3, similarities were noted between the two groups: poly-drug use on one occasion (aOR=2.54-4.14), substantial concerns with their drug use (aOR=4.86-6.78), number of STIs (aOR=1.15-1.16), and hepatitis C infection (aOR=3.40-3.21). Some predictor variables were more specific to Group 3: injecting drugs (aOR=10.21), barebacking while using drugs (aOR=3.64), sex working on a regular basis (aOR=4.02), knowing more HIV risk-reduction strategies (aOR=1.10), and PrEP use (aOR=1.71).

Conclusions: While there is a gradient of risk-taking behaviors between users of less common drugs, those who use them in a sexual context tend to be more aware and concerned by those same behaviors. This in turn can lead to safer-sex practices, which must be promoted amongst other drug users that also engage in risk-taking behaviors nonetheless.

EPD057

Risk assessment tool enables targeted testing for sustained HIV case finding among men who have sex with men in Lesotho

M. Rangoanana[1], L. Mokhameleli[1], M. Mohapi[1], M. Qhojeng[2], L. Mateka[3], D. Boyee[4], A. Lambert[5]
[1]Pact Lesotho / FHI 360, HIV Prevention, Maseru, Lesotho, [2]Phelisanang Bophelong, HIV Prevention, Maseru, Lesotho, [3]The Peoples Matrix Association, Prevention, Maseru, Lesotho, [4]FHI 360, Dar es Salaam, Tanzania, The United Republic of, [5]FHI 360, Cape Town, South Africa

Background: As HIV programs mature, implementers increase their efforts to find undiagnosed individuals living with HIV. A recent shift from universal to targeted testing challenges implementers to improve risk identification and segmentation in programs for men who have sex with men (MSM) and increase the use of data to differentiate and prioritize individuals for HIV testing and other prevention services.

Description: The USAID/PEPFAR-supported EpiC Lesotho project developed a risk assessment screening tool (RAST) to identify risks using several variables: time since last HIV test, incorrect condom use/ condom unavailable during sex, insertive/receptive sex with incorrect condom use, pre-exposure prophylaxis use, sexually transmitted infection symptoms, medical circumcision status, and intergenerational sex.

For each variable, response values were set for high, medium, or low risk. High, medium, and low values were totaled to determine an individual's risk category and testing priority. The RAST was piloted in three districts from February to March 2020 to validate the segmented risk. The RAST was then rolled out for routine programmatic use in April 2020 to further assess the validity of risk segmentation among MSM. We present results of the first 10 months of RAST implementation (April 2020-January 2021).

Lessons learned: The RAST was used to screen and categorize for HIV risk 2,780 MSM eligible for testing, with 52% (1,434) categorized as high risk, 42% (1,165) as medium, and 6% (181) as low. The HIV case-finding rate was 5.2% (75/1,434) in the high-risk category, 0.4% (5/1,165) in the medium, and 1.7% (3/181) in the low ($p<0.001$). The odds of testing positive were 3.3 times higher among MSM segmented as high risk than in the low-risk category ($p=0.045$).

Conclusions/Next steps: Using the RAST enhances the client-centered approach and allows programs to successfully segment and intensify targeted HIV testing for those at elevated risk of exposure, facilitating more efficient use of peer outreach workers' time and efforts. Lesotho will intensify work to reach and prioritize high-risk MSM for testing, allow medium- and low-risk individuals to opt out of testing, and institute a yearly HIV testing screening algorithm to test every man who has sex with men.

EPD058

Enhanced linkage to voluntary medical male circumcision: an essential prevention tool in programs serving men who have sex with men

M. Rangoanana[1], M. Dimene[1], J. Lehloka[1], S. Nako[1], T. Tlali[2], M. Qhojeng[3], D. Boyee[4], A. Lambert[5]
[1]Pact Lesotho / FHI 360, HIV Prevention, Maseru, Lesotho, [2]The Peoples Matrix Association, Prevention, Maseru, Lesotho, [3]Phelisanang Bophelong, HIV Prevention, Maseru, Lesotho, [4]FHI 360, Dar es Salaam,, Tanzania, The United Republic of, [5]FHI 360, Cape Town, South Africa

Background: Programs serving men who have sex with men (MSM) present an opportunity to reach men at risk of HIV infection with prevention services such as pre-exposure prophylaxis (PrEP) and voluntary medical male circumcision (VMMC). The goal of the Lesotho VMMC program funded by USAID is to reach 80% coverage among 10- to 29-year-old males by 2021, but there are no data to show representation of MSM in accessing VMMC services. There are likely missed opportunities for circumcision among MSM. However, in Lesotho specifically, MSM who also have sex with women represent a very high proportion of the cohort.

Description: We analyzed routine program data from the risk assessment of MSM as part of service provision from April 2020 to January 2021 to determine the proportion of MSM circumcised. Data were cleaned, and circumcision was analyzed as a factor associated with HIV diagnosis among MSM. The analysis adjusted for age, other sexually transmitted infection (STI) symptoms, number of sexual partners, and identity of partners.

Lessons learned: Records from 2,780 MSM were analyzed. Of these individuals, 2,480 (89.2%) were circumcised, 119 (4.3%) reported not being circumcised, and 181 (6.5%) did

not respond. Of the men tested for HIV, 78% (2,181) reported having sex with women. The HIV case-finding rate was 10% (10/101) among MSM who have sex with women and are not circumcised and 3% (63/1,967) among MSM who have sex with women and were reported to be circumcised (p<0.001). MSM who had sex with men only had lower HIV positivity rates, and the result did not differ by circumcision status.

Conclusions/Next steps: The MSM program is strengthening linkages with VMMC providers, referring men identified as not circumcised, and following up on the referral outcome and documentation. Information is needed about why uncircumcised MSM who also have sex with women had not accessed VMMC services, and whether there was perceived stigma in accessing VMMC services.

EPD059
Community perspectives on strategies to support equitable HIV care in the Southern United States

A. Agwu[1], D. Driffin[2], L. Walker[3], M. Mohammadi[4], J. Carter[4], L. Simone[4], E. Taneva[4]
[1]Johns Hopkins University School of Medicine, Baltimore, United States, [2]Georgia State University, Atlanta, United States, [3]THRIVE SS, Atlanta, United States, [4]PRIME Education, LLC, Fort Lauderdale, United States

Background: Despite national and local efforts, inequities in HIV outcomes persist in key populations, particularly among Black men who have sex with men (MSM) in the South. In partnership with THRIVE Support Services (THRIVE SS), we gathered insights from the community to inform patient-centered strategies for improving HIV prevention and treatment.

Methods: In May 2021, web-based surveys were administered by THRIVE SS to people in their network. The survey evaluated the experiences/perspectives of community members regarding strategies for improving sexual health counseling and access/adherence to HIV care.

Results: Surveys were completed by 110 participants, the majority of whom were cisgender male (76%); gay/lesbian/bisexual/pansexual/sexually fluid (73%); Black (73%); residing in Southern US states (81%), and living with HIV (55%) (Table 1).

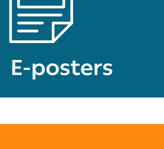
Top identified barriers to HIV care included stigma, concerns about privacy or side effects, and socioeconomic challenges. To improve sexual health dialogue with healthcare teams, participants endorsed the importance of sex-positive, gender-affirming, LGBTQ-friendly clinics (60%) and initiation of sexual health conversations by the clinician (44%).

To support initiation and adherence to HIV medications, including PrEP, participants indicated that clinician knowledge about PrEP (50%), not being judged by clinic staff (33%), and home delivery of medications (23%) were helpful. Home delivery was particularly favored by participants who identified as Black, gay/lesbian/bisexual/pansexual/sexually fluid, living with HIV, resided in the Southern US, or were uninsured. Favored strategies to improve access to and retention in HIV-related services included integrating HIV with other care services (59%), peer navigation (44%), and assistance with health insurance (43%). Care integration was more strongly favored by participants who identified as Black, gay/lesbian/bisexual/pansexual/sexually fluid, living with HIV, or residing in the Southern US.

Average age	Average: 38 years; median: 35 years; range: 24-74 years
Gender	
•Cisgender male	76%
•Cisgender female	14%
•Gender-nonconforming	5%
•Gender-fluid	2%
•Transgender (female-to-male)	1%
•Transgender (male-to-female)	1%
•Nonbinary	1%
Sexual orientation	
•Gay or lesbian	59%
•Heterosexual/straight	27%
•Bisexual	6%
•Sexually fluid	5%
•Pansexual	3%
Race/ethnicity	
•Black	73%
•White	26%
•Latinx	3%
•Asian/Pacific Islander	3%
•Native American/Alaska Native	3%
Region	
•Northeast	NY (3%); NJ (1%); MA (1%); PA (1%)
•Midwest	IL (4%); MI (2%)
•West	CA (5%); CO (1%); OR (1%)
•South	GA (61%); FL (5%); TX (5%); LA (4%); MS (2%); VA (2%); DC (1%); MD (1%)
HIV status	
•Living with HIV	55%
•Not living with HIV	40%
•Do not know	2%
•Prefer not to answer	3%
Health insurance status	
•Medicaid, Medicare, or Affordable Care Plan	44%
•Commercial or private plan	36%
•No insurance	17%
•On parents' insurance plan	2%
•Not sure	1%

Table 1. Survey participant characteristics

Conclusions: These real-world findings were shared with providers nationwide through an educational webinar and webcast, and can be used to inform future initiatives customized to the unique needs/perspectives of key communities to reduce inequities in HIV outcomes.



EPD060

Factors associated with HIV transmission risk from men who have sex with men to women in West Africa (CohMSM ANRS 12324-Expertise France)

M. Fiorentino[1], B. Coulibaly[2], C. Couderc[3], B. Dembele Keita[2], C. Anoma[4], E. Dah[5], E. Mensah[6], T. Niamkey Aka[4], F.R. Ouedraogo[5], N. Sangaré[2], A.R. Kokouba[6], G. Maradan[1,7], M. Mora[1], M. Bourrelly[1], L. Riegel[8], D. Rojas Castro[8,1], B. Spire[1], C. Laurent[3], L. Sagaon-Teyssier[1]
[1]Aix Marseille Univ, Inserm, IRD, SESSTIM, Sciences Economiques & Sociales de la Santé & Traitement de l'Information Médicale, ISSPAM, Marseille, France, [2]ARCAD Santé PLUS, Centre Intégré de Recherche, de Soins et d'Action Communautaire (CIRSAC), Bamako, Mali, [3]TransVIHMI, Univ Montpellier, IRD, INSERM, Montpellier, France, [4]Espace Confiance, Abidjan, Cote D'Ivoire, [5]Association African Solidarité, Ouagadougou, Burkina Faso, [6]Espoir Vie Togo, Lomé, Togo, [7]ORS PACA, Marseille, France, [8]Coalition PLUS, Laboratoire de Recherche Communautaire, Pantin, France

Background: The HIV epidemic in West Africa is highly prevalent in men who have sex with men (MSM). Accordingly, MSM who also have sex with women (MSMW), that is frequent in this region, are a potential bridge subpopulation for HIV transmission to women. We aimed to evaluate the proportions and characteristics of MSMW at 'high behavioral risk of acquiring HIV from male partner(s) and transmitting it to female partner(s)' (HBRMF).

Methods: The community-based prospective cohort study CohMSM included 630 HIV-negative MSM in Burkina Faso, Cote d'Ivoire, Mali, and Togo. Among MSMW (*ie.*≥1 female partner), HBRMF was defined using trajectory models based on seven at-risk sexual practices with male and with female partners, involving inconsistent condom use, multiple partnerships and receptive same-sex anal sex. To assess the relevance of trajectory models, we compared the proportion of HIV-seroconverted participants according to HBRMF. Factors associated with HBRMF were identified using a generalized estimation equation logistic regression model accounting for longitudinal data.

Results: 45% of the 304 MSMW (22% of all CohMSM participants) were at HBRMF. This group accounted for 72% of the 28 HIV-seroconversions observed during the follow-up (p=0.001). HBRMF was positively associated with being aged 18-24 years (adjusted odds-ratio [95% confidence interval] 1.67[1.23-2.27], compared to ≥25 years), being sexually attracted to men only (1.94[1.38-2.75]), feelings of loneliness (1.92 [1.39-2.67]), experience of homonegative violence (1.22[1.05-1.41] per unit score). HRMW was negatively associated with having had both steady and occasional female partners (0.34[0.19-0.57], compared to a steady female partner only), and tended to be associated (0.05<p<0.1) with ≥4 sexual intercourses with female partner(s) in the previous four weeks (0.55[0.28-1.07], compared to 0-3 intercourses).

Conclusions: Establishing official relationships with women might be a strategy for young and/or stigmatized MSMW to comply with social pressure to display a heterosexual lifestyle; this increases at-risk sexual behaviors with both male and female partners.
Although associated with little sexual activity with female partner(s), HBRMF concerned almost half of MSMW (one fifth of MSM included in CohMSM). This result stresses the need to adapt HIV research and prevention to MSMW and their female partners.

EPD061

'Discreet Life': An innovative HIV testing campaign targeting heterosexual men who have sex with men (MSM) in New South Wales (NSW), Australia

H. McCormack[1,2], P. Tayler[1], R. Avasalu[1], N. Ryder[1,2,3,4]
[1]NSW Ministry of Health, NSW STI Programs Unit, St Leonards, Australia, [2]UNSW, Kirby Institute, Sydney, Australia, [3]Hunter New England Sexual Health, Newcastle, Australia, [4]University of Newcastle, School of Medicine and Public Health, Callaghan, Australia

Background: Sustained investment in HIV prevention strategies among MSM has contributed to a recent decline in HIV notifications in NSW. However, the decline has been most significant in inner metropolitan Sydney, which have the largest populations of gay community attached MSM. Market research with heterosexual MSM identified that this population has limited engagement with the gay community and little exposure to HIV health promotion delivered by gay organisations. In 2018, 62% of MSM diagnosed with HIV had not tested in the past 12 months and 36% were late diagnoses. Discreet Life was developed to address these gaps and increase testing in heterosexual MSM.

Description: The campaign strategy centred delivery of key messages at the 'trigger moment' when heterosexual MSM are seeking sex with other men and are most receptive to related messaging. It included three pillars: digital advertisements on hook-up apps, posters in cruising areas where men meet for sex, and innovative use of geo-targeting to display digital advertisements to men who had recently visited an identified cruising location.
Campaign creative was informed by market research and focus testing with heterosexual MSM and consultation with sexual health promotion specialists.

Lessons learned: Although a hidden population, when given the opportunity to participate in market research anonymously, heterosexual MSM saw their contributions as meaningful and important. The use of language used by the target audience to identify themselves in online MSM spaces was positively received. The juxtaposition of heterosexually-coded imagery with communications channels used for MSM hook-ups achieved considerable cut through for heterosexual MSM. Discreet Life achieved high levels of engagement, significantly exceeding indus-

try benchmarks for click through rate (CTR) on digital advertisements and delivering a sixfold increase in visits to the NSW Health HIV testing website.

Conclusions/Next steps: A second Discreet Life campaign has been funded and will be in market at the time of the conference. This unique testing campaign was informed by new insights identified in market research with this 'hard to reach' population and demonstrates that HIV health promotion can be targeted effectively at MSM outside the gay community when members of the target audience are meaningfully engaged.

EPD062

"Sex without fear": exploring the psychosocial impact of HIV pre-exposure prophylaxis on gay, bisexual, and other men who have sex with men in England

R. Hayes[1], R. Horne[2], W. Nutland[3,1], S. Wayal[4], B. Rice[1], S. McCormack[5], M. Gafos[1]

[1]Faculty of Public Health and Policy, London School of Hygiene and Tropical Medicine, London, United Kingdom, [2]Centre for Behavioural Medicine, University College London, London, United Kingdom, [3]PrEPster, London, United Kingdom, [4]Institute for Global Health, University College London, London, United Kingdom, [5]Medical Research Council Clinical Trials Unit, University College London, London, United Kingdom

Background: Gay, bisexual, and other men who have sex with men (GBMSM) experience a higher prevalence of psychosocial health problems, such as substance misuse and depression, compared to heterosexuals. Previous research suggests HIV Pre-Exposure Prophylaxis (PrEP) has psychosocial effects beyond its intended purpose of reducing HIV infection. This study explores the psychosocial impact of PrEP use on GBMSM in England reporting regular condomless anal sex (CAS) using qualitative data from the PROUD trial.

Methods: From February 2014 to January 2016, semi-structured in-depth interviews were conducted with 40 GBMSM and one trans woman. Participants were purposively recruited based on trial arm allocation, adherence, and sexual risk behaviours. Participants were asked about their attitudes towards PrEP and its influence on their self-image and sex life. The interviews were conducted in English, audio-recorded, transcribed, coded, and analysed using reflexive thematic analysis.

Results: Our analysis generated eight themes which can be categorised as having either an emotional or behavioural impact. The emotional impact of PrEP was largely positive, with participants reporting reduced HIV-related anxiety, improved HIV prevention self-efficacy, reduced internalised stigma, and increased sexual pleasure and intimacy. These changes were attributed to PrEP eliminating the risk of HIV acquisition, thereby making CAS 'permissible'. However, for some participants, PrEP's disruption of social norms around condom use created internal conflict and feelings of reduced condom use self-efficacy. This led to increased CAS, which they perceived as a negative outcome. In contrast, most participants felt the impact of PrEP on their behaviour was positive, reporting greater sexual freedom, reduced recreational drug use during CAS, and more protective sexual health behaviours.

Conclusions: Our findings support calls to consider the psychosocial impact of PrEP in prescribing guidelines. It also highlights the need to offer psychosocial support alongside PrEP due to the potential for some users to experience internal conflict and reduced self-efficacy around condom use.

These findings provide a baseline of PrEP's psychosocial impact amongst some of the first PrEP users in England and could potentially inform current and future PrEP provision and research in a range of populations and settings.

EPD063

Social network strategy approach improves identification of HIV-infected individuals among men having sex with men in Nairobi urban slums Kenya

K. Kariuki[1]

[1]HOYMAS, SRHR Department, Nairobi, Kenya

Background: Kenya's attainment of the 95-95-95 HIV epidemic control is affected by the first 95, the cascade being 79.4%-95.7%-88.4% (Kenya Population-based HIV Impact Assessment (*KENPHIA*) 2018). There remain significant barriers to HIV testing among MSM, due largely to complex issues of layered stigma that deter MSM from accessing traditional peer-led, clinic-based testing. Only 65% of MSM are receiving HIV services in Kenya (Kenya AIDS Response Progress Report, 2018). Studies have shown testing and counselling of social networks of individual members of a key population has been used successfully to reach more MSM who are at risk of HIV infection and identify more HIV-infected individuals (Campbell, C.K. et. al., 2018). Since MSMs are at a heightened risk of being infected with HIV, increasing HIV testing rates and status awareness among them will be key to improving their quality of life and slowing down HIV transmissions.

Methods: To measure service uptake through SNS we analyzed the data from January 2020 to September 2020. 33 MSM aged 18 years and above (called "seeds") were recruited for HTS services. This included 7 known positives and 26 high-risk negative MSM clients.

Results: The 33 recruiters received a total of 88 coupons of which 83 network members returned coupons--94% return rate. All of the 83 new members were referred for HTS services, 5 of whom had a known HIV-positive status. Among the remaining 78, 6 clients tested positive to HIV—yielding 8% positivity. All the 6 were linked for care and treatment services. During the same period 349 MSMs were enrolled through peer education out of whom 3 (0.9%) tested positive to HIV.

Author Index

	SNS strategy	Peer Outreach Strategy	OR (95% C.I)	p-value
HIV-Positive	6 (8%)	3	9.611 (2.349-39.322)	p = 0.0016
HIV-Negative	72 (0.9%)	346		
	78	349		

Table.

Conclusions: In this study, we found that Social Network Strategy is associated with improving enrolment of MSM into HIV-prevention program and identification of new HIV-infected MSM. We recommend the use of this strategy as complementary approach to the peer outreach model in offering service to MSMs. Projects should ensure strict adherence to the laid down protocols for ethical programming and recruiter training.

EPD064

Formative evaluation of artificial intelligence chatbots among gay, bisexual, and other men who have sex with men to promote HIV testing and prevention in Malaysia: a qualitative analysis

M. Peng[1], J. Wickersham[2], F. Altice[2], R. Shrestha[3], I. Azwa[4], M. Akbar Ab Halim[4], W. Mohd Ikhtiaruddin[4], V. Tee[4], X. Zhou[2], A. Kamarulzaman[4], Z. Ni[2]

[1]Yale University, School of Public Health, New Haven, United States, [2]Yale University, Department of Internal Medicine, New Haven, United States, [3]University of Connecticut, Department of Allied Health Sciences, Storrs, United States, [4]University of Malaya, Faculty of Medicine, Kuala Lumpur, Malaysia

Background: Malaysia has one of the fastest growing HIV epidemics among gay, bisexual, and other men who have sex with men (GBMSM) in Southeast Asia. Artificial intelligence (AI) chatbots, defined as computer programs embedded with machine learning algorithms to simulate conversation with human users, are a promising strategy for promoting HIV testing and prevention. This study aimed to identify the facilitators of and barriers to GBMSM's acceptance of AI-chatbots and their preferred features.

Methods: We conducted five semi-structured focus-group interviews between July and September 2021. A total of 31 GBMSM were recruited in Malaysia using convenience sampling and community outreach. Inclusion criteria were:

1. Cis-gender male;
2. 18+ years;
3. Condomless sex with another man in the past 6 months; and;
4. HIV negative or status unknown.

All interviews were recorded, transcribed verbatim, coded using NVIVO 9. Thematic analysis was first conducted to inductively analyze the interview transcripts. Later, emerged themes were mapped onto the four constructs of the Unified Theory of Acceptance and Use of Technology (UTATU), namely *performance expectancy, effort expectancy, facilitating conditions, and social influence.*

Results: Overall, most participants had a positive attitude towards the use of AI-chatbots for improving HIV testing and prevention. Significant factors influencing the chatbot's performance expectancy (perceived usefulness) included privacy concerns, chatbot's ability to provide emotional support, and efficacy of information dissemination and problem solving.

Convenience, cost, and technical errors were the primary factors affecting the chatbot's effort expectancy (perceived ease of use). Efficient linkage to healthcare professionals and knowledge about HIV self-testing presented as facilitating conditions for chatbot acceptance. Lastly, LGBTQ stigmatization and legal concerns were identified as important socio-cultural factors for HIV-related technology acceptance. Accentuating the importance of a private and secure virtual environment, most GBMSM preferred the AI-chatbot to be embedded in GBMSM-friendly NGOs' or clinics' websites.

Conclusions: This study illuminates the importance of socio-cultural considerations beyond the characteristics of the technology itself in HIV-related technology acceptance. It provides valuable insights for the future development of HIV-preventing chatbots for GBMSM in Southeast Asia and prompts further quantitative studies to validate the correlation between disease-specific stigma and health technology acceptance.

EPD065

Characteristics of chemsexers in France during the COVID-19 pandemic: results from the ERAS 2021 national online survey

P. Roux[1], A. Faye[1], C. Donadille[1], G. Girard[1], B. Spire[1], C. Protiere[1], A. Velter[2]

[1]INSERM, SESSTIM, Marseille, France, [2]Sante Publique France, Saint Maurice, France

Background: Chemsex - the use of psychoactive substances in a sexual context - is a common at-risk practice in men who have sex with men (MSM). Several studies have identified specificities associated with chemsexer MSM as well as vulnerabilities. Although the current COVID-19 pandemic seems to have affected this sub-population more than non-chemsexer MSM, a lack of information prevents us from being able to characterize them in order that their needs can be better met by harm-reduction stakeholders. This analysis aimed to study the factors associated with the practice of chemsex.

Methods: Enquête Rapport au Sexe (ERAS) is an anonymous, online, self-administered repeated cross-sectional survey conducted from 26 February to 11 April 2021 in 18,478 MSM. The survey questionnaire collected socio-demographic, behavioural and health (HIV, STI and mental health) data.

The Generalized Anxiety Score (GAD) scale was used to measure anxiety. We used a classic logistic regression to understand the factors associated ($p<0.05$) with practicing chemsex, adjusting for known factors.

Results: Of the 12,494 MSM selected for the analysis, 1,512 (12%), reported practicing chemsex in the previous six months. The logistic regression results show that these chemsexers were more likely to be older, to live in large cities (>100,000 inhabitants) and to report a more difficult financial situation than non-chemsexer MSM. Chemsexers used websites and apps more frequently, had more sexual partners, but also got tested more frequently for STI.
Collected health data suggest that chemsexers were more likely to be HIV positive (aOR [95% CI]): 3.12 [2.64,3.70]), to have a high anxiety GAD score (aOR [95% CI]): 1.21 [1.06,1.38]), and to have attempted suicide in the previous 12 months (aOR [95% CI]: 2.33 [1.59,3.41]).
Conclusions: These results confirm that while chemsexer MSM are more exposed to HIV risks, they use prevention services (STI screening) more often than non-chemsexer MSM. Our results also shed new light on the mental health and socio-professional difficulties of chemsexer MSM. In addition, they suggest a link between HIV seropositivity and chemsex. This possible link deserves exploration through qualitative and longitudinal studies. In conclusion, prevention services must adapt to HIV+ chemsexers' needs and to their psychosocial fragilities.

EPD066

HIV PrEP provider communication preferences among Black sexual minority men

D. Dangerfield II[1], A. Lipson[1], J. Anderson[2]
[1]*Johns Hopkins School of Nursing, Baltimore, United States,* [2]*University of Tennessee Health Science Center, College of Nursing, Memphis, United States*

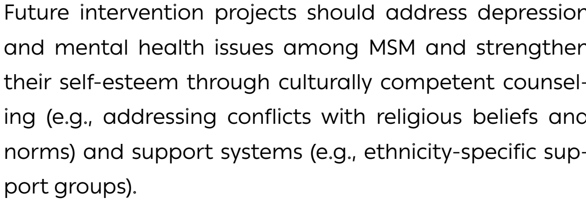
Background: Black sexual minority men (BSMM) are substantially less likely than white SMM to accept a clinician's recommendation to initiate HIV pre-exposure prophylaxis (PrEP). Barriers to accepting clinical recommendations include concerns about side effects and stigma as well as discomfort discussing sexual health issues with clinicians. Communication strategies to increase PrEP initiation among SMM are largely unknown. The purpose of this study is to identify PrEP messaging preferences among BSMM.
Methods: Data were obtained from 12 focus groups and one in-depth interview among BSMM in Baltimore, MD between October 2019 and May 2020 (N=39). Focus groups were stratified into three age groups, (18-24, 25-34, and 35 and older) and facilitators probed on ways clinicians could discuss PrEP with BSMM. An adapted pile sorting approach was used to identify themes.
Results: Most participants identified as homosexual, gay, or same gender-loving (68%), were employed (69%), and single (66%). Thematic analysis revealed that BSMM wanted clinicians to explain PrEP efficacy and side effects, tailor messaging according to individuals' lifestyles, provide prevention messaging with care, and disclose their own PrEP use.
Conclusions: Clinicians could increase uptake and adherence among BSMM by implementing PrEP communication preferences. Clinicians working with BSMM should learn their key characteristics and individual lifestyles. Learning individual risk behaviors will also enable clinicians to tailor prevention messaging. Discussing PrEP efficacy and safety is also necessary. When possible, clinicians should disclose PrEP use history to build trust, share vulnerability, and increase acceptability.

EPD067

HIV risk behaviors and psychosocial factors among men who have sex with men (MSM) in Kuala Lumpur Malaysia

T. Nemoto[1], M. Iwamoto[2], H. Xie[2], M.S. Hazratzai[2], S. Tan[2], Y.K. Teh[3]
[1]*Public Health Institute, San Francisco, United States,* [2]*Public Health Institute, Oakland, United States,* [3]*National Defense University of Malaysia, Kuala Lumpur, Malaysia*

Background: The major mode of HIV transmission in Malaysia has shifted from injection drug use to sexual transmission. Despite the high prevalence of HIV among men who have sex with men (MSM), few studies have investigated psychosocial factors among MSM. This study aimed to describe HIV risk behaviors and psychosocial correlates among MSM in Malaysia.
Methods: Based on stratified sampling, 140 MSM in Kuala Lumpur were recruited and administered a survey questionnaire (72.1% Chinese Malaysian and 27.9% ethnic Malay; mean age = 34.1 years; 41.4% living with HIV). Bivariate and multivariate analyses were used to describe HIV risk behaviors and psychosocial correlates (homophobia, self-esteem, identity with MSM community, and need for social support).
Results: Those identifying as homosexual were more likely to be living with HIV than those identified as bisexual ($p < .05$). Fifty-four participants had casual male partners in the past 30 days; 53.7% had engaged in receptive anal sex, and 10.3% had not always used a condom; 44.4% had engaged in insertive anal sex, and 20.8% of these had not always used a condom. Overall, 30.0% of the participants were depressed (CES-D). Malay participants had higher levels of depression ($p < .05$), homophobia ($p < .01$), and need for social support ($p < .01$) than Chinese. Malay participants showed lower levels of identity with the MSM community than Chinese ($p < .05$).
Overall, 43.9% reported having thought about committing suicide and only 39.3% had talked to someone or sought professional help. More Chinese reported having thought about committing suicide than Malay ($p < .05$). A multivariate analysis revealed that participants identifying as homosexual or who had lower levels of self-esteem showed significantly higher levels of depressive symptoms.
Conclusions: Because many participants were recruited from a CBO providing HIV care and support, this sampling bias must be considered.



Future intervention projects should address depression and mental health issues among MSM and strengthen their self-esteem through culturally competent counseling (e.g., addressing conflicts with religious beliefs and norms) and support systems (e.g., ethnicity-specific support groups).
Structural changes must be made to reduce homophobia against MSM in Malaysia while advocating to protect their human rights.

EPD068

Injectable PrEP for HIV prevention: perspectives from men who have sex with men and health system stakeholders in Ontario, Canada

D. Grace[1], M. Gaspar[1], A. Wells[2], J. Sinno[1], M. Montess[3], M. Hull[4], N. Lachowsky[2], D. Tan[5]
[1]University of Toronto, Dalla Lana School of Public Health, Toronto, Canada, [2]University of Victoria, Public Health and Social Policy, Victoria, Canada, [3]Western University, London, Canada, [4]University of British Columbia, Faculty of Medicine, Vancouver, Canada, [5]St. Michael's Hospital, Division of Infectious Diseases, Toronto, Canada

Background: In Canada, gay, bisexual, and other men who have sex with men (GBM) continue to make up over half of new HIV diagnoses, and oral PrEP uptake has plateaued among HIV-negative GBM. Approval of injectable PrEP is imminent, but a paucity of research exists to inform health promotion and delivery implementation. We explored GBM's awareness and interest in injectable PrEP compared to oral PrEP, as well as the perspectives of health system stakeholders.
Methods: In 2021, we conducted 22 in-depth interviews with GBM who were PrEP users (n=14) and non-PrEP users (n=8) living in Ontario, Canada. We also interviewed 20 key stakeholders (e.g., healthcare providers, public health officials, community-based organization staff). Interviews were audio-recorded, transcribed verbatim, and analyzed in NVivo using thematic analysis.
Results: Only a third (n=7) of GBM interviewed had heard about injectable PrEP. Among GBM, the general reaction toward it was favourable. Many PrEP users also expressed interest in trying it; they described greater perceived convenience of injectable PrEP and that it would improve adherence. However, none of the current PrEP users reported significant struggles with oral PrEP adherence.
Some GBM described that an injection may also help keep PrEP confidential. Some current PrEP users were curious about injectable PrEP, but did not think that they would switch because of a fear or discomfort of needles. A few PrEP users discussed preferring to still take oral PrEP to feel 'in control'. No non-PrEP users said that injectable PrEP would make them interested in being on PrEP.
The most frequently discussed barrier to using PrEP was cost. Stakeholders, however, noted that injectable PrEP can improve access, help adherence, and may help marginalized groups who experience precarious living conditions. Some clinicians also expressed concerns about the time and personnel needed for injectable PrEP to be made available.
Conclusions: For many GBM, injectable PrEP might offer additional convenience. However, it did not appear to affect PrEP decision-making in any significant way for this group of GBM. System-level challenges to implementing injectable PrEP must be addressed. Furthermore, significant systemic barriers remain for accessing oral PrEP in Ontario that injectable PrEP will not resolve.

EPD069

Acceptability of sexual orientation disclosure interventions in primary care survey

R. Truong[1,2], D.J. Brennan[3], A.N. Burchell[1,4], R. Upshur[2,4], D.H.S. Tan[1,2,5,6]
[1]St. Michael's Hospital, Unity Health Toronto, MAP Centre for Urban Health Solutions, Toronto, Canada, [2]University of Toronto, Institute of Medical Science, Toronto, Canada, [3]University of Toronto, Factor-Inwentash Faculty of Social Work, Toronto, Canada, [4]University of Toronto, Dalla Lana School of Public Health, Toronto, Canada, [5]St. Michael's Hospital, Unity Health Toronto, Division of Infectious Diseases, Toronto, Canada, [6]St. Michael's Hospital, Unity Health Toronto, Department of Medicine, Toronto, Canada

Background: Coming out is difficult for some gay, bisexual, and other men who have sex with men (gbMSM). Our objective was to quantify the acceptability of interventions that could support sexual orientation disclosure to primary care providers (PCPs) among Ontario gbMSM, and to explore their association with demographics, HIV-risk, and minority-stressors.
Methods: We conducted a cross-sectional survey for gbMSM via sexual networking applications (Scruff, Jack'd, Grindr) and community-based organizations in Ontario. A community-advisory-board assisted in conceiving ten potential interventions, and participants were asked to rate the acceptability of each on a 4-point Likert scale. Other measures included the HIRI-MSM risk index, Nebraska-Outness-Scale, Everyday-Discrimination-Scale, Internalized-Homophobia-Scale, and the Community-Connectedness-within-LGBT-Community-Scale.
We used logistic regression to identify characteristics associated with acceptability of the two least popular interventions, with not being "out" to their PCPs as the primary predictor.
Results: Of 404 participants, age ranged from 19-80 years (Mean=39, SD=12.2), with most identifying as cis-male (91.3%), gay (81.6%), and White (60.8%). All interventions were generally acceptable (≥50%; Figure 1).
The most acceptable intervention was a resource directory of LGBTQ2S+ friendly providers. The two least acceptable interventions were a performance-based incentive program and in-take process intervention. Acceptance of

these two interventions was associated with being non-Canadian born, PrEP-eligible, and generally "out"; as well as reporting household-income below $90,000, high levels of discriminatory experiences, and high levels of LGBT community connectedness (Table 1).

Figure 1. Levels of acceptability of specific sexual orientation disclosure interventions.

	Performance-based Incentive Intervention (n=281)				In-take Process Intervention (n=294)			
Variable	Univariable Models **OR (95% CI)**	***p***	Multivariable Model[a] **aOR (95% CI)**	***p***	Univariable Models **OR (95% CI)**	***p***	Multivariable Model[a] **aOR (95% CI)**	***p***
Not "Out" to Primary Care Provider	1.01 (0.60-1.71)	0.97	1.55 (0.77-3.14)	0.22	0.60 (0.36-1.00)	0.051	0.84 (0.44-1.59)	0.58
Not Born in Canada	1.76 (1.08-2.89)	0.025	2.36 (1.13-4.94)	0.022	1.06 (0.65-1.72)	0.83	0.97 (0.48-1.97)	0.94
Household income ≤$90,000	1.79 (1.11-2.87)	0.017	1.81 (1.04-3.17)	0.037	1.18 (0.74-1.88)	0.50	1.02 (0.60-1.74)	0.95
Eligible for PrEP	1.57 (1.003-2.45)	0.049	1.30 (0.75-2.25)	0.35	0.79 (0.51-1.23)	0.30	0.75 (0.44-1.29)	0.30
Outness score	0.96 (0.87-1.07)	0.47	1.00 (0.88-1.14)	0.98	1.14 (1.03-1.27)	0.011	1.18 (1.04-1.34)	0.013
High level of experiences of discrimination	2.64 (1.46-4.78)	0.001	3.25 (1.53-6.92)	0.002	1.00 (0.59-1.72)	0.99	1.33 (0.68-2.61)	0.40
High level of LGBT community connectedness	1.95 (1.15-3.30)	0.013	1.99 (1.05-3.76)	0.035	1.81 (1.08-3.04)	0.025	1.58 (0.87-2.88)	0.13
[a]Multivariable model adjusted for age, racialized identities, gender identity, sexual orientation, employment, and levels of internalized homonegativity								

Table 1.

Conclusions: Most interventions were acceptable and should be prioritized for implementation. The least acceptable interventions may be deprioritized but could still support gbMSM experiencing minority-stressors.

EPD070

Exploring the perceived risks that come with being a man who have sex with men while seeking HIV services in COVID-19 era, a qualitative study done in Nairobi-Kenya

A. Onsomu[1,2], M. Akolo[1,2], E. Ndirangu[1], I. Kambo[1], B. Waweru[1], H. Musembi[1], B. Mutwiri[1], F. Kiogora[2], J. Kimani[2], L. Gelmon[2]

[1]Aga Khan University, Nursing, Nairobi, Kenya, [2]University of Manitoba-PHDA, SWOP, Nairobi, Kenya

Background: In Kenya, Men who have sex with men (MSM) continue to live in fear of their lives because of the risks surrounding their sexual orientation. They are marginalized, criminalized, and face discrimination from the public, yet they carry an HIV burden of 18.2% compared to the general population, which has a prevalence of 4.9%. COVID-19 saw a decline in numbers of MSM seeking HIV services. This study explored the risks of seeking HIV services among MSM in the COVID-19 Era.

Methods: A qualitative descriptive study was conducted among MSM seeking HIV services within the Sex Workers Organization Project (SWOP) -a HIV/STI NGO serving 1400 MSM within Nairobi, Kenya. This study was conducted in October 2021 during COVID-19 era. Participants were recruited through purposeful sampling that utilized an outreach, peer-led model.Two focused group discussions were conducted, a total of 17 respondents participated.

An FGD guide was used to ascertain the risks encountered by MSM before/during COVID-19 era and how this affected their HIV services seeking behavior. The discussion was recorded, data were transcribed and coded for analysis through NVIVO.

Results: Most MSM respondents said their lives have always been miserable, but the COVID-19 pandemic worsened their situation. Some MSM reported that before the pandemic, they were afraid of; disclosing their orientation to health providers due to lack of trust, harassment, discrimination, and stigmatization especially in government health facilities. As a result, they risked unnecessary beating from the public and human rights violations to the extent of permanent disabilities/death.

Despite all these, they were still financially stable due to working from hidden, organized hot spots where they met their sex clients safely. The movement restrictions and hot spot closure that come with COVID-19 saw MSM experience the above and again lose sex clients, which affected their financial status.

Some MSM had to move to estates and "hunt" for potential clients, which earned them a beating from the "potential clients." This financial crisis saw them lack bus fare to access health facilities.

Conclusions: Ways to reach the MSM community optimally during COVID-19 era with HIV services should be devised.

EPD071

Navigating the gaps between initiation and treatment of MSM clients through the use of case managers

L. Asomaning Obeng[1], C. Asamoah-Adu[2], K. Diaba[2]

[1]Ghana West-Africa Program To Combat AIDS & STI (WAPCAS), Monitoring & Evaluation, Accra, Ghana, [2]Ghana West-Africa Program To Combat AIDS & STI (WAPCAS), Programs, Accra, Ghana

Background: Initiation of positive clients on antiretroviral therapy (ART) is one of the key challenges faced by KP programs especially among MSM. In Ghana, most KP access HIV testing services (HTS) mainly through community outreach programs in collaboration with the Public Health Sector. HIV testing is mostly conducted in KP communities; however, confirmation of reactive results and subsequent initiation could only be done in health facilities. These nurses who conduct the test are stationed in health facilities and therefore could not devote enough time to follow-up on reactive cases, do defaulter tracing, and ensure treatment adherence. This leaves a gap in linking and retaining positive KP on treatment.

Description: Ghana West-Africa Program to combat AIDS & STI (WAPCAS), a Principal Recipient under the Global Fund KP Grant in Ghana project introduced the case management strategy in partnership with sub-recipients including CEPEHRG, MARITIME and WAAF.

This strategy brought on board a pool of Case Managers comprising KP friendly community health providers, experienced KP volunteers, and other social workers to perform certain case management functions. This team was trained in case management strategies in a KP intervention and further integrated into the mainstream HTS team with clear roles and responsibilities. Their roles included; ensure same day linkage of positive clients on ART, do defaulter tracing, drug pick-up, provide adherence support, psychosocial counselling, facilitate viral load testing and serve as treatment monitors.

Lessons learned: Results on clients initiated on treatment from 2018 till 2021 were as follows;

MSM – 78% (2018), 82% (2019), 85% (2020) and 95% (2021).

Case Managers are the gatekeepers who ensure that all positive clients are linked on ART soon after confirmation.

Conclusions/Next steps: Assess the effectiveness of the various categories of case managers in enhancing treatment initiation among KP**.** Pilot this strategy in the public health system to assess its effectiveness in increasing enrolment on treatment.

EPD072

Evidence of considerable HIV prevention and care need among a large sample of bisexual men: findings from the 5-country Asia-Pacific MSM internet survey

A. Bourne[1], T. Norman[1], A.O. Hill[1], N. Amos[1], S.H. Lim[2], T. Guadamuz[3], M. Holt[4], B. Bavinton[5]

[1]La Trobe University, Australian Research Centre in Sex, Health and Society, Melbourne, Australia, [2]University of Malaya, Department of Social and Preventive Medicine, Kuala Lumpur, Malaysia, [3]Mahidol University, Department of Society and Health, Bangkok, Thailand, [4]UNSW Sydney, Centre for Social Research in Health, Sydney, Australia, [5]UNSW Sydney, Kirby Institute, Sydney, Australia

Background: Men who have sex with men (MSM) bear a disproportionately high burden of HIV in South-East Asia, however there is significant variation in risk practices and HIV prevention and care need among sub-sections of this population. Smaller scale studies indicate bisexual men may be especially exposed to HIV risk and to social harm.

Methods: From May 2020 to-January 2021, we conducted an online cross-sectional survey (promoted via social media) of 15,938 MSM across Thailand, Malaysia, Indonesia, Japan and Vietnam. Chi-square tests were used to establish differences in HIV prevention and care need between those identifying as bisexual versus homosexual/gay.

Results: In total, 22.3% (n=3,342) of participants identified as bisexual (Thailand=18.0%; Malaysia 19.2%; Indonesia 51.2%; Japan 21.0%; Vietnam 18.1%). Compared to gay men, bisexual men were significantly less likely to have ever taken an HIV test (61.1% gay Vs. 48.1% bisexual, $p<0.01$), less likely to be living with diagnosed HIV (13.6% Vs. 6.5%, $p<0.001$), less likely to have heard of PrEP (65.6% Vs. 48.1%, $p<0.01$) or have used it (12.8% Vs. 9.0%, $p<0.001$).

There were no differences regarding condom use with either casual or regular partners, nor with the number of such partners in the preceding 12 months. Compared to gay men, bisexual men were more likely to have avoided healthcare services because of a fear that people will learn they have sex with men (12.2% Vs. 17.8%, $p<0.001$) and were more likely to have been blackmailed because they have sex with men. Bisexual men were considerably less likely than gay men to have disclosed their attraction to men to family (out to all/almost all family: 17.6% Vs. 5.6%, $p<0.001$) or friends (out to all/almost all friends: 23.5% Vs. bisexual 5.5%, $p<0.001$).

Conclusions: Despite a similar profile of HIV risk-related activity, bisexual men were found to have considerably elevated HIV prevention and care needs, with lower levels of HIV testing and of PrEP awareness and use.

Interventions to reduce stigma directed towards all MSM, including those identifying as bisexual, need to be resourced, developed and sustained in community and clinical contexts to improve access to HIV education and biomedical interventions.

EPD073

Associations between HIV and sexual stigmas, and mental health and alcohol use among MSM newly diagnosed with HIV in India: a longitudinal observational cohort study

J. Kaur[1], A. Gupta[2], V. Chakrapani[3], F.R. Gulfam[2], A. Ahalawat[2], J. Ross[4], N. Chopra[4], D. Datta[4], S. Safren[5], V.V. Patel[4]

[1]Postgraduate Institute of Medical Education & Research, Chandigarh, India, [2]Alliance India (India HIV/AIDS Alliance), New Delhi, India, [3]Centre for Sexuality and Health Research and Policy (C-SHaRP), Chennai, India, [4]Division of General Internal Medicine, Albert Einstein College of Medicine, Montefiore Health System, New York, United States, [5]University of Miami, Florida, United States

Background: Little is known about the associations between HIV- and sexuality-related stigmas, and mental health and alcohol use among MSM living with HIV in India. The minority stress theory postulates that minorities experience stress stemming from experiences of stigma, placing them at risk of negative psychosocial outcomes. We investigated the association between stigmas related to HIV and same-sex sexuality, and depression, anxiety, and alcohol use among MSM newly diagnosed with HIV (MSMLH) in India.

Methods: We used three-wave data (baseline, 3- and 6-month follow-up) from a longitudinal observational study conducted among 227 MSMLH in 2020-21, across 11 states with high/moderate HIV prevalence. The outcomes were depression (PHQ-9), anxiety (GAD-2), and alcohol use (AUDIT-C) scores. Predictors included enacted HIV stigma, internalised HIV stigma, enacted sexual stigma, and internalised sexual stigma. To obtain robust population-averaged estimates and to handle repeated measures, generalized estimating equations (GEE) was used. All multivariable GEE analyses were conducted in Stata-16.

Results: Participants' mean±SD age was 33.3±9.9 years. The mean±SD scores of predictor variables are provided in Table-1. The mean±SD scores of outcome variables were: depression 4.76±7.32, anxiety 2.53±2.31, and alcohol use .32±.88. Enacted stigmas significantly predicted depression, anxiety, and alcohol use (Table-1).

Predictors (scores)		Outcomes (scores)		
Stigmas	Mean (SD)	Depression	Anxiety	Alcohol
		Estimate (95% CI); p-value		
Enacted HIV stigma	.58 (.57)	7.32 (5.28, 9.36)***	2.75 (2.27, 3.23)***	.35 (.07, .64)*
Internalised HIV stigma	1.16 (.57)	-2.07 (-4.57, .43)	.15 (-.44, .74)	-.05 (-.29, .18)
Enacted sexual stigma	2.09 (1.38)	1.24 (.56, 1.93)***	.34 (.19 .50)***	.09 (.01, .17)*
Internalised sexual stigma	1.80 (.63)	-1.39 (-3.03, .25)	.31 (-.18, .80)	.17 (-.05, .39)

Note. *p<.05, ***p<.001

Table 1. Predictors of mental health and alcohol use among men who have sex with men (MSM) newly diagnosed with HIV (N=227)

An increase in enacted HIV and sexual stigma scores increased outcome scores. That is, for every unit increase in enacted HIV stigma, depression, anxiety, and alcohol scores increased by 7.32, 2.75, and .35 units, respectively. Similarly, for every unit increase in enacted sexual stigma, depression, anxiety, and alcohol scores increased by 1.24, .34, and .09 units, respectively.

Conclusions: Enacted HIV and sexual stigmas contributed to poor psychosocial outcomes among MSM newly diagnosed with HIV. Findings call for stigma reduction campaigns to reduce stigma and discrimination faced by MSMLH, and to screen for and address mental health challenges faced by them due to those stigmas.

EPD074

The determinants of HIV test seeking behaviour among sexual and gender minorities: findings from a large-scale global survey from more than 160 countries

E. Lamontagne[1,2], S. Howell[3], A. Yakusik[1], B. Ventelou[2]

[1]UNAIDS, Strategic Information, Geneva, Switzerland, [2]Aix-Marseille University, School of Economics, Marseille, France, [3]LGBT+ Foundation, San Francisco, United States

Background: Sexual and gender minorities (SGM) continue to endure multiple forms of stigma and discrimination, which affect mental health and erode health. A disregard for human rights and multi-level barriers to health care among SGM are among the failures that have allowed HIV to remain a global health crisis.

We examine the role of intersectional stigma, mental health, and HIV sexual risk behaviours, as determinants of HIV test seeking in SGM.

Methods: This study is based on a cross-sectional internet survey of over 115,000 LGBT+ adult individuals from more than 160 countries. We developed a two-part model within a multilevel design where the individual effects and the socioecological effects at country level are disentangled to capture the determinants of two distinct decision process: ever getting tested for HIV and, for those getting tested, the recency of their last HIV test.

Results: A quarter of respondents (24.01%) had never tested previously for HIV, 17.40% had their last HIV test more than 12 months ago, 14.44% between 6 and 12 months and 44.14% in the last 6 months. The study showed that for most participants, HIV risk behaviours are consistently and strongly associated with higher odds of having a recent HIV test, suggesting a demand for HIV testing in proportion to individual's needs, with one single exception: those paying for sex whose HIV riskier behaviour is negatively associated with HIV testing (AOR 0.75, 95%CI 0.60-0.94.

The study also showed that homophobia negatively affect HIV test seeking, particularly among bisexual (AOR 0.96, 95%CI 0.94-0.99) and questioning individuals (AOR 0.92, 95%CI 0.89-0.96) compared to gay men. The model demonstrated the negative effect of depression and anx-

iety on HIV test seeking. Finally, the inclusion of psycho-economic variables, such as time preference and willingness to take risk, contributes to identifying fundamental parameters of the decision-making process of individuals in terms of HIV testing.

Conclusions: To meet the global AIDS targets among SGM, greater importance should be dedicated to mental health and homophobia. Efforts to increase HIV testing among SGM should intensify with greater emphasis put on bisexuals, questioning and clients of sex workers.

EPD075
Longitudinal impact of stressful life events on HIV risk and psychosocialproblems among MSM in Chennai and Mumbai, India

W. Lodge II[1], K. Biello[1,2], B. Thomas[3], S. Rawat[4], A. Dange[4], V. Anand[4], S. Swaminathan[5], S. Menon[6], C. O'Cleirigh[2,7], K.H. Mayer[7,2], S.A. Safren[8,2], M.J. Mimiaga[9,2]
[1]Brown University, Behavioral and Social Health Sciences, Providence, United States, [2]The Fenway Institute, Fenway Health, Boston, United States, [3]Indian Council of Medical Research-National Institute for Research in Tuberculosis, Chennai, India, [4]The Humsafar Trust, Mumbai, India, [5]Ministry of Health and Family Welfare, Government of India/Indian Council of Medical Research, New Delhi, India, [6]Sahodaran, Chennai, India, [7]Harvard Medical School, Boston, United States, [8]University of Miami, Coral Gables, United States, [9]University of California, Epidemiology, Los Angeles, United States

Background: HIV disproportionately burdens men who have sex with men (MSM) in India. Research has shown that stressful life events can lead to psychosocial problems and exacerbate sexual risk behavior among Western MSM, but studies examining this relationship among MSM in India are lacking, and none have examined this longitudinally with data from multiple cities.

Methods: Between 2015 and 2018, 608 MSM from Chennai and Mumbai, India, completed behavioral surveys at baseline, 4, 8, 12 months as part of an HIV-prevention intervention. We used longitudinal generalized estimating equations (GEE) modeling to examine the relationship between stressful life events/severity (i.e., total number of stressful life events and perceived positive or negative impact, with higher scores being more unpleasant/alarming; ranging from 0 to 156) and subsequent psychosocial problems (e.g., depression, heavy alcohol use), as well as HIV risk (e.g., condomless anal sex, STI incidence). All models are adjusted for age, sexual identity, intervention arm, HIV status, and recruitment city.

Results: Participants' mean age = 26.3 (SD=6.29); mean number of stressful life events = 9.26 (SD=4.35), with a mean impact score = 55.12 (SD=27.94). The top stressful life events was "attraction towards a man whose sexuality is not known." The number of stressful life events and their corresponding perceived impact score remained consistent at each time point.

In multivariable GEE models, the number of stressful life events was predictive of condomless anal sex (aOR=1.07, 95% CI [1.05,1.10]), depression (aOR=1.23, 95% CI [1.19, 1.26]), and harmful drinking (aOR=1.11, 95% CI [1.08,1.14]). Similarly, the impact of stressful life events was predictive of condomless anal sex (aOR=1.01, 95% CI [1.01,1.02]), depression (aOR=1.04, 95% CI [1.03, 1.04]), harmful drinking (aOR=1.01, 95% CI [1.01, 1.02]) and incident STI diagnosis (aOR=1.01, 95% CI [1.00, 1.01]).

Conclusions: These findings provide evidence of the predictive relationship between stressful life events/severity and subsequent psychosocial problems, as well as HIV risk among MSM in India. Future research should seek a greater understanding of the impact of stressful life events among Indian MSM and their relationship in potentiating psychosocial problems and HIV risk, which will inform interventions that can teach self-acceptance, coping skills, and other forms of resiliency.

EPD076
Location-based dating platform intervention (LBDPi) is an effective model in reaching high-risk MSM

J. Kumar[1], A Vijayaraman[1], V Sampath Kumar[1], J.D. Williams[1], S Abraham Lincoln[1], R Shanmuganathan[1]
[1]Voluntary Health Services, Chennai, India

Background: With the burgeoning of dating apps, a large number of MSM population are accessing these dating apps and are likely to engage in high-risk behavior (unprotected anal intercourse) exposing them to the risk of STI and HIV. Effective models of virtual interventions will be helpful to reach out to these populations and offer or facilitate access to HIV services. LBDPi has been demonstrated as an effective model in Vietnam, identifying a high proportion of HIV positives people (19%).

To increase HIV testing services to clients in the virtual space, we implemented LBDPi in four districts of Andhra Pradesh (AP).

Description: The model involves an outreach worker (ORW) working from a convenient place such as home or outreach office and connecting online with clients within the radius of 0.5 to 10 kms. The ORW identifies themselves as a public health worker and counsels the client for HIV services, shifting the conversation from online to offline. The ORW educates and provides HIV services such as condoms, HIV screening and linkages to PrEP and treatment.

Lessons learned: During October to December 2021, 4,987 MSMs were reached through online chat, 60% (2,984) agreed for further interaction and were provided HIV education. The project achieved an offline conversion in 17% (872). Out of these, 196 were tested and 8% tested positive and initiated on ART.

To take this to scale, the project will train MSM and transgender NGOs in the government sector across all districts of AP for implementing the LBDPi.

Conclusions/Next steps: A critical lesson that the project has observed through the LBDPi model is that the high-risk MSM opt for offline meeting and seek HIV services. LBDPi reached high risk MSM who are not engaged in GOI programmatic prevention activities, who opted for an offline meeting to seek HIV services. Among those who were offered HIV testing services, 8% returned as positive during a three-month period, while HIV negative clients were also offered a package of services for prevention.

EPD077
HIV Pre-exposure Prophylaxis use and subsequent bacterial Sexually Transmitted Infections among gay, bisexual and other men who have sex with men

T. Hart[1,2], S.N. Noor[3,1], G. Berlin[1], S. Skakoon-Sparling[1], F. Tavangar[1], D.H.S. Tan[4,5], G. Lambert[6,7], D. Grace[2], N. Lachowsky[8,9], J.M. Sang[10], D.M. Moore[10], J. Cox[11,6]

[1]Ryerson University, Psychology, Toronto, Canada, [2]University of Toronto, Dalla Lana School of Public Health, Toronto, Canada, [3]Louisiana State University, Shreveport, United States, [4]St. Michael's Hospital, Division of Infectious Diseases, Toronto, Canada, [5]St. Michael's Hospital, Centre for Urban Health Solutions, Toronto, Canada, [6]Direction Regionale de Sante Publique, Montreal, Canada, [7]Institut National de Sante Publique du Quebec, Montreal, Canada, [8]University of Victoria, Victoria, Canada, [9]Community-Based Research Centre for Gay Men's Health, Vancouver, Canada, [10]BC Centre for Excellence in HIV/AIDS, Vancouver, Canada, [11]McGill University, Montreal, Canada

Background: PrEP-using GBM may be more likely to engage in sexual behaviors associated with bacterial STI transmission. We assessed the associations between PrEP use, condomless anal sex (CAS), number of sex partners (NSP), oral sex (OS), and odds of acquiring a subsequent bacterial STI among GBM living in Canada.

Methods: Among HIV-negative/unknown-status GBM from the baseline visit of the Engage Cohort Study, we fit a structural mediation model to estimate pathways between PrEP use at baseline, and sexual behaviors and bacterial STI diagnoses (gonorrhea, chlamydia and syphilis) at the 1-year follow-up visit.

Results: Among 2,008 HIV-negative GBM at baseline, recruited from 2/2017 to 8/2019,341 (17.0%) used PrEP within the last 6 months and 136 (6.8%) were diagnosed with an STI at their 1-year follow-up visit.In the mediated model, the direct association between PrEP use at baseline and STIs at 1-year follow-up was non-significant; however, PrEP use was significantly associated with increased number of sex partners (β=.25; 95%CI,.18-.33;p<.001)andCAS (β=.18; 95%CI,.09-.28;p<.001), but not with oral sex (β=.02; 95%CI,-.10-.16;p=.76) at one-year follow-up.

Two indirect paths were statistically significant:

1. PrEP→CAS→STI (β=.09; 95%CI,.03-.17: p=.02) and;
2. PrEP→NSP→CAS→STI (β=.08; 95%CI,.03-.13: p=.001).

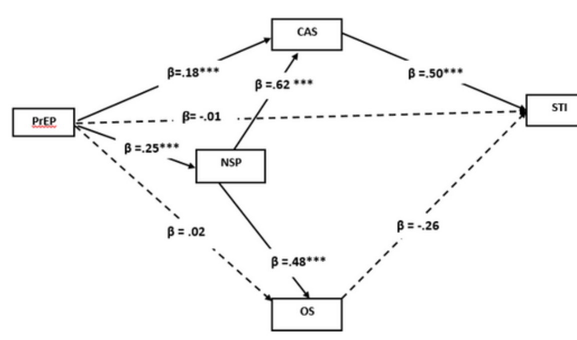

Figure 1. This structural equation model presents associations between pre-exposure prophylaxis (PrEP) use at baseline and bacterial STIs at one-year follow-up, with intermediary associations of condomless anal sex (CAS), number of male sex partners (NSP), oral sex (OS) at one-year follow-up. Dotted lines represent nonsignificant associations; bold lines represent significant associations. B = Standardized coefficient.
**p < 0.005; **p < 0.001*

Conclusions: In mediation models, PrEP use at baseline was indirectly associated with future bacterial STIs among GBM. Findings suggest that PrEP use may lead to bacterial STIs via both an increased number of sex partners and increased engagement in CAS. Behavioural and biomedical interventions, including increased screening as per PrEP care and potential bacterial STI prophylaxis and vaccines, are needed to reduce PrEP-using GBM's risk of bacterial STIs.

EPD078
How different social norms guide and constrain the use of pre-exposure prophylaxis among men who have sex with men

E. Thunnissen[1], J. de Man[2], V. Buffel[1], E. Wouters[1]

[1]University of Antwerp / Center for Population, Family and Health, Sociology, Antwerp, Belgium, [2]University of Antwerp / Family Medicine and Population Health, Faculty of Medicine and Health Sciences, Antwerp, Belgium

Background: It is well documented that social norms influence preventive sexual practices. The advent of Pre-Exposure Prophylaxis (PrEP) as a promising HIV prevention strategy has raised concerns that negative social norms could hamper PrEP uptake in high risk groups such as Men who have Sex with Men (MSM). It is therefore important to assess which social norm categories affect willingness to take PrEP, and actual PrEP-use, among MSM.

Methods: We collected a cross-sectional convenience sample of 415 MSM not living with HIV and residing in Flanders, through an online survey that ran October to November 2021. Linear regression, log-linear regression and structural equation modelling were performed.

Results: One in four MSM takes PrEP and 16% of those not currently using it are willing to start. Stratified by age: 13% of MSM aged 18-25 uses PrEP, 28% aged 26-40, and 27% over 40, while 20% of MSM aged 18-25 are willing to start, as are 15% aged 26-40 and 16% over 40. Descriptive norms (how many peers you believe act in a certain way) are di-

rectly related to PrEP-use. Self-efficacy mediates the effect of injunctive norms (what you belief about other's beliefs), role belief (if you see something as appropriate for the role you fulfill) and affect (individual feelings towards the behavior) on PrEP-use.

PrEP-use among the youngest age group (18-25) is significantly lower compared to MSM aged 26-40 when modelling the impact of affect mediated by self-efficacy on PrEP-use. Descriptive norms, role belief, social influence (how favorably you compare yourself to others), and personal normative belief (the stigma you attach to a type of behavior) were directly related to willingness to use PrEP. Self-efficacy mediated the effect of injunctive norms and affect on willingness to use PrEP.

Conclusions: Several social norm categories had a direct or indirect impact on willingness to use PrEP and PrEP-use. Results are similar to social norm research on alcohol use and condom use.

These findings show the importance of taking social norms into account when observing lower than expected uptake of PrEP among those at risk, and when designing interventions aimed at increasing PrEP uptake.

EPD079

COVID-19-related changes in sexual activity, condomless anal intercourse, HIV/STI testing and PrEP use among men who have sex with men (MSM) in the Netherlands: two-year trends and programmatic challenges

P.C.G. Adam[1,2,3], E.L.M. Op de Coul[4], C. Den Daas[5], P. Zantkuijl[6], J.-B. Paolucci[2,3], I. Ketsuwan[3], W. Zuilhof[6], J.B.F. De Wit[7]

[1]UNSW Sydney, Centre for Social Research in Health, Sydney, Australia, [2]Institute for Prevention and Social Research (IPSR Utrecht), Utrecht, Netherlands, the, [3]Institute for Prevention and Social Research (IPSR Bangkok), Bangkok, Thailand, [4]National Institute for Public Health and the Environment, Bilthoven, Netherlands, the, [5]University of Aberdeen, Aberdeen, United Kingdom, [6]Soa Aids Nederland, Amsterdam, Netherlands, the, [7]Utrecht University, Department of Interdisciplinary Social Science, Utrecht, Netherlands, the

Background: The impact of COVID-19 restrictions on MSM's sexual behaviour and access to HIV/STI services has been documented in a range of countries. It remains, however, unclear how successive lockdowns and relaxation periods affect sexual behaviours and HIV/STI risk.

We assessed changes in sexual activity, condomless anal intercourse (CAI), HIV/STI testing and PrEP use among MSM in the Netherlands from January 2020 to October 2021, a timeframe that includes two lockdown/relaxation cycles.

Methods: We conducted three cross-sectional online surveys in summer 2020, spring and autumn 2021. Respondents were recruited via social media. Across surveys, a total of 4241 MSM provided data on their sexual behaviour, HIV/STI testing and PrEP use at seven periods: in January-February 2020 (pre-COVID-19); during the first lockdown (starting mid-March 2020); in the first period of easing of restrictions; during the first normalisation attempt; during the second lockdown (starting mid-October 2020); in the second easing period; and during the second normalisation.

Results: Compared to the pre-COVID-19 baseline, the proportion of sexually active respondents was 21% lower during the first lockdown and 6% lower during the second. Sexual activity partially rebounded in the first normalisation period and entirely in the second. Rates of CAI showed similar patterns, although variations were more pronounced for CAI with fuckbuddies or casual partners than steady partners. COVID-19 disruptions in testing and PrEP use were noted across surveys.

In the Autumn 2021 survey, 34% of respondents had experienced times since March 2020 when they could not test for HIV/STI because of COVID-19, and 59% of these respondents could test later. 51% of the respondents who used PrEP pre-COVID-19 interrupted PrEP at some point because of COVID-19, and 73% of them had resumed PrEP.

Conclusions: MSM's sexual activity and CAI were moderately reduced during the first lockdown and slightly reduced during the second. During the second normalisation period, sexual activity and HIV/STI risk rebounded to levels similar to pre-COVID-19. COVID-19 disruptions in testing and PrEP use were substantial and more often resolved for PrEP than testing. Addressing COVID-19-related gaps in testing is needed to limit the transmission of STIs and HIV among MSM in the Netherlands.

EPD080

Assessing the performance of HIV testing self-efficacy and relevant theoretical constructs in predicting HIV testing intention among young men who have sex with men in two US urban areas

Y. Liu[1], J. Mitchell[2], S. Przybyla[3], C. Zhang[4]

[1]University of Rochester Medical Center, Public Health Sciences, Rochester, United States, [2]Florida International University, Miami, United States, [3]University at Buffalo, Buffalo, United States, [4]University of Rochester School of Nursing, Rochester, United States

Background: Bandura's Self-Efficacy Theory (SET) has been used to guide the development of various HIV prevention interventions among men who have sex with men (MSM). However, observational evidence is lacking regarding how SET and related constructs may influence HIV testing-related indicators.

We conducted a study to assess the associations between HIV testing-specific self-efficacy (HTSE), relevant theoretical constructs, and frequent (e.g., every six months) HIV testing intention among MSM in two US cities.

Methods: A cross-sectional survey was conducted among 347 HIV-negative MSM from Nashville, TN, and Buffalo, NY.

We used questionnaires to assess:
1. The intention of seeking regular HIV testing (moderate/high vs. no/low intention);
2. HTSE (using the adapted General Self-Efficacy Scale); and;
3. Relevant SET constructs, including mastery performance (i.e., frequency of previous HIV testing), vicarious experience (i.e., how often do their peers/partners test for HIV), verbal persuasion (i.e., how often have they been encouraged to test for HIV by peers/healthcare professionals), and physiological state (i.e., psychological function from a validated Quality-of-Life scale).

Multivariable causal mediation analyses were used to assess the associations between HTSE, relevant SET constructs, and HIV testing intention.

Results: Overall, we found that all SET constructs were directly associated with HIV testing intention and indirectly associated with HIV testing intention through HTSE. Specifically, we found that higher HTSE scores were associated with a higher likelihood of showing moderate/high intention of frequent HIV testing (AOR:1.07; 95% CI:1.04-1.10).

Multivariable analyses showed that increased mastery performance (one unit increase in previous HIV testing frequency; AOR: 1.12; 95% CI: 1.06-1.20), verbal persuasion ('sometimes/frequently' vs. 'never/rarely been persuaded to test for HIV; AOR:1.60; 95% CI: 1.23-2.09), vicarious experience ('many/most' vs. 'a few/none' tested for HIV every six months; AOR:1.28; 95% CI: 1.05-1.56), and physiological state (i.e., one unit increase in psychological function scores; AOR: 1.02; 95% CI: 1.01-1.03) were associated with a higher HIV testing intention among the study participants.

Conclusions: Screening for HIV testing self-efficacy and the performance of relevant theoretical constructs can be used to identify where additional support to improve frequent HIV testing is needed and inform the development of targeted interventions for MSM in the US.

EPD081

Tracking condom use trends among sexual minority men in the U.S. since 1988: a systematic review of pride event surveys and nationally representative data

A.O. Rosen[1], C.M. Curley[2], C.B. Mistler[1], R. El-Krab[2], S.C. Kalichman[2]
[1]University of Connecticut, Department of Allied Health Sciences, Storrs, Connecticut, United States, [2]University of Connecticut, Department of Psychological Sciences, Storrs, Connectiut, United States

Background: Eighty-two percent of new HIV diagnoses among men in the United States (U.S.) are from male-to-male sexual contact, and record-high rates of sexually transmitted infections (STIs) contribute. As uptake in biomedical advances including Pre-exposure Prophylaxis (PrEP), Treatment as Prevention (TasP), and the U=U campaign have increased, condom use has decreased, but must not be neglected for prevention against HIV and STIs. This systematic review assessed surveys conducted at gay pride events in the U.S. to track trends in condom use during anal intercourse among sexual minority men (SMM), and compare those to national surveillance condom use data.

Methods: PubMed, PsycInfo, and CINAHL databases were searched in November 2021 using terms related to SMM and gay pride events. Included studies were from a pride event in the U.S., surveyed SMM, and reported the percentage of condom use during anal intercourse. Condom use trends and determinants were extracted with a coding form. Available data on condom use among SMM from the Centers for Disease Control and Prevention (CDC) and National Survey of Sexual Health and Behavior (NSSHB) were collected for comparison.

Results: Twenty-six studies were fit for inclusion in the review, with data from 69 surveys from 1988-2018. Most surveys were conducted at general pride events (55.1%), the remaining from Black or Latino prides. Across studies, 18,288 participants were surveyed; 61.4% White, 24.3% Black, and 9.7% Hispanic. The mean age was 33 (SD=1.6), and 7.1% were HIV-positive. Data suggest that declining condom use pre-dates the onset of TasP, U=U, and PrEP.

Common correlates of condom use were race, age, education, HIV-status, intercourse position, substance use, and PrEP. Compared to the CDC and NSSHB data, pride event data on condom use was lower than among the nationally representative samples.

Conclusions: Our results suggest that perhaps with growing popularity of TasP, U=U, and PrEP; risk perception of HIV is diminishing over time, resulting in less condom use during anal intercourse.

However, these methods do not prevent against STIs and it is crucial for providers and others working with SMM to place a renewed emphasis on regular STI testing and other HIV prevention methods.

EPD082

Mixed-methods investigation of intersectional HIV, same-sex behavior, and gender non-conformity stigma experienced and internalized by MSM at health facilities

K. Saalim[1], G.M. Abubakari[2], R.P. Amoh-Otu[3], P. Adu[4], R. Akrong[5], R. Vormawor[5], P. Appiah[3], F. Boakye[4], R. Richmond[1], C. Logie[6], M.A. Stockton[7], E. Mankattah[5], A. Manu[8], A. Apreku[8], E. Gyamerah[5], D. Turner[9], K. Sharma[6], K. Torpey[8], L. Nyblade[10], L.E. Nelson[11]

[1]RTI International, Durham, NC, United States, [2]Yale University School of Public Health, Center for Interdisciplinary Research on AIDS, New Haven, United States, [3]Youth Alliance for Health & Rights, Kumasi, Ghana, [4]Priorities on Rights & Sexual Health, Accra, Ghana, [5]Educational Assessment & Research Center, Accra, Ghana, [6]University of Toronto, Factor-Inwentash Faculty of Social Work, Toronto, Canada, [7]Columbia University Irving Medical Center, Department of Psychiatry, New York, United States, [8]University of Ghana School of Public Health, Department of Population, Family & Reproductive Health, Accra, Ghana, [9]University of South Florida, College of Nursing, Tampa, United States, [10]RTI International, Washington, DC, United States, [11]Yale University, School of Nursing, New Haven, United States

Background: Men who have sex with men (MSM) across Africa face social and structural barriers that increase HIV risk. In 2019, HIV prevalence among MSM in Ghana was 18.1%, 11 times higher than the general population. Stigma is an established barrier to healthcare engagement for MSM, yet scant research has documented stigma experienced by MSM in healthcare facilities in Africa.

We aimed to understand experiences of stigma among MSM and the role of stigma in shaping HIV prevention and care engagement among MSM in Ghana.

Methods: Mixed-methods study: 10 in-depth interviews, 8 focus group discussions, and a baseline survey (N=237) with MSM (September 2020-April 2021) in Ashanti and Greater Accra regions, Ghana. Rapid analysis of qualitative data was followed by thematic coding. Frequencies from survey data triangulated themes from qualitative data.

Results: Baseline data indicate that many MSM experienced stigma at health facilities which aligns with their internalized stigma. Interviews with MSM corroborated quantitative data. MSM expressed that past stigmatizing experiences contribute to anticipating stigma at health facilities, causing MSM to internalize the need to change their behavior in order to receive quality treatment: *"I used to walk feminine but because I am in a straight space I have to conform so that I will not be noticed so that I can get the optimal health care that I need".*

Additionally, HIV-related stigma intersected with sexual identity stigma MSM to exacerbate enacted stigma at health facilities. Many MSM with HIV faced blame and guilt at HCF: *"Once they get to know your sexuality, they go like, because of what you did, that's why you had HIV".*

Interviews indicate experiences with stigma deterred MSM from HIV testing and treatment at certain HCF.

Stigma	Question	Ever
Experienced	Have you had to pretend that you do not sleep with men in order to be accepted in an HCF?	46.0% (n=109)
	Have you heard HCF workers say that MSM are not normal?	73.8% (n=175)
	How often has an HCF worker refused to serve you because you sleep with men?	13.9% (n=33)
		At All
Internalized	How much do you feel guilty that you are MSM?	41.5% (n=47)
	How much do you feel that you deserve to get HIV if you are MSM?	22.3% (n=25)

Table 1. Experienced and Internalized HCF Stigma among MSM in the past 6 months (N=237)

Conclusions: Insight on MSM's experiences of stigma in HCF can inform structural healthcare intervention strategies to improve HIV prevention and care cascade engagement.

EPD083

Attitudes, knowledge and worry about HIV in HIV-negative men who have sex with men in the era of Undetectable=Untransmittable

C.F. Sjöland[1,2], N. Dennermalm[3], D.S. Suarez[4], L. Nilsson Schönnesson[1], A.M. Ekström[1,5]

[1]Karolinska Institutet, Global Public Health, Stockholm, Sweden, [2]Public Health Agency of Sweden, Epidemiological Monitoring, Stockholm, Sweden, [3]Stockholm University, Department of Social Work, Stockholm, Sweden, [4]Posithiva Gruppen, Stockholm, Sweden, [5]Venhälsan, Södersjukhuset, Stockholm, Sweden

Background: Men who have sex with men (MSM) make up 32% of people living with HIV (PLHIV) in Sweden, with >95% of PLHIV on antiretroviral treatment (ART) and undetectable viral load. Despite high awareness of Undetectable=Untransmittable (U=U), negative attitudes remain toward MSM living with HIV, including in social, sexual and romantic relationships. Among self-reported HIV-negative MSM, we studied negative attitudes towards MSM living with HIV and determinants in terms of sociodemographics, openness about one's sexuality, and knowledge or worry about HIV.

In addition, we studied the impact on negative HIV attitudes of a 2020-2021 anti-stigma campaign seeking to challenge traditional prejudices against MSM and inform about U=U.

Methods: An online survey was administered in 2021 to MSM living in Sweden, recruiting participants through convenience sampling on popular gay dating and social media sites. Among respondents, 1,142 (89% of 1287) reported being HIV-negative, for which indices were created of negative attitudes towards MSM living with HIV, and knowledge or worry about HIV. Potential determinants of negative attitudes were entered into a multivariable logistic regression model.

Results: Among HIV-negative MSM participating in the 2021 survey, negative attitudes about HIV were associated with lower knowledge of HIV [OR=2.5, 95%CI:2.0-3.3] and more worry [OR=1.8, 95%CI:1.4-2.3] after adjusting for confounders, including: age, university education, and city of residence.

Openness about one's sexuality was independently associated with less negative attitudes towards MSM living with HIV [OR=0.4, 95%CI:0.3-0.5]. Exposure to the 2020-2021 anti-stigma campaign was associated with significantly less negative attitudes [OR=0.7, 95%CI:0.6-0.9].

Conclusions: Negative attitudes towards MSM living with HIV were associated with lower knowledge and increased worry about HIV. Findings around openness about one's sexuality indicate an intersectional effect of anti-LGBTQ-stigma and HIV-stigma.

The association between the anti-stigma campaign and less negative attitudes suggest that targeted campaigns are effective and necessary, even in the era of U=U and among well-informed MSM.

EPD084

Making meaning of methamphetamine use among sexual minority men living with HIV

W. Gómez[1], K.C. Organista[2], T. Sacks[2], S. Homes[2], A. Mericle[3], A.W. Carrico[4]

[1]*University of Illinois Chicago, Jane Addams College of Social Work, Chicago, United States,* [2]*University of California, Berkeley, United States,* [3]*Alcohol Research Group, Emeryville, United States,* [4]*University of Miami, Miami, United States*

Background: Although the relationship between methamphetamine and the health of sexual minority men (SMM) has been well document in the context of HIV research, attention to the meaning behind this substance and its use is sparse. Methamphetamine is a particularly deleterious substance for SMM because its use is framed within social and sexual contexts that are intimately associated with the causes and coping strategies related to social and structural stressors.

Despite sex and sexuality being at the center of HIV research around methamphetamine, the primary mechanism assessed is that of a pathway towards HIV infection and transmission, rather than inviting more nuanced understandings of how methamphetamine informs sociosexual meaning-making that impact these men's lives across several life domains. Informed by syndemics theory, intersectionality frameworks, and revised stress and coping theory, the purpose of this qualitative study is to provide a deeper understanding of SMM's relationship with methamphetamine in order to inform more effective substance interventions.

Methods: Data were collected from 2016-2018 as part of a randomized controlled trial testing a positive affect intervention for methamphetamine-using SMM living with HIV in San Francisco, CA. Participants were purposively sampled for a qualitative sub-study based on ethnicity (i.e., White, Black, and Latino) and study condition (i.e., intervention or control). Data were collected via in-depth, one-on-one semi-structured interviews.

Results: The mean age was 47 and 54% self-identified as non-White. The constructivist grounded theory analysis surfaced a core theme around *Relationships on/with Methamphetamine*. Five sub-themes elaborated on the ways in which SMM related through and with methamphetamine: *Coping Through Methamphetamine and Sex, Methamphetamine and Euphoria, Methamphetamine and Isolation, Relationships with Methamphetamine*, and *Methamphetamine Forging Synthetic Relationships.*

Conclusions: Findings highlight the embodied and intimate associations between SMM, methamphetamine, sex, and relationships. Data underscore the relevance of the somatic experiences of methamphetamine use that contribute not only to reconfiguring sexual experiences and developing various impairments, but also hindering recovery efforts.

Additionally, findings suggest that peer-based approaches are imperative to reframe the ways in which SMM form and sustain relationships, thus effective substance use interventions for SMM should address multi-level psychosocial factors in a holistic manner.

EPD085

Use of alternative treatments for HIV and ART defaulting among MSM living with HIV in Accra, Ghana

A.O. Gyamerah[1], A.A. Ogunbajo[2], E. Kinzer[3], G. Sorensen[4], M.D. Mensah[4], N.A. Vanderpuye[4]

[1]*University of California, Community Health Systems, San Francisco, United States,* [2]*Harvard University, Cambridge, United States,* [3]*University of California, San Francisco, United States,* [4]*West Africa AIDS Foundation, Accra, Ghana*

Background: In Ghana, men who have sex with men (MSM) bear a disproportionate HIV burden, with prevalence at 18%, yet only 3.5% are linked to antiretroviral treatment (ART). To understand what factors shape adherence to ART, we examined types of treatment alternatives HIV-positive MSM use and how these alternatives affect ART use.

Methods: Between March-July 2019, we conducted in-depth interviews with 35 HIV-positive MSM in the Accra, Ghana about their HIV treatment needs. Participants were purposefully sampled from HIV clinics/organizations. Eligibility criteria were: assigned male at birth, has sex with men, HIV-positive, and ≥18 years.

Participants were asked about whether they have used non-clinical treatments for their HIV diagnosis, such as traditional/herbal/religious treatments, and their experiences using these alternatives. Interview transcripts were analyzed using thematic analysis.

Results: Participant mean age was 29.7 years. About one-third of participants reported using traditional/herbal/religious treatments. Those who used alternative treatments defaulted from ART or had not yet initiated ART. Participants learned of treatment alternatives through other people living with HIV who were taking it, including friends; family members seeking to help them; religious figures like pastors; radio advertisements; and/or personal research.

A commonly used alternative treatment was by the Center of Awareness (COA), which sells a liquid formula across Africa that claims to cure HIV. Other alternative treatments included oregano, cardamom, and Black seed; homemade herbal concoctions; unknown formulas, including some that taste like "bleach"; holy oils/water; and prayers/camps.

Reasons given for alternative medication use included wanting to cure or suppress HIV and wanting to alleviate ART side effects. Side effects of using alternative treatments included weight loss, ulcers, and hospitalization.

Some reported benefits such as viral suppression, increased appetite, and weight gain. Reasons for not taking alternative treatments were: service providers advised against alternative medications; not believing in herbal/religious treatments; and not liking the taste of herbal medication.

Conclusions: Alternative treatments to ART are commonplace among HIV-positive MSM in Ghana and associated with defaulting from ART. Service providers and stakeholders must better educate HIV-positive clients about the effects of alternative treatments and the government should better regulate sale of these treatments.

Sex workers

EPD086

Awareness and acceptability of HIV pre-exposure prophylaxis (PrEP) among female sex workers in: a cross-sectional survey conducted in Horizons Femmes Yaounde, Cameroon

N. Pasma Rosalie[1], K. Aymard D'aquin[1], N. Denise[1], T. Carole[1]
[1]*Association Horizons Femmes, Yaoundé, Cameroon*

Background: In Cameroon, HIV prevalence remains high among female sex workers (FSW) with an estimated rate of 24.3% (IBBS, 2016). HIV pre-exposure prophylaxis (PrEP) has been adopted by the Ministry of Public Health as an additional innovative strategy of HIV prevention among key population in the 2018-2022 National Strategic Plan for HIV/AIDS. The implementation of this new strategy started on June 2019.

To explore awareness and acceptability of PrEP, a cross-sectional survey was conducted among female sex workers aged of at least 21 years.

Methods: From July 08th to December 23rd 2019, we conducted a cross-sectional survey in which 17 itemS questionnaires were administrated to 210 FSW with an age range between 25-30 years. These Questionnaire items specifically addressed female sex workers on awareness and acceptability of PrEp. Statistical analysis were conducted using CSPRO 6.2,and SPSS 22 software.

Results: A total of 210 FSW from range age of 21- 50 were surveyed . Overall,86.2% (181/210) of respondents were aware of PrEP against 13.8% (29/210) who heard about PrEP for the first time. The main source of information on PrEP was the outreach activities conducted by peer leaders and the counselling conducted by psychosocial counselors.

Regarding acceptability, 143 respondents (15 on PrEP) stated their intention to adopt PrEP as additional HIV prevention strategy whereas 62, who are still reflecting, perceive PrEP as a secondary barrier to protection for HIV infection. 22% (46/210) respondents were not in favor of PrEP with the mindset that it can lead to a decrease in condom use with their clients.

A study also shown a strong significant association between the level of knowledge and acceptability of HIV-PrEP, i.e. 4.3 times the chance of acceptability of PrEP, with a P value = 0.001.

Also, there was a significant association between a high risk of contracting HIV and the acceptability of PrEP, i.e. a P value = 0.021. The most common reasons for PrEP non-acceptance were related to side-effects, police harassment and daily taking of PrEP.

Conclusions: To Conclude, we can assert that FSW who perceived themselves to be at risk for HIV acquisition find daily oral PrEP as an acceptable prevention strategy.

EPD087

Increasing safe sexual decision making and access to youth friendly HIV and SRH services through service linking up intervention in Southern Burundi

C. Bonne[1], M. Martin[1], K. Husseni[1]
[1]*Solidarité Infirmière pour la Promotion de la Santé Maternelle et Infantile (SIPROSAMI), HIV Management and Research, Nyanza-Lac, Burundi*

Background: Baseline study conducted from May-July 2009 demonstrated practice of unsafe sex among adolescent Female Sex Workers (FSWs) and their clients who where in lack of access to youth friendly HIV, Sexual and Reproductive Health (SRH) care services in 5 fishing centers. The intervention purpose was to improve the health outcome of this key population while promoting Behavior Change (BC).

Description: This is a continued interventional study which targeted 143(28,3%) mobile FSWs and their clients 362(71,7%) who were mobile fisher men aged 14-24 y.o operating in 5 fishing centers of Southern Burundi. Link up to comprehensive health care services involved working with youth peers selected among our target population;

the Community health workers and local administration officers in collaboration and support from the local health care providers. Approach involved peer education and service referral via the existing health care stream where the target population was linked to youth friendly health care services which included: HIV counselling and testing, ART, Management of Reproductive and sexually transmitted Infections and family planning coupled with BCC through health education, counselling, and peer to peer education. Changes were measured prospectively at baseline to end line(March 2016-April 2019)

Lessons learned: At baseline, study showed 52% of youth engaged in unprotected sex while 85% reflected on their high risk activity and reported lack of access to comprehensive health care services. New findings upon initiation of this intervention showed a significant decrease in HIV and STIs incidence and prevalence as well as unwanted pregnancies which we correlated to the increase in condom use, safe sex negotiation and practice. 33/35 (94,2%) of FSWs who became pregnant followed Antenatal care; of them 8/35 (22,8%) were HIV+ and all had undergone PMTCT. Referral system was strengthened to benefit this key population as >95% accessed HIV tests which demonstrated a prevalence of 11% (49) among 454 (FSWs and their clients) who were tested. FSWs were the most affected than their male clients.

Conclusions/Next steps: Data showed that this intervention helped young FSWs and their clients to make safe sexual decision while helping them access a comprehensive HIV and SRH services and could make more positive impact if continued similar intervention was implemented.

EPD088

Young Female sex workers lived experience of selling sex and accessing HIV services in Tanzania: implications for sexual health

J. Wamoyi[1], S. Mugunga[2], K. Govender[3]
[1]National Institute for Medical Research, Sexual and Reproductive Health, Mwanza, Tanzania, The United Republic of, [2]National Instiute for Medcial Research, Sexual and Reproductive Health, Mwanza, Tanzania, The United Republic of, [3]UNiversity of Kwa Zulu Natal, Health Economics and HIV/AIDS Research Division (HEARD), Durban, South Africa

Background: Adolescent girls and young women who engage in sex work are at a heightened risk of HIV compared to those who don't. Access to Sexual and Reproductive Health (SRH) services is also limited. This study explored the context of sex work for young female sex workers (YFSWs) and how they accessed SRH services including HIV services.

Methods: This study utilized an ethnographic research design involving 38 in-depth interviews (IDIs) and photovoice with 10 Young Female Sex Workers (YFSWs) aged 18-24 years. Thematic analysis was conducted with the aid of NVIVO qualitative analysis software.

Results: Five themes emerged:
1. "Selling sex in a setting where it is illegal";
2. Nature of HIV services available to YFSWs;
3. Stigma as a barrier to accessing services;
4. Preference for differentiated type of HIV services; and
5. Peer influencers in creating demand for SRH services.

Participants reported that sex work was illegal in Tanzania and highly stigmatized and thus YFSWs were in constant fear ofpolice arrest forcing them to operate discreetly. Although general SRH services were available in the communities, there were no specific services for YFSWs. Stigma hindered YFSWs accessing services in crowded health facilities that opened only during certain hours of the day. YFSWs demand for SRH services was not uniform but depended on many factors in their lives. While the older ones with children expressed a need for family planning services, the younger ones did not seem to have the same priority as most of them did not have children. Peers were important in influencing other YFSWs' decision on SRH services to use and where and how to access the services. Older YFSWs shared their supply of condoms and contraception with peers and advised them on what services to use and where to find it.

Conclusions: YFSWs operate under stressful conditions that limiting access HIV services. Peers of YFSWs play a key role in their access to, and use of HIV services and could be utilized to promote access among YFSWs network. There is need for differentiated type of SRH services for YFSWs and building an enabling environmentto motivate YFSW to access services.

EPD089

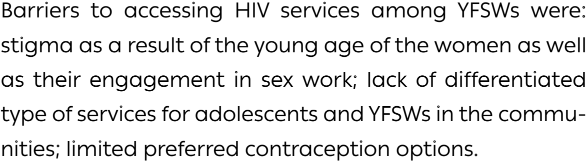
Barriers and Enablers to Young Female Sex Workers accessing HIV services in Tanzania: perspectives of health providers and Young Female Sex workers

J. Wamoyi[1], S. Mugunga[1], K. Govender[2]
[1]National Institute for Medical Research, Sexual and Reproductive Health, Mwanza, Tanzania, The United Republic of, [2]UNiversity of Kwa Zulu Natal, Health Economics and HIV/AIDS Research Division (HEARD), Durban, South Africa

Background: Despite being at an increased risk of violence and HIV infection, young women who sell sex, may not easily access HIV services. The objective of the study is to explore views of health providers and young female sex workers (YFSWs) themselves on barriers and enablers to accessing HIV services in Tanzania and to offer insights to enhance access.

Methods: This study utilized an ethnographic research design involving six SRH programme implementers and photovoice with 10 Young Female Sex Workers (YFSWs) aged 18-24 years. Thematic analysis was conducted with the aid of NVIVO qualitative analysis software.

Results: Health providers reported common SRH services available in their communities as HIV testing and treatment, contraception, and STIs treatment.



Barriers to accessing HIV services among YFSWs were: stigma as a result of the young age of the women as well as their engagement in sex work; lack of differentiated type of services for adolescents and YFSWs in the communities; limited preferred contraception options.

Enabling factors were reported as: Service providers supporting girls to access SRH services through peer groups; respect and trust built between health providers and YFSWs; prompt service provision to YFSWs when they come to facilities; localization of services to where YFSWs operate and making these services available for 24 hours.

Conclusions: There is need to address health provider-related barriers to YFSWs accessing HIV services while emphasizing the promotion of the factors that promoted uptake such as localization of services and 24-hour access.

EPD090
Substance use and depression impede optimal ART adherence among female sex workers living with HIV in the Dominican Republic

Y. Wang[1], T. Karver[1], C. Berg[1], C. Barrington[2], Y. Donastorg[3], M. Perez[3], H. Gomez[3], W. Davis[1], N. Galai[4], K. Starr[1], D. Kerrigan[1]

[1]George Washington University, Prevention and Community Health, Washington, United States, [2]University of North Carolina, Chapel Hill, Department of Health Behavior, Chapel Hill, United States, [3]Instituto Dermatologico y Cirugia de la Piel, Santo Domingo, Dominican Republic, the, [4]University of Haifa, Department of Statistics, Haifa, Israel

Background: Female sex workers (FSW) are disproportionately affected by HIV and have worse HIV outcomes compared to women not involved in sex work, attributed in part by lower anti-retroviral therapy (ART) adherence. Substance use and depression are important barriers to ART adherence among people living with HIV, yet few studies have assessed the relationships between substance use, depression, and ART adherence in FSW, with limited longitudinal studies.

Thus, this study assessed temporal relationships among illicit drug use and ART adherence among FSW and explored the moderating effect of depression.

Methods: A sample of 240 FSW living with HIV in the Dominican Republic were assessed in at least one of 3 annual time points (T1-T3) from 2018-2021. We used a validated 5-item measure to assess ART adherence (e.g., doses missed in the last 4 days), yielding a summary score (range: 0-5; higher scores reflect lower ART adherence).

The 9-item Patient Health Questionnaire (PHQ-9) assessed depressive symptoms (range: 0-27; ≥5 considered mild-severe). Past 6-month illicit drug use was assessed for marijuana, crack, cocaine, heroin, ecstasy and other illicit drugs), yielding a summary score of the number of drugs used. Cross-Lagged Panel Model (CLPM) analyses assessed the reciprocal relationship between drug use and ART adherence. Multiple group CLPM assessed variation in the relationship between drug use and ART adherence by depression, accounting for age, income, education, and relationship status.

Results: At T1-T3, mean scores were 1.7, 1.7, and 1.6 out of the 5 potential indicators of suboptimal ART adherence, while the prevalence of illicit drug use prevalence was 25%, 23%, and 19%. The majority of participants (70%) had mild-severe depressive symptoms at T1. Use of one more illicit drugs increased later levels of suboptimal ART adherence scores by 0.35 (SE=0.14, p=0.013).

The relationship between illicit drug use and ART adherence was significant among FSW with mild-severe depressive symptoms (B=0.37, SE=0.16, p=0.023), and not significant among FSW without depressive symptoms.

Conclusions: Findings highlight the importance of addressing the syndemic nature of HIV and associated co-morbidities (e.g., substance use, mental health) in order to improve ART adherence and subsequently viral suppression in FSW, and to curb ongoing HIV transmission.

EPD091
Prevention strategies against HIV transmission and detection among MSM

O. Adeshina[1]

[1]Ogun State College of Health Technology, Public Health Assistance, Ijebu-Ode, Nigeria

Background: With the ever increased prevalence of human immunodeficiency virus (HIV) among men who have sex with men (MSM) remains high in Nigeria and has shown an upward trend . However, the status of HIV-infected MSM in the underdeveloped southwest of Nigeria is unknown.

The study aimed to evaluate the real-world status of HIV-infected MSM and to compare the characteristics between HIV-infected 'men who have sex with men only' (MSMO) and 'men who have sex with men and women' (MSMW).

Methods: The study was conducted with HIV-infected MSM patients in Heartland alliance LTG/GTE Lagos Zone A branch in Agege in 2022. A questionnaire addressing socio-demographic characteristics, sexual behaviors, condom use, clinical signs and symptoms, and HIV detection and transmission routes was used.

Results: A total of 150 HIV-infected MSM were enrolled. More than 70% of MSM had experienced their first sexual intercourse before 20 years old. More than 55.8% of the patients had a high income. Compared with MSMW, more MSMO went to college (60.2% vs. 48.7%), and more often (20.9% vs. 8.7%) use condom during anal sex. Weight loss was the most common sign (15.1%). The numbers of male partners and high-risk sexual behaviors among HIV-infected MSM remained high (30.6%), and few patients (4.6%) agreed to voluntary counseling and testing (VCT).

Routine health examination was the most frequently (72.7%) used detection method. Homosexual behavior may be the most frequent transmission route (87.9%) among HIV-infected MSMO and MSMW.

Conclusions: The findings indicate that the government should promote more prevention strategies against HIV transmission and detection among MSM.

EPD092

Individual and collective forms of resistance: direct and mediated pathways between HIV and sex work stigma and viral suppression among female sex workers in the Dominican Republic

D. Kerrigan[1], C. Barrington[2], T. Sanchez-Karver[1], Y. Donastorg[3], M. Perez[3], H. Gomez[3], W. Davis[1], S.W. Beckham[4], N. Galai[5]

[1]*George Washington University, Prevention and Community Health, Washington DC, United States,* [2]*University of North Carolina, Health Behavior, Chapel Hill, United States,* [3]*Instituto Dermatologico y Cirugia de la Piel, Santo Domingo, United States,* [4]*Johns Hopkins University, Health, Behavior and Society, Baltimore, United States,* [5]*Johns Hopkins University, Epidemiology, Baltimore, United States*

Background: HIV stigma is a known barrier to optimal HIV outcomes, yet the interplay between HIV and intersecting stigmas among cisgender female sex workers (FSW) is less understood. Interventions that facilitate social cohesion among FSW, as a means of resisting stigma and addressing other structural constraints, have been successful in reducing HIV risk. Limited work has focused on multi-level stigma resistance to improve HIV treatment outcomes among FSW.

Methods: We assessed direct and indirect effects of multiple pathways between HIV stigma, sex work stigma and viral suppression using survey and biologic data collected from a cohort study of 210 FSW living with HIV in the Dominican Republic in 2019. We employed structural equation modeling to explore the role of anticipated HIV stigma and the mediating and moderating effects of individual and collective forms of stigma resistance, including dignity related to sex work as an occupation and social cohesion among FSW, on ART interruption (stopping ART one or more times in last 6 months) and viral suppression (<400 copies/mL).

Results: 76.2% of FSW were virally suppressed and 28.1% had interrupted ART in the last 6 months. ART interruptions had a negative direct effect on viral suppression (OR = 0.26, p<0.001), while cohesion had a positive direct effect on viral suppression (OR=2.07, p=0.046). Anticipated HIV stigma had a significant total unmediated negative effect on viral suppression (OR=0.34, p=0.055). This effect was mediated by the combined effects of cohesion and dignity whereas the impact of HIV stigma on viral suppression was no longer significant.

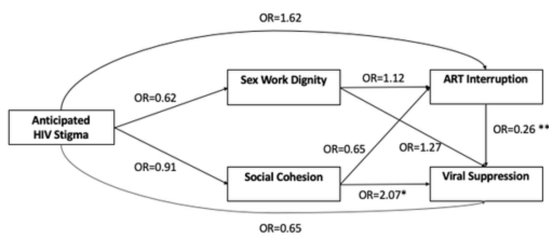


Figure. Structural equation model for pathways between HIV stigma and viral suppression: multi-level forms of stigma resistance.

Conclusions: Individual and collective forms of sex work stigma resistance reduced the negative impact of HIV stigma on ART interruptions and viral suppression. Findings reinforce the importance of expanding community-driven, multi-level interventions among FSW to improve HIV treatment outcomes and to curb ongoing transmission dynamics at a population level.

EPD093

Intragroup social support, social participation, & consistent condom use among women who exchange sex in Baltimore, Maryland

D.F. Nestadt[1], R.J. Musci[1], D. German[1], M.R. Decker[1], S.G. Sherman[1]

[1]*Johns Hopkins Bloomberg School of Public Health, Baltimore, United States*

Background: Consistent condom use (CCU) remains critical to HIV prevention among women who exchange sex (WES). WES-led community empowerment programs have been effective in addressing factors that contribute to HIV risk. Collective power is key to empowerment; both within-group and intergroup social connection have been associated with CCU, and theory posits synergistic relationships between them. However, research is limited, particularly in the United States and other high-income settings.

Methods: WES recruited at street locations throughout Baltimore, Maryland, United States responded to detailed questions about relationships with other WES and past-week sexual acts and condom use with paying clients. Using latent class analysis, we identified subgroups of WES based on the co-occurrence of indicators of intragroup social support, estimated subgroup-specific prevalence of past-week CCU with clients, tested for overall and pairwise significant differences, assessed associations between participation in non-sex work-related groups and CCU overall and within each latent class, and tested for interactions between intragroup and intergroup social connection.

Results: Fifty-four percent of participants reported past-week CCU with clients. Using a three-class model for intragroup social support (*broad support*, *low support*, and "*looking out*;" Figure 1), adjusted estimated prevalence of CCU was 48.9% in the *low support* class, 54.5% in the *looking out* class, and 61.3% in the *broad support* class. Preva-

Oral abstracts

Author Index

lence was significantly lower in the *low support* class than the *broad support* class (*p*=0.028). Among the *low support* class only, any non-WES-specific social participation was associated with 27% increased odds of CCU (*p*=0.028).

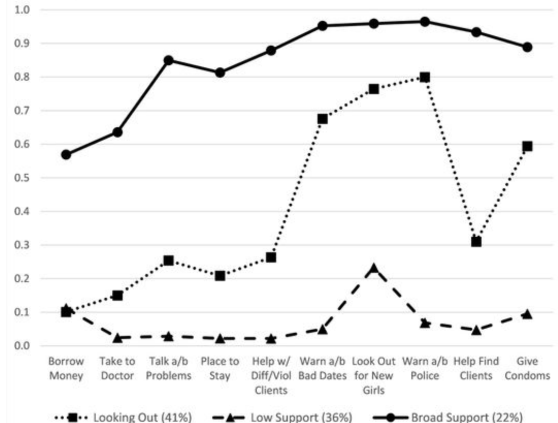

Figure 1. Conditional probability of each intragroup social support indicator given membership in each class.

Conclusions: Findings highlight the importance of broad instrumental and emotional support for CCU among WES, in addition to informal sex work-related informational support, such as bad-client warnings. In the absence of intragroup social support, participation in outside groups may offer some sexual risk protection. Thus, interventions seeking to increase CCU among WES should promote intragroup relationship-building and broader social participation.

EPD094

Social influences on PrEP initiation, adherence, and persistence among female sex workers in Durban, South Africa: a longitudinal qualitative analysis

M. Shoen[1], A. Rock[1], L. Shipp[1], M. Mcingana[2], N. Mulumba[3], S. Makama[3], T. Mkhize[3], L. Tingey[4], C. Comins[1], H. Hausler[2], S. Baral[1], S. Schwartz[1]

[1]Johns Hopkins Bloomberg School of Public Health, Department of Epidemiology, Baltimore, United States, [2]TB HIV Care, Cape Town, South Africa, [3]TB HIV Care, Key Populations Programme, Durban, South Africa, [4]Johns Hopkins Bloomberg School of Public Health, Department of International Health, Baltimore, United States

Background: South African national guidelines recommend pre-exposure prophylaxis (PrEP) for all individuals at high risk of HIV acquisition, but coverage, adherence, and persistence remain suboptimal among female sex workers (FSW). Social influence has been identified as both a facilitator and a barrier to PrEP use in numerous settings. This analysis investigates the social actors and mechanisms influencing PrEP initiation, adherence, and persistence over time among FSW in eThekwini (Durban).

Methods: Semi-structured, serial in-depth interviews were conducted from October 2020-June 2021 with 30 HIV-negative FSW initiating PrEP and a case management intervention through TB HIV Care's FSW HIV-prevention program in eThekwini. Interviews and case manager notes were analyzed within a social support framework using thematic coding in Atlas.ti 9, narrative summaries, and matrices.

Results: FSW PrEP use was influenced primarily by family, partners, friends, and work colleagues, and occasionally by clients and venue managers. Informational influence motivated PrEP initiation among FSW through sharing of knowledge and experience among peers *(Figure 1)*.

Instrumental influence and emotional influence supported or inhibited PrEP adherence and persistence, and negative forms of influence were often driven by stigma. Instrumental and emotional support were most likely to have a positive impact on PrEP adherence and persistence when consistent over time, while one instance of negative influence could be sufficient for discontinuation. Social environments were dynamic and FSW relied on social support less over time as pill-taking became routinized behavior.

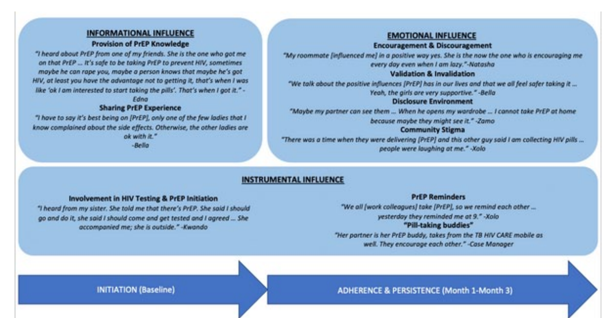

Figure 1. Social influences on PrEP use among FSW over time in eThekwini, South Africa during the first 3-months of PrEP use. Results are from serial in-depth interviews among 30 FSW initiating PrEP. Key themes at initiation and follow-up are described and complemented by illustrative quotes. Pseudonyms are used throughout.

Conclusions: Initiatives seeking to increase PrEP initiation, adherence, and persistence among FSW may want to consider leveraging PrEP peer ambassadors and social support in early stages of PrEP use to promote impactful positive social influence. Changing social norms around PrEP could prevent PrEP discontinuation by reducing negative forms of instrumental and emotional influence. Programs can additionally lessen the impact of social influences by teaching PrEP users self-management strategies.

EPD095

FSWS' situation assessment in Lahore Pakistan: a study by BAHAM Foundation on HIV&AIDS related vulnerabilities and life realities of 300 female sex workers in Pakistani culture

B. Rani[1], A. Rubab[1], Team BAHAM
[1]*Baham Foundation, Lahore, Pakistan*

Background: Sex work in Islamic Republic of Pakistan is criminalized under sections 377, 371A and 371B of Pakistan Penal Code. Gaps in pro women laws in relation to female sex workers make this marginalized group of population vulnerable to face extreme levels of stigma & discrimination along with physical and social risks. Sex workers' vulnerabilities pertinent to HIV&AIDS and other epidemics in Pakistan are still poorly documented and assessed as sex work operates mainly as secret in undergrounds because of illegal nature. This particular study aims to formulate evidence based advocacy, services delivery, information/education and empowerment programs for FSWs in Pakistan.

Methods: Using a cross-sectional survey design, during 15th-30th April 2021, non-probability sampling technique and snow-ball strategy was used to recruite a sample of 300 FSWs.

Questinnare consisted of 54 items divided into 4 sections namely yourself and family, Sex trade and other sexual relationship, sex trade and drug/alcohol use last one is sexual and reproductive health.

Data analysis was done SPSS version 22. Descriptive statistical method was used for statistical analysis.

Results:

- 89% FSWs are from age group 20-40 years, minimum age of initiation of sex work reported is below 15 years. 61.4% are illiterate, 65.5% are responsible for completely running house, 72.4% earn less than 250 $ per month.
- Partners vary in number, paying capacity and types age raning 10-70 years exposing FSWs to violence, low wages and increased drug-use.
- 78.6% FSWs are married with average 3 children. Negative effects of sex-work include stigma (89.5%), social boycott (44.2%), domestic violence (40%), disputes (68.8%), relationship problems (78.6%), malnutrition (55.1%) and child abuse (19.3%).
- 77% use drugs/alcohol during sex-work while upto 94.6% report poor health status. 72.6% FSWs experievced arrested and abused by police 87.1%'s work is affected by COVID-19.

Conclusions: Study highlights importance of involving young FSWs with focus on empowerment, HIV, SRH, pictorial communication. Invoving LEAs and urgent response to COVID-19 situation is needed.

Drugs/alcohol harms reduction and treatment can improve FSWs' quality of life. Reducing GBV and stigma, life-skills programs can ensure FSWs' social well-being. Focussed advocacy for improvement in laws leading to recognition of FSWs' rights is essential.

EPD096

Bringing PrEP closer to clients in Ghana: supporting pre-exposure prophylaxis (PrEP) initiation and adherence in the community

G. Nunoo[1], A. Amedzi[2], P. Kumar[3], T. Lillie[4]
[1]*Kwame Nkrumah University of Science & Technology, Social Sciences, Accra, Ghana,* [2]*Ghana Institute of Management and Public Administration (GIMPA), Information Management Systems, Accra, Ghana,* [3]*University of Central Nicaragua, Public Health, Managua, Nicaragua,* [4]*John Hopkins Bloomberg School of Public Health, Social & Behavioural Sciences, Baltimore, United States*

Background: In August 2020, thePEPFAR- and USAID-funded Meeting Targets and Maintaining Epidemic Control (EpiC) project began implementing Pre-Exposure prophylaxis (PrEP) in two regions (Greater Accra, Ashanti) in Ghana to prevent HIV acquisition among key populations (KPs) at high risk, including men who have sex with men (MSM) and female sex workers (FSWs).

After six months of implementation, demand for PrEP was decreasing and discontinuation was high. In response, EpiC adapted a differentiated service delivery (DSD) approach consisting of community-based PrEP services.

Description: EpiC implemented the community-based PrEP initiation and refill program using a private service mobile clinic and lay counselors, in the Greater Accra region. The mobile clinic began operation in October 2020, and lay counselor provision of community refills commenced in February 2021. Peer educators, lay counselors, and PrEP champions shared the mobile clinic's schedule and location with potential and current clients. With clients' permission, clinical staff informed lay counselors of who was due for refills so that lay counselors could follow up with those clients. Lay counselors also provided HIV testing, as appropriate, to avoid any lapse in PrEP services. They engaged with clients to establish a convenient meeting place for refills.

Lessons learned: Demand for community initiation and refills of PrEP was higher among FSWs than MSM. Of the 142 FSWs who initiated PrEP, 140 (98%) initiated PrEP through the mobile clinic. More than half (n=77 [55%]) of these individuals received their refills in the community versus the facility. The majority of MSM preferred to initiate PrEP and obtain refills at the facility over the community.

Of the 157 MSM who initiated PrEP, 119 (76%) did so in the facility and 38 (24%) through the mobile clinic. For the 89 MSM who sought PrEP refills, 76 (85%) received them at the facility and 13 (15%) from lay counselors in the community.

Conclusions/Next steps: Community initiation and refills of PrEP supported uptake and continuity of services among high-risk KP individuals in Ghana, but especially among the FSW. DSD options should be based on the unique needs and preferences of each population at risk of HIV.

Female sex workers' preferences for Multi-Purpose Technologies to prevent HIV, other Sexually Transmitted Infections and unintended pregnancies in Kampala, Uganda

S. Namukwaya[1], K. Katumba[1], I. Kayesu[1], Z. Nabalwanyi[1], R. Naluwooza[1], Y. Mayanja[1], P. Indravudh[2], M. Quaife[2], L. Gao[3], M. Kuteesa[4], Y. Machira[4], A. Kamali[4], J. Seeley[1], M. Gafos[2]

[1]Medical Research Council/Uganda Virus Research Institute & LSHTM, Uganda Unit, Entebbe, Uganda, [2]London School of Hygiene and Tropical Medicine, London, United Kingdom, [3]Busara Center for Behavioral Economics, Nairobi, Kenya, [4]International AIDS Vaccine Initiative (IAVI), Nairobi, Kenya

Background: Female sex workers (FSWs) in sub-Saharan Africa are at high risk of HIV infection, unintended pregnancies and other STIs. The development of innovative Multi-Purpose Technologies (MPT's) has the potential to address this dual risk. This study explored FSWs preferences for future HIV prevention MPTs in Kampala, Uganda.

Methods: We conducted 15 in-depth interviews with FSWs aged15-45 years in Kampala from October-December 2021. We explored women's perceived and lived experiences of existing family planning and HIV prevention products and preferences for future MPTs. Interviews were audio recorded, transcribed, translated and analyzed thematically.

Results: Most women used injectable contraceptives, which were acceptable except when they disrupted menstruation. Oral pills were considered unreliable due to the need for constant adherence; implants were considered too expensive and painful to insert and may move and be lost in the arm. Most of the women reported using HIV testing of clients and condoms for HIV prevention, with only a few women using oral PrEP.

Younger and older FSWs were interested in future long-acting LA MPTs. Their priority was for protection against HIV and unintended pregnancy, but less interest in additional protection against other sexually transmitted infections.Most women liked the idea of injectable MPTs although expressed different preferences for the period of protection (1 month to 5 years). Some interest was shown in MPT implants or pills because of favorable experiences using specific family planning and HIV prevention products.

Participants reported that vaginally inserted products were not suitable for women who have multiple partners due to an increased risk of vaginal infection. They reported misconceptions about vaginally inserted products, fearing that they may move and be lost inside the body. Misconceptions were shaped by participants' limited knowledge of, and experience with vaginal products as well as rumors' among peers.

Conclusions: Women in our study were interested in LA MPTs. In preparation for the implementation of LA HIV prevention products (i.e. vaginal ring) and potential future MPTs, appropriate interventions to improve sexual and reproductive health literacy are crucial to increase uptake of available products (such as oral PrEP) and new HIV prevention products and MPTs in the future.

EPD098

Youth as Actors of change against AIDS in Benin

B.E.T. Seriki[1]

[1]Un Regard ONG, Littoral, Cotonou, Benin

Background: In Benin, adolescents and young people make up 33.33% of the global population. Among 10-24 year old girls, 85% of them have no knowledge of HIV AIDS compared to 79% of boys. 62% of young women and 80% of young boys have never been tested for HIV. This situation has led to technical and financial support from UNAIDS Benin to increase the rate of HIV testing among young people through community testing.

Description: Having taken place in five districts, the young volunteers joined forces with the decentralized state services to facilitate the service offer. The young volunteers first carry out a scouting followed by awareness raising about the targets. Then the decent mobile clinic on the spot to screen adolescents and young people previously sensitized in the " ghetto "; prostitution area; markets; college and grounds. Once the screening sessions are over, the young volunteers record the data of the people screened (WITHOUT SEROROLOGY STATUS) in software called DHIS2.

Lessons learned: The implementation of this project required several strategies such as community screening: young volunteers are trained and equipped followed by support from state services. After 6 months of activity 1,600 adolescents and young people are made aware of HIV / AIDS and the advantages of Family Planning. 1,440 adolescents and young people are screened for HIV / AIDS but also for breast and cervical cancer and know their serological status. 90% of the people sensitized and screened are adolescents and young people aged 10-24. The remaining 10% have recently been tested for HIV and therefore already know their HIV status. 216 or 15% of people are detected positive and refer for antiretroviral treatment.

Conclusions/Next steps: The results are easily achievable when young volunteers are empowered for community screening as this accelerates the goal of the first 90 of UNAIDS. The sensitizations are open doors to generate the demand for screening. The current challenge remains to instill the habit of screening in young populations.

EPD099

Using participatory approaches to support empowerment and encourage HIV service use among sex workers: findings from five cities in Indonesia

G. Simanullang[1,2], T. Puspo Arum[1], D. Devika[1], A. Arina[1], A. Budiman[1], I. Praptoraharjo[1]
[1]Atma Jaya Catholic University of Indonesia, AIDS Research Center, Jakarta, Indonesia, [2]University of Illinois, School of Public Health, Chicago, United States

Background: Sex worker (SW) empowerment programs in Indonesia have several focus areas from health intervention, human rights and legal issues, economic empowerment, and violence management. However, studies on the exact empowerment mechanism that can increase SWs' access and their utilization of sexual and reproductive health and rights (SRHR) or HIV service are very limited.
This study aims to assess enabling factors and barriers of community empowerment on meaningful participation of SW communities in policies, programming, and services and on access and utilization of SRHR and HIV in Indonesia.
Description: Using a community empowerment conceptual framework, a mixed method study consisting of a literature review, survey, qualitative assessment, and policy modeling (DELPHI) was used to collect and analyze data in five cities. As participatory community-based research, this study actively engaged SWs as researchers or enumerators. Two SWs contributed as researchers and 25 SWs participated as survey data enumerators. Key elements of community empowerment used in this study were based on the Sex Worker Implementation Tool (SWIT).
Lessons learned: A total of 500 SWs and 50 experts from various background participated in the survey, qualitative assessment, and policy modeling. The majority (65%) survey respondents were female sex workers, and the average age was32 years old ranging from 18 to 62 years. Enabling factors to successful empowerment program for SWs were awareness and motivation to be involved in program, accurate information, social support, good relationships, coordination and collaboration between program implementer and sex workers.
Barriers in implementing empowerment program include stigma, regulations in entertainment venues, time availability, a mismatch between programs and SWs' needs, distrust, and indifference among SWs, and funding. Empowerment programs for SWs in Indonesia have been implemented by community-based organizations, NGOs and government agencies.
Conclusions/Next steps: Community empowerment has shown positive association with SWs' participation in decision making of policy and program development and access and utilization of SRHR services.
In order to address some barriers in term of coverage, access, and quality of empowerment program for SWs in Indonesia, this study recommends a model of empowerment program, including capacity strengthening, social, health, and economic empowerment at national or local level.

EPD100

Scaling up HIV service coverage among high class FSW through virtual interventions

L. Obeng Asomaning[1], C. Asamoah-Adu[2], E. Assisi[3]
[1]Ghana West-Africa Program To Combat AIDS & STI (WAPCAS), Monitoring & Evaluation, Accra, Ghana, [2]Ghana West-Africa Program To Combat AIDS & STI (WAPCAS), Programs, Accra, Ghana, [3]PROLINK Organization, Programs, Accra, Ghana

Background: The traditional peer education approach leaves out high class or corporate female sex workers (FSW) since they do not avail themselves for community-based HIV programs. This group of FSW are difficult to reach due to their clandestine nature of operations. Most civil society organizations implementing FSW programs are currently capitalizing on social media as an intervention tool for reaching hard- to- reach FSW.
Under the Key Population Program being led by West-Africa Program to Combat AIDS & STI with funding from The Global Fund, social media has been integrated as a mainstream strategy for reaching hard-to-reach FSW in Ghana.
Description: WAPCAS in collaboration with PROLINK, a sub-recipient under the FSW intervention introduced social media to expand service coverage among hard-to-reach FSW. The program adopted the use of social media apps including Badoo, Tiktok, SnapChat, Meet24, Locanto, Evamax, M2U, Facebook, WhatsApp, etc.
A dedicated desk was set up comprising Peer Educators who are active on these platforms to reach FSW online and link them to services. Clients reached through social media were referred to KP-friendly trained nurses from Ghana Health Service to access services including HIV testing services, STI services, and Pre-Exposure Prophylaxis (PrEP) through an appointment-based system.
These clients engaged healthcare providers for services without physical contacts with Peer Educators who fostered the linkage. This strategy was used to keep clients unanimous and avoid issues of mistrust.
Lessons learned: In 2021, this implementation approach reached 204 FSW with comprehensive HIV education and referred same for HIV testing services (HTS), STI screening and PrEP. A total of 50 FSW received HIV testing services, 8 diagnosed positive and same initiated on ART whilst 26 clients received Oral PrEP.
Conclusions/Next steps: Develop program tailored online apps for hard-to-reach FSW to allow real-time interaction with healthcare providers and promote access to services. Publish useful resources on HIV and related topics on this portal to serve as an information hub for FSW who operate online.

EPD101

Barriers and facilitators of HIV testing among women who exchange sex and use drugs in Kazakhstan: a mixed methods study

M. Darisheva[1], V. Frye[2], B. West[3], A. Terlikbayeva[4], S. Primbetova[1], T. McCrimmon[5], O. Cordingley[5], N. Zholnerova[6], E. Grigorchuk[7], A. Kuskulov[5], L. Starbird[8], L. Gilbert[3], N. El-Bassel[3]

[1]Global Health Reseach Center of Central Asia, Almaty, Kazakhstan, [2]The City College of New York, School of Medicine, New York, United States, [3]Columbia University, School of Social work, New York, United States, [4]Global Health Research Center of Central Asia, Almaty, Kazakhstan, [5]Columbia University, New York, United States, [6]Public Association ‚Amelia', Taldykorgan, Kazakhstan, [7]Public Association ‚Union of Leaders Sau Bolashak', Almaty, Kazakhstan, [8]University of Pennsylvania, Family and Community Health, Philadelphia, United States

Background: Women who both exchange sex and use drugs (WESUD) experience many impediments to HIV testing and service utilization, including violence perpetrated by partners and clients and self-, community- and provider-level stigma. Poverty, unemployment, and substance use decrease their ability to negotiate condom use and substantially increase their risk for HIV acquisition and transmission. Little research has examined the behavioral, social, and environmental factors that influence HIV testing and/or HIV self-testing (HST) among this population. This study uses mixed methods (quantitative/qualitative) to characterize barriers to and facilitators of HST among WESUD.

Methods: We conducted a computerized survey (N= 48) and online in-depth interviews (n=30) or focus groups (n=18) with WESUD in two Kazakhstani cities, Almaty and Taldykorgan (March-July 2021). We recruited participants through snowball sampling via two local non-profit organizations "Amelia" and "Sau Bolashak".

The survey collected data on sociodemographics, testing and HST experiences, stigma, substance use, and violence experiences. The qualitative interviews explored these areas and sought feedback on potential program features. The survey data were analyzed descriptively and the qualitative interviews were recorded, transcribed, coded and analyzed using a pragmatic analytic approach.

Results: The majority of participants (89.4%) reported sex work as their primary income. Participants reported multiple vulnerabilities to HIV: 16.7% used condoms at every sexual intercourse; 75.0% used alcohol/drugs before sex with paying partners. Under half (44.7%) were tested for HIV in past three months, and over one-third (36.2%) tested 6+ months ago.

In qualitative interviews, participants described fear as a barrier to HIV testing including potential outcomes of testing positive (public identification due to a breach of confidentiality, loss of job/income/livelihood) and high levels of community stigma and experienced stigma (from family/friends, health care providers, etc.). Participants expressed high interest in HST, identifying it as more confidential, accessible, secure, friendly, and user-controlled. Some reported that if provided instruction and test kits, they would teach their peers how to self-test.

Conclusions: We identified multiple and familiar barriers to HIV testing among FSWUD in Kazakhstan. WESUD need accessible and tailored interventions to address these barriers, particularly those promoting HIV self-testing.

EPD102

Crises response and reduction of human rights abuses against Key Populations (KP) in Ghana – a case of Peer Paralegal under the WAPCAS/Global Fund Human Rights Intervention

K. Owusu-Anane[1], C. Asamoah-Adu[2]

[1]Ghana-West Africa Program to Combat AIDS & STI (WAPCAS), Finance and Administration, Accra, Ghana, [2]Ghana-West Africa Program to Combat AIDS & STI (WAPCAS), Programs, Accra, Ghana

Background: Key Populations (KPs) including Female Sex Workers and Men who have sex with men encounter crises in their daily lives and operations. These crises include stigma and discrimination, assault, unlawful Police arrest, sexual harassment, and blackmail. These crises result in barriers to HIV, STI and TB Services thereby limiting the uptake of these health services.

The Ghana-West Africa Program to Combat AIDS and STI (WAPCAS) with funding from the Global Fund implemented a Human Rights intervention (2018-2020) using KPs as Peer Paralegals to mitigate crisis response within the KP communities.

Description: The human rights intervention implemented by WAPCAS identified the need to strengthen legal literacy among KP to improve crises response within the KP communities. Experienced peer educators were selected and trained as Peer Paralegals to provide support to KPs in crises. The Peer Paralegals identify and follow up on human rights abuse cases, resolve cases within their capacity, refer cases beyond them to the program Pro-Bono lawyers, and link KPs in crises to available legal services.

The Peer Paralegals also help promote the rights of KPs and persons affected by TB and PLHIV, provide behaviour change messages, reduce stigma and discrimination, and provide easy linkages to services.

Lessons learned: The Peer Paralegal approach has strengthened and improved confidence in the KP community crises response system. This is because KPs have an easier point of reference whenever there is crisis. The behaviour change education offered by the Peer Paralegals have improved knowledge and therefore contribute to the prevention of crises within the communities.

Strong networks have been established between the Peer Paralegals and the various government institution. This is important for sustaining the outcomes of the intervention.

Further, barriers experienced by KPs in accessing services including health have been reduced. Peer paralegals reported 141 cases after three years of implementation and were able to settle 7 cases by themselves.

Conclusions/Next steps: The Peer Paralegal program for KPs should be strengthened across all the districts of implementation. There is the need for greater collaboration among the KP Peer Paralegals and the PLHIV & TB Peer Paralegals.

EPD103

Acceptability of injectable cabotegravir versus daily oral TDF/FTC for PrEP: lesson from HPTN 084

E. Tolley[1,2], A. Bula[3], M. Chitukuta[4], J. Etima[5], N. Khoza[6], E. Namey[1], D. Kemigisha[5], L. Makhale[6], M. Tsidya[3], L. Schrumpf[7], M. Hosseinipour[3], S. Delany- Moretlwe[6], HPTN 084 Study Team

[1]FHI 360, Behavioral, Epidemiological & Clinical Sciences, Durham, United States, [2]University of North Carolina, Maternal and Child Health, Chapel Hill, United States, [3]UNC Project Malawi, Lilongwe, Malawi, [4]University of Zimbabwe, College of Health Sciences Clinical Trials Research Centre, Harare, Zimbabwe, [5]Makerere University, Johns Hopkins University (MU-JHU) Research Collaboration, Kampala, Uganda, [6]Wits Reproductive Health & HIV Institute, Johannesburg, South Africa, [7]FHI 360, Science Facilitation, Durham, United States

Background: HPTN 084, a multisite, double-blind, randomized Phase 3 trial, compared the safety and efficacy of a long-acting cabotegravir (CAB LA) injectable to daily oral TDF/FTC for prevention of HIV-1 in uninfected African women. Like a similar trial in MSM/TGW (HPTN 083), the trial was stopped early for demonstrating superiority of CAB LA over TDF/FTC in preventing HIV. The shortened timeline of these two trials has expedited the need to consider introduction strategies for different populations.

We examine qualitative data from a four-country substudy nested within HPTN 084 to better understand acceptability of these two PrEP methods and considerations for CAB LA access among African women at risk of HIV.

Methods: Qualitative research teams in Malawi, South Africa, Uganda and Zimbabwe conducted repeated, in-depth interviews with 68 women to understand beliefs about and experiences with trial products across individual, partner, community and clinical trial contexts.

The research teams followed a four-step process to read transcripts, develop a codebook and apply codes in NVivo to transcripts with intermittent interrater reliability checks. We developed memos describing Sexual History, Product-related Acceptability, Adherence, Pregnancy, PrEP Use, and Clinical Trial Experiences.

We classified participants as: self-declared sex work, transactional sex, non-transactional partners, and monogamy; summarizing information in Excel matrices to explore differences across risk categories related to product acceptability and other themes.

Results: Participants overwhelmingly preferred IM injections to daily pills. Regardless of risk category, women liked the injectable's privacy from husbands, boyfriends, sexual clients or just "nosey people".

At least half of participants worried about forgetting to take pills, describing previous mishaps with oral contraception or challenges with study pills. Late night work, unexpected travel or heavy drinking impeded pill adherence for some women. Descriptions of pain - the most common injectable concern – were variable; other side effects were rarely mentioned. Women in high-risk categories were more likely to mention "effectiveness" as a reason to prefer the injection, to have disclosed about study participation, and to know where they might access PrEP beyond the trial.

Conclusions: Women's desire for privacy and ease of use outweighed other injectable concerns, resulting in a strong preference for CAB LA.

EPD104

Self-reported adherence to antiretroviral therapy (ART) among women engaged in commercial sex work in Southern Uganda

J. Kiyingi[1], P. Nabunya[1], J. Nabayinda[1], S. Kizito[1], E. Nsubuga[2], F. Nakabuye[2], F. Namuwonge[3], O. Bahar[1], S. Witte[4], F. Ssewamala[1]

[1]Washington University in St. Louis, Brown School, Saint Louis, United States, [2]International Center for Child Health and Development, Masaka, Uganda, [3]International Center for Child Health and Development, Brown School, Masaka, Uganda, [4]Columbia University, School of Social Work, New York, United States

Background: Women engaged in sex work (WESW) are at a higher risk of acquiring and transmitting HIV. In sub-Saharan Africa, the HIV prevalence among WESW is estimated at 37%. In Uganda, WESW account for 18% of all new HIV infections. Even with the expansion in ART, WESW face access and treatment-related challenges, exacerbated by poverty, stigma, criminalization of sex work, and physical and sexual violence.

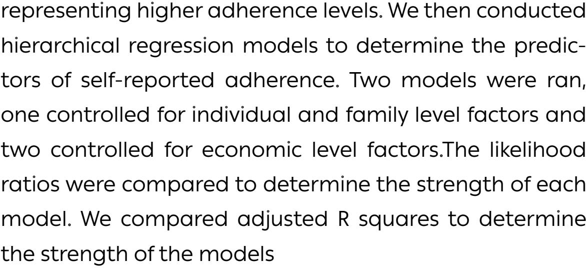
This study examined individual, family and economic level factors associated with self-reported adherence to ART among WESW in southern Uganda.

Methods: Baseline data from a longitudinal cluster randomized study involving 542 WESW (18-55 years), recruited from 19 HIV hotspots were analyzed.

Self-reported adherence to ART was measured using three items:

1. Number of days missed taking at least one dose of medication;
2. How often they take their medication as prescribed; and;
3. How good a job they did at taking their medication as prescribed in the past 30 days.

Item responses were linearly transformed to a scale of 0-100. Summary scores were created, with higher scores



representing higher adherence levels. We then conducted hierarchical regression models to determine the predictors of self-reported adherence. Two models were ran, one controlled for individual and family level factors and two controlled for economic level factors.The likelihood ratios were compared to determine the strength of each model. We compared adjusted R squares to determine the strength of the models

Results: Of the total sample, 42% (n=220) of participants tested HIV positive. Out of these, 89% (n=195) were enrolled on ART, 10% (n=19) were initiated on ART following study enrollment. Preliminary analyses indicate that financial distress (b=-0.62, 95% CI= -1.15, -0.09, p=0.02), depressive symptoms (b=-0.70, 95% CI= -1.23, -0.15, p=0.01), and age (b=-5.91, 95% CI= -10.45, -1.37, p=0.01) were associated with lower levels of adherence to ART.

Conclusions: Preliminary results show that poverty and mental health-related challenges undermine treatment adherence among WESW.

These results point to the need to integrate economic strengthening and mental health components in the HIV treatment cascade targeting WESW, especially in low resource settings.

EPD105

Increasing access and uptake of pre exposure prophylaxis (PrEP) among the sex workers in Uganda

M. Naomi[1]

[1]Uganda Network of Sex Worker Led Organizations (UNESO), Programs, Kampala, Uganda

Background: HIV prevalence is over 5 times higher among Sex Workers (35-37%) compared to the general population in Uganda. Despite the efforts made by the government of Uganda, implementing partners and CSOs to curb down the HIV prevalence through use of PrEP and other interventions, the infections have continued to raise especially among the Key populations, thus calling for urgent interventions that primary targets the most affected populations.

However, much as PrEP seems to be a promising intervention /programme to reduce new infections among sex workers, but its enrolment/implementation still faces challenges among which is information gap on PrEP by both the users and implementer/health providers thus necessitating the need to address the changing and complex challenges of PrEP implementation in Uganda.

Description: Uganda network of sex worker led organizations (UNESO) partnered with Ministry of Health in Uganda to implement a project titled' Strengthening capacity of health workers and sex workers to improve PrEP uptake in Uganda aimed at Improving PrEP uptake and retention among sex workers for HIV response.

The project Strengthened partnership with ministry of health leading to meaning full involvement of sex workers at national decision making level.

For example recently sex workers/UNESO was invited by the MOH to input in the development of PrEp guidelines. Improved recognition of sex workers' contribution in the HIV prevention responses. 200 health workers were trained on how to provide friendly and quality HIV services to sex workers. 415 sex workers were trained as champions to go and sensitize fellow sex workers on PrEP use.

Lessons learned: We have learnt that ,sex workers as one of the HIV and AIDS directly affected communities are very key in programming, planning, implementing and monitoring of programs that direct addresses the issues that affects them.

Use of health and human rights approach can effectively influence partnership between sex workers and Government entities like MOH, police and other key stakeholders.

Conclusions/Next steps: Need to continue engaging key stakeholders in sex worker activities so as to effectively lobby *and advocate for meaningful participation of sex workers in national decisions making processes for issues that affects sex workers.*

EPD106

Understanding the uptake of HIV care and prevention and the risk of acquiring and transmitting HIV amongst young women who sell sex in rural KwaZulu-Natal, South Africa

N. Chimbindi[1,2,3], L. Mazibuko[1], G. Chidumwa[1], N. Mthiyane[1,2], T. Zuma[1,2,3], G. Harling[1,4,2,5,3,6], K. Baisley[1,7], J. Dreyer[1], N. Okesola[1], O. Behuhuma[1], N. Gumede[1], C. Herbst[1], T. Smit[1], S. Danaviah[1], J. Seeley[1,7,3], S. Floyd[7], I. Birdthistle[7], F. Cowan[8,9], J. Hargreaves[7], M. Shahmanesh[1,2,3]

[1]Africa Health Research Institute, KwaZulu-Natal, South Africa, [2]University College London, London, United Kingdom, [3]University of KwaZulu-Natal, KwaZulu-Natal, South Africa, [4]MRC/Wits Rural Public Health & Health Transitions Research Unit (Agincourt), University of the Witwatersrand, Johannesburg, South Africa, [5]University of Johannesburg, Johannesburg, South Africa, [6]Department of Epidemiology & Harvard Centre for Population and Development Studies, Harvard T.H. Chan School of Public Health, Boston, United States, [7]London School of Hygiene and Tropical Medicine, London, United Kingdom, [8]Liverpool School of Tropical Medicine, Liverpool, United Kingdom, [9]Centre for Sexual Health and HIV/AIDS Research (CeSHHAR), Harare, Zimbabwe

Background: Young women who sell sex (YWSS) are at very high risk of acquiring HIV in South Africa (SA). We leveraged the roll-out of DREAMS combination HIV-prevention program to adolescent girls and young women (AGYW) in a rural sub-district in KwaZulu-Natal (KZN), SA to understand YWSS's risk of transmitting and acquiring HIV in a representative sample of AGYW.

Methods: Between 2017-2019 we interviewed a random-sample of AGYW (13-30 years) annually in rural KZN and collected dried blood spot (DBS) samples for HIV serology and viral load. YWSS were defined as those answering

'yes' to the following questions in any of the 3-year follow-up: *"having sex with anyone because you needed (or your partner provided) a material item that was important to you"* and/or *"having sex with other people for a living"*.
Transmissible HIV was defined as being HIV positive with a detectable HIV viral load (>50copies/ml) and being at risk of acquiring HIV was defined as condom-less sex when not on PrEP. We used multivariable logistic-regression analyses to identify determinants of YWSS and their HIV-outcomes, adjusting for age, education and socio-economic status.
Results: 2758 (96.2%) of those eligible participated and 2404 (87.2%) provided data for at least one follow-up time-point. Overall, 469 (19.5%) AGYW self-identified as YWSS. 100(32.2%) YWSS were HIV-positive compared to 18.3% all AGYW. Of which 60 (60%) were on ART. Transmissible HIV n=43 (43%) and risk of acquiring HIV n=113/191 (59.2%) was high among YWSS. 132 (42.4%) YWSS reported consistent condom use compared to 20.8% of all AGYW, and only six HIV-negative YWSS had ever used PrEP. YWSS was associated with food insecurity (adjusted OR=1.62 95%CI 1.16-2.26), a higher number of lifetime sexual partners (aOR=2.08, 95%CI 1.34-3.24), and positive HIV status (aOR=2.04, 95%CI 1.18-3.53). After adjustment, there was no association between risk of acquiring or transmitting HIV and selling sex.
Conclusions: Prevalence of selling sex is high amongst young women in this poor rural setting and associated with poverty and HIV status. Despite a high burden of HIV and interventions targeting AGYW, uptake of HIV services including PrEP and ART is sub-optimal among YWSS.

EPD107
Applying human-centered design approaches to identify barriers to continuous engagement in HIV/ART services among female sex workers and develop service prototypes to promote service uptake in Myanmar

S.S. Zin[1], W.W. Thaw[2], M.T.H. Aung[2], M.M. Thet[1]
[1]*Population Services International Myanmar, Strategic Information Department, Yangon, Myanmar,* [2]*Lan Pya Kyel Association, Yangon, Myanmar*

Background: Since 2018, HIV/ART drop-in centers under the Targeted Outreach Program (TOP) which provides HIV related health services in Myanmar have experienced low repeated HIV testing rates, delays in ART initiation and high loss-to-follow-up after initiation among female sex workers (FSWs).
This study aimed to identify FSWs' barriers to engagement in care and continuous engagement in HIV testing and treatment and design interventions to improve their service utilization in Yangon, Mandalay and Myitkyina.
Methods: Human-centered design (HCD) methodology was applied to gather insights from TOP clients who did not come for repeated HIV testing, delayed ART initiation and loss-to-follow-up. Because of COVID-19 pandemic, semi-structured qualitative interviews were conducted via telephone in September 2020 with 23 respondents. Inspiration and ideation phases were completed.
Findings were used to design service prototypes which addressed barriers to access regular HIV/ART services. 13 FSWs were interviewed again to obtain opinions on the prototypes.
Results: Frequent workplace migration, prioritizing jobs, inability to go outside freely without brothel managers' permission, fixed clinic opening hours and worrying about breach of confidentiality prevented FSWs from receiving regular testing and treatment. Transportation reimbursement failing to cover actual transportation charges deterred them from visiting the centers regularly. Difficulties in disclosing HIV status, low risk perception of disease, lack of comprehensive information on treatment resources and fear of consequences of positive HIV results such as being discriminated by colleagues and owners made FSWs delay initiating ART and lost to follow-up.
Based on these findings, three prototypes were developed:
1. Making services more FSW friendly with facilities such as transportation arrangement, flexible opening hours and teleconsultation with doctors and counsellors;
2. Advocating brothel managers and authorities through information sessions to reduce FSW's social and occupational challenges;
3. Establishing a communication channel which provides health education, treatment sources, regular reminders for HIV/ART services and psychological support to help them manage consequences of positive HIV results.
FSWs welcomed the idea of getting more FSW friendly services.
Conclusions: Despite COVID-19 pandemic, applying HCD approach enabled us gain insights into FSW daily lives and barriers in receiving HIV/ART services through interactive discussions and design customized prototypes.

EPD108
Children of female sex workers: a way forward to counter risk and vulnerabilities

K. Kusum[1], R. Rani[1], M. Benjwal[1], M. Sivasubramanian[1], J. Singh[1], A. Shetty[1]
[1]*The Humsafar Trust, NETREACH Department, Mumbai, India*

Background: Intergenerational risk of involvement in sex work among children of Female Sex Workers (FSWs) is a neglected area in HIV intervention programme. Studies have shown the risk and vulnerability among children of FSW especially those of the girl child. This paper draws from the experiences shared by FSWs, their fears of protecting their children and the welfare provisions they seek to protect the interests of their children.
Description: The Humsafar Trust, a community-based organization which implements a virtual HIV intervention programme to reach out to key, vulnerable and hidden

Oral abstracts

Poster exhibition

E-posters

Late-breaker abstracts

Author Index

populations who have not been part of the HIV intervention ambit thus far. A series of consultations were held with the FSW populations to understand their needs to appropriately target and reach out to at risk-populations under project NETREACH.

Lessons learned: Stigma and discrimination are still rife against FSWs and their children. Children undergo everyday discrimination at school and therefore are prone to dropout early. FSWs have to leave their children unattended when they have to leave for sex work; children are at high risk of abuse at such times. Most children are raised without a father/partner and therefore FSWs are the sole income providers. The mothers cannot speak to their child about their profession for fear of being judged by their own children. The ability to find a client and sustain her profession diminishes with growing age and hence the older FSWs are at higher risk of losing their livelihood. Increasingly, these are the pathways for a female child to join the same profession as her mother.

Conclusions/Next steps: There is a need to design, implement and enhance intervention strategies to reach these isolated sex workers and their children. Mental health needs of the community and children need to be addressed. A shelter home or drop-in center for children of FSWs can provide support groups to overcome mental health challenges and educational needs. It's important to work with the communities to explore additional employment opportunities.

EPD109

Confronting barriers to PrEP adherence and persistence: How a case management intervention supported female sex workers in eThekwini (Durban), South Africa

A. Rock[1], M. Shoen[1], L. Shipp[1], N. Mulumba[2], S. Ryan[3], S. Makama[2], M. Mcingana[4], C. Comins[1], T. Mkhize[2], H. Hausler[4], S. Baral[1], S. Schwartz[1]

[1]Johns Hopkins Bloomberg School of Public Health, Epidemiology, Baltimore, United States, [2]TB HIV Care, Key Populations Programme, Durban, South Africa, [3]NORC at the University of Chicago, Bethesda, United States, [4]TB HIV Care, Cape Town, South Africa

Background: 60% of female sex workers (FSW) are living with HIV in South Africa, indicating critical unmet HIV prevention needs. Studies have shown a precipitous decline in persistence on and adherence to pre-exposure prophylaxis (PrEP) following initiation among FSW. We examined how an individualized case management intervention (ICM) supported FSW in contending with barriers to PrEP adherence and persistence during the first three months post-initiation.

Methods: We analyzed serial in-depth interviews (IDIs), case manager (CM) notes, and PrEP refill records from a peer-led ICM pilot study to promote sustained PrEP use among FSW in eThekwini, South Africa (n=30). Cisgender, HIV-negative FSW initiating PrEP through TB HIV Care's program were enrolled October 2020-February 2021 and received in-person and telephonic ICM counseling sessions. IDIs at baseline, month-1, and month-3 explored participants' experiences with PrEP, their CM, and life context. We analyzed textual data using thematic coding, narrative summaries, and matrices to examine themes longitudinally and compare experiences between those FSW continuing and discontinuing PrEP at 4-months.

Results: By study end, 18/30 (60%) participants were continuing PrEP. The CM helped strategize ways to maintain PrEP despite anticipated stigma from partners and emotionally cope with stigma-rooted isolation and shame, which motivated PrEP continuation. Extensive mobility commonly led to pill shortages, to which the CM responded by liaising with the program to arrange longer PrEP refills and strategizing about keeping pills in places they visited. The CM helped address disruptions due to economic stressors, such as housing insecurity, through arranging replacements for stolen pills and social services referrals, and provided information that enabled perseverance through distressing side effects.

Participants discontinuing PrEP predominantly received informational and/or practical support, whereas many participants continuing PrEP developed intimate relationships with the CM, additionally receiving emotional support. Contextual factors hampering PrEP use, namely stigma, economic strain, and mobility, also impeded participants' engagement with the CM.

Conclusions: The CM's support was critical for many FSW to overcoming PrEP use barriers during the early post-initiation period, including stigma, mobility, economic strain, and side effects. Complementary interventions addressing contextual barriers, which also constrained participants' engagement with the CM, could enhance impact of the ICM intervention.

EPD110

Decoding HIV and AIDS in addressing myth and misconception for children

S. Obeng[1], S.N.E. Obeng[1]

[1]GN Media, Management, Elmina, Ghana

Background: Child prostitution is one of the most common sex trades in the Central Region of Ghana. Girls between the ages of 10 to 15 years are mostly paid less than a dollar for this trade. These girls are the usually the breadwinners in their families. Statistics from the Ghana AIDS Commission indicates that about 25,955 children (0-14 years) are living with HIV. This creates a platform to enhance education on HIV and AIDS, addressing its myths and misconceptions at the basic level.

Description: Community Drama Initiative was introduced in collaboration with partners. Information on HIV was dramatized in the communities, schools and churches in the local languages to enhance education on HIV. After the drama session, trained students nurses had a one on

one discussion with the children on their understanding of the subject, and addressing the myth and misconceptions these children have inherited on HIV. This initiative was done strategically such that, whiles a section of the team were in a particular area doing the advocacy, another section (tiger team) were moving from house to house to educate persons below 15 years on HIV. A third section (the butterfly team) mostly did the general observation on the ground and in the community and reported same.

Lessons learned: Through the initiative, we raised public discourse on the alarming rate at which girls below 16years were engaging in child prostitution thereby galvanizing public support in engaging with the children. The engagement also brought to light some significant misconceptions about HIV which includes the mode of transmission, the strong immune system of children which is expected to fight against HIV (as in the case of Covid 19) among others. These misconceptions among those we engaged were dealt with.

Conclusions/Next steps: Children should not be left out of the education on HIV. Language on HIV should be decoded to the understanding of the average child thereby empowering the child to make significant choices. Using basic animations and graphics on HIV and AIDS is a sure way and my next phase as an animator and an audio visuals editor in enhancing the education on HIV among children.

People who inject drugs

EPD111

"From an HCV and HIV point of view, it's been remarkable" – Examining "safer opioid supply" (SOS) from the perspective of healthcare providers and clients in Ontario, Canada

A. Guta[1], R.A. Schmidt[2], K. Rudzinski[1], N. Kaminski[2], D. Kryszajtys[2], M. Perri[2], M. Gagnon[3], G. Kolla[3], A. Sereda[4], C. Strike[2]

[1]*University of Windsor, School of Social Work, Windsor, Canada,* [2]*University of Toronto, Dalla Lana School of Public Health, Toronto, Canada,* [3]*University of Victoria, Victoria, Canada,* [4]*London InterCommunity Health Center, London, Canada*

Background: Opioid assisted treatment (OAT) is associated with improved HIV and HCV related health outcomes. In response to the devastating opioid overdose crisis, Canada is piloting innovative "safer opioid supply" (SOS) programs. SOS programs provide individuals who use illicit opioids and have not benefited from traditional OAT with an 'off label' prescription for pharmaceutical-grade alternatives. We examined the perspectives of SOS stakeholders with a focus on HIV/HCV prevention, treatment, and care.

Methods: We conducted semi-structured interviews with purposively sampled healthcare providers and clients across 4 SOS programs in Ontario, Canada from February to October 2021. Interviews examined SOS implementation and adaptation, with HIV and HCV-specific questions (e.g., testing and treatment). Participants filled out a questionnaire with demographic, employment and health information. Thematic analysis was conducted in MAXQDA and descriptive statistics in SPSSv28.

Results: We interviewed *n=80* participants across all sites, comprised of *n=27 providers* [physicians, nurses, community health workers, pharmacists; cis woman 62%/cis man 29%/gender diverse 9%; white 71%, with 29% racial diversity] and *n=53 clients* [cis man 57%/cis woman 43%; white 77%, Indigenous 19%, Black 2%, Latino 2%; HIV+ (13%); HCV+ (77%); 89% had ever injected drugs, 87% had ever tried methadone, mean age 47 (SD 9.5; range 29-62)]. SOS programs prioritized clients living with HIV and/or HCV at intake.

Clients typically received daily observed oral slow-release morphine and hydromorphone tablets to take with them (i.e., to crush and inject later). Providers described SOS as a mechanism to engage clients in HIV/HCV testing and treatment, and shared examples of clients who were homeless/virally unsuppressed at intake becoming housed/virally suppressed through these programs.

Clients reported that SOS reduced overdoses, increased access to HIV/HCV care (e.g., by providing daily dispensed opioids with HIV medications), and reduced their need to engage in criminalized activities (e.g., sex work). While SOS programs permit injection use, many clients switched to primarily oral use.

Conclusions: In this study, respondents described SOS as a life-saving intervention for individuals living with HIV/HCV who have not benefited from traditional OAT.

Future quantitative research is needed to explore the integration and adaptation of SOS into the HIV/HCV continuum of care beyond these pilot programs.

EPD112

Oral or injectable: who's to choose? A novel decision-making context for antiretroviral therapy modalities among persons who inject drugs and clinicians in Vietnam

A.L. Sibley[1], S.E. Rutstein[1], H.E. Huffstetler[1], T. Do[2], H. Tran[2], L.M. Giang[3], T. Sripaipan[1], M. Nguyen[1], W.C. Miller[4], J.J. Eron[1], C.L. Gay[1], V.F. Go[1]

[1]*University of North Carolina-Chapel Hill, Chapel Hill, United States,* [2]*University of North Carolina-Chapel Hill, Hanoi, Viet Nam,* [3]*Hanoi Medical University, Hanoi, Viet Nam,* [4]*The Ohio State University, Columbus, United States*

Background: HIV patients have historically had no choice in treatment modality, as daily oral antiretroviral therapy (ART) has been the only effective option available. Long-acting injectable (LAI) ART represents a compelling and effective alternative that may be especially suitable for

Poster exhibition

E-posters

Late-breaker abstracts

Author Index

those struggling with adherence, including people who inject drugs (PWID). LAI implementation introduces novel decision-making considerations for HIV care, as providers and patients may choose between two equally effective treatment modalities with differing benefits and drawbacks.

We evaluated perceptions of treatment choice among HIV-infected PWID and ART clinicians in Vietnam, a healthcare context that has traditionally emphasized hierarchical authority above provider-patient partnership.

Methods: We conducted key-informant interviews with HIV-infected PWID (n=19) and ART clinicians (n=14) in Hanoi, Vietnam. Patients and clinicians were enrolled from public HIV/ART clinics. Participants were briefed on LAI administration, effectiveness, side effects, and dosing frequency, and were asked about their perceptions of LAI compared to oral ART. Interviews were de-identified, transcribed verbatim, and thematically coded.

Results: PWID and clinicians were enthusiastic about LAI as an alternative to daily oral ART, underscoring convenience and privacy afforded by a once-monthly injection compared with a daily pill. Contingent on presumed access to and evidence demonstrating effectiveness of LAI, clinicians noted PWID as a population for which LAI would be particularly beneficial.

When asked about how they would approach prescribing LAI, many clinicians expressed excitement about the possibility of offering multiple treatment options, highlighting a new context for patient autonomy and choice. Conversely, though nearly all PWID expressed preference for LAI, anticipating easier adherence, many expressed deference to clinicians in making treatment-related decisions.

Conclusions: Though LAI represents an acceptable alternative to daily oral ART in Vietnam, its introduction may create decisional interactions that are unfamiliar to ART patients and clinicians. Our sample was mixed in their perspectives on patient choice versus provider deference regarding ART modality.

Thus, implementation of LAI in Vietnam must include guidance around treatment selection in the clinical encounter and consider patient and provider expectations and preferences surrounding shared decision-making; such guidance would aid clinicians in identifying the most appropriate LAI recipients during pilot and scale-up phases of implementation.

EPD113

Behavioral patterns of people who use synthetic psychostimulants and HIV infection risks: results of a qualitative study in St. Petersburg, Russia

A. Lakhov[1], R. Skochilov[2], E. Aserova[2], J. Godunova[3], S. Koren[4]

[1]Charitable Fund "Humanitarian Action", Saint Petersburg, Russian Federation, [2]The Saint Petersburg State University, Saint Petersburg, Russian Federation, [3]EVA Association, Saint Petersburg, Russian Federation, [4]V. Serbsky National Medical Research Centre for Psychiatry and Narcology National Scientific Research Centre on Addictions, Moscow, Russian Federation

Background: At present, Russia, like many other places, is experiencing an active proliferation of new psychoactive substances (NPS), many of which are psychostimulants. In St. Petersburg, these appear to be mostly congeners of cathinone. Researchers from the St. Petersburg State University and charitable fund "Humanitarian Action" sought to obtain qualitative data to better understand the impact of these substances on the health of people who use drugs (PWUD).

Methods: Individuals provided data on their current drug use and its' effects through interviews and two focus groups. Secondary data from online drug purchase websites were obtained from a source that accesses and analyzes dark web purchases. The interviews and focus groups also provided data on the social contexts of drug use including sexual behaviors and associated medical issues.

	Interview participants (n=30)	Focus groups participants (n=10)
Male	18	5
Female	12	5
Age, years	33.66 / 35.50	24.2 / 24
Years of using drugs	12.26 / 10	4.7 / 4
Months of using synthetic cathinones	20,10 / 24	23,2 / 11
The main synthetic cathinone used at the time of research:		
Alpha-PVP	20	0
Mephedrone	10	10
Injecting drug use at the time of research	29	7

Table.

Results: Distinct differences in behavior patterns between older, more experienced PWUD and a "new generation" of younger PWUD were identified. Both groups reported high levels of unsafe injection and sexual behaviors. The older males using alpha-PVP expose themselves and their injecting and sexual partners to higher risk through unprotected sex and sharing unsterile injecting equipment.

Among novice users of mephedrone, the risk in the field of sexual behavior initially prevails. As severe drug dependence develops, there is a tendency to switch to injecting the psychoactive substances, as well as a decrease in the frequency of using mephedrone specifically for sex. It can

be assumed that an increase in the proportion of injectable use of synthetic cathinones in this group will pose an increased risk of infection and transmission of HIV.

Conclusions: The emergence of NPS presents new threats to the health of drug users and new opportunities to intervene to reduce those risks. The information obtained may assist HIV prevention specialists in their efforts to decrease unsafe drug use and sexual behaviors.

EPD114

HIV and HCV serosorting upon completion of HCV treatment in people with the history of injecting drug use in Ukraine

A. Meteliuk[1], Y. Liu[2], T. Fomenko[1], D. Marunko[1], Z. Islam[1], D.C. Ompad[2]
[1]*Alliance for Public Health, Kyiv, Ukraine,* [2]*New York University, Department of Epidemiology, School of Global Public Health, New York, United States*

Background: People who inject drugs (PWID) are at the highest risk of HCV infection with very high rates of HIV/HCV reinfection. In Ukraine, the prevalence of HIV and HCV reaches 20.5 and 63.9% respectively among about 300,000 PWID. In 2016-2019 about 2,000 PWID underwent HCV treatment using direct-active antivirals (DAAs).

The objective of this study was to assess the levels of HIV and HCV treatment in PWID upon completion of HCV treatment.

Methods: 500 PWID who underwent 12-week HCV treatment using DAAs in 2016-2019 from 5 HCV treatment sites representing 13 regions of Ukraine randomly sampled from a larger cohort of almost 2,000 patients were interviewed by phone in November-December 2020. HIV/HCV serosorting was defined as (a) no injection/ inject but not sharing syringes – serosorting, and (b) injecting and sharing syringes with HCV+ and/or HIV+ /unknown and bought pre-filled syringes – no serosorting.

Results: The rate of HCV/HIV serosorting become lower in more population dense areas. Older participants (>45 y/o) generally have significantly lower odds of not participate in HCV serosorting (aOR: 0.39 CI: 0.16, 0.96). Women have significantly lower odds of not participate in HIV serosorting (aOR: 0.54 CI: 0.32, 0.89) compared to men. Marriage relationship potentially serve as a protective factor for engaging in HCV/HIV serosorting. Not known the HIV status of the sexual partner can significantly amplify the odds of not doing HCV serosorting (aOR: 4.13 CI: 1.58, 10.79).

Conclusions: Active PWID either stopped injecting, continued to inject but did not share syringes, or continued to inject and shared syringes with other PWID who they either knew to have HCV or did not know their HCV status upon completion of HCV treatment.

There was no HCV serosorting. HIV serosorting was observed – 35% of the sample continued to inject and share syringes with other PWID who they either knew to be HIV serodiscordant or did not know their HIV status. A small proportion of patients only shared syringes with partners they knew to have seroconcordant HIV status. Case management through the HCV treatment course plays a crucial role in terms of HCV/HCV transmission harm reduction messages.

EPD115

COVID-19 disruptions and the adaptation and implementation of a dyad-based intervention to improve antiretroviral therapy adherence among HIV-positive people who inject drugs in Kazakhstan: strategies and lessons learned

A. Davis[1], G. Mergenova[2], E. Rozental[2], V. Gulyaev[2], P. Gulyaev[2], M. Nurkatova[2], A. Terlikbayeva[2], S. Primbetova[2], S. Landers[1], Y. Sun[1], N. El-Bassel[1]
[1]*Columbia University, School of Social Work, New York, United States,* [2]*Global Health Research Center of Central Asia, Almaty, Kazakhstan*

Background: Kazakhstan had a 73% increase in new HIV cases from 2010-2020, the highest in the Eastern Europe/Central Asian region. HIV prevalence among people who inject drugs (PWID) is 8.3%, higher than any other key population. Of all estimated HIV-positive PWID in Kazakhstan, only 38% are virally suppressed. We adapted a dyad-based social support intervention for PWID to increase ART adherence. Originally designed to be delivered in-person, we transitioned to remote training and intervention delivery due to COVID-19.

Description: The intervention is delivered to HIV-positive PWID and their treatment support partners and aims to increase ART adherence. The intervention is being tested in an ongoing randomized controlled trial (RCT) in Almaty, Kazakhstan. Participants in both arms are given electronic monitoring devices (EMDs) to monitor their adherence through a mobile app, and they provide biological samples (dried blood spots and hair) to pharmacologically test adherence levels.

Originally scheduled to launch in-person in March 2020, we adapted the intervention for remote delivery for safety and to meet COVID-19 restrictions.

Lessons learned: Out of 66 dyads targeted for enrollment, we have enrolled 43 and 19 have completed the study. (Updated information will be presented at the conference.) Intervention facilitators are clinical psychologists at the Almaty City AIDS Center and local social workers, who were trained to use Zoom and deliver the three-session intervention online. All HIV-positive participants are mailed kits containing a study smartphone, EMD device, and hair sample collection kit. A quarter (25%) of participants learned how to use the EMD device and mobile app through a video call; 75% required additional training sessions. 53 participants have self-collected hair samples and mailed them to research staff.

Challenges include unstable internet connection, partners from separate homes, heavy substance use, and lost/sold phones. Benefits include partner accompani-

Author Index

ment to AIDS Center visits (even post-intervention), improved communication and social support within dyads, and easy incorporation of the intervention into standard clinical practice.

Conclusions/Next steps: Remote delivery of a dyad-based ART adherence intervention among PWID in Kazakhstan is feasible and acceptable. It could help to improve retention in HIV care and health outcomes, especially in resource-constrained settings where in-person delivery has become limited.

EPD116

The perceived impact of social support on HIV-treatment engagement in women who use drugs in Dar es Salaam, Tanzania

K. Meek[1], N. West[1], S. Likindikoki[2,3], J. Mbwambo[3], H. Saleem[1]
[1]Johns Hopkins Bloomberg School of Public Health, International Health, Baltimore, United States, [2]Muhimbili University of Health and Allied Sciences, School of Public Health and Social Sciences, Dar es Salaam, Tanzania, The United Republic of, [3]Muhimbili University of Health and Allied Sciences School of Medicine, Department of Psychiatry and Mental Health, Dar es Salaam, Tanzania, The United Republic of

Background: Although control of the HIV epidemic has increased dramatically with improved antiretroviral therapy, HIV treatment uptake and adherence remains a challenge for women who use drugs (WWUD) and living with HIV. Social support interventions have shown promise for increasing access and adherence to HIV treatment.

This study examined the types of social support WWUD, specifically those who use heroin, receive from the perspective of the women and their social supporters, and investigates the role of social support in motivating WWUD and living with HIV to seek out and engage in HIV treatment.

Methods: We conducted 30 in-depth interviews with WWUDHIV about their experiences with HIV treatment, drug use, and their social networks. We also interviewed nineteen social supporters identified by participating WWUD interviewed about their experiences providing social support to WWUDHIV. All interviews were analyzed using both deductive and inductive coding and matrices to identify key themes about social support and their engagement to HIV treatment.

Results: Social support facilitated both HIV treatment initiation and adherence, and helped to mitigate the effects of layered stigma. Some women reported isolation, judgment, or harassment from relatives after disclosing their HIV status that was combatted by positive encouragement from social supporters.

Participants commonly reported informational support in the form of HIV education and advice to initiate or continue HIV treatment. Emotional support inspired hope and buffered the impact of drug use and HIV-related stigma. Instrumental support facilitated HIV treatment progress and antiretroviral adherence. Appraisal support encouraged behavior change, specifically to seek out HIV treatment.

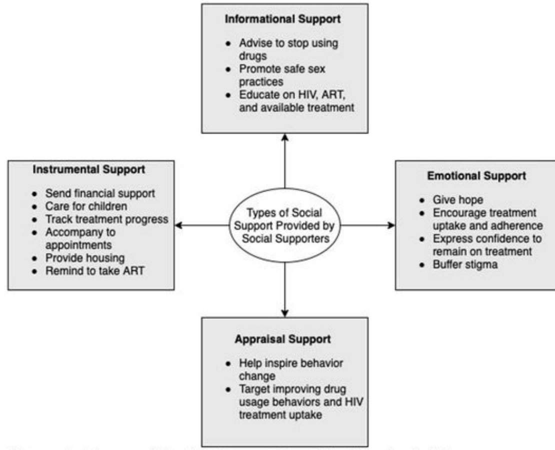

Figure 1. Types of social support provided by social support

Conclusions: Findings from this study highlight that involving social supporters can positively influence engagement to HIV care and treatment among WWUD. Social network interventions that enhance existing social support or expand the network of support of WWUDHIV may help to improve HIV treatment initiation and adherence.

EPD117

Social support as a buffer of negative mental health symptoms during the COVID-19 pandemic among current and former people who inject drugs

E.U. Patel[1], J. Astemborski[1], K.A. Feder[1], D.W. Sosnowski[1], G.D. Kirk[1], S.H. Mehta[1], B.L. Genberg[1]
[1]Johns Hopkins Bloomberg School of Public Health, Baltimore, United States

Background: In the U.S., mental wellbeing worsened early in the COVID-19 pandemic. Among people who inject drugs (PWID), poor mental wellbeing is associated with relapse in injection drug use and reduced engagement in HIV prevention and care. There are limited data on which pre-pandemic factors may have buffered the negative mental health consequences of the pandemic among PWID. We examined the association of pre-pandemic perceived social support with psychological resilience and distress during the pandemic among current and former PWID with and without HIV.

Methods: Between June and September 2020, we conducted a telephone survey among participants in the AIDS Linked to the IntraVenous Experience (ALIVE) study—a community-based cohort of current and former PWID in Baltimore, Maryland. Perceived social support was measured using the Medical Outcomes Study-Social Support Survey during pre-pandemic semi-annual study visits (Jan. 2018-Feb. 2020). Outcomes included mean psychological resilience scores (range=1-5), anxiety symptoms, increased loneliness, and perceived stress from social

isolation. Multivariable linear and logistic regression were used to assess associations between social support and each outcome adjusting for pre-pandemic factors. We also assessed whether associations were modified by HIV status.

Results: Of the 545 participants, the median age was 58 years, 38% were female, 83% were Black, and 30% were living with HIV. During the pandemic, the mean resilience score was 3.63, 36% experienced anxiety symptoms, 36% reported increased loneliness, and 47% reported feeling stressed from social isolation.

Compared to participants in the lowest tertile of pre-pandemic social support levels, participants in the highest tertile had higher mean resilience scores (adjusted β=0.24 [95%CI=0.09, 0.39]) and half the odds of anxiety symptoms (adjusted odds ratio=0.50 [95%CI=0.29, 0.88]) and increased loneliness (adjusted odds ratio=0.48 [95%CI=0.29, 0.81]) during the COVID-19 pandemic. No associations were modified by HIV status.

Pre-pandemic perceived social support	Brief Resilience Scale, continuous score	Generalized Anxiety Disorder-7, score >5	Increased loneliness	Perceived stress from social isolation
	Adjusted β (95% CI)*	Adjusted Odds Ratio (95% CI)*	Adjusted Odds Ratio (95% CI)*	Adjusted Odds Ratio (95% CI)*
Tertile 1 *(low)*	0.00 [Reference]	1.00 [Reference]	1.00 [Reference]	1.00 [Reference]
Tertile 2 *(moderate)*	0.11 (-0.03, 0.25)	0.73 (0.43, 1.24)	0.67 (0.42, 1.08)	0.90 (0.57, 1.42)
Tertile 3 *(high)*	0.24 (0.09, 0.39)	0.50 (0.29, 0.88)	0.48 (0.29, 0.81)	0.72 (0.45, 1.17)

*Adjusted for pre-pandemic factors including sociodemographic factors (i.e., age, sex, education, income, housing, etc.), behavioral and psychosocial factors (ie., high-risk alcohol use [AUDIT], injection drug use in the past 6 months, use of medication for opioid use disorder in the past 6 months, depressive symptoms [CES-D], history of depression treatment, and history of anxiety treatment), and HIV status.

Table.

Conclusions: Pre-pandemic social support was positively associated with psychological resilience and generally better mental wellbeing during the pandemic. Interventions to increase social support may improve mental wellbeing among PWID with and without HIV.

EPD118

Changes in survival of HIV-positive heroin use disorder patients admitted to treatment in Barcelona, Spain: a 30-year multicenter observational study

A. Sanvisens[1], M. Torrens[2,3], F. Bolao[4,5], D. Fuster[6,7], F. Fonseca[2,3], P. Zuluaga[6,7], A. Hernandez-Rubio[6,7], E. Abelli-Deulofeu[6,8], R. Muga[6,7]

[1]Institut de Recerca Contra la Leucèmia Josep Carreras, Department of Epidemiology, Girona, Spain, [2]Institut de Neuropsiquiatria i Addiccions, Hospital del Mar, Barcelona, Spain, [3]Universitat Pompeu Fabra, Barcelona, Spain, [4]Hospital Universitari de Bellvitge, Department of Internal Medicine, L'Hospitalet de Llobregat, Spain, [5]Universitat de Barcelona, Barcelona, Spain, [6]Hospital Universitari Germans Trias i Pujol, Department of Internal Medicine, Badalona, Spain, [7]Universitat Autònoma de Barcelona, Barcelona, Spain, [8]Germans Trias i Pujol Research Institute / IGTP, Badalona, Spain

Background: Survival of Heroin Use Disorder (HUD) has changed due to the generalization of opiate agonist treatment, risk reduction interventions and the effectiveness of antivirals for HIV and HCV infections among other diseases. We aimed to analyze the evolving characteristics and survival of HUD in a multicenter cohort study where patients were admitted for 30 years to 3 hospital-based, addiction units in Barcelona, Spain.

Methods: Longitudinal study in patients admitted between 1989-and-2018. Drug use characteristics and blood samples were obtained during admission. Three periods of 10-years-each were defined. Vital status was ascertained from clinical charts and the mortality register until June 30, 2019. The primary outcome was the elapsed time from first admission to either death or end of follow-up.

Using the period analysis approach, individuals contributed as many records to the analyses as periods in which they were observed at risk. Survival time was treated as late entry if the admission occurred in a previous period and it was right-censored if individuals were alive at the end of period. Kaplan-Meier methods and log rank tests were used.

Results: 3.100 patients (80% men) were admitted. Median age was 28 years [IQR: 24-33 yrs], 87% were injecting drug users-(IDUs) and 31% had co-occurring alcohol misuse. Prevalence of HIV infection was 51%, 27%, and 24%, for the 1989-1998, 1999-2008 and 2009-2018 periods, respectively. HIV-positive patients had higher prevalence of IDU, HCV-infection and imprisonment than HIV-negatives at each period ($p<0.001$).

Total follow-up was 52.114 person-years and 1.254 (24%) patients died at the-end-of-study. Mortality rate of HIV-positive patients decreased from 6.1/100 p-y in first period to 1.06/100 p-y in the last. Among the HIV-negative, mortality rate decreased from 2.2/100 p-y in 1989-1999 to 0.6/100p-y in the last period.

Oral abstracts

Poster exhibition

E-posters

Late-breaker abstracts

Author Index

During the periods analyzed, survival of HIV-positive patients was worse than observed in the HIV-negative (P<0.001 for all periods).

Conclusions: Characteristics of HUD patients have changed in Spain. Survival of HIV-positive patients has improved substantially but continues to be shorter than observed in those without infection irrespective of the period. In the near future, a similar survival should be obtained by ensuring access to treatment for HUD and its complications.

EPD119

A roadmap for implementing injectable opioid agonist therapy: learnings from a three-year pilot project

S. Elliott[1], R. Baltzer Turje[1], P. McDougall[1], C. McDermid[1,2], M. Holland[1], D. Hassan[1]

[1]Dr. Peter AIDS Foundation, Vancouver, Canada, [2]Providence Health Care, Crosstown Clinic, Vancouver, Canada

Background: Since the onset of COVID19, Canada has experienced an unprecedented number of accidental drug toxicity deaths. Injectable opioid agonist therapy (iOAT) is a promising treatment option for people who use drugs (PWUD) that provides prescription grade opioids as a replacement to an increasingly toxic street supply.

iOAT is also linked to increased anti-retroviral (ART) initiation and adherence, and decreased HIV viral loads among people living with HIV (PLHIV). Scaling up iOAT services may help to circumvent the devastating impact that dual public health emergencies have had on PWUD and PLHIV.

Description: The Dr. Peter Centre (DPC) is the first community agency in North America to implement iOAT services. DPC has been tracking lessons learned and mobilizing knowledge gained to expedite the efforts of organizations in the early stages of iOAT implementation.

There are particular considerations for community agencies implementing iOAT services that include establishing strategic partnerships and developing policies and practices that meet regulatory requirements.

Lessons learned: To mobilize the spread of iOAT services across Canada, this presentation will share findings from a process evaluation of the implementation of iOAT within a community agency setting. It will discuss key learnings for community agencies seeking guidance on the implementation of iOAT services, including opportunities for funding, sourcing medications, addressing iOAT prescriber shortages, establishing partnerships with local pharmacy teams, and navigating complex regulatory requirements.

Conclusions/Next steps: iOAT is an effective treatment option that reduces the risk of overdose and HIV transmission for PWUD and improves treatment outcomes among PLHIV. With the unprecedented and relentless rise in overdose deaths exacerbated by COVID19, there is a need for the rapid implementation of iOAT services in diverse community settings. By sharing key learnings, this presentation aims to expedite the start-up and roll out of iOAT services for community agencies across Canada, contributing to a decrease in overdose deaths and HIV transmission.

EPD120

Exploring the relationship between syringe services programs and law enforcement in rural counties in Kentucky (USA)

S. Allen[1], S. Danforth[2], S. Grieb[3], J. Glick[1], S. Harris[4], C. Tomko[1], S. Sherman[1]

[1]Johns Hopkins University, Health, Behavior and Society, Baltimore, United States, [2]Johns Hopkins University, Baltimore, United States, [3]Johns Hopkins University, School of Medicine, Baltimore, United States, [4]Johns Hopkins University, Health Policy and Management, Baltimore, United States

Background: Implementing syringe services programs (SSPs) is one evidence-based strategy communities may employ to reduce community-level risks for injection drug use-associated HIV outbreaks among people who inject drugs (PWID). However, SSP implementation may be obstructed by law enforcement practices. Many studies conducted in urban areas have documented associations between policing practices (e.g., syringe confiscation) and a range of adverse health behaviors and consequences among PWID, including increased risks for HIV acquisition. Enhanced understanding of how law enforcement may affect SSP implementation in rural contexts and, by extension, risks for HIV infection among PWID, is vital to SSP operations in non-urban areas.

This study explores the influence of law enforcement during processes to approve SSP implementation and subsequent program operations in rural Kentucky (USA) counties.

Methods: In-depth, semi-structured interviews with persons (n=18) who were involved with SSP implementation in rural Kentucky counties were conducted from August-October 2020. During the interviews, persons were asked to describe SSP implementation processes, including the role of law enforcement. Interviews were professionally transcribed verbatim. For the present analysis, we focused on examining coded text pertaining to law enforcement.

Results: Participants described scenarios in which law enforcement advocated for SSP implementation; however, they also reported police opposing SSP implementation and engaging in adverse behaviors (e.g., targeting SSP clients) that may jeopardize the public health of PWID and increase risks for HIV acquisition. Participants said that law enforcement advocating for SSP implementation carried significant weight at the local level during processes to acquire approvals for implementation. Participants reported that efforts to educate law enforcement about SSPs were particularly impactful when they discussed how SSP implementation could prevent needlestick injuries.

Conclusions: This research demonstrates that law enforcement may play a prominent role during SSP implementation processes in rural counties, ranging from vocal support to engaging in policing behaviors that may increase HIV risks among PWID. Engaging law enforcement officials in discussions about SSP implementation may be particularly impactful via incorporating messaging about how SSPs may decrease risks for needlestick injuries. Future work is needed to explore how to expeditiously educate law enforcement about SSPs and their role in preventing HIV transmission.

EPD122

Influence of descriptive network norms on injection behaviors among people who inject drugs during the COVID-19 pandemic: a latent profile analysis

C.-H. Shrader[1], A. Borquez[2], T.I. Vasylyeva[2], A. Chaillon[2], I. Artamanova[2], A. Harvey-Vera[2], C.F. Vera[2], G. Rangel[3], S.A. Strathdee[2], B. Skaathun[2]

[1]*Columbia University, New York, United States,* [2]*University of California, San Diego, Medicine, La Jolla, United States,* [3]*U.S.-Mexico Border Health Commission, Mexican Section, Tijuana, Mexico*

Background: Descriptive norms within networks influence HIV risk (i.e., sharing injection equipment vs using a new syringe). People who inject drugs (PWID) along the U.S.-Mexico border are at high risk of HIV. The closure of the U.S.-Mexican border during the COVID-19 pandemic posed structural HIV risk, as it disrupted cross-border mobility, harm reduction services, and established networks. We assessed the impact of descriptive network norms on HIV risk and harm reduction behaviors during the COVID-19 pandemic.

Methods: Participants were PWID aged ≥18 from 3 groups: PWID who engage in "drug tourism" in Tijuana but live in San Diego (drug tourists (DT)), PWID who have never used illicit drugs across the border and live in San Diego (SD NDT) or Tijuana (TJ NDT). From 10/2020-10/2021, participants were administered a behavioral and egocentric social network questionnaire. We used Latent Profile Analysis (LPA) to categorize PWID into network risk profiles based on proportions of their network members who used injection and non-injection drugs, were DT, lived in Mexico, shared a syringe with the participant, offered the participant drugs, and either doubled daily use or mixed drugs. Multinomial logistic regression was used to assess the influence of network descriptive norms on individual-level HIV risk and harm reduction behaviors in the last 6 months.

Results: Of 399 PWID (n=150 DT, n=90 SD NDT, n=159 TJ NDT), mean age was 43 years and 26% were female. Fit indices indicated a 4-latent profile solution.

Network risk groups were classified as:

1. Very low risk,(n=128),
2. Low risk (n=94),
3. High risk (n=34), and;
4. Very high risk (n=93).

In the past 6 months, relative to participants in the very low risk group, participants in other groups had higher odds of giving/lending a syringe they used (p<0.001), using a used syringe (p<0.001), using a cooker/cotton after someone else used it (p<0.001); and lower odds of consistently using sterile syringes (p<0.01).

Conclusions: PWID's gradient of HIV risk behaviors mirrored that of their networks', suggesting that intervening on high risk networks rather than individuals is warranted when services are limited and networks are PWID's main source of influence.

Transgender people

EPD123

Antecipated stigma and socio barriers to communication between transgender women living with HIV and healthcare providers: a mediation analysis

I. Chypriades Junqueira Amarante[1], S. Lippman[2], J. Sevelius[2], G. Santa Roza Saggese[2], A.A. Moura da Silva[3], M.A. de Sousa Mascena Veras[1]

[1]*Faculdade de Ciências Médicas da Santa Casa de São Paulo, São Paulo, Brazil,* [2]*University of California, San Francisco, United States,* [3]*Universidade Federal do Maranhão, São Luís, Brazil*

Background: In Brazil, as in many parts of the world, transgender women living with HIV (TWH) face several barriers to healthcare access, including discrimination from healthcare providers. Using a mediation analysis, we assess whether the fear of experiencing discrimination due to their gender identity (antecipated stigma) impacts communication with healthcare providers.

Methods: We conducted a secondary analysis of baseline data from the TransAmigas study, an intervention study, conducted in São Paulo, Brazil. Survey data were collected between May and November of 2018 with 113 TWH participants who were 18 years or older and residing in the São Paulo metropolitan area. We performed multivariate logistic regression to assess both the relation of anticipated stigma with communication in the healthcare context and the relation of social variables with anticipated stigma; alpha was set at 0.05. Mediation analysis, which was based on a counterfactual approach, was conducted to determine the existence of an indirect effect of the social variables on the communication with healthcare providers, mediated by anticipated stigma. Estimates were bootstrapped.

Results: Fear of being mistreated due to their gender identity increased 9.26 times the risk of having difficulty telling their healthcare provider about new symptoms (p=0.002). The social variables associated with fear of being mistreated were unemployment (OR=6.94; p=0.004),

E-posters

Late-breaker abstracts

Author Index

sex work (OR=4.01; p=0.014) and wishing to change their name in documentation (OR=3.13; p=0.02). All of these variables had relevant indirect effect on the difficulty to tell their healthcare provider about new symptoms, mediated by the fear of being mistreated: unemployment (OR=1.70; CI: 1.17 - 2.63); sex work (OR=1.60; CI: 1.03 - 2.92); and wishing to change their name in documentation (OR=1.54; CI: 0.89 - 2.72).

Conclusions: Anticipated stigma was associated with difficulties in communication between TWH and healthcare providers. Factors associated with anticipated stigma were identified, and our data suggests their having an indirect effect on communication barriers.

These findings can help us predict which healthcare seekers will be more predisposed to anticipate stigma from their providers, and may have more difficulty communicating with them.

EPD124

Avoidance of health services by transgender people in Benin in 2020: a cross-sectional study

D. Kpozehouen[1], C. Ahouada[1], M. Nelson[2], J. Martineau[3], S. Ogoudele[1], O. Sodoloufo[1]

[1]Plan International Benin, Cotonou, Benin, [2]Plan International Canada, Otawa, Canada, [3]Plan International Canada, Montreal, Canada

Background: In Benin, transgender people represent less than 0.01% of the population. The sociocultural environment obstructs their integration and deprives them of benefiting from some of their rights, mainly the right to health in a self-supported healthcare fees country.

This study aims to measure the extent to which transgender people in Benin avoid using health care services in general and the factors associated with this behavior.

Methods: This was a cross-sectional study involving transgender people, aged 15 years and above in 2020 and recruited by respondent-driven sampling in six cities of Benin. Interviewers were selected among transgender people and trained. Sociodemographic information, data related to health facilities' frequentation and stigmatization were collected. All analyses were weighted and associations were measured using simple logistic regression with STATA.

Results: The study included 290 transgender people, primarily between the ages of 19 and 24 years old (56%). One respondent out of seven (14%) was non-binary and respectively 70% and 16% identified themselves as female and male. In presence of a social worker or health worker, one participant out of two reported being uncomfortable with sharing their gender identity.

One participant out of three reported the same discomfort in a gathering of transgender people. Out of 285 respondents, 58 (13%) reported having avoided health services because of fear of being identified as transgender. Discomfort to assert one's gender identity in a transgender gathering (OR =2.23; CI95%: 1.03 - 4.84; p=0.04) and in presence of a social worker or health worker (OR =2.41; CI95%: 1.09 - 5.31; p=0.03) doubled each the risk of avoiding the use health services.

In addition, participants with a monthly income of less than 50,000 FCFA were three times more likely to avoid using health services (OR =3.13; 95% CI: 1.02 - 9.48; p=0.04).

Conclusions: The avoidance of health services by transgender persons in Benin is associated with their monthly income and the confidence to assert their identity.

To address this issue, strategies aiming to prevent stigma and discrimination in the health sector and to promote gender identity affirmation and universal health coverage should be implemented.

EPD125

Human-centered design to understand the needs of transgender women and design the first transgender women's clinic in Yangon, Myanmar

M.M. Thet[1], H.K. Ko[2], T.N. Oo[2], H.L. Oo[3], K.S. Swe[2]

[1]Population Services International Myanmar, Strategic Information Division, Yangon, Myanmar, [2]Population Services International Myanmar, Lan Pya Kyel, Yangon, Myanmar, [3]FHI 360, EpiC Project, Yangon, Myanmar

Background: With significant advancements in the national response to HIV in Myanmar, the National Strategic Plan aims to provide a comprehensive prevention package for 95% of transgender women (TGW), including testing and treatment. Population Services International Myanmar (PSI/Myanmar) conducted a needs assessment to explore TGW's experiences, needs for and barriers to services at the individual, community, and societal level, to support the national plan.

This study is part of a U.S. Agency for International Development (USAID) project funded by the U.S. President's Emergency Plan for AIDS Relief (PEPFAR).

Methods: A qualitative study using a human-centered design (HCD) approach was conducted with 16 TGWs in Yangon. Participants were identified and recruited through social networks in December 2020 and semi-structure individual in-depth interviews were done. Due to COVID-19 restrictions, data were collected through telephone interviews. Results were generated through consumer journey mapping using public health focused market research approach together with HCD tools.

Results: According to the TGW participants,there is insufficient knowledge about TG health among healthcare workers, particularly hormone therapy, drug interaction between hormones and ART, mental health and cancers common among TGW. Providers' mistreatment and lack of training on trans-competent health services are major barriers for TGW to seek services at public hospitals.

Services in the non-profit sector are favored by these women. TGWs use unqualified providers for hormonal counseling and therapy due to the lack of these services in the formal health sector.

They reported service gaps for mental and psychosocial support and no established referral mechanism or networking for gender-based violence. Anal cancer screening is not routinely done and treatment is often sought at advanced cancer stages. Those residing outside major cities and in rural areas have limited access to services in urban areas. Trans-competent facilities with trained staff are strongly desired by TGWs.

Conclusions: The study highlighted that the new clinic should employ staff who are either TGW or TGW friendly, provide HIV and ART services as well as TGW-specific services such as, mental health, gender-based violence, cancers, and hormonal therapy for TGW to meet their needs and reduce barriers to care.

EPD126

The effects of HIV-related structural discrimination on mental health outcomes for trans women, San Francisco

D. Cano[1], M. Leathers[1], I. Chiu[2], C. Turner[3], D. Trujillo[3], S. Sicro[3], K. Taylor[4], S. Arayasirikul[5], W. McFarland[3], E.C. Wilson[3]

[1]UC Berkeley, Ethnic Studies, Berkeley, United States, [2]UC Berkeley, Molecular and Cell Biology, Berkeley, United States, [3]Center for Public Health Research, San Francisco Department of Public Health, San Francisco, United States, [4]University of California, Institute for Global Health Sciences, San Francisco, United States, [5]University of California, Department of Epidemiology and Biostatistics, San Francisco, United States

Background: Trans women are disproportionately affected by HIV; psychological distress is a known risk factor. Due to marginalization, trans women face tremendous levels of structural discrimination, particularly as it relates to access to healthy food, housing, and employment.

In this study, we examined the relationship between HIV-related structural discrimination and mental health outcomes among trans women in San Francisco, California.

Methods: This is a secondary analysis of data from the TEACH 4 study, a cross-sectional survey of trans women over the age of 18, recruited in San Francisco through respondent-driven sampling from July 2019 to February 2020. Logistic regression analysis identified structural discrimination factors significantly associated with psychological distress and suicidality. All odds ratios reported had significant p-values <0.01 or more, except having been fired due to anti-trans discrimination (p=0.034).

Results: Among 201 trans women recruited, 68.6% experienced psychological distress and 31.34% experienced suicidal thoughts. Psychological distress was significantly associated with cutting meals (OR 3.6; 95%CI 1.8-7.3), not eating for a day (OR 3.6; 95%CI 1.9-6.7), homelessness in the last 12 months (OR 2.6; 95%CI: 1.35-5), housing denial due to anti-trans discrimination (OR 4.4; 95%CI: 1.9-10.10), being fired due to anti-trans discrimination (OR 3.3; 95%CI 1.1-9.95), and trouble finding a job because they are trans or gender non-conforming (OR 5.5; 95%CI: 2.7-11.2). Cutting meals was significantly associated with suicidal thoughts (OR 4.9, 95%CI 1.82-13.37) as was not eating for an entire day (OR 4.4, 95%CI 2.0-2.64).

Conclusions: Structural inequities are associated with psychological distress and suicidality among trans women, which may increase their risk for HIV. HIV prevention coupled with providing access to food, employment and housing is needed to best serve trans women at risk of and living with HIV.

We found alarmingly high levels of psychological distress and suicidality among trans women in San Francisco. Exposure to structural discrimination (food, housing, and job insecurity) were associated with both psychological distress and suicidality.

There is an urgent need to develop HIV prevention interventions that address HIV-related structural discrimination if we are to meet UNAIDS' goal of ending HIV by 2030.

EPD127

Perceived susceptibility to HIV among key populations in Nigeria: implication for prevention interventions

B. Olakunde[1], C. Ujam[1], C. Ndukwe[1], Y. Folala-Anoemuah[1], T. Oladele[1], Y. Olaifa[1], E. Okey-Uchendu[1], K. Essomeonu[1], M. Egemba[1], H. Bello[1], H. Yahaya[1], A. Ogundipe[1]

[1]National Agency for the Control of AIDS, Abuja, Nigeria

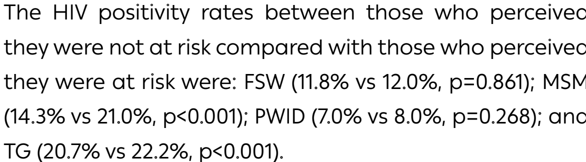
Background: High-risk behaviours and other social factors increase the vulnerability of key populations (KPs) to HIV. However, perceived susceptibility to HIV may affect their uptake of prevention interventions such as condom use, pre-exposure prophylaxis, or HIV testing.

In this study, we assessed the HIV risk perception among KPs in Nigeria and concurrence with HIV status.

Methods: Data from the 2020 Integrated Biological & Behavioural Surveillance Survey (IBBSS) were analyzed. The IBBSS was conducted in 12 states across the six geopolitical zones in Nigeria. Serological tests were performed and behavioral information was collected from 17,975 KPs, including female sex workers (FSW), men who have sex with men (MSM), people who inject drugs (PWID), and transgender people (TG). The respondents were asked: "Do you feel that you are at risk for infection with HIV?"

The responses were: Yes/No/Don't know. We limited our analysis to 14,649 respondents after excluding those who self-identified as HIV-infected or responded "don't know" or "no response" to the risk perception question. We performed weighted descriptive statistics and bivariate analysis using the chi-square test.

Results: Overall, 62.8% reported that they were not at risk of HIV. It varied among the KP groups in the following order of magnitude: MSM (57.6%), FSW (58.7%), PWID (63.8%), and TG (73.1%), p<0.001. About 13.5% of those who perceived themselves not to be at risk tested positive for HIV, while 15.9% of those who felt they were at risk of HIV tested positive (p<0.001).



The HIV positivity rates between those who perceived they were not at risk compared with those who perceived they were at risk were: FSW (11.8% vs 12.0%, p=0.861); MSM (14.3% vs 21.0%, p<0.001); PWID (7.0% vs 8.0%, p=0.268); and TG (20.7% vs 22.2%, p<0.001).

Conclusions: The majority of KPs in Nigeria perceived they were not susceptible to HIV, with significant variation by KP group. However, HIV infection was high among them, occurring at comparable rates with those who perceived that they were at risk of HIV in some KP groups. This study highlights the need to improve HIV risk communication among KPs in Nigeria.

EPD128

Social network characteristics and HIV prevention and care engagement among transgender women in Tijuana, Mexico

H.A. Pines[1,2], L.R. Smith[3], A.B. Algarin[3], M.F. Zapien-Vasquez[4], R. Padilla-Garcia[4], S. Navarro-Alvarez[5], E.V. Pitpitan[6]

[1]*San Diego State University, School of Public Health, San Diego, United States,* [2]*University of California, San Diego, Herbert Wertheim School of Public Health, La Jolla, United States,* [3]*University of California, San Diego, Medicine, La Jolla, United States,* [4]*Clinica Trans, Centro de Servicios SER A.C., Tijuana, Mexico,* [5]*Hospital General de Tijuana, Tijuana, Mexico,* [6]*San Diego State University, School of Social Work, San Diego, United States*

Background: Social network interventions may build resilience against socio-structural factors that limit engagement in the HIV prevention and care continuums (HIV-PCC) among transgender women (TW) globally. We examined the effect of social network mechanisms hypothesized to support HIV-related behavior change (i.e., social support, behavioral norms, attitudes) on engagement in the HIV-PCC among TW in Tijuana, Mexico.

Methods: From 2020-2021, we recruited 148 TW from physical and virtual venues frequented by TW in Tijuana. Participants completed interviewer-administered surveys that collected their HIV status, engagement in the HIV prevention (i.e., HIV testing in the past 3 months, consistent with WHO guidelines) and care (i.e., currently taking antiretroviral therapy [ART]) continuums, as well as data on up to 20 members of their social networks with whom they interacted in the past 3 months.

Multivariable Poisson regression models with robust error variance were used to examine the effect of social network mechanisms hypothesized to support HIV-related behavior change on engagement in the HIV-PCC.

Results: Participants reported a mean age of 32.6 years (standard deviation [SD]=9.1) and a mean social network size of 6.7 persons (SD=4.4); 44% reported at least a high school education; 38% identified as a sex worker; and 18% reported living with HIV.

While 43% of participants reported engagement in the HIV-PCC, engagement was higher for those who reported living with HIV (85% [23/27] currently taking ART) than those who reported being HIV-negative (33% [40/121] tested for HIV in the past 3 months) (p<0.001). HIV-PCC engagement was also associated with a greater proportion of participants' networks providing emotional (adjusted prevalence ratio [aPR]=2.13; 95% confidence interval [CI]: 1.08-4.23), informational (aPR=2.10; 95% CI: 1.17-3.78), and material/financial (aPR=1.67; 95% CI: 0.94-2.96) support, living with HIV (aPR=3.86; 95% CI: 1.95-7.62), engaging in sex work (aPR=1.97; 95% CI: 0.90-4.32), ever expressing opinions encouraging HIV testing (aPR=2.03; 95% CI: 1.10-3.75), and offering support for HIV testing or care (aPR=2.03; 95% CI: 1.14-3.61).

Conclusions: Our findings suggest interventions designed to foster social support, establish HIV as normative, and promote communication around HIV prevention and care within TW's social networks may help build network-level support that bolsters engagement in the HIV-PCC.

EPD129

HIV-related stigma and mental health outcomes among transwomen living with HIV: TransCitar study

E. Frontini[1], R. Caballero[1,2], V. Zalazar[1], P.D. Radusky[1,2], N. Cardozo[1,3,4], M. Duarte[1,4], S. Fabián[1,5], F. Vissicchio[1], S. Cahn[1], C. Cesar[1], V. Fink[1], C. Frola[1,6], I. Arístegui[1,7], TransCITAR Study Group

[1]*Fundación Huésped, Research Department, Buenos Aires, Argentina,* [2]*Universidad de Buenos Aires, Facultad de Psicología, Instituto de investigaciones, Ciudad Autónoma de Buenos Aires, Argentina,* [3]*REDLACTRANS, Buenos Aires, Argentina,* [4]*Asociación de Travestis, Transexuales y Transgéneros de Argentina (A.T.T.T.A.), Buenos Aires, Argentina,* [5]*Asociación Civil Gondolin, Buenos Aires, Argentina,* [6]*Hospital Juan A. Fernández, Infectious Diseases Unit, Buenos Aires, Argentina,* [7]*Universidad de Palermo, Buenos Aires, Argentina*

Background: TransCitar is a cohort study that seeks to assess and follow physical and mental health outcomes of transgender and non-binary (TNBP) individuals from Buenos Aires, Argentina. A subanalysis of baseline data is presented, exploring associations between HIV-related stigma and mental health indicators among transwomen participants living with HIV.

Methods: Participants were recruited by peer navigators and currently receive healthcare in a trans-affirmative clinic. From September/2019 to December/2021, 396 transwomen completed baseline psychosocial interviews, mostly conducted in person, and during COVID-19 pandemic, by telephone.

Questionnaires included: socio-demographics variables, Berger HIV Stigma Scale, SCL-27, CES-D, Suicidal Ideation Screener, SF-36 Health Survey, DAST-10, AUDIT. Spearman correlations were conducted to explore associations between HIV-related stigma and mental health indicators among the 150 transwomen who self-reported HIV diagnosis.

Results: Median age was 31 years (IQR: 27-37), 62% reported incomplete high school or lower, 49.3% unstable housing, 52% received financial aid, 36.7% foreign-born, 56% current sex work.

Regarding mental health indicators, 32% exhibit significant depressive, 10.7% risk of mental disorders, 22.4% problems related to alcohol and 4.1% substance use. A quarter reported lifetime self-harm behavior (25.3%) and suicide attempts (26.7%).

HIV-related stigma positively correlated with all negative indicators of mental health: depressive symptoms (r=.44 , p<.001); suicidal ideation (r=.33, p<.001); psychological distress (r=.44, p<.001); dysthimic symptoms (r=.40, p<.001), vegetative symptoms (r=.36, p<.001), agoraphobic symptoms (r=.49, p<.001), social phobia symptoms (r=.56, p<.001), and mistrust symptoms (r=.45, p<.001); alcohol (r=.23, p<.001) and substance use (r=.21, p<.001).

However, HIV-related stigma was negatively associated with both dimensions of quality of life: physical health (r=-.42 , p<.001) and mental health (r=-.34, p<.001).

Conclusions: This preliminary analysis describes the mental health situation of transwomen with HIV in Buenos Aires, Argentina. Negative mental health indicators were highly prevalent and negatively associated with HIV-related stigma, highlighting the need to continue working on reducing HIV stigma, and to develop a comprehensive/interdisciplinary approach to improve health outcomes.

EPD130

Addressing risk for HIV through shaping landscape of Inclusion for marginalized and Vulnerable Trans-Communities in Corporate India

A. Siroya[1], S Shwetambera[1], C. Kaura[2], T. Chopade[1], V. Anand[1]

[1]*The Humsafar Trust, Advocacy, Mumbai, India,* [2]*Publicis Communications Private Limited, CSR, Delhi, India*

Background: Most HIV interventions for Trans-communities in India highlight only safer sex behaviors and do not address the systemic causes behind HIV-risk like socio-economic exclusion. NALSA judgement by the Apex court of India, legally recognized Trans-communities and gave directives for socio-economic inclusion. Reading down of Section 377, which criminalized homosexual behaviors further encouraged conversations on inclusion of LGBTQ+ in workplaces.

Description: The Humsafar Trust (HST) has been implementing a targeted recruitment facilitation program under TRANScend, an initiative to promote socio-economic inclusion of transgender persons, supported by Publicis Sapient. This is a one-of-its-kind program which is community-owned and aims to shape Diversity and Inclusion landscape in India by advocating for communities that are face exclusion at multiple levels like caste, gender identity and expression, religion that increases their vulnerability to HIV coupled with lack of formal education and employment opportunities puts them on the path of high-risk behavior. A national level community consultation was organized to document aspirations of LGBTQ+ and this consultation helped shape an exhaustive process followed by HST, including community-led policy reviews and sensitizations.

Lessons learned: In the past 5 years, over 200 employers have been engaged with, over 2500 employees sensitized through various workshops and events and over 1500 transgender persons supported with skilling and recruitment facilitation. Community-led interventions for workplace inclusion result in lasting changes in workplace culture and better retention of transgender persons.

Conclusions/Next steps: Our experience has been that there are multiple knowledge gaps which are observed in corporates understanding and community needs. This leads to loss of economic productivity while communities continue to face marginalization in the society.

The employers need to acknowledge this on immediate basis and start working in tandem with communities, the more effective inclusion initiatives will be, creating a systemic shift in reduction of risk for HIV.

EPD131

Healthcare workers perspectives of peer delivery of HIV prevention services among trans women in Uganda: a qualitative study

J. Mugisha[1], M. Bagaya[1], R. Nsubuga[1], A. Nakyanzi[1], T.R. Muwonge[1], A. Mujugira[1]

[1]*Makerere University, Infectious Disease Institute, Kampala, Uganda*

Background: Peer delivery is a person-centered approach that could maximize the coverage and impact of HIV services for transgender women (TGW). Peer delivery is recommended by the World Health Organization for delivery of HIV testing and pre-exposure prophylaxis (PrEP). Healthcare workers can elucidate best practices for HIV self-test (HIVST) and PrEP distribution and provide insight into barriers and facilitators of peer delivered HIV services for transgender women.

Methods: From October 2019 to April 2020, we conducted in-depth interviews with purposively sampled healthcare workers who were experienced in providing HIV testing and PrEP to TGW in Kampala, Uganda.

Qualitative interviews explored:

1. Effective ways of distributing self-test kits and PrEP refills to TGW;
2. Barriers and facilitators of peer-delivered HIV self-test kits and PrEP refills;
3. Effective methods for ensuring linkage to care after HIV self-testing;
4. Considerations for providing HIV care to the transgender community.

Interviews were conducted in English at the interviewee's workplace, audio recorded and transcribed verbatim. We used an inductive content analytic approach centering on descriptive category development to analyse the data.

Results: Ten HCW interviews were conducted; five with private sector providers and five with public sector providers. Respondents included HIV nurse counselors, clinic manager, program coordinator and doctor. Median age was 35 years. HCW considered peer delivery "the best method to reach TGW" but noted that peers needed training and close supervision to perform effectively.
Training was perceived to address the lack of adequate counseling skills by peers. HCW felt that peers would help bridge the "information gap to the end users" and follow up TGW who received HIVST and PrEP.
However, they cautioned that gossip and breaches of confidentiality through disclosure of personal health information by peers would hinder TGW engagement in care. They also noted the lack of gender-sensitivity training for providers at health facilities.
Conclusions: HCW supported implementation of peer delivered HIV services as a best practice for increasing coverage of HIV prevention services among TGW in Uganda, especially when peers were trained and supervised.

EPD132

We decide for ourselves! Community feedback on transgender persons (protection of rights) rules 2020: implications for social determinants of health and HIV

S. Tamanna Gupta[1], N. Mahske[1], A. Siroya[1], N. Kanojiya[1], A. Singh[1], S. Parashar[1], A. Dange[1], T. Tandon[2], A. Grover[2], V. Anand[1]
[1]The Humsafar Trust, New Delhi, India, [2]The Lawyer's Collective, Delhi, India

Background: In the year 2019 Union Government of India passed Transgender Persons Act 2019 in the Parliament. In March 2020 considering the Pandemic outbreak Government of India announced country wide lockdown led to total loss of livelihoods of transgender persons. During this period the Ministry of Social Justice and Empowerment released Transgender Persons (Protection of Rights) Rules 2020 for community inputs. The pandemic hit transgender community were unware about these rules which required them to give feedback on rules that had ramifications on their health and rights. The Humsafar Trust organized a series of community consultations to give feedback into these rules.
Description: Led by a Trangender woman employee, we formed a forum of 10 transgender women, 2 community and HIV experts collaborated with 2 experienced legal experts from organization laywer's collective. This team of 12 persons deliberated during long 5 virtual sessions over a period of two months. The lawyers first explained each rule, held a discussion and sought the opinion of TG community members and experts. We deliberated onprocedure of issuing trangender identity certificate clause 'Requirement proof of continuous residence for one year' and recommended this be replaced with 'current residence'; 'the report of a psychologist of a hospital of appropriate', we recommendedthat identity document be provided without any medical examination. We recommended flexibility of the proof of residence and accountability of district magistrate to provide reasons on non-granting of application. In view of HIV and social determinants of health we suggested the creation of state level welfare boards to bring accountability at ground level for implementation of these rules. We recommended total 7 deletions and 8 modifications to the rules.These changes and recommendations were systematically added and submitted via an online portal.
Lessons learned: These on-line deliberations were highly productive as in the final rules document of MoSJE, 80 percent of our recommendations were accepted by the authorities.
Conclusions/Next steps: Community feedback counts and brings changes at field level. Transgender person's identity papers are crucial in securing their rights. This changes their social determinants of health, vulnerability to HIV. We need rights related awareness via virtual and physical spaces.

EPD133

Trans women´s perception toward stigma, discrimination, gender confirmation surgery and HIV in Iran; a qualitative study

L. Taj[1], T. Amiri[1], S. Pashangzadeh[1], E.C. Wilson[2], W. McFarland[2], M. Mohraz[1]
[1]Tehran University of Medical Sciences, Iranian Research Center for HIV/AIDS, Infectious Diseases Department, Tehran, Iran, Islamic Republic of, [2]Center for Public Health Research, San Francisco Department of Public Health, San Francisco, United States

Background: HIV prevalence among trans women is estimated at 1.9 % in Iran, however, little is known about HIV risk factors. Unmet gender health needs are a known risk factor for HIV risk among trans women. Gender confirmation surgery (GCS) is universally available in Iran. Stigma and it's sequelae are HIV risk factors among trans women around the globe. We conducted a qualitative study to examine HIV risk factors for trans women in Iran.
Methods: Semi-structured interviews and focus group discussions were conducted with 12 trans women from August, 2020 to July 2021 in Tehran. We assessed GCS and other gender-related procedures, stigma and discrimination, and HIV risk perception. Participants were 18 years and older, assigned male sex at birth, and identified as women. Content analysis was done on transcribed interviews.
Results: Participants had a mean age of 29 years and 25% had GCS. Most (58.3%) participants lived openly as women and 25% self-reported living with HIV. Participants who identified as "transexual" were more interested in having GCS than those who identified as transgender. All believed that regret after GCS was common in their community. Most believed that regret was due

to low quality surgeries and the quality of life after GCS. HIV awareness was low, and most were not concerned about HIV or STI risk (except for human papilloma virus) and did not connect HIV risk to GCS access. Discrimination emerged as the most important HIV risk for trans women. Most, reported rejection, physical violence, verbal abuse, and suppression of their gender by family throughout their lives.

Conclusions: Iranian trans women in this study faced societal discrimination and family rejection, which may be a driver of HIV risk. Unmet gender related needs did not present as a risk factor for HIV as GCS was not universally utilized, sometimes regretted, and of varying interest by gender identity.

We also found a low-level of awareness and concern regarding HIV risk. More research is needed on HIV risk factors among trans women in Iran, HIV awareness, discrimination, and how access to gender affirming care intersects with HIV risk.

EPD134

Cisnormativity is a structural barrier to HIV and STI testing for transgender men who have sex with men in Ontario, Canada: a community-based qualitative study

M. Stewart[1], D. Grace[1], H. Ryu[1], E. Blaque[1], P. Anand[1], K. MacKinnon[2], M. Gilbert[3], C. Worthington[4], O. Gómez-Ramirez[3]

[1]University of Toronto, Dalla Lana School of Public Health, Toronto, Canada, [2]York University, School of Social Work, Toronto, Canada, [3]BC Centre for Disease Control, Vancouver, Canada, [4]University of Victoria, School of Public Health and Social Policy, Victoria, Canada

Background: Transgender, non-binary, and Two-Spirit people who identify as gay, bisexual, queer or men who have sex with men (trans GBM) are historically undertested for HIV, despite being a population that is considered at elevated risk. However, limited qualitative work has addressed reasons for this undertesting.

This analysis draws on the findings from trans GBM participants' experiences with HIV/STI in-person testing and will examine the hypothesis that these populations face trans-specific barriers that reduce their access to testing.

Methods: Between June 2020 to December 2021, peer researchers conducted focus groups and interviews with 39 cis and trans GBM residing in Ontario, Canada to understand the HIV/STI testing landscape. Of the 39 participants, 13 identified as trans GBM. Focus groups and interviews were conducted virtually and analyzed by cis and trans GBM peer researchers. Data were analyzed using thematic analysis techniques in NVivo 12 software following grounded theory.

Results: We identified three overarching themes concerning HIV/STI testing barriers among the trans GBM population. First, participants noted that cisnormative clinic environments, such as gender-segregated clinic hours, are inaccessible to navigate. Second, cisnormative practitioners and lack of provider knowledge surrounding trans GBM bodies and sex practices resulted in participants feeling stigmatized and that they were not being sufficiently tested for HIV and other STIs.

Finally, cisnormative assumptions that all service users seeking testing had documentation with correct gender markers and names made trans GBM with incongruent documentation reluctant to attending testing clinics.

Our findings illustrate that while trans GBM may have similar HIV risk to cisgender GBM, trans-specific testing barriers have led this population to avoid necessary testing and may contribute to underdiagnoses of HIV in trans GBM.

Conclusions: Trans GBM are not being appropriately tested for HIV and other STIs due to cisnormativity in the current testing systems, leading to a paucity of HIV data that can help implement population-level interventions to increase HIV testing and diagnosis in trans GBM.

Our findings suggest that the development of interventions such as hosting all-gender testing hours, opening more LGBTQ+ clinics, and offering training in transgender health and inclusivity to providers would increase testing uptake for trans GBM.

EPD135

Innovating for equitable, integrated and comprehensive care for transgender people: the transgender health and wellness centre in Manipur, India

[1]Manipur State AIDS Control Society, Manipur, India, [2]UW International Training and Education Centre for Health Private Limited, New Delhi, India, [3]Maruploi Foundation, Imphal, India, [4]Centers for Disease Control and Prevention, New Delhi, India

Background: In 2020, HIV prevalence amongtransgender (TG) people in India was estimated at 7.5%.In Manipur, 700 TG people were identified through mapping exercises, although this number may underestimate the true population size due to misclassification with other groups like men who have sex with men (MSM). I-TECH India, supported by CDC India under the President's Emergency Fund for AIDS Relief (PEPFAR), in collaboration with Manipur State AIDS Control Society and Maruploi Foundation (a community-based organization), launched the first "Transgender Health and Wellness Centre" (TGHWC) in North-eastern India, to strengthen a comprehensive, integrated HIV and health response for TG people in March 2021.

Description: The objective of the TGHWC is to provide overall health, wellness, and gender affirmation services (GAS), along with capacity and skill-building to empow-

Oral abstracts

Poster exhibition

E-posters

Late-breaker abstracts

Author Index

er TG communities using a community-led model. The TGHWC has a wellness community-based clinic and a community-led health desk situated in the public hospital setting.

Lessons learned: Over 750 TG people have registered in the first six months of operation, which is higher than previous TG size estimates. Thirty-seven percent (n= 277) received HIV testing and 8% (n =22) were HIV positive and linked to ART through the community-led health desk. Additionally, 35% (n=262) agreed for first-time syphilis screening and 10% (n= 26) were diagnosed and linked to treatment services.

Community system strengthening was especially critical during the COVID-19 pandemic and included young TG leadership opportunities through webinars, gender-based violence support groups, skill-building, and income generation through an on-site beauty parlour.

Conclusions/Next steps: The TGHWC, a community-led model for comprehensive health for TG people, provided point-of-care diagnostic and treatment services to TG people while offering a wider spectrum of services for integrated care including gender-affirmation services and economic empowerment options.

Key lessons for the early success of the centre included strong political will, public sector engagement, and community-led response to fully stand up the health service integration.

This community-led model is a sustainable model due to its integration into the public sector and is being recognized as a 'game-changing model' in the HIV response for TG people in India.

EPD136

Limited access to PrEP by female transgender people in Mauritius: a qualitative study

N. Khodabocus[1], S. Seeroo[1], Y. Ramkalam[1], A. Treebhoobun[1], R. Barrakad[2], L. Sagaon-Teyssier[3], F. Diallo[4], D. Rojas Castro[5,3], R.M. Delabre[5], L. Ouarsas[2], A. Ben Moussa[2], M. Karkouri[2]

[1]Prévention Information et Lutte contre le Sida, Port-Louis, Mauritius, [2]Association de Lutte contre le Sida, Casablanca, Morocco, [3]Aix Marseille Univ, Inserm, IRD, SESSTIM, Sciences Économiques & Sociales de la Santé & Traitement de l'Information Médicale, ISSPAM, Marseille, France, [4]ARCAD Santé PLUS, Bamako, Mali, [5]Laboratoire de Recherche Communautaire, Pantin, France

Background: In Mauritius, HIV prevalence among Female Transgender People (FTGP) is 28% according to the Integrated Biological and Behavioral Survey of 2017. PrEP exists in the public sector of the island since 2018 but the uptake among this population remains very limited.

The main objective of this study is to assess awareness and perceptions of PrEP as a method of HIV prevention and identify enabling factors for its uptake among FTGP in Mauritius.

Methods: A qualitative study was conducted between March and May 2021 whereby transgender women aged 18 and over were recruited via snowball sampling. Semi-directed, in-depth qualitative interviews were conducted via phone calls, by trained research assistants using an interview guide, in Mauritian Kreol.

The themes included percerption and knowledge on PREP, its acceptability, challenges to its use and components of a desired PrEP package. Data collected were transcribed and analyzed thematically using NVIVO 14 software.

Results: 19 FTGP aged between 23 to 52 years, with mostly with secondary education and informal jobs participated in the study. The majority of the participants were aware of PrEP and its availability free of charge in the public healthcare sector. They had a positive attitude towards PrEP and found it was a pertinent prevention tool for FTGP who were from cross populations.

However, some were worried about its side-effects as they were on hormone therapy. It has been highlighted that FTGP are affected by social determinant of health and environmental factors such as unemployment, difficulty to find housing, stigma and discrimination including difficulties with the legal system. Many wished that the dispensation of PrEP services is given as a comprehensive package and is extended to community-based NGOs where they feel welcomed and can have more privacy. The presence of transgender peers has been voiced as a key enabling factor A strong need for psychological support has also been expressed.

Conclusions: The findings demonstrate that there is a demand for community-based PrEP services in Mauritius among FTGP. Comprehensive prevention packages, which take into account human rights, health and social needs may facilitate access to PrEP among this group.

EPD137

Strategies to implement HIV testing in transgender people, sex workers in the workplace

F. Bagilet[1], N. Haag[1], G. Alaniz[1], M. Pedrola[1]

[1]AIDS Healthcare Foundation, Buenos Aires, Argentina

Background: In Argentina, transgender people who are sex workers are a key population in terms of HIV/AIDS. AHF Argentina and its partners are offering rapid TESTS for HIV at their working sites.

Description: In the first months of this year, we observed that these people asked about the possibility of taking the syphilis test but did not accept the HIV test. Starting in May 2021 we started offering combined HIV and syphilis tests (Bioline™ HIV/SYPHILIS DUO). All people who tested positive for HIV, syphilis or both were linked to the free public health service.

Since January 2021, a sex work area in the Buenos Aires suburbs where mainly transgender women offer their work was visited. The visits were made by volunteers allied to AHF Argentina during sex work hours, from 22:00

to 24:00 hs, on Tuesdays and Thursdays. At these visits, information, condoms and the rapid HIV test were offered.

Lessons learned: Until May, only 10% of the people who had been offered the HIV test accepted to take it. When adding the syphilis test, the percentage increased to 80%. The prevalence of syphilis was 22% and HIV was 14%.

Most trans gender women with a positive HIV test already knew their diagnosis, although most of them were not on treatment. Through this process, 95% of them were linked to treatment.

Conclusions/Next steps: We see that it is important to assess the needs of the key populations with whom you decide to work with. By sharing their vision on the different problems, they face, we can achieve the proposed objectives.

Prisoners and other incarcerated people

EPD138
Retention strategies in the first Pre-Exposure Prophylaxis (PrEP) observational cohort among those on community supervision in the South: lessons learned during the SARS-COV-2 pandemic

B.J. Uhrig Castonguay[1,2], K. LeMasters[2], C. Corsi[2], M. Travis[2], C. Waleed[2], C. Oser[3], K. Nowotny[4], L. Brinkley-Rubinstein[2]
[1]University of North Carolina at Chapel Hill, School of Medicine, Chapel Hill, United States, [2]University of North Carolina at Chapel Hill, Center for Health Equity Research, School of Social Medicine, Chapel Hill, United States, [3]University of Kentucky, Center on Drug & Alcohol Research, Center for Health Equity Transformation, Department of Sociology, Lexington, United States, [4]University of Miami, Department of Sociology, Miami, United States

Background: Cohort studies must implement effective strategies to retain study participants because the participants that are retention challenges are likely to be the ones to most benefit from the research findings. Study retention is more challenging among vulnerable populations that experience poverty, have inconsistent contact information, and are engaged in substance use.

We implemented various retention strategies to maintain high participation among people under criminal-legal (CL) supervision and who were clinically indicated for Pre-exposure prophylaxis (PrEP)—an effective biomedical HIV prevention strategy that remains underutilized among people under CL supervision.

We report our retention strategies to address the challenges of retention during the SARS-COV-2 pandemic.

Methods: Southern Pre-Exposure Prophylaxis Study (SPECS) is an 18-month observational cohort of individuals with CL involvement and a clinical indication for PrEP in North Carolina, Florida, and Kentucky. Recruitment began July 2019 and was paused on March 13, 2020 due SARS-COV-2. The SARS-COV-2 pause reduced our retention efforts to phone calls and mailings, removing in-person "field days"—used when a participant's contact information was no longer working.

Pivoting to a virtual format, we implemented new strategies to obtain more locator information: we paid participants for locator updates ($5) and for completing visits on-time ($5), we paid $15 incentive to a participant's contact if the contact successfully connected study staff to the participant, and significantly increased our mailings to participants, including more study-branded materials.

Results: As of March 2020, when recruitment paused due to the SARS-COV-2 pandemic, SPECS had enrolled 227 individuals across its three sites (N=46 NC; N=99 KY; N=82 FL). Of these, 180 completed follow-up through the 18-month visit. Three participants have revoked consent, seven are now deceased, and 21 have been re-incarcerated for the remainder of the study. This results in 196 individuals eligible for the 18-month visit and 92% retention. SPECS retained 84% of its participants in NC, 89% in KY, and 100% in FL.

Conclusions: Our findings highlight the importance of incentivizing retention strategies particularly when shifting to a virtual retention format is required.

Additionally, it is important for retention strategies to be flexible and to consider retention opportunities beyond the study participant.

EPD139
HIV-related peer-to-peer counseling by prisoners – an innovative model in Ukraine

S. Bolsheva[1]
[1]Charitable Organization FREE ZONE, Kyiv, Ukraine

Background: COVID-19 significantly limited the possibility to provide HIV-related counseling in prisons. In some prisons access of social workers from outside is also limited due to the administrations' decision. At the same time HIV-related counseling is a needed services among prisoners – the HIV prevalence level among prisoners is 7,4%.

Description: Free Zone Ukraine has implemented an innovative model of involving prisoners as peer-to-peer counselors in provision of HIV-related counseling. The key goal of such counselors is to motivate their inmates for HIV testing and provide accurate information about HIV to them.

To prepare prisoners for being counselors the Methodical guidelines has been developed and includes guidelines on HIV, TB, HCV. Based on them prisoners who are willing to work as counselors pass a 8-module training, which covers ethical norms of counseling, basic counseling skills, principles of index testing, HIV/TB/HCV prevention and treatment, ART adherence. Such peer-to-peer approach

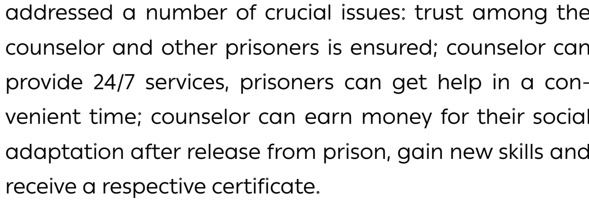
Oral abstracts

Poster exhibition

E-posters

Late-breaker abstracts

Author Index



addressed a number of crucial issues: trust among the counselor and other prisoners is ensured; counselor can provide 24/7 services, prisoners can get help in a convenient time; counselor can earn money for their social adaptation after release from prison, gain new skills and receive a respective certificate.

Lessons learned: In 2020 52 prisoners have been trained as counselors, in 2021 – 350, out of them 11 people have received jobs as counselors at NGOs after release, 8 became volunteers after release. In COVID-19 conditions this approach became a system model of counseling provision in prisons, which ensured continuity of HIV-related services for prisoners.

Conclusions/Next steps: 350 prisoners from 69 prisons of Ukraine will be trained as counselors. This approach will lay the basis for peer-to-peer service provision in prisons as such.

Provision of such services, as peer-to-peer provision of needle and syringe exchange services, OST-related counseling, which are currently unavailable in Ukrainian prisons, will be built on this experience.

EPD140

Ensuring access to drug addiction services for prisoners of Ukraine after release

M. Sydorenko[1], O. Ghatiatullin,[1]

[1]Charitable Organization FREE ZONE, Kyiv, Ukraine

Background: Accordingto the 2019 IBBS study among prisoners 31,2% of prisoners have drug use experience; this number is 54,2% among HIV-positive prisoners. Most often the drug experience is reported by people aged 30-39 years. At the moment there is limited access to drug dependance support services in prisons, needle and syringe exchange programs are not available, OST is very limited.

Description: In 2021 Free Zone has developed a model of comprehensive interventions to ensure access of ex-prisoners to support related to drug addiction to assist in their resocialization, prevent repeated relapse into crime, prevent HIV transmission and improve their quality of life.

Three months prior to release prisoners take part in training to prepare themselves for release. The pre-release training course has been developed in cooperation with the Ministry of Justice and considering COVID-19 restrictions, thus, it is an online course with usage of video materials.

Courses are conducted on a weekly basis during three months prior to release. Courses take place on a routine basis in 53 penitentiary institutions (77% of all penitentiary institutions in Ukraine). The course covers issues of drug addiction, harm reduction programs, overdose prevention, OST. When released prisoners receive prevention packages which contains a clean syringe, alcohol wipes, naloxone ampules and instruction on first aid in case of overdose. During 3 months after release social workers ensure readdressing of ex-prisoners to harm reduction and OST programs or rehabilitation centers based on the client's needs.

Lessons learned: In 2021 pre-release life skills course has been taken by 2217 prisoners, 1498 of them were successfully readdressed to the programs that support people with drug addiction after release. Prevention packages were distributed to 84 prisoners to prevent overdose during the first days after release

Conclusions/Next steps: This intervention is an innovation for the penitentiary institutions of Ukraine.In 2022 it will be spread to all prisons in the country. The necessary normative documents are being developed to ensure provision of pre-release preparation and support by the NGOs at the cost of state budget

EPD141

Ensuring sustainable psychosocial services and comprehensive HIV, tuberculosis (TB), and hepatitis C virus (HCV) care package to detainees in Ukrainian pre-trial detention centers

S. Leontieva[1], T. Gaborets[1], K. Gamazina[1], S. Vasyliev[2], I. Khaniukov[3]

[1]PATH, Ukraine Country Program, Kyiv, Ukraine, [2]Ministry of Justice of Ukraine, Center of Health Care, Kyiv, Ukraine, [3]Global Fund and Serving Life Projects Implementation Group, Kyiv, Ukraine

Background: Ukraine has the second-largest HIV epidemic in Eastern Europe, and HIV prevalence in Ukrainian penal settings is 8.9%. Since 2017, the USAID/PATH Serving Life project has implemented a comprehensive HIV, TB, and HCV care package for people in penal settings across 12 regions in Ukraine. In 2021, Serving Life, together with the Ministry of Justice of Ukraine's Center of Health Care (MOJ/CHC), implemented the first pilot to provide sustainable psychosocial and HIV services to detainees in a pretrial detention center (SIZO).

Description: A Serving Life-supported NGO hired and trained a social worker for HIV/TB/HCV prevention, HIV rapid testing, and treatment adherence in Poltava SIZO's health care unit. Serving Life financed the social worker's activities during the one-year pilot, while advocating for staffing changes to add this position as regular SIZO staff.

As a result of this advocacy, the MOJ/CHC granted approval to officially employ the NGO social worker in the SIZO using state funds, and as of January 2022, the first social worker was officially included in the SIZO's health care unit staff, employed and paid through MOJ/CHC.

Lessons learned: In 2021, the NGO social worker conducted counseling and motivational interviewing sessions for SIZO detainees (222 on HIV/TB/HCV prevention; 250 on HIV index case testing (ICT) and ART adherence; 663 on HIV pre- and post-testing; 31 on drug dependency). He also counseled 37 HIV-positive detainees (index clients), who accepted ICT services and provided contact information

for their 72 index partners. Seventy index partners were tested for HIV and 9 new HIV-positive cases were identified and linked to treatment, a 12.9% case yield from the social worker's efforts. Daily provision of psychosocial services to detainees by a trusted, trained social worker, without stigma and discrimination, was key to the pilot's success.

Conclusions/Next steps: The successful pilot in Poltava SIZO showed the value of counseling and motivational interviewing to provide comprehensive HIV/TB/HCV care in penal settings, and provided an opportunity to ensure sustainability of psychosocial services for detainees using state funds beyond the Serving Life project. The MOJ plans to expand this approach to all SIZOs in Ukraine in 2023.

EPD142

Inter-ministry convergence, prison peer volunteers, and technical assistance are critical for the scale-up of HIV, TB, STI, and hepatitis services among incarcerated populations in India

A. Hazra[1], S. Rajan[2], B. Singh[2], S. Purohit[2], M.S. Mudaliar[1], M. Mistry[1], H. Sharma[1], S.K. Komaragiri[1], S. Jha[1], L Ramakrishnan[1], S.S. Raghavan[1]

[1]*Solidarity and Action Against The HIV Infection in India (SAATHII), New Delhi, India,* [2]*National AIDS Control Organization (NACO), New Delhi, India*

Background: Prisoners have a higher prevalence of HIV, TB, STI, and Viral Hepatitis (HTSH) than the general population. However, diagnosis and treatment services are limited in Prisons and Other Closed Settings (POCS). SAATHII, in partnership with National AIDS Control Organization, and with funding from EJAF, implemented project Subhiksha to scale up HTSH services in 706 prisons and 239 OCS (women shelters) from 13 states between 2018 and 2021.

Description: Interventions included:

i. Facilitating formal agreements with Ministries of Home Affairs, Social Justice and Empowerment, Women and Child Development, and Health and Family Welfare;

ii. Integrating HTSH services within existing POCS facilities;

iii. Establishing linkages with local HTSH services for camp-based screening, confirmation, and treatment;

iv. Identification and training of 6,515 prison peer volunteers (PPV) to increase health literacy and service uptake;

v. Ensuring access to HIV services and social protection to family members; and vi) post-release follow-up of HIV+ inmates.

Lessons learned: Over 36 months, the project facilitated testing of 744,531 inmates for HIV, 588,843 for TB, 240,643 for STI, 64,900 for HBV, and 22,787 for HCV and enabled diagnosis of 2,252 HIV, 891 TB, 862 STI, 890 HBV, and 240 HCV cases.

Among these, >95% of TB and STI, 85% of HIV, 84% of HBV+, and 50% of HCV+ were linked to treatment. Additionally, 811 HIV+ inmates and family members were linked to social protection and 260 partners were screened for HIV, and 37 HIV+ were linked to treatment. Convergence across ministries helped in rapid scale-up and post-release follow-up. Trained PPVs were instrumental in motivating the inmates for HTSH testing and initiation of and adherence to the treatments.

The outreach workers obtained the correct residential addresses for post-release follow-up by gaining the trust through good counseling. Decentralized TB and STI services helped link >95% of cases to treatment. Shortage of prison guards to accompany inmates to services, unscheduled release, and difficulty in tracing inmates post-release led to linkage loss of HIV treatment.

Conclusions/Next steps: Based on the effectiveness and replicability the national program has expanded these HTSH interventions across the country through GFATM funding, beginning April 2021.

EPD143

A narrative inquiry into the experiences of transitions into and out of correctional facilities for people living with HIV

M. Wadams[1]

[1]*University of Alberta, Faculty of Nursing, Edmonton, Canada*

Background: Limited research focuses on peoples transitions into and out of provincial correctional facilities in Canada. Transitions are complex and require the intersection and cooperation of social, health, and justice systems. Understanding transitions for people living with HIV (PLWH) is critical, because it holds the possibility to improve interdisciplinary coordination and practices for people who face structural marginalization.

The *purpose* of the study was to explore the experiences of transitions into and out of correctional centres in Alberta, Canada for PLWH. In this project transitions are conceptualized narratively.

Methods: Narrative inquiry is a qualitative methodology focused on understanding experience as a narrative phenomena. Integral to narrative inquiry is relational ethics, which is marked by a long-term engagement with participants in their social contexts and in diverse places.

Throughout the study, based on diverse field texts (conversations, notes, and artifacts), I have co-composed and co-constructed meaning alongside two male participants. The fieldwork is ongoing since July 2021. Through closely attending to the co-composed narrative accounts, narrative threads or resonances were discerned.

Results: The study provides insights into the sense-making processes and experiences of people who have experienced significant inequities. 'Stories to live by', a narrative term describing the interconnectedness of knowledge, context, and identities, are key to understand the experience of transitions for PLWH who have been incarcerated.

Participants' experiences challenge the understanding that they are 'transitory' and 'passive' recipients of care. Instead, participants see themselves as having agency and

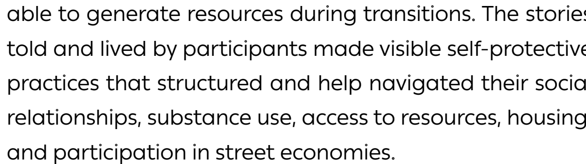
Oral abstracts

Poster exhibition

E-posters

Late-breaker abstracts

Author Index



able to generate resources during transitions. The stories told and lived by participants made visible self-protective practices that structured and help navigated their social relationships, substance use, access to resources, housing, and participation in street economies.

Conclusions: Living in the context of transitions in and out of correctional facilities remains a part of a PLWH's identity across time. Participants lived and told stories of siphoning power from structural forces that regulate resources and relationships to themselves.

These insights into how PLWH make sense of transitions encourages further opportunities to foster agency amongst this population while reconceptualizing services and resources aiming to support PLWH.

EPD144

A COVID response to better serve prisoners and ex-prisoners

C.M. Medina[1], C. McNab[1]

[1]*PASAN, Toronto, Canada*

Background: COVID quickly forced organizations to pivot the way they provided services to clients. PASAN was impacted in a specific way as ex-prisoners in community were not able to leave their homes and staff were not able to access prisoners inside the institutions to provide one on one support and programming. PASAN's COVID response took into consideration that Prisoners were being immensely affected by the pandemic with COVID-19 transmission rates rapidly increasing in institutions. Ongoing lockdowns also meant prisoners were unable to attend programming, do recreational activities like exercise, or access phones to call family and friends, resulting in prisoners spending more time inside their cells. The state of the prison environment and the lack of access and information to PPE culminated, causing the mental health of Prisoners to be impacted.

The need also grew to provide emotional support for ex-prisoners living with HIV/HCV that were experiencing isolation, heightened drug use, and lack of access to essential services during the pandemic.

Description: Calls were forwarded to staff work cell phones in order to remain in contact with prisoners, wellness worksheets were created and mailed as a response to the mental health concerns being reported by prisoners throughout the COVID-19 pandemic. PASAN partnered with PWA for food deliveries to create an opportunity to see clients and assess their needs, harm reduction supplies were delivered to clients, weekly wellness calls were made and staff were deployed to PWA as another method to remain in contact with clients.

Lessons learned: Providing these shifts in programming has shaped the way the organization provides services to marginalized and high-risk communities. Often the way organizations offer services is based on the expectation that clients come to staff, this method of providing services does not take into account the barriers and the reality of people incarcerated or previously incarcerated, those that use drugs, and are living with HIV/HCV.

Conclusions/Next steps: As a result of the strategies and interventions used during the pandemic access to clients in the community improved linkages to care. By having prisoners identify how best to support them demonstrated a best practice model for developing meaningful resources.

Young key populations

EPD145

HIV/AIDS knowledge, related-stigmatization and preventive behaviours among college students in Ghana: an exploratory study

D.G. Dampson[1]

[1]*University of Education, Winneba, Institute for Teacher Education and Continuing Professional Development, Winneba, Ghana*

Background: Despite Ghana's low level of positive cases in HIV/AIDS (1.6%), the surge in HIV/AIDS positive cases in the Eastern Region is alarming. As of September, 2021, Ghana had recorded an astronomical new HIV/AIDS infections of 18,928 with majority between the ages of 15-24 years found to dominate in the Eastern Region. This age range is alarming because these are the youthful population in the Tertiary Institutions in Ghana.

This study therefore investigated the college students' knowledge on transmission, related-stigmatization and preventive measures employed in curbing the situation.

Methods: Using the cross-sectional mixed-method design, a sample 321 college students were surveyed with the HIV-KQ 18 knowledge instrument (Carey & Schroder, 2002), a 14-item HIV stigma instrument (Herek, Capitanio, & Widaman, 2002) and a self-developed 7-item access to HIV information instrument. The data collected were analysed descriptively and inferentially.

Results: The study found that majority of the respondents had inadequate knowledge on HIV/AIDS transmission, showed no compassion to those suspected to be living with HIV/AIDS and majority of them perceived HIV/AIDS as a myth. The study also found a positive relationship between knowledge in HIV/AIDS and related-stigmatization.

Therefore, there the need to improve upon the dissemination of HIV/AIDS information to bridge the knowledge gap and as well scale up measures to decrease the stigmatization of people living with HIV/AIDS.

Conclusions: Notwithstanding the numerous efforts made by the Ministry of Health, NGOs and other public health sectors in Ghana, it seems the level of knowledge and related-stigmatization among young college stu-

dents in Ghana is very low. There is therefore the need to increase the level of knowledge on HIV-AIDS through series of workshops and inclusion in the new Ghanaian curriculum.

EPD146
Gender norms, HIV risk, and attitudes towards PrEP and other HIV preventive interventions among South African adolescents

I. Agaku[1], L. Nkosi[2], J. Gwar[3], T. Tsafa[3]
[1]Harvard School of Dental Medicine, Boston, United States, [2]Sefako Makgatho Health Sciences University, Pretoria, South Africa, [3]Benue State University, Makurdi, Nigeria

Background: HIV infections have been increasing among South African adolescents. For long-term impact, HIV prevention/control strategies must acknowledge and address the social norms that underpin HIV transmission.
We, therefore, examined HIV-related social norms and perceptions among South African adolescents aged 15-18 years and evaluated their openness to using pre-exposure prophylaxis (PrEP) to reduce HIV risk.
Methods: We analysed cross-sectional data of 4,567 adolescents aged 15-18 years from the Fifth South African National HIV Prevalence, HIV Incidence, Behaviour and Communication Survey (2017/2018). Outcomes of interest in our study were HIV-related social norms and awareness of HIV prevention methods, including pre-exposure prophylaxis (PrEP).
Results: Our results showed that compared to their female counterparts, a significantly higher percentage of male adolescents endorsed the statement "Men can have two or more sexual partners at the same time" (14.2% vs 10.1%, p=0.021). Condoms were the most popular method of HIV prevention, with 83.5% of all participants reporting awareness. Yet, 35.4% of those sexually active in the past year reported not using condoms all the time.
Exposure to parental sex education and community campaigns for HIV prevention were both associated with increased awareness of HIV prevention measures and openness to PrEP. Unaided recall of PrEP was very low (3.7%), but most of those who were HIV seronegative (69.3%) were open to using it after learning about it.
Openness towards PrEP was significantly higher among those reporting vs not reporting past-year sexual activity (Adjusted prevalence ratio [APR]=1.16, 95%CI, 1.06-1.28), and binge drinking (APR=1.24, 95%CI, 1.08-1.41).
Conclusions: This study showed that male teens were a lot more permissive towards young men having multiple female sexual partners than with the reverse, and over a third of adolescents who were sexually active in the past year reported not using condoms all the time. Many South African adolescents were interested in trying PrEP, but initial awareness was low. Ensuring barrier-free access to evidence-based preventive strategies may benefit public health.

EPD147
Acceptability of HIV self-test among adolescent men who have sex with men andtransvestites and transsexual womenin Brazil

É. Dumont[1], D.A.d.S. Ferraz[2], M. Greco[3], A.P. Silva[3], L. Pedrana[4], I. Douraado[4], D.B. Greco[3], M.E.P. Castellanos[4]
[1]Federal University of Minas Gerais, Department of Maternal-Child Nursing and Public Health, Belo Horizonte, Brazil, [2]FIOCRUZ School of Government, Oswaldo Cruz Foundation, Brasília, Brazil, [3]Federal University of Minas Gerais, Belo Horizonte, Brazil, [4]Federal University of Bahia, Salvador, Brazil

Background: HIV self-testing (HIV-ST) is a technology that is part of combined prevention initiatives, currently considered strategic for controlling the epidemic, and may be especially relevant for populations among which HIV prevalence is highest. The literature describes this technology as well accepted among different groups, but there are knowledge gaps concerning specific groups, such as adolescents.
In this qualitative study, we aimed to analyze the acceptability of HIV-ST among adolescent men who have sex with men and transgender women in three Brazilian capitals.
Methods: We carried out interviews and focus groups with 74 participants from the PrEP1519 study, being 25transvestites and transsexual womenand 49 men who have sex with men.
All interviews were recorded, transcribed, and analyzed based on the Theoretical Framework of Acceptability (TFA) associated with the theoretical framework of vulnerability.
The TFA comprises seven dimensions of acceptability: "affective attitude", "perceived effectiveness", "intervention coherence", "self-efficacy", "participation load", "ethicality" and "opportunity costs".
We chose not to include the "opportunity costs" dimension, considering that HIV-ST is currently distributed by the Brazilian Unified Health System for the adult population and that it may also be done for adolescents.
Results: The analysis of the acceptability dimensions that make up the TFA show good acceptability of HIV-ST among men who have sex with men and transgender women, although not homogeneous.
Among the positive aspects of the tests there are, for instance, the agility and confidentiality as components of "affective attitude"; the practicality of use, privacy and emotional management related to the testing process associated to its "self-efficacy" and "perceived effectiveness".
However, there is the concern with how to deal with a positive result that is recognized as a "participation load" and about the "intervention coherence" there is a perception that testing is not effectively prevention method since for them this would only confirm an existing serological status.

Development of a PrEP-inclusive STI and HIV prevention intervention for youth with sexually transmitted infections in primary care

S. Wood[1], J. Bauermeister[2], A. Phillips[3], S. Wood[3], S. Garcia[4], R. Beidas[5], A. Fiks[1], N. Dowshen[1], J. Young[4], R. Gross[6]
[1]University of Pennsylvania Perelman School of Medicine, Pediatrics, Philadelphia, United States, [2]University of Pennsylvania School of Nursing, Philadelphia, United States, [3]Oregon Health Authority, Portland, United States, [4]Children's Hospital of Philadelphia, Philadelphia, United States, [5]University of Pennsylvania, Philadelphia, United States, [6]University of Pennsylvania Perelman School of Medicine, Infectious Diseases, Philadelphia, United States

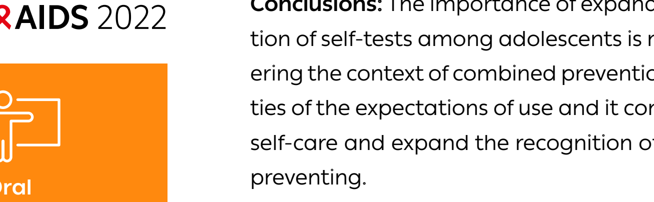
Background: There is a need for PrEP-inclusive HIV prevention interventions for adolescents with sexually transmitted infections (STIs) in primary care.
Our objective was to elucidate targets and content for a comprehensive HIV and STI prevention intervention for this population.
Methods: Mixed methods cross-sectional study enrolling 13-19 year olds with gonorrhea, chlamydia, trichomonas, or syphilis in the past 30 days at two urban primary care clinics. Participants completed surveys and audiorecorded individual interviews. Interview data were qualitatively analyzed by three independent team members using an integrated approach. Transcripts were first coded deductively using Fishbein's Integrated Behavioral Model (IBM) which posits that knowledge, social norms, and self-efficacy influence intention for behavior change. We then identified themes not represented in the IBM through inductive analysis.
Results: Surveys were completed by 35 youth, 33 (94%) of whom completed interviews. Participants were 85% cisgender females, 14% cisgender males, 1% transgender females, and 25% identified as gay, lesbian, bisexual, or queer. The majority (97%) identified as non-Latinx Black. Mean age was 17.2 years (SD 1.3). None used condoms consistently, 26% were aware of PrEP, and 69% were never HIV tested.
Five key themes emerged. Corresponding to IBM targets, youth desired an intervention that ameliorated knowledge gaps to improve informed prevention decision-making (theme 1), reframed negative social norms wherein condom use was viewed as a marker of relationship distrust (theme 2), and improved self-efficacy around PrEP initiation and HIV testing (theme 3).
Additionally, mental health played a key role for participants in both prevention behavior uptake and coping with STI diagnosis (theme 4).
Finally, youth emphasized a desire for counseling that allowed decisional autonomy and individualized goal setting (theme 5).
Conclusions: We have integrated these data and developed the T.A.K.E (Treat, Act, Know, Engage) Steps intervention, which includes:
1. Tailored prevention education,
2. Evidence-based communication skills to facilitate partner communication,
3. Skill building around accessing prevention health services including PrEP and HIV testing,
4. Mental health referral, and;
5. Motivational interviewing to enhance goal planning and readiness for behavior change.
The intervention will be further assessed in a randomized controlled trial for acceptability, feasibility, and impact on prevention self-efficacy.

EPD149

Behavioral factors affecting lack of condom-use negotiation among South African female youth

O.J. Baruwa[1]
[1]North-West University, African Unit for Transdisciplinary Health Research (AUTHeR), Potchefstroom, South Africa

Background: In the war against HIV/AIDS and unintended pregnancies, studies have shown that sexual partners who can talk about the use of condoms and safe sex have a lower likelihood of contracting HIV and being victims of unintended pregnancy.
Methods: The data for the present study came from the individual record file of the 2016 South African Demographic and Health Surveys (SADHS), which contains information on women of reproductive age.
The study used responses from females aged 15-34 years from the 2016 South African Demographic and Health Survey (SADHS) data. Multivariate logistic regression modelling was employed to analyze the association between behavioral factors and condom use negotiation among female youth.
Results: Many of the behavioral variables were insignificant after adjusting for the effects of other behavioral variables. However, the stepwise logistic regression results showed that female youth that did not intend to use contraceptive had lower risk of condom-use negotiation (OR; 0.49, CI; 0.33-0.71) compared to female youth that were currently using contraceptive. Female youth that have tested for HIV have higher risk of condom-use negotiation (OR; 3.07, CI: 1.72-5.49) compared to those that have never tested for HIV.
Surprisingly, having experienced emotional violence increased the risk of condom-use negotiation (OR: 1.58, CI: 1.01-2.48) and condom use at last sex increased the risk of



condom-use negotiation (OR: 1.83, CI: 1.22-2.74). Findings also showed that none of the socio-demographic factors controlled for in objective four of the study were significant.

Conclusions: The study also established that some behavioral factors such as contraceptive use, ever delay or avoid pregnancy, HIV test, use of the internet, coerced sex, emotional violence, sex refusal, and condom-use with partner at last sex among female youth in South Africa predict condom-use negotiation with partner.

This study underscores the need for policies that promote delayed sexual activities more among young women in South Africa. It is important that HIV intervention stakeholders understand the significance of the behavioral factors that influence condom-use negotiation in providing strategies to consistent condom use among female youth in South Africa. In addition, this study adds to the literature on sexual behaviors, particularly condom-use negotiation among young people.

EPD150

HIV- and prevention-related knowledge and beliefs, HIV testing, and condom use in a school-based sample of 6,000 Rwandan adolescents

L.A. Hunter[1], R. Hémono[1], L. Packel[1], E. Gatare[2], L. Kayitesi[2], S. Olabode-Dada[2], R. Hope[2], S.I. McCoy[1]

[1]University of California, Berkeley School of Public Health, Epidemiology, Berkeley, United States, [2]YLabs, Kigali, Rwanda

Background: Comprehensive sex education was added to Rwanda's national school curriculum in 2016. We evaluated HIV- and condom-related knowledge/beliefs and their associations with HIV testing and condom use in a school-based sample of Rwandan adolescents to identify enduring gaps in HIV and family planning education.

Methods: From February-May 2021, we surveyed 6,082 students ages 12-19 (median: 15; 51% female) from 60 secondary schools in 8 Rwandan districts about their sexual health knowledge and behavior. We consolidated responses to 7 true-or-false questions testing HIV knowledge and 8 statements encoding condom beliefs which may facilitate or demotivate use to classify level of HIV knowledge (high, medium, low) and favorability of condom beliefs (prohibitive, middling, favorable). We estimated adjusted prevalence ratios (aPR) to compare HIV testing and condom use by HIV knowledge and condom beliefs.

Results: HIV knowledge was high overall, with 74% answering at least 6 of 7 HIV-related knowledge questions correctly. In contrast, beliefs about condoms were mixed, with students responding favorably to 4 of 8 condom-related statements on average. Many believed condoms could disappear inside the body (64%), were not suitable for casual (50%) or steady (40%) relationships, or were too embarrassing to buy (37%).

One third (38%) of students reported previous HIV testing, of which half (20%) had tested within the past year. Among the 28% of students who reported having ever had sex, 38% reported using a condom at last sex. Higher HIV knowledge was associated with increased HIV testing (aPR high vs. low: 1.3; 95% confidence interval [CI]: 1.1, 1.5) but not condom use.

However, students with favorable or middling condom beliefs were more likely to report condom use than students with prohibitive beliefs (aPR favorable vs. prohibitive: 1.6; 95% CI: 1.3, 2.1; aPR middling vs. prohibitive: 1.4; 95% CI: 1.1, 1.8).

Conclusions: Despite high HIV-related knowledge, HIV and pregnancy prevention among Rwandan youth may be stymied by prohibitive beliefs and misconceptions about condoms. The association between condom beliefs and condom use warrants renewed attention to educational gaps about condoms' value in prevention and motivates school-based interventions to create supportive social norms around condom use among youth.

EPD151

Trajectories of depressive symptoms and HIV-related sexual behaviors among adolescent girls and young women in Rural South Africa (HPTN 068)

N.L. Bhushan[1], H.O. Pitchik[2], E.O. Chung[3], K. Kahn[4], F.X. Francesc Xavier Gómez-Olivé[4], J. Maselko[3], A.E. Pettifor[3]

[1]RTI International, Research Triangle Park, United States, [2]University of California, Berkeley, Berkeley, United States, [3]University of North Carolina at Chapel Hill, Chapel Hill, United States, [4]University of the Witwatersrand, MRC/Wits Rural Public Health and Health Transitions Research Unit (Agincourt), Johannesburg, South Africa

Background: In sub-Saharan Africa, adolescent girls and young women (AGYW) are twice as likely to experience depression and HIV infection as their age-matched male counterparts. Yet little is known about trajectories of depressive symptoms amongst this population or how trajectories of depressive symptoms overlap with engagement in HIV-related sexual behaviors such as early sexual debut, condomless sex, transactional sex, and age-disparate partnerships.

Methods: We used data from the HIV Prevention Trials Network (HPTN) 068 study in rural South Africa (2012-2019). AGYW, aged 14-20 at baseline, were followed approximately annually for up to 6 years. Depressive symptoms were measured with the Center for Epidemiologic Studies Depression Scale (CES-D-10) and group-based trajectory modeling was used to identify longitudinal patterns of depressive symptoms.

After model fit was assessed, each AGYW was assigned to the trajectory group for which they had the highest posterior probability of membership and HIV-related sexual behaviors (early sexual debut (≤ 15), condomless

sex, transactional sex, and age-disparate partnerships (partner≥ 5 years older)) for each group were descriptively compared using chi-square tests.

Results: Among 1753 AGYW included in our analysis, at baseline the median age was 16 (IQR 15-17), 28% were sexually active (n=507), and 33% (n=587) reported depressive symptoms. We identified three distinct depressive symptoms trajectories: "increasing across adolescence" (n=69, 4%), "decreasing across adolescence" (n=257, 15%), and "no depression across adolescence" (n=1437, 81%).

Across all visits, the "increasing across adolescence" and "decreasing across adolescence" groups, compared to the "no depression across adolescence" group, were more likely to have early sexual debut (26% 'increasing', 37% "decreasing', 21% 'no depression': p < 0.001) and ever engage in condomless sex (45% 'increasing', 55% 'decreasing', 39% 'no depression'; p < 0.001), transactional sex (35% 'increasing', 45% 'decreasing', 24% 'no depression; p < 0.001), and age-disparate partnerships (42% 'increasing', 49% 'decreasing', 36% 'no depression'; p < 0.001).

Conclusions: In rural South Africa, AGYW who experience depressive symptoms during adolescence are potentially more at risk of engaging in HIV-related sexual behaviors than AGYW who experience no depressive symptoms, particularly AGYW who experience depressive symptoms earlier in adolescence.

EPD152

Adverse childhood experiences and resilience among youth living with HIV in the Deep South of the United States

T. Chenneville[1], H. Drake[2], A. Cario[3], C. Rodriguez[3]

[1]University of South Florida, Psychology, Saint Petersburg, United States, [2]University of South Florida, Public Health, Saint Petersburg, United States, [3]University of South Florida, Pediatrics, Tampa, United States

Background: The southern region of the United States, referred to as the Deep South, is disproportionately affected by HIV. It has the highest rates of new HIV infections. Approximately one in five new HIV infections are among youth. Youth living with HIV (YLWH) have multiple health risks, including co-occurring mental health and substance abuse disorders, which negatively affect medication adherence, contribute to less engagement in HIV care, and result in poor health outcomes.

Research suggests that adverse childhood experiences (ACEs) contribute to HIV risk behaviors and that YLWH may be more vulnerable to the negative health outcomes and adverse effects of stressors. At the same time, many YLWH demonstrate resilience.

Methods: Using existing program evaluation data, we examined screening data from YLWH receiving HIV treatment in an integrated pediatric care setting. Data on adverse childhood experiences (ACEs) and resilience were collected from a subset of patients from January 2019 to August 2021 using the following measures: 10-item ACES questionnaire (Felitti et al., 1998), the Brief Resilience Scale (Smith et al., 2008), and the Resilience Scale (Wagnild & Young, 1993).

Because this study relied on anonymous program evaluation data, it was exempt from institutional review board approval. Descriptive statistics were used to describe the sample screening results. One-way ANOVAs and linear regression were used to examine differences in ACE and resilience scores based on demographic variables.

Results: Participants were 41 YLWH aged 17-24, primarily Black/African American Non-Hispanic young men who acquired HIV behaviorally. A slight majority of participants identified as homosexual, bisexual or questioning. Approximately one-third of YLWH screened positive on the ACE screener. There were no significant differences in scores based on demographic variables. Resilience screening data revealed moderately high resilience among YLWH. There were no differences in resilience based on demographic variables with the exception of living situation. Youth who were living with parents reported higher levels of resilience than those living with roommates or friends.

Conclusions: Approximately one-third of YLWH screened positive on an ACE screener, yet resilience was moderately high in our sample. These findings have important implications for HIV prevention and treatment targeting youth in the Deep South.

EPD153

"The change was too sudden": Experiences of transition to adult care for adolescents living with HIV in North-Central and North-Western Nigeria

C. Isah[1], V. Tepper[2], N. Sam-Agudu[1,2], C. Iwodi[1], A. Akiode[1]

[1]Institute of Human Virology Nigeria (IHVN), Prevention, Care and Treatment, Abuja, Nigeria, [2]University of Maryland School of Medicine, Pediatric, Maryland, United States

Background: There is an increased risk of disengagement for adolescents living with HIV (ALHIV) transitioning from pediatric to adult care. The Adolescent to Adult Patient-centered Transition (ADAPT) formative study explored experiences of ALHIVs in the transition cascade to guide tailored retention strategies.

Methods: For this qualitative study, 18 FGDs were conducted between July and August 2017 for purposively-sampled 15-19-year-old ALHIVs at six health facilities in NC/NW Nigeria. Participants were aware of their HIV status and on ART for ≥12 months. Pre-transition, transition and post-transition experiences were explored. FGDs were transcribed and thematically analyzed using MAXQDA Analytic Pro v12.3.9.

Results: For 149 ALHIV interviewed, mean age and age at disclosure were 17.0 (SD 16.0-18.0) and 14.0 (SD 12.0-15.0) years respectively; 79% were perinatally infected. ALHIV reported being unaware of transition, and ill-prepared to cope in the adult care environment.

- Pre-transition: Adolescents were uninformed about transition and the process was unplanned or poorly planned.

"They didn't tell me beforehand..., I wasn't happy about it, the change was too sudden"

"I came to the clinic that day... the doctor ...he said you are not supposed to be here now, what are you doing here? ... carry your folder, just go to adult clinic"

- At transition: There was no planned/coordinated transfer to adult care.

"I was having so many thoughts...because I don't know where they will decide to keep us"

"It was on a Tuesday; they were [like] this is your final day ... in fact move your folder to adult clinic; you will start adult clinic. I was shocked."

- Post-transition: Adolescents had difficulties settling in adult care.

"I went to the other side; just like, I feel lonely, I don't have anybody to talk to. I went to sit down quietly just like that"

"I felt very confused, ...the struggle there, it's not something that is easy ...they shout, they push one another.

Conclusions: ALHIV in our Nigerian cohort have gaps in transition preparation, planning and post-transition accommodation in the pre-, during, and post-transition periods. These experiences are important to consider in designing effective transition strategies that are responsive to ALHIV needs.

EPD154

High rates of co-occurring substance use: a key missed opportunity in young Black Latinx sexual minority men and transgender women living in the US

R.A. Sanders[1], N. Galai[2], A. Wirtz[3], C. Beyrer[3], S. Falade-Nwulia[4], D. Celentano[3], PUSH Study Group

[1]*Johns Hopkins University School of Medicine, Pediatrics, Division of Adolescent and Young Adult Medicine, Baltimore, United States,* [2]*University of Haifa, Department of Statistics, Mount Carmel, Israel,* [3]*Johns Hopkins School of Public Health, Epidemiology, Baltimore, United States,* [4]*Johns Hopkins School of Medicine, Division of Infectious Diseases, Baltimore, United States*

Background: Young Black sexual minority men and transgender women have some of the highest burdens of HIV in the United States. Substance use (SU) negatively impacts uptake of HIV prevention and treatment services and may contribute to disparities in HIV outcomes.. This analysis aimed to examine patterns of SU behavior over time, factors associated with SU, and whether SU changed with the onset of the COVID pandemic.

Methods: A longitudinal analysis of 195 young sexual minority men and transgender women, aged 15-24 living in 4 cities (Baltimore, MD; Washington, DC; Philadelphia, PA; and St. Petersburg/Tampa, FL) recruited to participate in the PUSH randomized study of an 18-month status-neutral intervention to increase HIV medication and PrEP adherence. At each follow-up visit, participants reported demographics, sexual and SU (tobacco, alcohol, cannabis, and other – amphetamine, hallucinogens, narcotics) behaviors in the previous 3 months. Logistic generalized estimating equation model with robust variance was used to identify correlates associated with each SU outcome accounting for repeated measurements per participant, adjusting for baseline characteristics (age, sexual identity, gender identity), and pre/post covid.

Results: Most (76%) youth described alcohol/cannabis use. SU patterns are illustrated in the Figure. Younger (15-18 and 19-21) compared to older (22-24) participants experienced a lower odds of tobacco and alcohol use. HIV diagnosis and bisexual identity were associated with 2.14 and 2.30 greater adjusted odds of tobacco and cannabis use, respectively. Transactional sex was associated with a 2.58, 2.42, 2.63 and 3.57 greater adjusted odds of tobacco, alcohol, cannabis, and other drug use, respectively. Unstable housing had 2.87 and 2.06 increased adjusted odds of tobacco and other drug use. Post-COVID was associated with lower adjusted odds of tobacco/cannabis use.

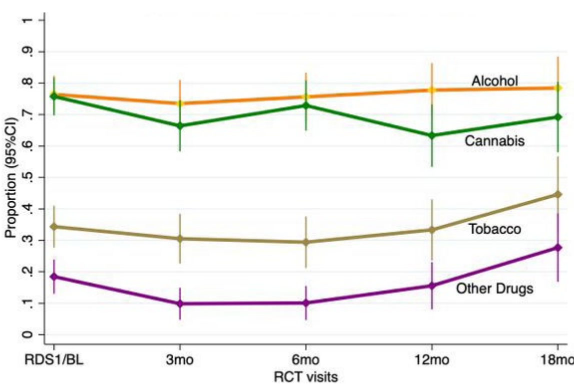


Figure. PUSH study: Substance use over time.

Conclusions: High SU indicates the need for integrated models to address co-occurring substance use, a key gap in HIV treatment adherence and prevention.

EPD155

Next generation HIV stigma: young people's perceptions of PLWHIV in contemporary South Africa

N. De Wet- Billings[1]

[1]*University of the Witwatersrand, Demography and Population Studies, School of Social Sciences, Johannesburg, South Africa*

Background: South Africa has one of the highest rates of HIV and AIDS in the world. Driving the infection rates are gender-based violence, lack of knowledge of the disease and stigma.

The objective of this study is to examine the perceptions of young people (15-24 years old) toward people living with HIV and AIDS (PLWHIV) with the aim of identifying key attitudes for targeted intervention.

Oral abstracts

Poster exhibition

E-posters

Late-breaker abstracts

Author Index

Methods: The study set in South Africa, will use data from the SABSSM 2017 data which is a nationally representative survey conducted by the HSRC (http://www.hsrc.ac.za/). A sample of 9,113,879 young people (15-24 years old) are analysed. The study will examine key perceptions by demographic, socioeconomic and sexual behaviour (including GBV) of respondents. Descriptive and inferential statistics are used.

Results: The table below shows the percentage distribution of key perceptions toward PLWHIV among youth in South Africa. The table shows that social attitudes toward marriage (21.01%) and talking about HIV (13.49%) are particularly negative. In addition, socioeconomic perceptions pertaining to employment (14.28%) and buying food from someone with HIV (13.49%) are also highly stigmatised.

Rank	Perception	Yes	No	Don't know
1	A person would be foolish to marry a person who is living with HIV/AIDS	21.01	70.02	8.97
2	Is it a waste of money to train or give a promotion to someone with HIV/AIDS?	14.28	80.79	4.93
3	Are you comfortable talking to at least one member of your family about HIV/AIDS?	84.06	13.49	2.46
4	If you knew that a shopkeeper or food seller had HIV, would you buy food from them?	84.52	13.35	2.13
5	Would you buy fresh vegetables from a shopkeeper or vendor if you knew that this person had HIV?	84.53	13.07	2.4
6	Do you think children living with HIV should be able to attend school with children who are HIV negative?	89.61	7.79	2.6
7	If a pupil has HIV but not sick, should he or she be allowed to continue to go to school?	89.53	7.86	2.61

Table.

Conclusions: Despite the country's many efforts stigma around PLWHIV exists among young people in South Africa. This is concerning as young people will likely grow with these misconceptions and contribute to further perpetuation in the state. Efforts to reduce stigma among young people will reduce infections.

EPD156

The importance of psychosocial resources in positive adaptation to challenging situations among adolescents living with a perinatal HIV infection in Kwazulu-Natal, South Africa

T. Nyoni[1], L. Small[2], M. McKay[3]

[1]University of Toronto, Factor-Inwentash Faculty of Social Work, Toronto, Canada, [2]University of California Los Angeles, UCLA School of Public Affairs, Department of Social Welfare, Los Angeles, United States, [3]Washington University in St. Louis, The Office of the Provost, St. Louis, United States

Background: The ability to cope with adversity (or positive adaptation to challenging situations) can improve health outcomes, particularly among adolescents living with a perinatal HIV infection (APHIV), exposed to HIV-related stressors. Despite APHIV's positive adaptation to challenging situations, little is known about the role of psychosocial resources in enhancing their ability to cope with adversity.

This study examines the association between psychosocial resources and the ability to cope with adversity among APHIVs living in KwaZulu-Natal, South Africa.

Methods: This cross-sectional study used baseline data from the VUKA Family Program, an RCT conducted with a convenience sample of 315 perinatally HIV-infected adolescents (ages 9 to 15) and their caregivers in KwaZulu Natal, South Africa, between 2011 and 2016. Predictors were psychosocial resources and counseling serviced use, with coping as the outcome. Psychosocial resources (e.g., positive parenting, number of supportive relationships, HIV knowledge) and the ability to cope with adversity were measured using APHIV self-reports to standardized scales. Counseling service use was assessed using caregiver reports to a single item measure. An ordinary least squares (OLS) regression model was conducted to examine the associations between psychosocial resources and the ability to cope with adversity. Regression analyses adjusted for child age, gender, living with a biological mother, and caregiver age.

Results: Univariate statistics indicate that among APHIVs, 60% reported high levels of positive parenting, 93% reported high rates social support, and 85% reported medium to high levels of HIV knowledge.

Among caregivers, 75% reported their APHIVs used counseling services. OLS regression results showed increased HIV knowledge (β = .09, p =.006), high rates of available supportive relationships (β = .23, p =.003), and positive parenting (β = .08, p =.042) were positively associated with the ability to cope with adversity. However, counseling service use (β = -.48, p = .016) was negatively associated with coping with adversity.

Conclusions: Psychosocial resources are associated with the improved ability to cope with adversity among APHIVs. Counseling is not enough for these youths. Psychosocial interventions that enhance coping and provide emotional/instrumental support should be promoted to better serve the needs of APHIV facing challenging situations.

EPD157

A new approach to achieving HIV prevention outcomes for AGYW: progressing the journey to relationship goals

J. Mulhausen[1], P. Kramer[1], P. Noble-Campbell[1], A. Gangaramany[2], Y. Croucamp[3], P. Manchi[4]
[1]Upstream Thinking, Austin, United States, [2]Final Mile Consulting, Chicago, United States, [3]Final Mile Consulting, Johannesburg, South Africa, [4]Final Mile Consulting, Mumbai, India

Background: In South Africa, our prior research indicated that 62% of high risk Adolescent girls and young women (AGYW) aged 15-24 did not see relevance for HIV prevention in their lives and thus weren't adopting preventive behaviors. In 2021, an innovative program was co-created with AGYW, implementing partners and donors (USAID, BMGF) and introduced that aimed to progress AGYW through their journey to a point where HIV prevention products would become relevant in their lives.

Description: Together with two implementing partners (ANOVA and TB/HIV Care) the Relationship Workshop was developed as a hybrid program that consisted of impactful one day in-person sessions once a week over 5 weeks along with asynchronous WhatsApp group conversations, much shorter than other structural programs.

Organized by 3 different segments of AGYW, the workshop is structured to start with relationship goals and work towards relevance of sexual health with interactive activities that build on one another. Different from didactic programs, facilitators help participants arrive at their own conclusions and priorities, culminating in commitments to behavior change.

Lessons learned: The pilot program successfully progressed over half of the participants (58%) in their relationship journey and that progression was durable after 3 months. Increases in relevance were seen in the increased interest in PrEp (51%), likelihood of testing (67%) and likelihood of asking partners to get tested (71%).

Key behavioral changes were seen in the increased PrEp initiation (69%), and testing (36%) along with self-reported changes of increased communication with partners about their relationship in the data collected for one segment. The experience created a sisterhood that was missing in the lives of high risk AGYW.

Conclusions/Next steps: Relationship Journey progression of high risk AGYW correlates with increased prevention behaviors such as testing, PreP initiation, etc. Scaling this program and its underlying principles represents an opportunity to prepare 62% of the market for multiple products in the HIV prevention pipeline.

To attract participants at scale, segment specific communication and channels can be optimised to meet AGYW where they are and address their relationship needs. A hybrid digital and in-person approach supports behavior change better than either method alone.

EPD158

Effects of quality of caregiver-adolescent relationship on HIV, HSV-2 and on pregnancy incidence among young women in rural South Africa enrolled in HPTN 068

N. Shangase[1], J. Edwards[1], B. Pence[1], A. Aiello[1], A. Hussong[2], X. Gómez-Olivé[3], K. Kahn[3], M. Stoner[4], A. Pettifor[1,3]
[1]University of North Carolina at Chapel Hill, Gillings School of Global Public Health, Chapel Hill, United States, [2]University of North Carolina at Chapel Hill, Department of Psychology, Chapel Hill, United States, [3]University of the Witwatersrand, MRC/Wits Rural Public Health and Health Transitions Research Unit (Agincourt), Johannesburg, South Africa, [4]RTI International, Women's Global Health Imperative, San Francisco, United States

Background: Adolescent girls and young women (AGYW) are at an increased risk of acquiring HIV and HSV-2, and pregnancies are high as well in AGYW. Despite the protective effect of caregiver-adolescent relationships on risk behaviors, less attention has been paid to the effect of these relationships on sexually transmitted infections (STIs) and pregnancy.

Methods: We used longitudinal data from HIV Prevention Trial Network 068 – conducted among 2,533 AGYW (13 – 20 years) over 5 years in Agincourt, South Africa. Quality of caregiver-adolescent relationship (caring and closeness) was measured by asking AGYW perceptions of their relationship with their primary caregiver. Kaplan Meier and Cox models were used to estimate the effect of quality of caregiver-adolescent relationships (caring and closeness) on STIs and pregnancy.

Also, we assessed effect measure modification (EMM) by age (14-19 vs. 20-25 years) for STI risk using stratum-specific estimates and likelihood ratio tests (LRT) with a p-value <0.1 indicative of EMM.

Results: There were no significant differences in the hazard of HIV by our exposures (caring: hazard ratio (HR): 1.03, 95% CI: 0.75, 1.42; closeness: HR: 0.80, 95% CI: 0.57, 1.11).

Among 14-19-year-olds, those who reported caregiver caring were less likely to acquire HSV-2 (HR: 0.69, 95% CI: 0.51, 0.94, LRT = 3.89, p-value=0.0487); in contrast, there were no significant differences among 20 – 25-year-olds.

AGYW who reported high quality relationships had a lower hazard of incidence pregnancy (caring: HR: 0.79, 95% CI: 0.68, 0.93; closeness: HR: 0.76; 95% CI: 0.64, 0.91).

Conclusions: Findings indicate, positive caregiver-adolescent relationships are associated with reduced risk of HSV-2 among younger AGYW and pregnancy incidence. Family-centered interventions focused on improving these relationships are recommended.

EPD159

Economic empowerment and adherence to antiretroviral therapy improve the quality-of-life and school-life satisfaction among adolescents living with HIV in Uganda

S. Kizito[1], P. Nabunya[1], J. Nabayinda[1], V. Ssentumbwe[1], J. Kiyingi[1], F. Ssewamala[1]
[1]*Washington University in St. Louis, Brown School, St. Louis, United States*

Background: With the increased survival among adolescents living with HIV (ALWHIV) in the era of antiretroviral therapy (ART). ALWHIV experience psychosocial challenges such as school disruption, stigma, and discrimination. It is essential to pay attention to their psychosocial well-being.
In this longitudinal study, we explored the impact of a family-based economic empowerment intervention on the quality of life and School-life satisfaction among ALWHIV in Uganda.
Methods: We used data from a two-arm cluster-randomized trial between 2012 and 2018. The study recruited 702 ALWHIV (control =344 and intervention = 358), aged 10 – 19 years from 39 clinics in Uganda. The intervention included a long-term child development account, four micro-enterprise workshops, and 12 mentorship sessions.
We measured ART adherence using Wilson's three-item self-report measure. Quality of life was measured using four questions adapted from the Pediatric Quality of Life Inventory (alpha=0.9), while Satisfaction with school life was measured using an eight-item scale (alpha=0.9).
Outcomes were measured at baseline, 12, 24, 36 and 48 months post-intervention. We fitted three-level mixed-effects regression models to assess the impact of the intervention on the two outcomes.
We included the study group, the time of follow-up in years, and group-time interaction for each model. We also included adherence in the model to determine its association with our outcomes. We reported robust standard errors, and all p-values of 0.05 or less were considered significant.
Results: The intervention was significantly associated with increased school-life satisfaction, b = 0.74 (95% CI: 0.09 – 1.38), p value 0.026. Also, there was an increase in the quality of life of the adolescents over the five-measurement point, with statistically significant increases marked at 24 months b = 2.00 (1.06 – 2.93), p-value <0.001 and 48 months b = 1.00 (0.17 – 1.83), p-value 0.019.
In addition, optimal ART adherence was significantly associated with improved quality of life b = 0.52 (95% CI: 0.64 – 2.41), p-value 0.001 but did not affect school-life satisfaction.
Conclusions: Economic empowerment and optimal ART adherence play a key role in improving the quality of life among ALWHIV. HIV interventions should include economic empowerment and enhance treatment adherence.

EPD160

Food insecurity on trust in providers among adolescents and young adults newly diagnosed with HIV

T. Makuvire[1], T. Lemon[2], E. Rousseau[3], S. Sindelo[4], R. Julies[3], S. Weiser[5], L.-G. Bekker[4], I. Katz[1,6]
[1]*Brigham and Women's Hospital, Medicine, Boston, United States,* [2]*Harvard T. H. Chan School of Public Health, Boston, United States,* [3]*University of Western Cape, Cape Town, South Africa,* [4]*University of Cape Town, Cape Town, South Africa,* [5]*University of San Francisco, Medicine, San Francisco, United States,* [6]*Harvard Medical School, Boston, United States*

Background: The dual epidemics of food insecurity and HIV/AIDS are a growing concern in South Africa. Rates of undernourishment are increasing among people living with HIV (PLWH). Studies have shown the negative impacts of food insecurity on HIV related clinical outcomes. Given high levels of attrition in care for adolescents and young adults (AYA), we wanted to explore the association between food insecurity and trust in providers, a potential mediator of the relationship between food insecurity and wellness among AYA living with HIV.
Methods: We analysed baseline data from Standing Tall, a prospective cohort study of newly diagnosed HIV-positive AYA in South Africa collected between 2018-2019.
We performed a cross-sectional analysis of food insecurity, defined using the Household Food Insecurity Access Survey (HFIAS), and two measures of patient trust: complete trust in providers and complete trust in the healthcare system. Logistic regression analyses were performed with adjustment for the following covariates: age, gender, education, health literacy, and perceived social support.
Results: Overall, 100 subjects were included in the analysis. The mean age was 21 years old. Ninety percent of subjects were female. At baseline, the prevalence of food insecurity was 63%. There were minor differences in patient trust by food insecurity.
Those with less food insecurity reported higher complete trust (provider: 84% vs. 73%, healthcare system: 86% vs. 71%). In adjusted analyses, the odds of complete trust in the healthcare system was significantly lower in those with more food insecurity than those with less food insecurity (aOR: 0.28, 95% CI: 0.09, 0.97). The adjusted odds ratio for complete trust in providers was similar (aOR: 0.45, 95% CI: 0.15, 1.39).
Conclusions: The majority of AYA newly diagnosed with HIV in our study report high levels of food insecurity that are associated with lower trust in the healthcare system, potentially limiting antiretroviral therapy initiation and retention. Every health encounter with young PLWH should incorporate screening for food insecurity to increase early identification and referral to appropriate resources.

EPD161

Perspectives of youth living with HIV, parents, and public health experts on a novel mHealth application, *PEERNaija,* integrating medication reminders with virtual peer support and social/ financial incentives to improve adherence

C. Ekelem[1], I. Idigbe[2], L. Pierce[3], A.N. David[2], O. Ezechi[2], M. Were[3], C. Audet[3], A.A. Ahonkhai[3]
[1]*Vanderbilt University, School of Medicine, Nashville, United States,* [2]*Nigerian Institute of Medical Research, Lagos, Nigeria,* [3]*Vanderbilt University Medical Center, Nashville, United States*

Background: Youth living with HIV (YLWH) have greater rates of virologic failure than their adult counterparts due in part to medication nonadherence. *PEERNaija* is a novel, gamified mobile health application (app) designed to improve medication adherence by integrating medication reminders with social and financial incentives, virtual peer social support (via chatroom), and early clinic outreach for non-adherent YLWH in Nigeria.

Methods: User-centered design was employed to develop, then refine, an initial prototype of*PEERNaija.*We utilized Focus Group Discussions (FGDs) to identify reactions to key features (user interface, medication reminders, incentives, and peer support), facilitators and barriers to app use, and how well the app would meet adherence needs. FGDs were conducted with 3 groups:

1. YLWH (ages 15-27 years) engaged in care,
2. Parents of YLWH, and
3. Adolescent/public health agency representatives in Nigeria.

FGDs were recorded, transcribed, and analyzed using thematic content analysis.

Results: Fifty-one Nigerian YLWH (29 female, 22 male) with poor (15%), suboptimal (36%), and high medication adherence (49%) (based on pharmacy refills in the prior year), 14 parents, and 5 public/adolescent health experts participated in the FGDs. All groups expressed enthusiasm about the *PEERNaija* app and thought it would improve medication adherence by providing daily medication reminders and critical peer support. YLWH expressed excitement, especially about the gamified and incentive components. All participants highlighted the importance of maintaining privacy and minimizing disclosure threats. Some facilitators and barriers varied by stakeholder group [Figure 1].

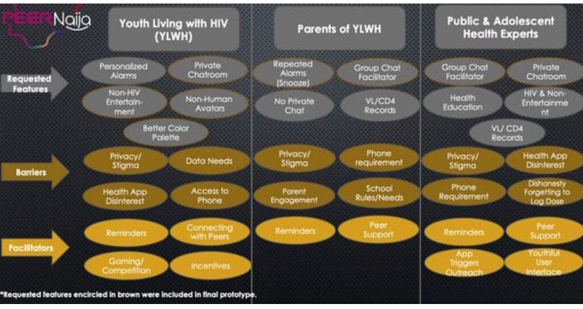

Figure 1. Stakeholder perspectives on facilitators and barriers to PEERNaija application use.

The app was refined in response to stakeholder feedback, prioritizing desired features of YLWH and addressing barriers across stakeholder groups.

Conclusions: Our findings suggest the*PEERNaija*app will be acceptable to all stakeholders (YLWH, parents, and public/adolescent health experts) and highlights the importance of user-centered design to adapt and refine mHealth interventions.

*Ekelem and Idigbe are co-first authors of this abstract.

EPD162

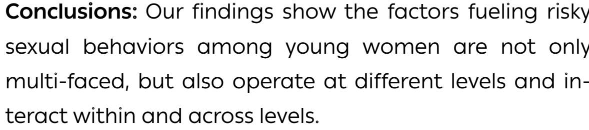
Factors for engagement in HIV-related risky sexual behaviors among young women in southwestern Uganda

J. Namanya[1], L. Zulu[1]
[1]*Michigan State University, Geography, Environment and Spatial Sciences, East Lansing, United States*

Background: Although sub-Saharan Africa has made commendable progress in the fight against HIV/AIDS, new HIV infections among young women remain high. In Uganda in 2018, young women (aged 15-24 years) had 14,000 new HIV infections, approximately triple the 5,000 among their male counterparts.

Methods: Using a modified Social Ecological Model for Young Women's Vulnerability to HIV Infection, this qualitative study explored the contextual and broader socio-structural factors underlying risky sexual behaviors associated with the high new HIV infections among young women (15-35 years) in Mbarara district, southwestern Uganda. From October 2018 to September 2019, we conducted 32 focus group discussions with purposively selected diverse stakeholders including young women, young men, elders and community members. Key informant interviews were conducted with 15 social workers. Focus group discussions and key informant interviews were audio recorded and transcripts analyzed using thematic analysis in ATLAS ti.

Results: The findings reveal young women continue to engage in transactional sex with older men to meet basic needs (food, shelter, school fees) and for materialistic gains (designer clothes, nice phones, cosmetics). Cross-generational sexual relationships were often characterized by imbalance of power to the disadvantage of the young women. Social norms that young people should submit to old people and that women are subordinate to men limited the young women's negotiating power for safe sex. Growing unemployment and underemployment even among college graduates were key facilitators of risky sexual behaviors among the young women. Dynamics at health facilities, including unprofessional health staff (judgmental, rude), long waiting times, and lack of privacy hindered young women from accessing HIV services. The rollout of antiretroviral drugs is reported to have reduced the perceived severity of HIV/AIDS and created a false sense of hope among young people generically.



Conclusions: Our findings show the factors fueling risky sexual behaviors among young women are not only multi-faced, but also operate at different levels and interact within and across levels.

The findings highlight the importance of implementing a holistic approach with different interventions at multiple levels (individual, dyad/relationship, friends/peers, family and community, institutional, policy) to address risky sexual behaviors fueling increased new HIV infections among young women.

EPD163

Engaging key population peer educators to improve HIV care and treatment outcomes amongst key populations

P. Ogunsanya[1], A. Ogunsanya[1], E. Kihika[1], D. Mpagi[1], M. Chebet[1], W. Ecedita[1], C. Adongo[1], D. Nagadya[1], C. Ndeloa[2], M. Cassolato[2]

[1]*Alive Medical Services, Clinical, Kamapala, Uganda,* [2]*Frontline AIDS, Programs, Brighton, United Kingdom*

Background: Key populations often face significant challenges in accessing care and treatment. In many countries including Uganda where certain sexual identifications and practices are criminalized, additional barriers are created by individuals' own fears of stigma, abuse, harassment and legal consequences. The COVID-19 pandemic catalysed paradigm shift in the delivery of health services with a greater push to the community and less focus on the facility. Alive Medical Services (AMS) with support from Frontline AIDS UK and Elton John AIDS foundation (EJAF) implemented a project aimed at promoting a resilient HIV response amongst Key populations.

Description: Peer educators from different categories of key populations including men who have sex with men, sex workers, transgenders were identified and trained in HIV care, counselling, linkage follow up and self-care interventions. Peer educators were assigned responsibility to follow up physically and virtually those in their category who are accessible to them and have consented. Peer educators would actively track and follow up appointment dates for refills and comprehensive clinical assessment. They pick refills or escort the client or inform the medical centre of the client coming to ensure they are fast tracked. Peer educators would distribute HIV self-testing kits and follow up to link for PrEP or ART. The peer educators report weekly on WhatsApp group and meet monthly with the facility staff to assess progress

Lessons learned: By Dec 2021, there was a 36% increase in the number of KPS retained in care, and the overall 12-month retention rate in care was at 96%, viral load coverage at 95% and viral load suppression at 93%.

Even with the COVID 19 challenges, overall performance across all of the HIV continuum for Key populations improved to be better than before COVID 19 as the peer educators intensified their community service delivery with close monitoring. Given that the Peer educators are also in care, they supported the others to overcome self-stigma and embrace self-care interventions.

Conclusions/Next steps: Peer to peer support models are ideal in promoting a resilient HIV response but also require intentional monitoring and support to track progress for effective and efficient delivery.

Keywords: Key population, Retention, Viral load

EPD164

A peer support model to promote adherence and retention in care in adolescents living with HIV during COVID 19

R. Tumba[1], N. Nene[1], C. Tait[1]

[1]*Anova Health Institute, Johannesburg, South Africa*

Background: The COVID-19 pandemic has had a significant impact on adolescents' mental health, with less social interaction, higher levels of anxiety, and depression. Adolescents living with HIV (ALHIV) face additional challenges including reduced face-to-face contact with their healthcare providers.

We describe the implementation and adaptations of a peer support model to provide social and emotional care for ALHIV in the primary care setting during COVID-19 in Johannesburg, South Africa.

Description: A peer support model, adapted from the Zimbabwe Zvandiri model, was implemented within our existing psychosocial support programme at seven Department of Health primary care facilities in Johannesburg, for clients 12-24 years. The relatable peer supporters, who are young people living with HIV aged 18-24 years, educate, and motivate clients using their lived experience.

Due to the pandemic occurring in waves, we implemented an adaptable hybrid model with different methods of support according to the COVID-19 burden at the time. Enrolment of clients, typically done face-to-face, was done telephonically during COVID-19 waves.

Support sessions were conducted in-person at facilities when restrictions eased and via WhatsApp when cases increased and in-between visits. Data is presented from November 2020 to December 2021.

Lessons learned: 635 adolescents and youth were enrolled *(12-14 years: 192; 15-19 years: 244; 20-24 years: 199)*,15% (n = 98) of whom had previously disengaged and were brought back into care through the peers' support and then enrolled. Close to 3,500 virtual and face-to-face support sessions were conducted. Clients' positive feedback included enjoying discussing their challenges with someone relatable at convenient times, that virtual support helped break the silence during lockdowns, and interacting with their peers during the virtual group sessions.

Challenges with virtual delivery included lack of data or a device to connect, poor network coverage (often related to electricity cuts), lack of flexibility over group times and group participants not joining as planned.

Conclusions/Next steps: Despite the barriers, an adapted combination peer support model can be an effective intervention for continuity of psychosocial care for adolescents and young people living with HIV during COVID-19. A focus on emotional wellbeing is important during pandemics, and to improve adherence.

EPD165
Prevalence of mental health distress among recently diagnosed HIV-positive South African youth in the Standing Tall randomized controlled trial cohort

C.P. Fontanet[1], T. Lemon[2], E. Rousseau[3], S. Sindelo[3], R. Julies[3], N. Siko[3], A. Fata[1], V. Earnshaw[4], L.-G. Bekker[3], I. Katz[1,5]
[1]Brigham and Women's Hospital, Department of Medicine, Boston, United States, [2]Harvard T.H. Chan School of Public Health, Department of Epidemiology, Boston, United States, [3]University of Cape Town, The Desmond Tutu HIV Foundation, Cape Town, South Africa, [4]University of Delaware, Department of Human Development and Family Sciences, Newark, United States, [5]Harvard University, Harvard Global Health Institute, Cambridge, United States

Background: In South Africa, 3.5% of males and 10.4% of females aged 15-24 years are living with HIV. Living with HIV is associated with a higher likelihood of mental disorders, which is associated with lower rates of HIV treatment adherence.
Understanding which psychosocial factors such as social support and future life orientation, impact mental health symptoms could help inform future interventions. In this study, we examine changes in psychosocial outcomes after a recent HIV diagnosis.
Methods: Our cohort included 100 adolescents and young adults enrolled between April 2018 and October 2019 in Cape Town, South Africa. Eligible participants were ages 18-24 years old who presented to a mobile testing van or were enrolled in the Women of Worth community-based cash and care program, tested positive for HIV, and resided in the study area.
We compared demographic and psychosocial characteristics of participants over 6 months using descriptive statistics and bivariate correlations.
Results: 90% of the adolescents in our sample identified as female and 92% had a high school level education or above. Over 6 months, the percentage of participants who reported depression or anxiety symptoms fell from 44% to 7%.
Participants reported a slight increase in religiosity and orientation towards the future, fewer maladaptive coping mechanisms, and a slight reduction in social support.
Participants with persisting mental distress symptoms were more likely to report baseline or ongoing maladaptive coping mechanisms.

	Baseline	Endline	Change
PHQ-9 Score, mean (SD)	4.5 (4.2)	1.6 (2.3)	-2.9 (4.9)
Mild to severe depression, N (%)	34 (34%)	11 (11%)	-24%
GAD-7 Score, mean (SD)	3.7 (3.0)	1.6 (2.0)	-2.1 (3.0)
Mild to severe anxiety, N (%)	32 (32%)	9 (9%)	-23%
Composite mental health distress score, mean (SD)	8.2 (6.7)	3.2 (4.0)	-5.0 (7.4)
Religiosity, mean (SD)	75.4 (28.9)	84.8 (21.9)	10.0 (34.7)
Social Support, mean (SD)	55.2 (16.9)	52.8 (14.6)	-2.5 (23.8)
Life Orientation, mean (SD)	72.3 (13.0)	73.9 (9.3)	0.80 (12.9)
Maladaptive Coping, mean (SD)	35.5 (15.2)	31.0 (10.0)	-4.1 (16.3)

Table 1. Mental Health Outcomes (N=100)

Conclusions: The prevalence of mental health distress in our cohort was lower than previously reported in the literature, especially 6 months after diagnosis. Improvement was associated with a decrease in maladaptive coping mechanisms. Interventions that leverage healthy coping skills may help reduce the burden of mental health distress on South African adolescents newly diagnosed with HIV.

EPD166
The road to reach marginalized adolescent girls and young women with SRH/HIV services in Nairobi Kenya - responded driven sampling

M. Akolo[1,2], E. Ndirangu-Mugo[1], J. Kimani[2], B. Waweru[1], R. Wagathu[1], H. Musembi[1], I. Kambo[1], L. Gelmon[2]
[1]Aga Khan University, SONAM, Nairobi, Kenya, [2]University of Manitoba, PHDA, Nairobi, Kenya

Background: Many adolescent girls and young women (AGYW) residing in informal settlements within Nairobi County engage in sex work but don't seek Sexual Reproductive Health (SRH) Services and HIV services. Cases of increased teen pregnancies and HIV incidences were observed from March 2020 to April 2021, where COVID-19 cases had led to school closure. Some of the marginalized AGYW are school going girls with babies, engaging in sex work to earn a living. They operate in shadows/fringes of existing hotspots/streets frequented by other sex workers, making it hard for healthcare providers to access and offer SRH/HIV services. Partners for Health and Development in Africa (PHDA) sought to mobilize and retain AGYW sex workers into a program offering free SRH/HIV services.
Methods: Responded Driven Sampling (RDS), method was employed to reach AGYW sex workers aged 15-24 years accessing SRH /HIV services at PHDA clinics in a period of three months. Fourteen seeds were purposefully selected from PHDA facilities, the seeds brought their friends following the Social Network Strategy (SNS) platform.
Results: In three months, we managed to reach, mobilize and link 100 AGYW to SRH/HIV services through RDS. All 100 AGYW were selling sex for survival on the streets and controlled hot spots, 67% (67) were school going girls with no parents, 46% (46) were single mothers. None of them was aware of availability of facilities offering free SRH/HIV services. 99% of the girls preferred three monthly PrEP/PEP

injection as a form of HIV prevention-Among the reasons given were "confidentiality, no one knows or sees the drug in your body" another one said, "she does not want to be judged by her mother and friends in school".

All the girls agreed to HIV testing whereby 13% (13) tested HIV positive.

Most preferred 5AM-7PM as best time of accessing SRH/HIV services before going to school, or after leaving the streets, some chose 5 PM-7PM that's before heading to the streets/pallor or after school.12/70(17%) were treated syndromically for STIs.

Conclusions: Young sex workers have higher SRH/HIV burden, ways to help this group to access SRH/HIV services should be researched and devised by policy makers.

EPD167

Adapting tablet-based neuropsychological tests for luo-speaking adolescents and young adults with perinatally acquired HIV in Uganda: the translation process for two languages

N. Asiedu[1], R. Robbins[1], A. Santoro[1], C. Ferraris[1], J.L. Gumikiriza-Onoria[2], A. Nanteza[3], S. Dirajlal-Fargo[4]

[1]*Columbia University and New York State Psychiatric Institute, HIV Center for Clinical and Behavioral Studies, New York, United States, [2]Makerere University College of Health Sciences, School of Medicine, Department of Psychiatry, Kampala, Uganda, [3]Butabika National Referral Mental Hospital, Kampala, Uganda, [4]Case Western University School of Medicine, Department of Pediatric Infectious Diseases, Cleveland, United States*

Background: Neurocognitive problems are common among adolescents and young adults (AYA) with perinatally-acquired HIV (PHIV) and detecting them requires neuropsychological (NP) testing. However, few NP tests exist for languages in Uganda (i.e., Luganda and Luo). Adapting NP tests for different languages requires careful consideration of word choice to ensure culturally appropriate and understandable translations. Additionally, NP tests may use technical words not readily translatable to other languages (e.g., "motor skills").

This study describes a novel process of translating a battery of tablet-based NP tests for use for AYA with PHIV in Uganda into the Luo and Luganda languages.

Description: Two professional translators were hired to translate the English NP tests into Luo and Luganda. After the English-to-Luo and English-to-Luganda translations had been generated, two groups comprised of bilingual speakers (Luo- English, Luganda-English) back-translated the respective translations into English. Translator groups met to compare and review all translations for accuracy, cultural appropriateness, and understandability.

Lessons learned: Groups identified translations that could cause confusion such as: words that were too formal (e.g., *obukulungwa* in Luganda for "circle"), words that did not convey the English as intended (e.g, "sign language" in Luo for "motor skills"), and words that did not accurately describe visual stimuli (e.g., "brown" in Luo for "yellow"). Some technical words did not have a direct translation and had to be resolved by the groups to produce an understandable alternative (e.g., there is no word for maze in Luganda, but "arrangement of walls" was an accepted alternative).

Conclusions/Next steps: Forward translation alone of NP tests from English to Ugandan languages did not provide the most accurate and understandable translations, which could affect an examinee's understanding of task demands and subsequent test performance.

Using a group of bilingual speakers to back-translate and review allowed for greater insight into the cultural appropriateness of the translations and helped produce translations that conveyed the intended meaning of the English text (especially technical terms) to understandable Luo and Luganda.

This process can serve as a model for future translations of NP testing, and our findings could inform future translations of NP tests for different languages.

EPD168

Engaging social networks to increase HIV case finding among key populations

P. Kalenga[1], S. Wenson[1], F. Mulenga[1], F. Mwape[1], S. Nyirenda[1], J. Kamanga[1], N. Phiri[2], M. Bateganya[3], E. Oladele[1]

[1]*FHI 360 Zambia, Lusaka, Zambia, [2]United States Agency for International Development, Lusaka, Zambia, [3]FHI 360, Durham, United States*

Background: In Zambia, the USAID Open Doors project (ODP) provides access to comprehensive HIV prevention, care, and treatment services to key populations (KP): female sex workers (FSWs), men who have sex with men (MSM), and transgender people.

After observing that the project's initial HIV case-finding rate among KPs was lower than the national general population yield of 12%, the project introduced the social networking strategy (SNS) to increase HIV case finding. We share lessons from eight project sites for implementation October 2017–September 2019.

Description: To implement SNS, ODP identified 33 KP peer leaders who were familiar with the project, maintained a large KP social network, and could mobilize their peers. Peer leaders were trained to identify high-risk clients from their social networks who could act as "seeds" to distribute coupons for services at ODP wellness centers to additional unreached clients. Each coupon included a unique identifier to track clients and seeds. Peer leaders were asked to identify at least three seeds to distribute coupons each month.

Monetary incentives were provided for every coupon returned to the wellness center. A risk assessment tool—evaluating condom use, number of sexual partners, and sexually transmitted infection history—was used to gauge clients' risk level and eligibility to receive a coupon.

Lessons learned: After implementation of SNS, project case finding increased from 13% in FY17 (FSWs=1,221 [16%]; MSM=117 [5.6%]; transgender people=30 [11%]) to 28% in FY19 (FSWs= 3,574 [32%]; MSM=774 [19%]; transgender people=119 [36%]). There was a significant increase in project yield in FY19 (*M* = 1105.75, *SD* = 370.3) compared to FY17 (*M* = 342, *SD* = 119.7), $t(3) = -3.21$, $p < .05$. By the end of FY19 the total SNS positivity contribution to the project yield was 32%, and 2,115 (76%) coupons were returned from 2,799 distributed to clients across all sites.

Conclusions/Next steps: SNS was successful in increasing case finding among KPs. Leveraging trusted and knowledgeable social relationships to extend HIV services to hard-to-reach KP individuals is a strategy that should be scaled up.

EPD169

Health care practices of young people and adolescents using PrEP from the perspective of health providers

A.Z. Urbano[1], Y. Raymundo[2], E. Zucchi[3], A. Grangeiro[4]
[1]Universidade Católica de Santos, Programa de Pós-Graduação em Saúde Coletiva, Santos, Brazil, [2]Universidade Católica de Santos, Nursery Undergraduate, Santos, Brazil, [3]Universidade Católica de Santos, Programa de Pós-Graduação em Saúde Coletiva, Mestrado Profissional em Psicologia, Desenvolvimento e Políticas Públicas, Santos, Brazil, [4]Universidade de São Paulo, Faculdade de Medicina, São Paulo, Brazil

Background: Health providers are key in the delivery of PrEP tailored to young people and adolescents needs. We analyzed the perceptions of health providers regarding engaging adolescents into PrEP care in Brazil.

Methods: Nested in a PrEP demonstration study (PrEP 1519), eight in-depth interviews were conducted with health professionals who serve young people aged 15 to 19 years who use PrEP in a Center for Testing and Counseling in São Paulo, Brazil. Most were male (5), white (4), homosexuals (6), with complete graduation (7) and aged between 25 and 52 years old. The interviews were conducted by video call on account of the Covid-19 pandemic in October 2020 and finalized in February 2021.

Results: Health professionals described young people and adolescents as sincere and interactive during attendance. However, low of responsibility is an often cited and age-related characteristic. Providers reported that using a language closer to the teenager's daily life positively influences the relationship with health care and consequently improves adherence to PrEP use.

The use of PrEP is seen by professionals as a self-care strategy and they cite the ease of access to the service and the use of more welcoming professional practices as determining factors for the successful use of PrEP by adolescents. The sexual orientation of self-declared gay/homosexual providers is associated with the affection and paternalistic care given to adolescents, causing the provider to project a greater identification in the adolescent and, with this, they reported greater understanding of personal issues and sought greater proximity to the participants, able to influence the use of PrEP and other HIV prevention strategies.

Conclusions: Health providers have different perspectives about the use of PrEP and adolescents. Using daily and understanding language are factors that bring health providers closer to adolescents and improve the use and adherence of PrEP. Ease of access to the service and finding a diverse and welcoming team are crucial in health care for adolescents. Sexuality diverse providers are seen as capable an affectionate link capable of positively influencing the choices of health care and HIV prevention strategies.

EPD170

Effect of community and facility-based care on viral load suppression among young women on ART in the Mulago Immune Suppression (ISS) clinic

R. M. Kivumbi[1], N. Kalema[2], F. C. Semitala[3,4], R. Akunzirwe[1], J.F. Zalwango[1], J. N. Kalyango[1,5]
[1]Makerere University, Clinical Epidemiology Unit, Kampala, Uganda, [2]Makerere University, Infectious Diseases Institute, Kampala, Uganda, [3]Makerere University, School of Medicine, Kampala, Uganda, [4]Mulago Hospital, Mulago Joint AIDS Program ISS Clinic, Kampala, Uganda, [5]Makerere University, Department of Pharmacy, Kampala, Uganda

Background: The burden of HIV is still high among young women aged between 15- 24 years in Uganda. Viral load suppression, an indicator of successful treatment outcomes, stands at 44.9% among HIV positive young women aged 15-24 years, much lower than the UNAIDS target of 73%. The Uganda Ministry of Health (MOH) released the national implementation guide for differentiated service delivery (DSD) to optimize quality of care and efficiency of service delivery for HIV treatment among specific populations, however, it is not clear if viral load suppression levels remain optimal among young women under DSD. We evaluated the effect of receiving community-based care versus facility-based care on viral load suppression levels among young women in the Mulago ISS clinic.

Methods: A retrospective cohort study was conducted among 49 young women receiving community-based care versus 153 receiving facility-based care identified during January 2018 and March 2020. Medical records of young women (15-24 years) who are HIV positive on the same ART regimen for at least 12 months, with a suppressed viral load, good adherence to ART of greater than 95%, were extracted and used for analysis. Main outcome variable was viral load suppression 12 months after ART initiation.

Results: Of the 202 young women studied, majority had normal weight (48.3%), no signs and symptoms of TB (98.0%) and in WHO treatment stage I (81.4%). Factors associated with viral load suppression included; receiv-

Author Index

ing community based care (Incidence risk ratio [IRR]= 1.43, 95% CI=0.88-2.36); PMTCT care entry point (IRR=4.21,95% CI=1.70-10.4).

Conclusions: The incidence of viral load suppression was increased by 43% among young women receiving community-based care compared to those receiving facility- based care. Based on these results, we argue there is potential of achieving better viral load suppression levels among young women by scaling up community-based care for treatment of HIV in Uganda, by augmenting the capacity of health care providers to deliver these services at that community level and increasing the number of community centers in the Kampala area. Further work will help refine treatment strategies and combat the spread of HIV in Uganda and beyond.

EPD171

CHILL the series: engaging key populations through use of edutainment and digital media

C.B. Wilson[1], M.W.A. Holgate[2]

[1]The ASHE Company, Kingston, Jamaica, [2]The ASHE Company & The University of the West Indies, Mona, Kingston, Jamaica

Background: COVID-19 has furthered the issues as some of the population would have been forced to become more reclusive. The ASHE Company developed and produced the first season of a 13-part television series to help reduce the prevalence of HIV in Jamaica. The Chill Series tells the story of a group of Jamaican millennials as they navigate the realities of the still present HIV epidemic intrudes on their lives and pushes them to face fears and uncomfortable truths.

Description: CHILL the series was released in March 2021 on YouTube and featured the release of thirteen weekly episodes for 25 minutes each. Each episode pushed the envelope on various HIV related issues affecting MSM, Youth, PLHIV, women and TG in a culturally relevant manner. Each episode also featured a call to action and a 60 minutes live, interactive post-show inter active discussion on social media.

Lessons learned: The series had viewership of approximately 21,000.00 each episode. A total of 1027 MSM were tested through the CHILL Series and supporting interventions across the island. Approximately 30 PLHIV were identified during the period. 70% were new cases and 30% were known cases. Over 50% of cases identified were linked and/or returned to care.

Future orientation protects against suicidal ideation among adolescents and young adults affected by perinatal HIV

L. Liotta[1], L. Kluisza[1], N. Nguyen[2], C.S. Leu[1,3], R.N. Robbins[1], C. Dolezal[1], P. Kreniske[1], A. Wiznia[4], E.J. Abrams[5], C.A. Mellins[1]

[1]HIV Center for Clinical and Behavioral Studies, New York State Psychiatric Institute and Columbia University, New York, United States, [2]The Aaron Diamond AIDS Research Center, New York, United States, [3]Department of Biostatistics, Mailman School of Public Health, Columbia University, New York, United States, [4]Jacobi Medical Center, Albert Einstein College of Medicine, Bronx, United States, [5]ICAP at Columbia University, Mailman School of Public Health and Vagelos College of Physicians & Surgeons, Columbia University, New York, United States

Background: Adolescents and young adults (AYA) with perinatal HIV infection (PHIV) are challenged by living with a stigmatized chronic illness while also navigating transition into adulthood. We previously found significantly higher rates of attempted suicide in AYAPHIV compared with perinatally HIV-exposed, uninfected (PHEU) peers. However, few studies have examined suicidal ideation

(SI), a strong predictor of suicide attempts, nor factors associated with SI in HIV-affected AYA. Future orientation has been found protective against SI in other AYA but has not been investigated in AYAPHIV and AYAPHEU. To inform interventions, we examined associations between future orientation and SI in AYAPHIV and AYAPHEU.

Methods: Data come from an ongoing longitudinal New York City (NYC)-based cohort study of 206 AYAPHIV and 134 AYAPHEU enrolled when 9-16 years and interviewed every 12-18 months. These analyses focus on 3 follow-up visits which included questions on future orientation and SI (follow-ups 2, 4 and 5). Past-year SI and psychiatric disorders were assessed using the DISC-IV.

Future orientation was assessed using four items, rated on a 5-point Likert scale (1=very low, 5=very high), measuring confidence that participants will:

1. Go to college,
2. Have an enjoyable job,
3. Have a happy family life, and
4. Stay in good health.

We used generalized estimating equations to estimate differences in mean future orientation scores by PHIV-status and adjusted odds ratios (AOR) and corresponding 95% confidence intervals (CI) for associations between future orientation and SI across visits, controlling for age, sex, follow-up, and PHIV-status.

Results: In this cohort of primarily Black and Latinx AYA living in vulnerable communities in NYC, across visits, AYA reported high future orientation (mean score=4.12), and relatively low rates of SI (15 AYAPHIV [3.20%] versus 6 AYAPHEU [2.00%]) with no statistically significant differences by PHIV-status in either variable. Overall, higher future orientation was associated with lower odds of SI (AOR=0.48, 95% CI: 0.23, 0.996).

Conclusions: Our findings highlight the resiliency of AYAPHIV and AYAPHEU, who reported high future orientation and low SI, despite HIV-related challenges. Understanding how future orientation can be cultivated and sustained, as well as how it protects against SI can inform preventive interventions for AYAPHIV and AYAPHEU.

EPD173

A moderated mediation model: does HIV status moderate the mediating role of coping between loneliness and depression among adolescents in India?

A. Gill[1], I. Marbaniang[2], S. Sangle[3], S. Nimkar[4], A. Chavan[4], S. Suravase[4], A. Pawar[4], K.P. Theall[1], A. Gupta[5], V. Mave[4], N. Suryavanshi[4]

[1]Tulane University School of Public Health and Tropical Medicine, Department of Social, Behavioral, and Population Sciences, New Orleans, United States, [2]McGill University, Department of Epidemiology, Montreal, Canada, [3]Byramjee Jeejeebhoy Government Medical College, Pune, India, [4]Byramjee Jeejeebhoy Government Medical College/Johns Hopkins University Clinical Trials Unit, Pune, India, [5]Johns Hopkins University, School of Medicine, Baltimore, United States

Background: A high burden of mental health conditions has been reported among adolescents living with HIV. Stressors such as loneliness associated with HIV status may lead to poor coping styles contributing to this higher burden, potentially mediating the relationship between loneliness and depression among adolescents.

Hence, we examined the mediating role of coping strategies between loneliness and depression among adolescents living with and without HIV in India and the moderating role of HIV status on this relationship.

Methods: A cross-sectional and conveniently sampled study at a tertiary care government hospital in Pune conducted from August 2018 to June 2020 was leveraged for the secondary data analysis. The study included adolescents (15-19 years) living with (N=70) and without HIV (N =126). A moderated mediation analysis with bootstrapped confidence intervals was implemented in MPLUS 8 with loneliness as exposure, coping strategies as a mediator, depression as an outcome, and HIV status as moderator. Twelve separate models with coping strategies (venting, diversion, self-reliance, social support, solving family problems, avoidance, spirituality, close friendships, professional support, engaging in demanding activities, humor, relaxing) as mediator was implemented. Only significantly mediating strategies were included in the moderated mediation model.

Results: The mean age of the study sample (N=196) was 17 years, with a range of 15-19 years. Females and faith-based minorities constituted 59.18% and 9.18% of the sample. Depression and severe loneliness were reported by 57% and 23% of the study population respectively. Venting as a coping strategy was seen to mediate the relationship between loneliness and depression among adolescents living with and without HIV, with an indirect effect of 0.09 (p=0.02).

A unit increase in loneliness was associated with a 0.20-point decrease in venting as a coping strategy (p<0.05) and a 0.60-point increase in depression scores (p<0.05). Venting was associated with a 0.47-point decrease in depression scores (p=0.02). However, no moderation by HIV status on the mediating effect of venting was seen.

Oral abstracts

Poster exhibition

E-posters

Late-breaker abstracts

Author Index

Conclusions: The findings indicate that interventions to improve depression among adolescents living with HIV should not only focus on individual-level factors such as coping strategies like venting but also interpersonal factors to reduce loneliness.

EPD174

Mobile technology access and use among youth in Nairobi, Kenya: implications for mobile health intervention design

B. Kharono[1], K. Ronen[1], A. Kaggiah[2], C. Mugo[2,1], D. Seeh[2], B. Guthrie[1], M. Moreno[3], I. Inwani[2], G. John-Stewart[1,4]
[1]*University of Washington, Seattle, Global Health, Seattle, United States,* [2]*Department of Paediatrics and Child Health, Kenyatta National Hospital, Paediatrics and Child Health, Nairobi, Kenya,* [3]*Department of Pediatrics, University of Wisconsin-Madison, Paediatrics and Child Health, Madison, United States,* [4]*University of Washington, Seattle, Departments of Epidemiology, Medicine, Pediatrics, University of Washington, Seattle, WA, USAPaediatrics and Child Health, Seattle, United States*

Background: While few studies have used smartphone-based interventions to support the health of youth in SSA, there is growing interest in using this platform in this age group. Social media can be used to support the health of underserved youth beyond clinical settings. Young people are avid users of social media, but estimates of smartphone access among youth in sub-Saharan Africa are lacking, making it difficult to determine context-appropriateness of online and social media interventions.

Methods: We conducted a cross-sectional observational survey assessing technology access and use among youth aged 14–24 receiving general outpatient / HIV care in three hospitals in Nairobi, Kenya classified as a national referral hospital, a county referral hospital, and a sub-county hospital. Data collection was conducted between December 2017 and April 2018. Participants were recruited in-person through convenience sampling by study staff. HIV care clinics. Correlates of smartphone access and social media use were evaluated by Poisson regression with robust standard errors. Data were analyzed using R version 4.0.2.

Results: Of 600 youth, 301 were receiving general outpatient care and 299 HIV care. Median age was 18 years. Overall, 416 (69%) had access to a mobile phone and 288 (48%) to a smartphone. Of those with smartphones, 260 (90%) used social media.

Smartphone access varied by facility (40% at the sub-county hospital*vs.*55% at the national referral hospital, P=0.004) and was associated with older age [65% in 20–24-year-old*vs.*37% in 14–19-year-old, adjusted prevalence ratio (aPR) 1.58, 95% CI: 1.30–1.92], secondary*vs.*primary education (aPR 2.59, 95% CI: 1.76–3.81), and HIV*vs.* general outpatient care (aPR 1.18, 95% CI: 1.01–1.38). Social media use was similarly associated with facility, older age, higher education, and male gender.

Conclusions: These data suggest that smartphone-based and social media interventions are accessible in Nairobi, Kenya, in the general population and youth living with HIV, and most appropriate for older youth.

Intervention developers and policymakers should consider smartphone and social media interventions as candidates for youth health programs, while noting that heterogeneity of access between and within communities requires tailoring to the specific intervention context to avoid excluding the most vulnerable youth.

EPD175

Transactional sex among adolescents enrolled in a cash plus intervention in rural Tanzania: a mixed-methods study

M. Ranganathan[1], S. Quinones[2], T. Palermo[2], U. Gilbert[3], L. Kajula[4]
[1]*London School of Hygiene and Tropical Medicine, London, United Kingdom,* [2]*University at Buffalo, Buffalo, United States,* [3]*UNICEF, Dar es Salaam, Tanzania, The United Republic of,* [4]*Independent Consultant, Dar es Salaam, Tanzania, The United Republic of*

Background: Transactional sex or material exchange for sex is associated with HIV incidence among adolescent girls and young women in sub-Saharan Africa. The motivations for engaging in transactional sex vary from the fulfilment of basic needs, to enhancing social status or the expectation that men should provide.

Transactional sex is also associated with HIV risk behaviours, such as multiple sexual partners and other determinants of HIV risk, including partner violence and abuse, alcohol consumption, and inconsistent condom use.

Methods: Our study examines drivers of transactional sex within the context of the *Ujana Salama* 'cash plus' intervention in rural Tanzania and examines whether the 'plus' intervention reduced transactional sex among adolescents and young women. We use data from the first and third rounds of data collection.

The impact evaluation consisted of a parallel mixed-methods design where the quantitative and qualitative data collection occurred simultaneously, and integration of the findings were done during interpretation and the discussion.

We used multivariable logistic regression models to estimate the association between transactional sex and contextual factors and performed analysis of covariance (ANCOVA) to explore whether the cash plus reduced transactional sex. We used thematic content analysis for analysing qualitative transcripts.

Results: The prevalence of transactional sex among unmarried female adolescents at wave 3 was 26%. Findings show that increasing age is a risk factor for transactional sex (OR=1.80; 95% CI: [1.50, 2.17]), staying in school was protective against engagement in transactional sex and sexual violence was associated with increased odds of transactional sex (OR=0.23; 95% CI: [0.14, 0.39]).

The cash 'plus' intervention showed no impacts on reducing transactional sex (β=0.003, p=0.905), although there was evidence of improvements in food security.

Conclusions: The mechanisms of impact for a cash plus intervention on transactional sex is complex; economic insecurity is an important driver, but psychosocial factors and gendered social norms need consideration in intervention development.

Combination prevention interventions that can address structural drivers of HIV infection, such as barriers to school attendance and economic vulnerability, alongside empowering adolescents by addressing psycho-social factors, such as improving self-esteem or cultivating aspirations and addressing gendered social norms hold potential.

EPD176

Social support and life experiences among Adolescents living with HIV (ALWH): a mixed methods study conducted in Kilimanjaro, Tanzania

I.U. Swai[1], R. Maro[2], L. Masika[2], K. Ngowi[2], A. Mtenga[2], N. Lekashingo[1], B. Mtesha[1], M. Sumari-de Boer[3,4]

[1]*Kilimanjaro Clinical Research Institute, Clinical Research, Kilimanjaro, Tanzania, The United Republic of,* [2]*Kilimanjaro Clinical Research Institute, Kilimanjaro, Tanzania, The United Republic of,* [3]*Kilimanjaro Clinical Research Institute, Clinical Research, Moshi, Tanzania, The United Republic of,* [4]*Amsterdam Institute for Global Health and Development, Amsterdam, Netherlands, the*

Background: Tanzania has an HIV prevalence of 2% among adolescents aged 15-19. Despite having good access to lifelong ART, adolescents living with HIV (ALWH) have poor adherence to medication. Social support is key for people living with HIV (PLHIV) to manage their situation.This study describes social support and general life experiences of ALWH in Kilimanjaro, Tanzania.

Methods: We conducted a cross-sectional study using mixed methods from September 2021 to January 2022. A semi-structured questionnaire was used to interview adolescents aged 15-19 years receiving HIV care from four health facilities in Kilimanjaro Tanzania.

We conducted in-depth interviews with purposively selected adolescents until data saturation was reached. Descriptive statistics were done for quantitative data. Categorical variables were summarized using frequencies and proportions while numerical variables using means and standard deviations. Association was determined using P value. We used thematic analysis for qualitative data.

Results: We included 81 adolescents, 11 interviewed in-depth. Forty-four (54.3%) were male. Adolescents had an average of 9.3(SD 4.5) years in HIV care. 48(59.3%)of adolescents reached optimal adherence (≥95%).

Those with a supportive person to remind them to take medication were 67(82.7%) while 53(65%)had people that collected medication for them in case they couldn't attend.Seventy-one (88%) were part of peer support groups and 66(81.5%) received HIV education from those groups. Thirteen (16%) adolescents were in a relationship, but not sexually active.

Among 12 adolescents (14.8%) that reported experiencing difficulties due to their HIV status, 7(58%)were girls. Gender was not significantly associated with experiencing difficulties due to HIV(p=0.35).Themes from in-depth interviews were:

1. The need for reminders to take medication and clinic visits,
2. Peer support groups,
3. Financial support,
4. Difficulties in disclosing to new closer person and
5. Fear of unwanted disclosure at the work place.

Conclusions: Most ALWH are getting social support from close family members and peer support groups that are aware of their HIV status. However, they experience difficulties when needed to interact in a new environment i.e. work or when they get into a relationship.Multi-sectoral support systems are needed to assist them with each stage of life to enable them to retain to care and manage well their situation.

EPD177

Prevalence and influence of HIV stigma on the psychosocial wellbeing of people living with HIV/AIDS in University of Nigeria Teaching Hospital, Enugu, Nigeria

E. Okeke[1], E. Nwankwo[2], C. Umeoguaju[1]

[1]*University of Nigeria Teaching Hospital, School of Nursing, Enugu, Nigeria,* [2]*School of Nursing, University of Nigeria Teaching Hospital, Enugu, Nigeria*

Background: Purpose: To determine the prevalence and influence of HIV stigma on the physical, psychosocial and behavioural wellbeing of people living with HIV/AIDS (PLWH) in University of Nigeria Teaching Hospital (UNTH) Enugu, Nigeria.

Methods: The study period was about 10months. The study was carried out at PERFAR Clinic of UNTH, Ituku/ozalla, Enugu. It is a tertiary hospital with a total number of 22 wards. PEPFAR clinic is located discreetly away from the general hospital setting.

Design: The design was a cross sectional descriptive design. Study Population: A sample of 102 adolescents and young adults were statistically determined from population of 138.

Data Collection: data was collected using structured questionnaire adapted from the HIV stigma scale.

Method of Data Analysis: Collated data was analyzed using descriptive and inferential statistics. SPSS version 25 and Microsoft Excel 2007 used.

Results: Findings showed that the prevalence of HIV stigma was very high (97.5%). To determine the influence of HIV stigma on physical wellbeing of people living with HIV. The findings showed that the highest influence was

on pain/discomfort although experienced below average (2.49±1.10) followed by performing usual activities (2.44±1.04). The overall influence on physical wellbeing was below average (2.32±0.90).

Findings on the influence of HIV stigma on the psychological wellbeing of PLWH at UNTH. Overall influence of HIV stigma on psychological wellbeing was above average (3.48±1.06). The two factors-anxiety (3.44±1.12) and depression (3.52±1.16) were influenced aboveaverage. To identify the influence of HIV stigma on the behavioural and social wellbeing of people living with HIV/AIDS at UNTH.

Findings showed that the HIV stigma influence on behavioural and social wellbeing was mainly that of feeling isolated (3.24±1.36) and low self-esteem (3.21±1.22). The overall influence was below average (2.86±0.76).

Conclusions: The Implication of findings: From the findings, the prevalence of HIV stigma was high among PLWH, also stigmatization among PLWH has psychological and social influence on PLWH, the study helps health care professionals to be well informed and take precaution/care in handling PLWH in the clinical setting. It also puts health professionals at the forefront in fighting against stigmatization of PLWHA.

EPD178

Improving HIV Oral PrEP Continuation Among Adolescent Girls and Young Women (AGYW) Evidence from a novel branding and service delivery strategy in Zimbabwe

K. Chatora[1], M. Munjoma[1], V. Mabhunu[1], T. Mawoyo[1], I. Moyo[1], K. Shelley[2], T. Sisimayi[3], B. Mutede[1], N. Taruberekera[1]

[1]Population Solutions for Health, Harare, Zimbabwe, [2]PATH, Seattle, United States, [3]PATH, Harare, Zimbabwe

Background: Nearly 1,000 Adolescent Girls and Young Women (AGYW) are infected by HIV daily in sub-Saharan Africa. The complex mix of Covid-19, social, cultural, and religious barriers make it challenging to reach AGYW with HIV prevention. In Zimbabwe, PrEP continuation remains a challenge among AGYW. Population Solutions for Health implemented a demand generation intervention dubbed the "V-campaign" in 3 Zimbabwean districts.

The intervention comprised implementing community interpersonal strategies delivered by trained peer mobilizers and health care workers, offering PrEP at community outreach sites, and issuing a V-"Starter Kit" which enables taking PrEP in a discrete, fashionable way that promotes self-care and boosts confidence.

Methods: V was implemented in 3 intervention districts between April 2021–December 2021, with 3 control districts for comparison. We hypothesized that AGYW in the intervention districts will have longer continuation rates at 3 months after initiation on PrEP compared to those in control districts. Using routinely collected data, we compared one-, two- and three-month PrEP continuation rates among AGYW in the intervention (N=1020) versus control (540) districts. Virtual qualitative interviews and site monitoring explored implementation fidelity and barriers and facilitators to contextualize trends in continuation data.

Results: Intervention districts performed significantly better compared to control districts (Figure 1):

Overall, 3-month continuation rates increased from 41% ((38%-43% (95% CI)) to 62% (60%-65% (95% CI)) in the intervention districts (27% increase) compared to a 13% increase in the control districts. Qualitative data indicated high levels of intervention acceptability and feasibility among young women and providers.

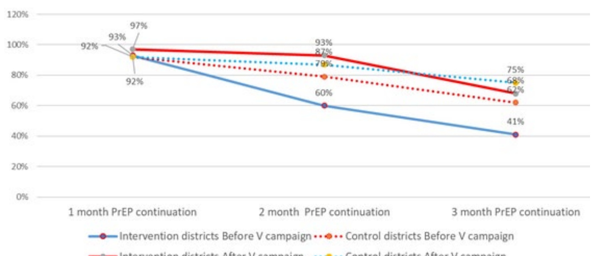

Figure 1. PrEP continuation rates before and after the "V" intervention.

Conclusions: The V-campaign has shown a significant impact in retaining AGYW on PrEP. The intervention will be scaled up to other districts in Zimbabwe with low uptake and poor PrEP continuation. Programs that seek to scale up PrEP continuation can adopt V to bring care closer to AGYW and enhance peer support and build self-empowerment.

EPD179

Research topic: the living conditions of vulnerable children in the rural areas of Lesotho: the case of Maphotong

P. Mpeisa[1]

[1]National University of Lesotho, Department of Anthropology, Sociology and Social Work, Maseru, Lesotho

Background: This study explored the influences on the living conditions of vulnerable children in the rural areas of Lesotho; case study of Maphotong in Maseru district. The study conceptualised three factors which are poverty, child abuse and HIV/AIDS.

Description: A total of forty-two (42) respondents (adults; male=7 and female=16 while children; male=6 and female=14) participated in this study.

The overall objective of the study was to understand the living conditions of orphaned and vulnerable children in the rural areas of Lesotho. To do this, the study adopted the qualitative design whereby snowballing and purposive sampling techniques were used to get the forty-two (42) respondents from Maphotong community. In addition, face-to-face individual interview was used to gather information.

Thereafter, collected data was coded using different themes under each concept and analysed using framework analysis technique. Findings suggest that children

face challenges that make them vulnerable at home, school and at play. Under the concept of poverty, children are challenged with lack of adequate food and school needs as majority of them come from unemployed or underemployed families. Similarly, within the concept of child abuse, emotional and physical abuse as well as neglect seemed to be common risk factors at Maphotong.

Lessons learned: The results from the concept of HIV/AIDS show that children are vulnerable as they are stigmatised because of the HIV positive status of their parents.

Conclusions/Next steps: Majority of children at Maphotong are living with their grandparents because of orphan-hood and negligence by their parents and these challenges affect children's school attendance and performance while some children eventually drop-out of school. Despite the challenges, the findings have shown that children at Maphotong are resilient to overcome such challenges; for instance, amongst other things, they do herding and get paid.

Other populations vulnerable in specific contexts

EPD180
The state of aging with HIV in the US: implications on care coordination

H. Butenschoen[1], M.P. Prior[1], S.D. Bertani[1], E.J. Starzyk[1], C.J. Gray Le Compte[1], B. Hujdich[1]
[1]*HealthHIV, Washington, United States*

Background: Persons aging with HIV (PAWH) are the fastest growing group living with HIV in the U.S., with nearly 75% of all persons with HIV (PWH) estimated to be over age 50 by 2030. HIV amplifies the impact of aging, chronic inflammation, and chronic disease, and has increased demand for tailored care for older PWH. To better understand the health care experiences of PAWH, HealthHIV, a U.S. national nonprofit, fielded HealthHIV's Second Annual State of Aging with HIV™ National Survey.

Methods: HealthHIV recruited participants of diverse socioeconomic and demographic backgrounds through its database. Eligibility included:

1. PWH ≥ age 50, or
2. A person living with HIV ≥ 15 years.

The online survey encompassed 102 externally-reviewed qualitative and quantitative questions, and was fielded from March 15-June 16, 2021 using Survey Monkey. Univariate, bivariate, and multivariate statistics were calculated using Stata 17 and SAS 9.4 software, and compared to results from 2020.

Results: Of the n=479 eligible respondents, n=420 were PWH ≥ age 50, and n=59 were persons living with HIV ≥ 15 years. Respondents overwhelmingly used the word "evolving" to describe the state of aging with HIV. PAWH using telehealth to access care increased 11-fold from 2020, with 80% of respondents receiving treatment for chronic conditions other than HIV. 40% reported diagnosis of a mental health condition, and over 25% were in recovery from addiction and/or post-traumatic stress disorder. The cohort experienced high rates of stigma (28%), homophobia (19%), ageism (17%), and racism (10%) when accessing care.

Conclusions: The survey identified current healthcare needs of PAWH. Findings showed that COVID-19 altered how people aging with HIV are accessing healthcare. PAWH with multiple comorbidities require improved coordinated care that includes chronic condition management and behavioral health services.

Aging with HIV has mental health ramifications, including increased social isolation, suggesting opportunities for PAWH to socially engage, especially given limitations and restrictions with COVID-19. Additionally, discrimination remained a key barrier to accessing care.

EPD181
Influence of mandatory HIV testing policy on prenatal services seeking behavior among pregnant women in Nyamira North Sub-County Kenya

S. Auya[1]
[1]*Moi University, Sociology and Psychology, Eldoret, Kenya*

Background: HIV/AIDS has had devastating effects in third-world countries. In the effort to contain the spread of the HIV virus, like some countries across the globe, the Kenyan government has instituted compulsory HIV tests policy for pregnant women seeking prenatal services in hospitals. According to this policy, pregnant women seeking prenatal services must undergo HIV tests without their consent. However, how the mandatory HIV test policy has influenced prenatal services-seeking behavior among pregnant women remains unclear. This study investigated how mandatory HIV testing policy has influenced prenatal services-seeking behavior among pregnant women in Nyamira North Sub County, Kenya.

Methods: This study that was qualitative in nature was undertaken between July and December 2021 in Nyamira North Sub-County Kenya. The study population was pregnant women. Five focus group discussions for pregnant women were organized and ten key informant interviews were undertaken. The participants for focus group discussions and key informant interviews were purposively selected. Qualitative data analysis techniques were utilized in data analysis.

Results: The study findings revealed that mandatory HIV testing policy is a stumbling block for prenatal services seeking among some pregnant women because of fear of HIV test outcomes, limited pre-testing counseling and psychological preparedness for HIV tests, and fear for counselors majorly hailing from the village knowing and spreading the women's HIV test results back in the village.

Conclusions: Mandatory HIV test for pregnant women seeking prenatal services is among the highly placed strategies to thwart the spread of the HIV virus in the world.

Although some pregnant women have a reservation to seek prenatal services in health facilities, there is a need for the creation of awareness on the significance of HIV tests during pregnancy and address structural and institutional shortcomings associated with HIV tests in health facilities to foster hundred percent access to prenatal services for reduced vertical transmission of HIV and safe delivery. This will have a far-reaching impact on the realization of the Kenyan government Universal Health Care agenda, African Union agenda 2063, and United Sustainable Development Goals.

EPD182

Risks and vulnerabilities among adolescent girls and young women accessing HIV prevention services at DREAMS Centers in Zambia

L.K. Mwango[1], P.O. Olowski[2], B. Musonda[3], J. Chipukuma[2], K. Tembo[2], M. Mujansi[2], S. Shamoya[1], L. Masiye[1], N. Nanyangwe[1], A. Mweemba[1], N. Mbakani[1], M. Mukobonda[1], Z. Malwa[2], S. Sakala[2], S. Ntutuma[2], R. Sheneberger[4,2], L. Hachaambwa[1,4], J. Okuku[5], K.C. Nkwemu[5], C. Muleya[5], B. Lindsay[4], C. Claassen[4,2]

[1]Ciheb Zambia, Community Health Services, Lusaka, Zambia, [2]Maryland Global Initiative Corporation, Community Health Services, Lusaka, Zambia, [3]Ministry of Health, Public Health, Lusaka, Zambia, [4]Center for International Health, Education, and Biosecurity, University of Maryland School of Medicine, Global Health, Lusaka, Zambia, [5]U.S. Center for Disease Control and Prevention, Lusaka, Lusaka, Zambia

Background: Many adolescent girls and young women (AGYW) in Zambia experience low socio-economic conditions, disproportions and socially created gender roles that pose health risks and increase vulnerability to HIV infection.

We present risk and vulnerabilities among AGYW enrolled into the Determined Resilient Empowered AIDS Free Mentored and Safe (DREAMS) program through the CIRKUITS and ZCHECK projects in Zambia.

Methods: The CIRKUITS/ ZCHECK DREAMS program identified risks and vulnerabilities among AGYW as a component of eligibility screening for DREAMS. A structured risk assessment form assessed sexual reproductive health, gender-based violence (GBV), orphan hood. The data were analyzed according to age bands of 10-14 years, 15-19 and 20-24 years.

To evaluate risks and vulnerabilities, we analyzed age disaggregated data for 12months (October 2020 to September 2021) across the six DREAMS centers in Southern and Western Provinces. We performed descriptive statistics and estimated risk and vulnerabilities, using Chi square tests to compare vulnerabilities by age and strata.

Results: In the 12-month period, 29,246 AGYW were screened for vulnerabilities: 9,506 (32.5%) were 10-14 years, 16,083 (55.0%) 15-19 years and 3,657 (12.5%) 20-24 years. In all the age bands less than 5% were mothers/pregnant, with 0.3% among the 10-14 years. As early as 10-14 years, 5% were sexually active and 1% reported transactional sex, which increased across age groups. GBV was highest at 18% in the 10-14 years and decreased across the older age groups. The distribution of all vulnerabilities differed significantly by age group, p<0.001).

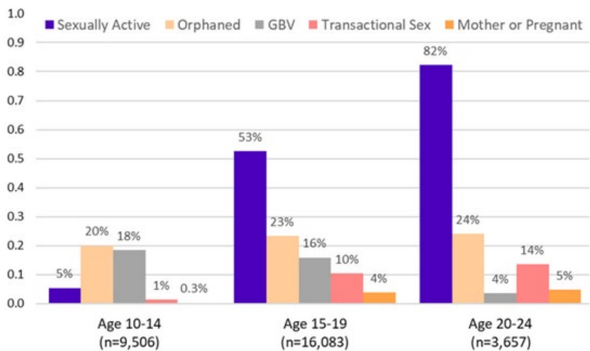

Figure 1. Risks and vulnerabiities reported by AGYW screened for the DREAMS program (N=29,246). Data indicate the percent of the age group experiencing the risk.

Conclusions: AGYW in Zambia experience multiple overlapping sexual and social vulnerabilities, including early sexual debut, early pregnancy, GBV, orphan hood, and transactional sex. Structured sexual reproductive health and HIV preventive services such as DREAMS for adolescents and young women are required to reduce HIV risk and avert new infections.

EPD183

PrEP Prescriptionin Primary Health Care: strategy for reducing racial inequities to access to HIV prevention in Brazil

T. Cherem Morelli[1], A.F. Kolling[1], A.C. Garcia Ferreira[1], T. Beloni Rocha[1], R. Vianna Brizolara[1], A. Freire da Silva[1], G.F. Pereira[1]

[1]Ministry of Health of Brazil, HIV/AIDS, Brasília, Brazil

Background: PrEP has been available in Brazil as a public health policy since 2018. The prescription during this time was centered on reference services, mainly linked to health services that provide care for people living with HIV/AIDS. This care format allowed security in the construction of the strategy and organization of the network. However, access to referral services still presents important barriers for populations historically neglected in health care.

Despite efforts and the significant reduction in overall AIDS mortality in Brazil, the black population continues to show an increased mortality. And it is precisely this population that, since the beginning of the implementation, is the one that least accesses PrEP, compared to the white population.

Description: Brazil has been seeking the path of strengthening primary health care (PHC). In a country with continental dimensions, PHChas the potential to reduce inequities in access to health. Since September/2021 the Brazil MoH started to allow and encourage PrEP prescription in PHC. This is a very important step towards expanding access to PrEP in Brazil, precisely for those who need it most.

Lessons learned: In a short time of implementation, PrEP at PHC was already accessed more by black population than white. Comparing the proportion of black population who had access to PrEP in specialized public services with black population who had access to PHC in the months of September, October and November 2021, we observe higher access among black peoples than white at PHC.

In these 3 months, 62.8% of PHC users are black, in the proportion between blacks and whites (total of 610 people), while in the specialized service, 45.5% of users are black (total of 17.348 people). Since the beginning of the implementation, the majority of PrEP users in Brazil are white people. In Brazil, 53.6% of the population identifies as black.

Conclusions/Next steps: Despite an initial process, PrEP in PHC has the potential to provide this prevention technology to all municipalities in Brazil and expand access to the most vulnerable populations to HIV. PrEP in PHC is presented as one of the main strategies for the expansion of PrEP in Brazil.

Factors associated with changes in alcohol use during pregnancy among women with HIV in South Africa and Uganda

A. Stanton[1], B. Hornstein[2], N. Musinguzi[3], B. Dolotina[1], C. Orrell[4], G. Amanyire[5], B. Bwana[3], S. Asiimwe[3], A. Cross[6], C. Psaros[1], D. Bangsberg[7], J. Hahn[8], J. Haberer[9], L. Matthews[10]

[1]*Massachusetts General Hospital/Harvard Medical School, Psychiatry, Boston, United States,* [2]*Alabama Department of Public Health, Birmingham, United States,* [3]*Mbarara University of Science and Technology, Mbarara, Uganda,* [4]*University of Cape Town, Institute of Infectious Disease and Molecular Medicine, Cape Town, South Africa,* [5]*Makerere University, Kampala, Uganda,* [6]*City of Cape Town, Cape Town, South Africa,* [7]*Oregon Health and Science University, Portland, United States,* [8]*University of California San Francisco, Medicine, San Francisco, United States,* [9]*Massachusetts General Hospital/Harvard Medical School, Medicine, Boston, United States,* [10]*University of Alabama at Birmingham, Medicine, Birmingham, United States*

Background: The intersection of alcohol use and pregnancy among women with HIV (WWH) is poorly understood and of concern given potential negative health impacts on women, children, and families. Identifying the factors associated with changes in alcohol consumption during pregnancy is important for the development of alcohol use interventions for pregnant WWH.

Methods: A subset of pregnant WWH in Uganda and South Africa (N = 202) enrolled in a cohort study of people initiating ART between 2015 and 2017 who completed two assessments, six months apart, were included in the analyses.

We derived the following four categories based on AUDIT-C scores at each assessment:

1. No alcohol use at enrollment or follow up ("no use", n = 137, 67.8%);
2. No alcohol use at enrollment to any alcohol use at follow-up ("new use", n = 18, 8.9%);
3. Alcohol use at enrollment to no alcohol use at follow-up ("quit", n = 22, 10.9%); and;
4. Alcohol use at enrollment and continued use at follow-up ("continued use", n = 25, 12.3%).

We performed multivariable multinomial regression models, considering participants in the "no use" category as the reference, to assess demographic, psychosocial, structural, and HIV-related factors associated with these categories.

Results: In this sample (mean age = 26.2 years, mean gestational age = 19.7 weeks),living with a partner (vs. being single/divorced/widowed) was associated with lower risk of continued use (RRR 0.30, p=0.028), and severe food insecurity was associated with a higher risk of new use (RRR 3.20, p=0.089). Each unit increase in HIV stigma corresponded to a 23% reduced likelihood of being in the quit vs. no use group (RRR 0.77, p=0.081).

Conclusions: This preliminary investigation identified that, during pregnancy, WWH who live with a partner may have lower risk of continued alcohol use, and WWH who have food insecurity may be more likely to initiate use. Moreover, increased stigma may be linked to a reduced likelihood of quitting.

Future alcohol reduction interventions for WWH who are pregnant or breastfeeding may incorporate strategies to address partnership dynamics, food security, and community-level HIV stigma.

Health promotion messaging intervention reduces risky sexual behaviors and improves repeat testing among a cohort of adolescent girls and young women in Homa Bay County, Kenya

R. Bosire[1], K. Agot[1], N. Okeyo[1], N. Chhun[2], C. Cleland[3], A. Kurth[4], I. Inwani[5]

[1]Impact Research and Development Organization, Research, Kisumu, Kenya, [2]Yale University, Research, New Haven, Connecticut, United States, [3]New York University, Population Health, New York, United States, [4]Yale University, School of Nursing, New Haven, Connecticut, United States, [5]Kenyatta National Hospital, Nairobi, Kenya

Background: Despite UNAIDS reporting a 46% decline in HIV incidence among youth from 2000 to 2019, 82% of new HIV infections in sub-Saharan Africa occurred among adolescent girls and young women (AGYW) in 2019.

We used technology to deliver health promotion messages to promote safe sexual behaviours and HIV retesting among AGYW.

Methods: AGYW ages 15-24 years from Homa Bay-County, Kenya were enrolled into a study to determine their preferred recruitment strategies and testing modalities.

Those eligible participated in one of two longitudinal cohorts:

1. Newly diagnosed with HIV; and,
2. Testing negative and identified as high-risk using predetermined criteria.

Over 12 months, health promotion messages were sent quarterly to the AGYW living with HIV cohort to support retention and adherence and six-monthly to the HIV-negative cohort to encourage risky sexual behavior reduction and repeat test.

ART adherence and treatment message	Health promotion message
The best way to stay healthy is to follow medical advice: if on treatment, take your pills on time and keep your clinic appointments	*You are a strong female and deserve a healthy life. Regularly test. Protect yourself by not having sex or use condoms or PrEP when you do*

A brief survey on selected sexual behaviors and HIV testing was sent through short messaging system. We compared behaviors at baseline and follow-up using generalized estimating equations.

Results: We tested 1198 AGYW and enrolled 199 (16.6%) in the two cohorts. The mean age was 20.8 years, 19.6% were in school, 58.8% were married, 28.6% began sexual activity <15 years, and 8.5% tested HIV-positive, of whom 47.1% had a viral load <1000 cp/ml.

Over 12 months, participants self-reported significant reduction in multiple sexual partnerships (33% to 12%; p<0.001) and increase in condom use (25.1% to 53.6%; p<0.001), partner testing (70.9% to 85.7%; p<0.001) and HIV retesting (74.2% to 81.6%; p=0.099).

However, transactional sex increased from 14.6% to 24.2% (p<0.020) and drug use before sex increased from 4.5% to 14.6% (p<0.001).

Conclusions: Text messaging should be considered to promote safer sex practices and retesting among AGYW, and to provide data on patterns of ongoing risk to address.

EPD186

Impacts of the syndemic of HIV and early motherhood on adolescent girls and young women in South Africa

E. Toska[1,2], B.H. Banougnin[1], W. Rudgard[2], W. Saal[1], L. Hertzog[1], J. Jochim[2], L. Cluver[2,1]

[1]University of Cape Town, Centre for Social Science Research, Cape Town, South Africa, [2]University of Oxford, Department of Social Policy and Intervention, Oxford, United Kingdom

Background: Persisting HIV infections among adolescent girls and young women combined with high rates of early motherhood threaten long-term health and social development. However, no studies have investigated if the negative effects of HIV infection and motherhood are exacerbated when they are experienced together/simultaneously.

Methods: We analysed data from 1,712 adolescent girls and young women in South Africa, combining data from Mzantsi Wakho and HEY BABY studies (2018-2019).

Participants were recruited through a multi-prong sampling approach, including health facilities, schools, community organisations and referrals, to minimise selection bias (>95% enrolment for each recruitment channel).

Ethical approvals were given by the Universities of Cape Town and Oxford, provincial government and health facilities. Standardised questionnaires measured past-year experiences across multiple domains, including SRH, violence, and education.

We assessed main and interaction effects of early motherhood and living with HIV using multivariate covariate-adjusted regression models.

Results: Three out of five participants were mothers, 46% were living with HIV, and 18% were mothers living with HIV.

Adolescent mothers were less likely to report: witnessing domestic violence (aOR=0.43 95%CI=0.32-0.58, p<0.001), sexual abuse (aOR=0.33 95%CI=0.22-0.52, p<0.001), consistent condom use (aOR=0.18 95%CI=0.14-0.23, p<0.001), and school enrolment (aOR=0.40 95%CI=0.30-0.54, p<0.001).

Adolescent girls and young women living with HIV were more likely to report: sexual abuse (aOR=1.60 95%CI=1.04-2.45, p=0.033), consistent condom use (aOR=1.64 95%CI=1.23-2.08, p<0.001), and less likely to report: school enrolment (aOR=0.58 95%CI=0.44-0.77, p<0.001).

Multiplicative interaction between motherhood and HIV was significant for sexual abuse, substance use, and school non-enrolment (Figure 1).

Motherhood and HIV synergistically accounted for 53% (attributable proportion=0.53 95%CI=0.32- 0.74), p<0.001) of school non-enrolment.

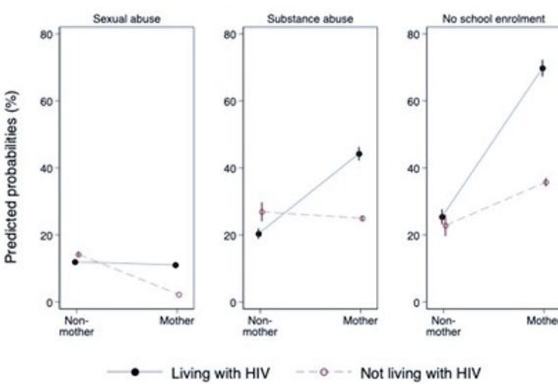

Figure. Adjusted predicted probabilities by motherhood and HIV

Conclusions: Targetted help to address school non-enrolment and excessive substance use may benefit young mothers, especially those living with HIV. Programmes must account for the syndemic of HIV and adolescent motherhood to improve the lives of adolescent girls and young women, and their children.

EPD187

HIV among men who pay for sex in Western Africa: a descriptive review and narrative synthesis

Y.A. Adebisi[1], N.D. Jimoh[2], I.O. Ogunkola[3]

[1]University of Ibadan, Ibadan, Nigeria, [2]Federal University of Technology, Minna, Nigeria, [3]University of Calabar, Calabar, Nigeria

Background: Many studies have reported how sex workers are at high risk of HIV acquisition and transmission. Men who pay for sex can contribute to HIV transmission through sexual relationships with both sex workers and their other partners. The aim of this study is to conduct a descriptive review and narrative synthesis of evidence to better understand HIV among men who pay for sex in Western Africa.

Methods: We conducted a review of population-based survey studies conducted in Western African countries (Benin, Burkina Faso, Cabo Verde, Cote d'Ivoire, The Gambia, Ghana, Guinea, Guinea-Bissau, Liberia, Mali, Mauritania, Niger, Nigeria, Senegal, Sierra Leone, and Togo) from 2010 to 2020 with information on paid sex by men.

We extracted information on population size, number of sexual partners, condom use, and HIV prevalence among sexually active men who pay for sex. Data were extracted and descriptively synthesized.

Additionally, search for peer-reviewed literature published from 2010 to 2020 was also conducted in PubMed, and Google Scholar using predetermined search terms. Abstracts were screened by two researchers according to the inclusion criteria pre-specified in the review protocol and narrative synthesis was performed.

Results: Within the period of analysis (2010 to 2020), our review identified 27 nationally representative population-based surveys which revealed that 7,969 men reported to have ever pay for sex with average of 7.0 lifetime sexual partners reported. From 15 population-based surveys, 3,798 of men who paid for sex have been reported to be living with HIV prevalence of 4.5%. Four thousand and forty-five (62.4%) men who pay for sex have been reported to use condom the last time they had sex based on findings from 17 population-based surveys. The narrative synthesis of the included 12 peer-reviewed articles revealed that men who pay for sex are one of the risk groups that can facilitate the spread of HIV within a population.

Conclusions: Our findings suggest that men who pay for sex should be recognized as a prime-concern population for HIV prevention in the Western African region.

EPD188

Associations between Intimate Partner Violence and HIV Risk Behaviours and HIV Prevention Cascades in Married Women in Manicaland, East Zimbabwe

A. Cordeiro[1,2], L. Moorhouse[1], C. Nyamukapa[3,1], T. Dadirai[3], A. Chang[4], R. Maswera[3], P. Mandizvidza[3], F. Dzamatira[3], B. Tsenesa[3], S. Gregson[1,3]

[1]Imperial College London, Medical Research Council Center for Global Infectious Disease Analysis, School of Public Health, London, United Kingdom, [2]Weill Cornell Medicine, Center for Global Health Research, New York, United States, [3]Biomedical and Research Training Institute, Harare, Zimbabwe, [4]Danish Institute for Advanced Study; University of Southern Denmark, Odense, Denmark

Background: HIV-negative married women experiencing intimate partner violence (IPV) may be a priority population for HIV prevention, but few studies have measured associations between IPV and sexual risk-behaviours in this group. We measured these associations and the condom HIV prevention cascade for uninfected married women experiencing IPV in a high HIV prevalence population in Manicaland, Zimbabwe.

Methods: Data on IPV, sexual risk-behaviours and HIV prevention cascades were collected in a general-population HIV sero-survey between August 2018 and December 2019 (N=9803). Associations between physical and sexual IPV in the last 12 months and HIV risk-behaviours were measured in age-adjusted logistic regression models. A condom HIV prevention cascade was constructed and focus areas for interventions identified.

Results: 15.5% (386/2450) and 5.1% (126/2450) of uninfected married women reported recent physical and sexual violence from an intimate partner. Physical violence was associated with early sexual debut, alcohol consumption, and multiple sexual partners in the last 12 months (Table 1).

Sexual violence was associated with early sexual debut but also showed a trend towards greater condom use. Large gaps in motivation (reflecting low risk perception and perceived negative consequences [reduced sexual pleasure]) and in capacity to use condoms effectively (reflecting partner resistance and lack of negotiating skills) were found in the condom HIV prevention cascade (Figure 1).

	Physical Violence			Sexual Violence		
Sexual risk behaviour	Yes (%)	No (%)	AOR (95% CI)	Yes (%)	No (%)	AOR (95% CI)
Age at first sex <17 years	44.0	29.8	1.79 (1.41-2.22)	41.2	31.2	2.17 (1.49-3.13)
Alcohol consumption (last 12m)	3.4	1.3	2.81 (1.38-5.43)	3.2	1.5	2.15 (0.64-5.50)
Multiple sexual partners (last 12m)	2.1	0.7	2.79 (1.11-6.50)	1.6	0.9	1.75 (0.28-6.07)
Non-regular partner(s) (last 12m)	6.0	5.5	1.02 (0.63-1.60)	7.1	5.5	1.30 (0.60-2.49)
Partner with STI (last month)	25.6	15.2	1.95 (0.93-3.81)	14.0	4.7	3.37 (1.25-7.61)
Condom use at last sex	5.7	5.5	1.09 (0.66-1.71)	9.5	5.3	1.89 (0.97-3.41)

Table 1: Associations between physical and sexual violence in the last 12 months and HIV risk behaviours in 2450 HIV-negative married women in Manicaland, east Zimbabwe, 2018-2019.

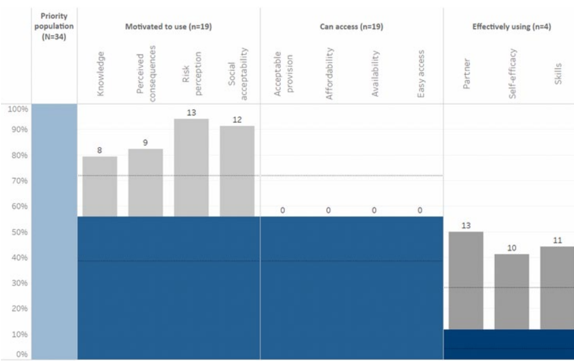

Figure 1: HIV prevention cascade for condom use in HIV-negative married women (15-54 years), at risk of HIV infection in Manicaland, east Zimbabwe, 2018-2019.

Conclusions: Interventions to screen, improve risk perceptions and reduce IPV among HIV-negative married women in Manicaland may reduce new infections in this group.

EPD189

Similarities and differences in men's experience of antiretroviral therapy (ART) and pre-exposure prophylaxis (PrEP) in Southern African high-prevalence settings

A. Berner-Rodoreda[1], E. Ngwira[2], K. Bärnighausen[1], R. Dambe[3], S.A. McMahon[1], B. Chione[3], A. Hettema[4], S. Matse[5], M. Taegtmeyer[6], Y. Alhassan[6], S. Phiri[7], T. Bärnighausen[1], F. Neuhann[1]

[1]Heidelberg University, Heidelberg Institute of Global Health, Heidelberg, Germany, [2]Lilongwe University of Agriculture and Natural Resources, Lilongwe, Malawi, [3]The Lighthouse Trust, Blantyre, Malawi, [4]Clinton Health Access Initiative, Manzini, Eswatini, [5]Ministry of Health, Mbabane, Eswatini, [6]Liverpool School of Tropical Medicine, Department of International Public Health, Liverpool, United Kingdom, [7]Partners in Hope, Lilongwe, Malawi

Background: Advances in antiretroviral therapy (ART) and pre-exposure prophylaxis (PrEP) have led to significant progress towards HIV epidemic control. A key challenge remains in improving the engagement of men who have sex with women (MSW) in ART and PrEP interventions. This study compares the experiences of MSW on ART and those on PrEP in high HIV-prevalence settings in Malawi and Eswatini respectively.

Methods: The study is based on semi-structured in-depth interviews with MSW on ART in Blantyre, stakeholders and men in surrounding communities (n=72) and with MSW on PrEP, male stakeholders and community leaders (n=70) in the north-west of Eswatini. Interviews were audio-recorded, translated and analyzed in NVivo drawing on reflexive grounded theory. Haberer and colleagues presented major ART and PrEP differences (2015). Based on MSW's experiences in Blantyre and Eswatini, we have amended Haberer's table and bolded new insights (see results).

Results: Our studies showed that stigma, trust and relationships, sexual behavior when on ART or PrEP, education and information and service provision played an important role for men's engagement in antiretroviral drug-based HIV interventions. While PrEP was seen as a way to overcome serodifference and create ease in relationships, men on ART viewed seroconcordance as more re-assuring of the partner's loyalty and adherence support. Alcohol consumption could be combined with PrEP, which was seen more critically with ART. While men on ART primarily trusted relatives, for men on PrEP, the partner's real or perceived HIV-status was a major reason for initiating PrEP, yet she was also the main confidant. The need for male-friendly services was raised in both studies.

	Antiretroviral Therapy (ART)	Pre-Exposure Prophylaxis (PrEP)
Eligibility	Everyone tested positive for HIV	Everyone tested negative for HIV and at high risk
Regimen	Globally, mostly a daily regimen of three ARVs; various triple therapies available.	Presently a daily regimen of two ARVs (tenofovir disoproxil fumarate combined with either emtricitabine or lamivudine).
Benefit	Effective treatment - preventing onset of AIDS; prolonging life and restoring/ maintaining health; **becoming non-infectious (mentioned mainly by stakeholders).**	Effective prevention against HIV; **does not disturb sexual relations and can be combined with alcohol consumption. Tool to overcome serodifference; creating ease in relationships**
Duration	Life-long treatment	Exposure-related; intermittent.
Trust and relationships	**Reliance on practical and moral support from family for access to and retention on ART. Selective disclosure to trustworthy people (mainly family, partner and good friends). Greater ease with seroconcordant partner on ART; wariness of serodifference.**	**Rationale for uptake of PrEP closely linked to distrust in partner/partner's HIV-status. Sharing information about PrEP with partner, friends and colleagues; moral support from serodifferent partner. Ambiguous attitude towards partner on PrEP.**
Sexual behaviour after starting pill-taking	**Range of sexual behaviour from less or no sexual activity for fear of passing on virus to forgoing ART for better sexual performance.**	**Range of sexual behaviour yet no trend to increase number of sexual partners; condom decrease for various reasons including desire to procreate.**
Education/ Information	**Clinic- and community-based, yet detailed ART knowledge, e.g., "undetectable = untransmittable" unknown to MSW; media and community-based education to be strengthened**	**Largely clinic-based with some media and community education, but hardly reaching MSW. Treatment as prevention largely unknown to PrEP users in serodifferent relationships. Media and community-based education to be strengthened**
Psycho-social Concerns	Risk of stigma and discrimination with implications for daily pill-taking and frequent clinic visits. **Judged to have been promiscuous. Re-evaluating future plans.** Need to come to terms with side-effects and depression.	Risk of being confused with a person living with HIV and experiencing stigma with implication for daily pill-taking and frequent clinic visits. Risk of being seen as promiscuous. Consideration of side-effects for uptake and continuation.
Services	Mostly clinic-based **Need for community-based and male-friendly services**	Clinic-based **Need for community-based and male-friendly services**

Table.

Conclusions: MSW's experiences in Blantyre and Eswatini have highlighted important issues for men not previously included in an ART/PrEP comparison with a need to adapt education and service delivery. Further research will clarify if the additional points are gender- and location-specific.

EPD190

The role of finance and administration in supporting children living with HIV in Shelter Homes under the care of elderly mothers in Buikwe District in Uganda, East Africa

P.P. Okiror[1]
[1]*Batabaazi Cultural Group, Finance and Administration, Buikwe, Uganda*

Background: Children living with HIV under elderly care takers in Buikwe district continue to fail on ART treatment amidst the various interventions by the MOH in Uganda, the shelter faces shortages in financing dates for ART refill, ensuring good nutrition given their abject poverty.
The shortfall in resources has led to poor adherence to programme activities and low viral load suppression and poor school attendance. The idea was to strengthen OVC shelter in provision of comprehensive HIV/AIDs care, treatment and support to children living with HIV in Buikwe District by Batabaazi Cultural Troop.
Description: In February 2018 Batabaazi Cultural Troop with support from Slovakia initiated shelter homes to support mitigate the challenge of viral load suppression among children living with HIV under the care of elderly in clinical stage three (iii) and four (iv), the home started with five (5) children in the age bracket of 0-22 years, children were monitored on their adherence through directly observed therapy (DOT), nutrition and hygiene, provided with psycho social support for one year and later re-integrated back into their communities.
This was done within meager resources from few individuals and aid from Slovakia but this sources are not sustainable.
Lessons learned: Despite no funding, the meager funds raised locally have kept the shelter progressing
The program has supported over 300 children with comprehensive HIV package
The program has achieved 95% of viral load suppression of all children in the shelter.
The Shelter has supported over 133 children with education sponsorship and scholarship.
50 elderly mothers have been supported to start income generating activities in order to take care of the children after integration.
Registered reduced incidences of illness by 80% among the children due to good adherence especially contributing to good school attendance.
Conclusions/Next steps: Generation of funds through local approaches coupled with community support and other well wisher stakeholders has resulted into OVC shelter proving effective in the provision of comprehensive and coordinated HIV/AIDs services to children living with HIV as it provides a basis for easy monitoring of all indicators around treatment, care, nutrition, and support for Adolescents and young people living with HIV.

EPD191

Factors contributing to the risk and vulnerability to HIV infection among individuals with spinal cord injuries (SCI) in South Africa

J. Lloyd[1], J. Phillips[2]
[1]*National Department of Health South Africa, Gordons Bay, South Africa,* [2]*University of the Western Cape, Physiotherapy, Bellville, South Africa*

Background: HIV/AIDS has made a huge impact on human development and sexual reproductive habits in this century and especially in sub-Saharan Africa. It has only recently been acknowledged that despite the notion that those with a disability is asexual, HIV/AIDS has an equal if not greater effect on or threat to people with disabilities. The crucial elements of knowledge and information in the prevention of HIV/AIDS for people with disabilities are very clear.
The overall objective of this study was to assess the factors that exacerbate the risk and vulnerability of individuals with spinal cord injuries to HIV infection in order to develop a more effective HIV intervention.
Methods: A self-administered questionnaire consisting of the following sections were used to collect data in four provinces from survivors of a traumatic spinal cord injury in South Africa: Demographics; HIV-Knowledge (HIV- KQ-18); Sexual behaviors; Sexual communication and negotiation skills and Self-efficacy to refuse sex.
Results: Of the 242 participants, 71.5% reported being sexually active at the time of the survey. Significantly more males (50.7%) than females (36.5%) reported multiple sexual partners. Almost half (47.5%) indicated no condom use with last sexual intercourse with significantly more females (51.5%) reporting condom use than males (45.3%). Independent-samples t-tests showed that participants that reported having received peer education had significantly higher scores for HIV-knowledge ($M = 13.11$, $SD = 3.73$) than those who had not received peer education (($M = 11.83$, $SD = 4.41$) ($p < 0.05$). Low levels of HIV-knowledge, and being male were the strongest predictor of risky sexual behaviors in this sample.
Conclusions: It is clear that individuals with a traumatic spinal cord injury are still sexually active. Of concern however is the high number of participants that reported multiple sexual partners and the lack of condom use with their last sexual encounter. The importance of peer education with regards to HIV was evident in this study. Concerted efforts should thus be made to protect this vulnerable group of the population by means of empowerment, improving HIV-related knowledge, and including people with disabilities in HIV prevention education programs.

Navigating the sociality of womanhood and HIV - narratives by "No Show" mothers in PMTCT care in Kenya

K.J.C. De Angeles[1], M. Skovdal[2], E. Were[3], A. Kågesten[4], E. Faxelid[5]

[1]Karolinska Institute, Global Public Health, Stockholm, Sweden, [2]Copenhagen University, Copenhagen, Denmark, [3]Moi University, Eldoret, Kenya, [4]Karolinska Institute, Stockholm, Sweden, [5]Karolinska University, Stockholm, Sweden

Background: In resource-limited settings, defaulter-tracing is one strategy hoping to return and re-engage mother-infant pairs who miss scheduled clinic visits during care to prevent vertical HIV transmission (PMTCT). Studies have explored barriers to care engagement, but few have captured the dynamics behind women who circle in and out of care despite tracing efforts.

Methods: Nested in a randomized control trial in Western Kenya, our study draws on interviews (N=15) conducted over a 10-months period ending July 2018 with 10 women aged 25-38 years who were re-engaged and traced either multiple times via phone calls or a home visit during their time in PMTCT care. Six others agreed, but failed to show up for the interviews.

Results: Narrative analysis illustrates how the linearity of the care continuum failed to harmonize with a social reality where women tap in and out of multiple social roles and identities that condition care engagement. Women described how they were both mothers, wives, neighbors, daughters, workers and how social relations and expectations could keep them from care when more immediate needs or those of others were put before a scheduled clinic visit. Most assured they had antiretrovirals, knowing the risks of rising viral loads. Sharing and social support would help them cope with what initially was a life-changing HIV diagnosis and some aspired to be peer counselors. Male dependency, fear of social exclusion and a life in poverty, on the contrary, kept most from disclosing their status in public. Most indicated that their HIV status was a result of infidelity.

Conclusions: While small-scale, our study illustrates that PMTCT care and engagement is social. Women navigate and balance multiple social roles and identities which condition care engagement beyond clinical assessments and facility schedules.

In this, socioecological factors such as gender, cultural and societal norms and poverty remain key challenges. We urge for scaled socio-structural efforts to engage hard-to-reach populations in PMTCT care.

EPD193

Differentiated service delivery of treatment and laboratory services for people living with HIV in closed settings to avert treatment interruption and HIV transmission, Mizoram, India

M. Ralte[1], B Chhakchhuak[1], R Hluna[1], A Parvez[1], R. Mahajan[2], C. Lalrindiki[2], S.S. Todmal[2], B George[3], N Tanga[4], P Adhikaree[4], A. Harshana[2]

[1]Mizoram State AIDS Control Society, Aizawl, India, [2]UW International Training and Education Centre for Health Private Limited, New Delhi, India, [3]FHI 360, New Delhi, India, [4]Science Health and Allied Research and Education INDIA (SHARE INDIA), New Delhi, India

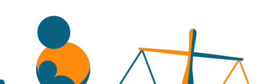
Background: In 2019, Mizoram state had the highest estimated adult HIV prevalence (2.4%) and annual HIV incidence (0.94 per 1000 at risk) in India, with 21% HIV prevalence among prison inmates. People who inject drugs (PWID) are disproportionately impacted by HIV and if incarcerated or in other closed settings, PWID may have limited access to prevention and treatment services; this is the case with Mizoram's central prison and drug demand reduction centres (managed by non-profit organizations for rehabilitation of PWID).

Description: Delayed ART initiation, irregular clinical follow-up, non-adherence, and limited viral load (VL) testing were identified as major challenges in closed settings as a result of limited transportation between prisons and the ART centres, and limited bridge care upon prisoners' release. In November 2018, we implemented a differentiated service delivery model that included decentralized drug dispensation, VL specimen collection, and biweekly clinician visits at the closed setting facility to enhance rapid ART initiation, annual VL testing, and post discharge follow-up (continuation of care).

Lessons learned: During November 2018- December 2021, we served 1,013 PLHIV in closed settings. The majority of those served were males (840, 83.1%), 26-36 years (486, 48.2%), and with a substance-use disorder (795, 78.1%). By the end of 2021, 416 (41.1%) PLHIV were still retained in the closed setting; 4 (0.4%) died and 593 (58.5%) were referred to ART centres for post-release follow up. Among the 416 who stayed in the closed settings, 89.7% (373) were due for VL testing; 64.2% (239) received a VL test in the last 12 months, and 93.2% of those tested 222 were virally suppressed. Among the 593 released from closed settings, 81.1% (480) were retained in ART care in the community.

Conclusions/Next steps: Differentiated service delivery models are essential to decrease treatment interruption for PLHIV in closed settings and to ensure retention in care. We experienced some challenges post-discharge for 8% of patients due to COVID-19 when VL testing was disrupted.

Despite this, decentralization of clinical and laboratory services with a coordinated post-release plan was key for higher rates of treatment engagement and VL testing access, leading to ongoing treatment engagement and high VL suppression.



EPD194

"Life is a lot more brighter now": exploring the perspectives of older adults living with HIV who use drugs regarding health and aging in Vancouver, Canada

C. Ng[1], K.L. Chayama[1,2], R. McNeil[1,3], W. Small[1,4]

[1]British Columbia Centre on Substance Use, Vancouver, Canada, [2]University of British Columbia, Vancouver, Canada, [3]Yale School of Medicine, New Haven, United States, [4]Simon Fraser University, Burnaby, Canada

Background: Older adults living with HIV (OALHIV) who use drugs experience higher levels of comorbidities (e.g. mental illness, chronic pain) compared to the general older adult population. Further, OALHIV are more likely to be impacted by social and structural inequities (e.g., poverty, stigma) that further negatively impact their health and ability to manage co-morbid conditions. However, few studies have explored the perspectives of this population regarding the process of aging with HIV.

The purpose of this study is to explore how OALHIV who use drugs describe and understand the aging process, and its impacts on their health.

Methods: Between January 2019 and March 2020, we interviewed 42 OALHIV (50 years of age or older) who use drugs with complex comorbidities in Vancouver, Canada about aging. Interviews were transcribed verbatim and coded using NVivo qualitative software. Interview transcripts were coded and prominent themes were identified using deductive and inductive approaches.

Results: Many participants associated aging with positive changes to health-related behaviors with regards to substance use (e.g. reduction in substance use) and managing personal health needs (e.g. responding to health issues) due to factors such as perceiving their health as more precarious than when they were younger. They also emphasized that they no longer engaged in behavior that they characterized as "reckless" when younger (e.g. impaired driving, "unsafe" drug use).

Participants described "positive thinking" (e.g. "thinking good thoughts") and how their perspectives shifted to a more optimistic and accepting outlook on life and their health challenges. While many participants discussed positive developments in health-related behaviors and perspectives on life, they nonetheless reported experiencing accelerated aging-related conditions due to living with HIV, as well as worsening mental, physical, and cognitive health due to factors such as reduced mental acuity, feeling overburdened with health conditions, and social isolation.

Conclusions: These findings point to the ways OALHIV who use drugs may develop health-enhancing practices as they age, as well as the need for policies and programs that improve their mental, physical, and cognitive health, and prevent and/or delay the onset of co-morbid conditions due to living with HIV.

EPD195

Association between intersectional stigma and HIV care engagement among women living with HIV who inject drugs in Kyiv, Ukraine

S. Fuller[1], C. Coyle[1], K. Tobin[1], M. Davey-Rothwell[1], T. Kiriazova[2], J. Owczarzak[1]

[1]Johns Hopkins Bloomberg School of Public Health, Department of Health, Behavior & Society, Baltimore, United States, [2]Ukrainian Institute on Public Health Policy, Kyiv, Ukraine

Background: Stigma continues to be a major barrier to care for people living with HIV. Recent work has drawn attention to the significance of intersectional stigma – the compounding impacts of stigma related to multiple characteristics such as drug use and HIV status on HIV care outcomes. People who use drugs represent a key population in Ukraine, yet few studies have focused on women living with HIV (WLWH) who inject drugs to understand how layered stigma correlates with care engagement.

Methods: Surveys were conducted in Kyiv between November 2019-2020 with WLWH who disclosed recent injection drug use. The survey assessed perceptions of internalized and enacted drug use and HIV stigma, HIV care history, drug use experiences, and other demographic characteristics. Univariable and multivariable logistic regression analyses examined associations between experiencing enacted and/or internal stigma related to HIV and/or drug use, with HIV care engagement as the primary outcome.

Results: Among the 306 women surveyed (median age 34 years), 43% reported high internalized stigma related to both HIV and drug use (22% high in either, 35% low in both). Experiences of enacted stigma were reported as: high related to HIV status and drug use (40%), high in either (39%), and low in both (21%).

Overall, 55% were engaged in care. In the adjusted model, experiencing internal stigma related to both drug use and HIV status (aOR: 0.52, 95% CI: 0.30, 0.92) and enacted stigma related to both drug use and HIV status (aOR: 0.47, 95% CI: 0.23, 0.95) were significantly associated with lower odds of care engagement, while women who knew their HIV status for more than 5 years were more likely to be engaged in HIV care (aOR: 2.29, 95% CI: 1.35, 3.87) after adjusting for disclosure, demographic characteristics, and injection drug use frequency.

Conclusions: This study adds to the growing body of evidence that intersectional stigma is a significant factor in HIV care engagement. Our findings underscore the need for additional programs to support women newly diagnosed.

Further research and targeted interventions are needed to address the multiple mechanisms and layers of stigma among WLWH who use drugs.

EPD196

Female genital mutilation/cutting delays HIV elimination in Eastern Uganda: a case in Sebei region

H. Ndagire[1], V. Kiwujja[2], R. Ogolla[3], R. Kindyomunda[4]
[1]*United Nations Population Fund, Gender Empowerment and Women Equality, Kampala, Uganda,* [2]*United Nations Population Fund, Monitoring and Evaluation, Kampala, Uganda,* [3]*United Nations Population Fund, Gender Equality and Women Empowerment, Kampala, Uganda,* [4]*United Nations Population Fund, ISRHR, Kampala, Uganda*

Background: Despite the efforts to reduce HIV prevalence in Uganda, by 2020 Ministry of Health estimated a 5.4% prevalence among adults (15-49) years, higher in women (6.8%) compared to men (3.9%). 29% of all new HIV infections are by adolescent girls and young women yet they represent just 10% of the total population. Social norms and some cultural practices have serious implications for the spread of HIV/AIDS. Female genital Mutilation is one of the practices speculated to increase the risks of HIV infection in Uganda, especially in Sebei and Karamoja region.
In addition to its known short- and long-term adverse physical, psychological, emotional and sexual impact. FGM is at 0.32% in Uganda (UDHS, 2016), but higher in Sebei and Karamoja (26.6% in the 2016 FGM survey). As well HIV prevalence was at 5.1% in the same region (UPHIA, 2016).
Description: United Nations Population fund in partnership with Action Aid Uganda and government of Uganda in 2021, built capacity and empowered young people (boys and girls), men, women, Police, religious and cultural leaders, health workers to implement interventions to eliminate FGM and reduce new HIV infections, in Kween, Bukwo and Kapchorwa districts. Conducted Inter-generational dialogues, community policing and surveillance, and HIV/SRHR awareness meetings. Conducted community service outreaches/camps, strengthened referrals and linkages of girls at risk to HIV for testing, same-day enrolment and livelihood-empowerment for HIV and FGM prevention.
Lessons learned:
- 4,205 adolescent girls tested for HIV, with positivity rate reducing by 56% to 0.86% 2021 compared to 1.96% positivity rate in 2020.
- Reached over 20,000 people with messages on FGM through dialogues and 5,000,000 people through mass media.
- Over 10,000 girls in hotspots received livelihood skilling integrated with HIV and SRHR prevention
- More than 100 communities & 100 religious / cultural leaders made public declarations to denounce FGM and prevent HIV new infections.

Conclusions/Next steps: FGM has no health benefits. Rather, it carries severe short- and long-term risks to the physical and psychological health of women and girls. Increase the risk of new HIV infection through the practice and the outcome as arite of passage to adulthood. Elimination of FGM will drastically lead to Zero new HIV infection in the practicing communities.

Community mobilization and demand creation

EPD197

Use of modern social media to improve tracking and addressing stock-outs by community-based organisations

D. Mikulich[1], Y. Vereshchagina[1]
[1]*Treatment Preparedness Coalition, Saint Petersburg, Russian Federation*

Background: Patient Control is a movement of people affected by HIV and other socially significant diseases. Its mission is to control provision of medical care across Russia, including monitoring and reacting to medicines shortages. To do so, the organisation needs to use all social media platforms, including the recently emerged ones. One of them is Tik Tok with more than 1 billion subscribers.
Our hypothesis was that this platform will help to obtain additional information about drug shortages in Russia which cannot be received though traditional monitoring tools (pereboi.ru website, forums).
Description: Our Tik Tok page: https://vm.tiktok.com/ZSe4aAoJk/ has been active since November 2021. The target group is Russian-speaking people living with HIV. We use specific tags for videos to enable the target audience to find them; statistically, tags are more effective in Tik Tok as compared with other media.
We use trends and adapt them to HIV infection to attract audience; to reach the goal of collecting messages about shortages, we use two broad content clusters: entertaining content (videos, news, useful tips, FAQs) and content to motivate people to write about stock-outs or other issues related to HIV care.
Lessons learned: In 3 months, the Tik Tok profile gained 373 subscribers and received 11 new ARV shortage reports from various regions of Russia. Drug shortages were mentioned in at least 11 comments, which makes it 22 messages in total with broad geographical diversity. Tik Tok enabled the organisation to reach people who do not have other social media accounts. Tik Tok interface is more convenient for people who do not wish to disclose their status as compared with other social media, such as Instagram, Facebook or VK, due to the system which enables users to more effectively conceal their activities, including subscriptions, comments, and likes from other users.
Conclusions/Next steps: Our experience shows that Tik Tok has proven to be an effective media tool for tracking medicine shortages by reaching new audience due to its

specific Interface, algorithms and its current popularity. Given sufficient Internet coverage in a country, it can become an additional source of information about healthcare issues from remote areas for grass-root communities.

EPD198
Offering online HIV services to key populations through a nongovernmental organization in Mali

A. Ag Alitini[1], F. Sidibe[1], S. Dembele[1], M. Ruberitwari[2], J.R. Nsanganira[2], M. Tall[2], S.N. Minichiello[3], Y. Diallo[4], N. Diarra[5], D. Bore[5], S. Barry[5]
[1]*SOUTOURA, Bamako, Mali,* [2]*FHI 360, Bamako, Mali,* [3]*FHI 360, San Francisco, United States,* [4]*Sectoral Committee on AIDS, Tuberculosis and Hepatitis/Ministry of Health and Social Development (CSLSTBH/MSDS), Bamako, Mali,* [5]*USAID, Bamako, Mali*

Background: In Mali, nongovernmental organization SOUTOURA is implementing the USAID/PEPFAR-funded EpiC project that supports HIV prevention and treatment services for key populations, including female sex workers (FSWs) and men who have sex with men (MSM). With technical assistance from FHI 360, SOUTOURA uses online peer education and an online booking application to reach MSM and FSWs not reached through traditional outreach approaches to refer them to offline services.

Description: From May 2020 to September 2021, SOUTOURA conducted online outreach and service promotion using posters, images, videos, and messages on social media platforms and instant messaging apps. Trained online peer educators helped clients take risk assessments and book HIV services using Ibadon, Mali's online reservation and case management app, which is available in French and Bambara and includes oral functions to facilitate use.

The app helps clients identify service needs through risk assessment, screens for COVID-19 risk, and facilitates HIV service booking in three regions (Bamako, Sikasso, and Ségou). For clients living with HIV, the system facilitates index testing and partner referral. Ibadon's data visualizations allow it to track the HIV cascade: number of risk assessments, bookings, arrivals, HIV test results, and antiretroviral therapy or pre-exposure prophylaxis uptake.

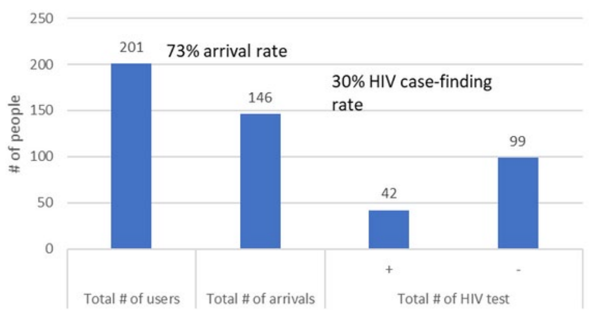

Figure. Total number of online users and HIV test results May 2020 - September 2021

Lessons learned: Online peer outreach was effective for reaching higher-risk MSM and FSWs. From May 2020 to September 2021, 57% of users were MSM and 12% were FSWs. Average age was 26 years.

Overall case finding among online clients was 30% (31% among MSM, 38% among FSWs) compared to an overall case-finding rate of 9%.

Conclusions/Next steps: Targeted outreach through online platforms used by key populations was effective for engaging younger, higher-risk individuals compared to traditional outreach approaches.

Next steps include intensified promotion of Ibadon on social media and using influencers to reach more key population members.

EPD199
Barriers to HIV/AIDS knowledge and prevention among deaf and hard of hearing people in Pakistan

J. Dilawar[1], J. Dilawar[2], U.U. Rehman[3]
[1]*Institute for Social and Youth Development - ISYD, Programs, Lahore, Pakistan,* [2]*Artivism Academy, Planning and Development, Lahore, Pakistan,* [3]*Institute for Social and Youth Development - ISYD, Media and Coordination, Lahore, Pakistan*

Background: In Pakistan, the estimated prevalence of HIV among the general population is less than 0.1% and according to WHO, 5% of every country's population has some sort of hearing impairment and approximately 10 million are hearing impaired in Pakistan. Out of which 1 million are Deaf Children with no awareness around HIV/AIDS.

We've found that deaf individuals lack access to HIV/AIDS information, due to problems in communication, No available material in sign language, low literacy and tightly woven social networks within the community.

Description: A project was conducted in two provinces of Pakistan for deaf and hard of hearing people to enable them to break the barriers preventing themselves from HIV/AIDS; aimed to engage people living in rural and urban areas to identify their knowledge around HIV/AIDS prevention and to build their capacity using sign language through different focused group discussions, Interactive sessions, training workshops and consultations.

Lessons learned: Significant differences in levels of understanding about certain aspects of how HIV/AIDS is spread were identified, capacity of deaf people were built as well as differences in available resources for access to accurate information.

1. More than 2000 deaf and hard of hearing people were engaged, educated and given the right education about HIV/AIDS prevention including males, females, transgender and other sexual minorities.

2. Through our more than 2000 direct beneficiaries and 14,000 indirect beneficiaries, we're continuously approaching more beneficiaries.

3. Videos are being developed on HIV/AIDS prevention and other components of SRHR in sign language.
4. This has now become a huge movement and now we are designing more projects focusing these people and engaging more partners onboard.

Conclusions/Next steps: These findings from Pakistan speak strongly to the need for the development of interventions that include people with disabilities in public health and HIV/AIDS strategies and that address their specific vulnerabilities. There should be proper awareness material for deaf and hard of hearing people in sign language to get proper education around HIV/AIDS and other components for their health and wellbeing.
Evaluating the adaptation of education material and the inclusion of the deaf population in HIV awareness programmes is an urgent next step.

EPD200
Reimagining our futures

R. Mbewe[1], F. Murau[2,1], A. Namiba[1], L. Kwardem[1], N. Osborne[3], E. Ndungu[1]
[1]4M Mentor Mothers Network CIC, London, United Kingdom, [2]Independent Consultant, Brighton, United Kingdom, [3]Independent Consultant, London, United Kingdom

Background: During the COVID lockdown period over the last 2 years the need to move some forms of peer support to a virtual platform became essential. National Lottery funded project 4M: Women Living with HIV Re-imagining the Future, sought to find out how to help communities move towards recovery and renewal after the impact of COVID-19 drawing on all the creativity seen in communities and across civil society.

Description: Over 9 months, starting in November 2020, a virtual safe space training 21 members to use photography and creative writing to document and share their visions for better, self measured futures post-lockdown. To ensure maximum involvement (participation) the women were each provided with an android mobile phone and data bundles.

Lessons learned: Women who participated in the project were equipped with writing a joint femifesto, curating a virtual exhibition and used meditation tools they acquired to support their mental wellbeing. Participants additionally reported that working with others in a supportive, safe and trusted community space makes it easier for women to participate at their own pace. Working in a creative environment eases people into managing difficult emotions.

Conclusions/Next steps: Virtual creative peer support is essential in engaging with women living with HIV, this mitigates the challenges around language issues and use of technology. The main aim of this project is to share the outcomes of this work with key stakeholders including policy and decision makers with whom rest the power to makes changes and to improve the quality of life of women living with HIV. It shows the importance of creative spaces in enabling women's voices and facilitating participation.
It has helped women living with HIV and the community to see that it is possible to plan for the future although there are challenges. It has helped to reinforce the value of community spaces and strengthened the resolve to keep those going because of the benefit received.

EPD201
Lessons from COVID-19 on the use of digital tools to support HIV service uptake and community engagement in research: voices from India

P. Saha[1], D.L. Bose[1], A. Hundal[1], S.u. Hadi[1], J. Mukherjee[1], S. Rawat[2], D. Baruah[2], A. Kumar[3], C. Dewan[3], T. Aurora[3]
[1]IAVI, New Delhi, India, [2]Humsafar Trust, Mumbai, India, [3]Quicksand Design Studio, New Delhi, India

Background: COVID −19 catalyzed the use of digital tools in health, making it imperative to understand ways to include marginalized HIV affected communities. IAVI, in partnership with Quicksand and Humsafar Trust, facilitated virtual roundtables to explore the potential of strategies to enhance digital participation and people-centeredness in prevention and biomedical research.

Description: Two virtual roundtables were conducted in December 2020 and September 2021 with 34 participants representing PWID, MSM, TG, FSW and AGYW communities, researchers and technologists to understand a) existing digital ecosystems; b) digital behaviors during the pandemic; c) what these shifts mean for the design and scaling of future interventions. These conversations were audio recorded with due participant consent and transcribed. Data was coded using an inductive framework based on key areas of enquiry.

Lessons learned: Though COVID-19 fastened the adoption of digital tools, a significant segment of PWID, TG, FSW and AGYW communities are still on the digital fringe. Platforms like Facebook and WhatsApp were used for outreach and real-time reporting about condom/ needle availability; hyper-local service delivery; and access to referrals/peer support.
However, FSW, PWID and TG communities highlighted the need for legal digital support groups and awareness workshops.

Challenges: Digital literacy, privacy and data security are key concerns. Other emerging issues include digital fatigue, spread of misinformation and unequal digital access in communities, including gender disparities. Fear of stigma and violence due to outing of sexual/gender identities or engagement in sex work/substance use were voiced as barriers to participation, along with ambiguity around ethics of digital engagement in research.

Opportunities: Written/audio-visual content in community friendly language can enhance research participation and service uptake. Hybrid approaches that com-

bine digital and physical methods can help overcome access barriers by leveraging on shared community infrastructure and networks. Community gatekeepers, service providers, CBOs can play a critical role in bolstering digital inclusion and outreach with training. Maintaining confidentiality and ensuring data security requires detailed risk-mitigation strategies and skilling of researchers.

Conclusions/Next steps: To ensure uptake and scalability of digital strategies, it is imperative to better understand inter-/intra-community digital behaviors and strategize inclusion by strengthening digital literacy and addressing concerns around privacy, security, accessibility and affordability.

EPD202

Community-health workers have seized opportunities during the Covid-19 crisis to improve services for key populations: results from the international EPIC program

R.M. Delabre[1], J. Castro Avila[1], L. Kretzer[2,3], J.M. Mutima[4], E.A. Kambire[5], G. Kpakpo[6], M. Magassouba[7], J.R.G. Cañizares[8], I. Castillo[9], D. Dondbzanga[2,10], T. Cerveau[2], O. Apffel Font[1,11], L. Sagaon Teyssier[10,12], B. Spire[12], M. Di Ciaccio[1,13], P. Roux[12], N. Lorente[1,14,15], V. Villes[1], C. Folch[14,15], R. Diagne[2], L. Riegel[1], D. Rojas Castro[1,12], EPIC Study Group

[1]Coalition PLUS, Community-based Research Laboratory, Pantin, France, [2]Coalition PLUS, Community-based Research Laboratory, Dakar, Senegal, [3]Corporación Kimirina, Quito, Ecuador, [4]ANSS, Bujumbura, Burundi, [5]REVS PLUS, Bobo-Dioulasso, Burkina Faso, [6]Bésyp, Abomey-Calavi, Benin, [7]ANCS, Dakar, Senegal, [8]Corporación Red Somos, Bogotá, Colombia, [9]Colectivo Amigos Contra el SIDA (CAS), Guatemala City, Guatemala, [10]ARCAD Santé PLUS, Bamako, Mali, [11]Coalition des Organismes Communautaires Québécois de Lutte Contre le Sida (COCQ-SIDA), Montréal, Canada, [12]Aix Marseille Univ, INSERM, IRD, SESSTIM, Sciences Economiques & Sociales de la Santé & Traitement de l'Information Médicale, ISSPAM, Marseille, France, [13]Université Lyon 2, Groupe de recherche en psychologie sociale (GRePS), Lyon, France, [14]Centre d'Estudis Epidemiològics sobre les Infeccions de Transmissió Sexual i Sida de Catalunya (CEEISCAT), Departament de Salut, Generalitat de Catalunya, Badalona, Spain, [15]Centro de Investigación Biomédica en Red de Epidemiología y Salud Pública (CIBERESP), Madrid, Spain

Background: To understand and learn from the impact of the Covid-19 health crisis on HIV prevention and care, it is necessary to evaluate how it has affected key populations (KP) and community health workers (CHW) working with KP. The community-based research program EPIC aimed to evaluate this impact among CHW and KP.

In this descriptive analysis, we present preliminary findings among CHW in 7 countries.

Methods: EPIC, an international, community-based research program coordinated by Coalition PLUS, was launched in 2020. A questionnaire for CHW in direct contact with beneficiaries of the participating community-based organizations (CBOs) collected information on socio-demographic characteristics and the impact of the Covid-19 crisis. The questionnaire was deployed online and in paper format from March-December 2021 by organizations in Benin (Besyp), Burkina Faso (REVS PLUS), Burundi (ANSS), Senegal (ANCS), Colombia (Red Somos), Guatemala (CAS), and Spain (CEEISCAT).

Results: Among 558 CHW respondents, the median age was 38 years [IQR: 30;46], 52.1% (n=290) were women, and 64.7% (n=361) completed post-secondary education. Almost half (47.2%, n=262) identified with at least one KP. A majority (72.1%, n=380) reported a negative overall impact of Covid-19 on their work and 57.4% (n=304) reported an increase in workload. Almost all (93.9%, n=492) felt that their work was essential to their structure and 68.4% (n=361) reported being able to develop new professional skills. More than one quarter (27.3%, n=141) reported more frequent communication with the beneficiaries of the structure since the start of the pandemic and 65.7% (n=341) felt that the Covid-19 pandemic will be an opportunity to create new links or to strengthen existing links with beneficiaries.

Conclusions: Despite the increased workload and overall negative impact of Covid-19 on their work, the pandemic has reaffirmed the essential role of CHW in maintaining KP in care. CHW have notably seized the opportunity for capacity-building and to create or reinforce relationships with beneficiaries. As the Covid-19 crisis continues, and for future health crises, CHW can provide unique expertise for the improvement and adaptation of services for KP.

EPD203

Enhanced outreach demand generation activities for engaging transgenders with service delivery

V. Pawar[1], D. Gohil[1], P. Sarode[1], U. Kanojiya[1], S. Poojary[1], C. Vasudevan[1], B. Maheshwari[1], S. Shaikh[2]

[1]YR Gaitonde Center for AIDS Research and Education, Chennai, India, [2]The Johns Hopkins University School of Medicine, Baltimore, United States

Background: Transgender people face inequalities in access to health and social services and are particularly vulnerable to HIV. However, there is limited documentation of models through which transgender people can be provided with HIV services and wider social support in low- and middle-income countries. The ACCELERATE project which is supported by USAID and PEPFAR in India and Implemented by John Hopkins University school of Medicine and YRG Care initiative called Mitr Clinic. In the efforts to improve the Transgender and Hijra (TG-H) programme in Maharashtra and Telangana states to provide comprehensive health care services to Transgenders.

Description: A series of stakeholder consultations were conducted to understand the needs, opportunities and challenges to improve the TG-H programme and design the technical assistance plan for the states, in close

Oral abstracts

Poster exhibition

E-posters

Late-breaker abstracts

Author Index

coordination with National AIDS Control Organizations (NACO), State AIDS Control Organizations and Technical Support Unit. The purpose of stakeholder consultations was to meet the community and relevant key players working with TG-H people to obtain inputs and understand their perspective on what needs to be done to enhance the service delivery. In continuation to the consultation, comprehensive health care service delivery models are developed.

Lessons learned: Based on the successful consultations the Mitr Clinic in Thane has reached 200 transgender individuals with evidence-informed clinical practice guidelines for primary care-initiated gender-affirming therapy for adults with gender dysphoria and an enabled bouquet of allied services such as healthcare services include gender affirmative hormone treatment and other sexual health services covering 61 HIV testing and counseling, testing and treatment for other sexually transmitted infections.

In addition, the clinic offers antiretroviral treatment and currently 4 clients are on ART and pre-exposure prophylaxis. Provision of select cosmetic/aesthetic services from M to F trans persons, referrals for wider range of services. Legal gender recognition documentation and access to social protection schemes.

Conclusions/Next steps: Community-based and client centric approaches can increase demand for and increase access to a range of tailored services for transgender populations. Community involvement and rights-based collectivization approaches that strengthen self and collective efficacy and identity of transgender communities provide an avenue for improving health and social services.

EPD204

Malawi EMPOWER's use of demand-creation strategies for sexual and reproductive health services for adolescent girls and young women during COVID-19 in Zomba and Machinga Districts

P. Gwaza[1]

[1]*University of Malawi, Communication, Blantyre, Malawi*

Background: Adolescent girls and young women (AGYW) in Malawi bear a disproportionate burden of HIV compared to male peers; HIV prevalence is 2.3 times higher among young women ages 15-24 compared to young men the same age, according to the 2018 Malawi Population-Based HIV Impact Assessment. High access to and utilization of sexual and reproductive health (SRH) services among AGYW ages 10-24 requires increased use of demand-creation strategies in communities.

This abstract highlights the USAID-funded Malawi EMPOWER Activity's use of digital platforms in demand-creation strategies to increase SRH service uptake among AGYW in Zomba and Machinga Districts during the COVID-19 pandemic.

Description: Social and behavior change communication interventions were adapted to fit Malawi's COVID-19 restrictions, which suspended direct community mobilization.

To eliminate barriers to service access by increasing awareness of the services being provided in targeted districts, demand-creation messages on the benefits of services and service delivery schedules were shared with AGYW, community mobilizers, and health care workers through social media (Facebook, WhatsApp groups) and other digital platforms such as radio.

Lessons learned: Malawi EMPOWER began implementation in March 2020, just when the Malawi government established restrictive measures against COVID-19.

These restrictions suspended demand-creation activities such as dialogue sessions with AGYW, Go! Girls Clubs sessions, community special events, advocacy meetings, and campaigns. From March to April, EMPOWER experienced a 40% drop in AGYW accessing SRH, HIV, and gender-based violence (GBV) services due to the ban on these activities.

Following implementation of adapted strategies from the end of April to August 2020, 28,971 AGYW were reached with SRH services (family planning methods, counseling), including HIV testing services, representing a 73% achievement of the annual target of 39,643. Of these, 64% (n=17,090) were ages 10-14, 27% (n=7,051) were ages 15-19, and 9% (n=2,421) were ages 20-24.

Conclusions/Next steps: Although COVID-19 has presented barriers to full implementation of mobilization activities affecting the uptake of SRH/HIV/GBV services among AGYW, an adapted package of demand-creation strategies implemented through social media and other digital platforms was successful in reaching this population with messages and services.

Community-based approaches (including empowerment, outreach and service delivery)

EPD205

Providing integrated and comprehensive HIV response (prevention and services delivery) to the marginalized population: a community-based approach by OGA Services 4U Foundation

O. Adeniyi[1]

[1]*OGA Services 4U Foundation, Paramaribo, Suriname*

Background: HIV response in Suriname continues to be disjointed, duplicated, and implemented in parts. Active players continue to work in isolation and as competitors sending mixed, inconsistent, and contradictory messages to the target groups.

Several members of the target groups are now in survival mode due to the economic hardship and do not consider HIV as a top priority.

Oral abstracts

Poster exhibition

E-posters

Late-breaker abstracts

Author Index

The main objective of this initiative was to provide an integrated and comprehensive health screening service. The scope spans HIV, NCD, COVID-19, welfare, and nutrition support.

Description: OGA Services 4U Foundation brought together over 10 different HIV and non-HIV organizations providing different services from assigned space in the same location in one day. Three communities (Texas, Flora, and Wan Hatti) were targeted based on a need assessment. These are marginalized communities with low levels of income, literacy, limited access to health services, and standard of living.

The target groups included single parents, unemployed, school dropouts, drug users, homeless, young persons, and indigenous people. Services provided included screen, counseling, and referral. Over 3,200 persons were reached. 100% of participants were happy being able to access different services in one location same day.

About 95% of participants indicated that they have never received any education or services on HIV and NCDs prior to this. The distribution of food packages and COVID 19 palliative addressed some immediate challenges of several participants.

During follow, 67% of the participants reported having accessed at least 1 other HIV and NCD within 2 months as a result of the intervention. Other communities are now requesting a similar intervention.

Lessons learned: The integration of services and partnership with local organizations including non-HIV such as FBOs increased reach and impact. Having diverse services available on the same day and location increased access to health services.

Strategic collaborations break barriers among players and facilitate the sharing of strategic information. The distributed palliatives helped to mobilize people and meet their immediate needs.

Conclusions/Next steps: Health services, especially HIV-related ones must be integrated and comprehensive. Forming strategic alliances is essential. No health service should be provided in isolation. Governments and stakeholders must facilitate strategic collaborations in the national response.

EPD206

Disclosure of HIV status among HIV positive women and other teen mothers, a vital procedure to preventing positive new borns/children

J.F. Ndibalekera Kaweesa[1]

[1]*MU-JHU Research Collaboration, Kampala, Uganda*

Background: Disclosing one's HIV- positive status is an essential prerequisite for the prevention and care of persons living with HIV/AIDS and preventing spread of the virus to the new born. Disclosure is an important public health goal for a number of reasons like motivating sexual partners to seek testing, change behaviors and ultimately decrease transmission of HIV.

Women who disclose their status to partners are more likely to participate in programs for prevention of HIV transmission from mothers to infants.

This study sought to improve disclosure of HIV status among women attending the PMTCT (Prevention of Mother to Child Transmission) through routine peer- education, counselling and sharing experiences.

Methods: - A sample of 100 women who had not disclosed their HIV status to anyone were selected using random sampling in Mulago, Kawempe Division.

- They gave a verbal consent and accepted to receive peer counselling and education during their routine clinic visits from January to December 2019.

- Counselling and education about the importance status disclosure.

- The peer educator also shared her experience with the women and how to disclose to other people of choice.

- An interview questionnaire was administered on subsequent visits to assess disclosure and reason for non-disclosure.

Results: 100 women selected for the study, 11% women had disclosed their HIV status by the second visit and 27% of the women had disclosed by the third visit, 39% disclosed at the fourth month visit and 7% disclosed by the fifth visit. 51% disclosed to parents, 20% disclosed to friends and relatives and 13% disclosed to their spouses. 16% women did not disclose.

The major reasons for non-disclosure included stigma fear of partner abandonment and unstable partners.

Conclusions: Peer education and counselling can improve HIV status disclosure if done continuously at each routine clinic visit here in Uganda. Strategies to mitigate HIV related stigma in the community should be strengthened so that People with HIV are free to talk about their status without fear of being isolated or stigmatized.

Encourage the disclosure of one's status and hence preventing the passing on the virus to the baby born thus less positive numbers.

EPD207

Generating demand for pediatric dolutegravir 10 mg: early lessons from Afrocab's development of treatment literacy materials and subsequent collaboration with national governments

J. Wambui[1], A. Mishra[2], B. Ngwatu[3]

[1]*Afrocab Treatment Access Partnership, Nairobi, Kenya,* [2]*Clinton Health Access Initiative, New York, United States,* [3]*Clinton Health Access Initiative, Kampala, Uganda*

Background: In mid-2021, pediatric dolutegravir 10 mg (pDTG), a child-friendly formulation of dolutegravir, began to be introduced in sub-Saharan Africa.

Community Advisory Boards (CABs) established with the support of Unitaid, Catholic Relief Services, the Clinton Health Access Initiative (CHAI), and Afrocab supported

Oral abstracts

Poster exhibition

E-posters

Late-breaker abstracts

Author Index

the introduction of pDTG by developing a suite of treatment literacy materials designed to sensitize mothers and caregivers about this new formulation.

Description: In advance of pDTG's introduction, CAB members formed a Working Group to develop a multimedia package of adaptable treatment literacy resources for use by ministries of health (MOHs), implementing partners, civil society organizations, and national PLHIV networks to expand access to information on pDTG and support demand generation. Materials included both print and audiovisual resources such as posters, pocketbooks, and videos.

Following initial development, national CABs shared the package of resources with MOHs for their review, local adaptation, and adoption. During the development and review process, CABs solicited feedback directly from caregivers during training's and workshops and relayed these to the relevant government stakeholders.

To date, these resources have been officially adopted by MOHs in over 10 countries and are being utilized to sensitize thousands of mothers and caregivers across the continent.

Lessons learned: The widespread endorsement, utilization, and impact of the CAB-developed pDTG materials highlight several key lessons for the development of future treatment literacy materials:

1. *Materials development should be driven by communities:* The success of these materials reflects the fact that the materials' core messaging and design was driven by communities. Furthermore, the diverse array of print and audiovisual materials addressed a range of knowledge gaps, while also triggering caregiver interest, confidence, and demand.
2. *Materials should be shared with MOHs for adoption:* Sharing these materials with MOHs prior to product introduction not only generated government buy-in, but ensured consistent messaging, accelerated widespread dissemination, and created synergies between MOH and CAB activities.

Conclusions/Next steps: Community-friendly, accurate, and consistent treatment literacy materials are vital for generating demand for HIV products. Empowering communities to lead material development efforts and encouraging them to collaborate closely with MOHs should become the norm for pDTG's and future optimal HIV product introductions.

EPD208

Beyond clinical interventions: using a community-based social work delivery approach to support viral load suppression among children living with HIV in five countries

A. Koler[1], J. Charles[2], A. Barankena[2], C. Jacob[3], M. Briede[3], S. Ginindza[4], Z. Dlamini[4], N. Gwebu Storer[4], P. Mugwaneza[5], P. Mawora[6], S. Kelbert[7], S. Posner[1], E. Kuhlik[1]

[1]Pact, Washington, United States, [2]Pact Tanzania, Dar es Salaam, Tanzania, The United Republic of, [3]Pact South Africa, Pretoria, South Africa, [4]Pact Eswatini, Mbabane, Eswatini, [5]Pact Rwanda, Kigali, Rwanda, [6]Jhpiego South Sudan, Juba, South Sudan, [7]Jhpiego, Baltimore, United States

Background: Global progress towards 95-95-95 targets among children living with HIV (CLHIV) remain suboptimal. In Eastern and Southern Africa, 74% of CLHIV on ART age 0-14 years are virally suppressed (UNAIDS, 2020). Pact implements PEPFAR and USAID-funded orphans and vulnerable children (OVC) programming including family-based case management for CLHIV to improve HIV clinical outcomes including viral load suppression (VLS).

Description: Targeting CLHIV who receive clinical services from PEPFAR-supported facilities, Pact's case management service delivery approach enables OVC and caregivers to access needs-based comprehensive social services through professional or volunteer para-social workers.

This workforce supports continuity of HIV treatment through ART monitoring and counseling, disclosure support, reminders for appointments and multi-month dispensing pick-up, escorted referrals to health facilities, case conferencing with facility staff, psychosocial support, and linkages to CLHIV groups and food support.

From October 2020-September 2021, Pact provided case management to 24,277 CLHIV age 0-14 years on ART with viral load results reported within the last 12 months across five countries: Tanzania (n=17,896), South Africa (n=4,489), Eswatini (n=1,314), Rwanda (n=314), and South Sudan (n=264).

Lessons learned: Among these CLHIV, 90% were virally suppressed; country results ranged 80%-98%. VLS rates varied by age group, from 85% (age <1) to 90% (age 5-9). While variations between sex within age groups were minimal (<1.5%), greater differences (>5%) were observed in Eswatini and South Sudan. CLHIV in urban areas had higher VLS rates (91%) than rural areas (88%). VLS rates among CLHIV age 0-14 in Pact's programs were higher than national UNAIDS estimates for the same age band: South Sudan (83% vs. 36%), Tanzania (91% vs. 72%), South Africa (80% vs. 70%), Rwanda (98% vs. 89%), and Eswatini (92% vs. 91%).

Conclusions/Next steps: The social service sector can play an important role in pediatric VLS. CLHIV receiving case management through OVC programs have higher VLS rates compared to national estimates, yet quasi-experimental research is needed to determine the attribution of case management on VLS among CLHIV on ART.

Given observed variations in VLS, OVC programs should ensure interventions are tailored to meet the needs of CL-HIV as they age and transition to different ART doses and regimens.

EPD209

Reconciling advocacy and research to fight HIV/AIDS at the level of key populations

J. Ouessou[1]
[1]*Réseau Bénin Synergie Plus, Atlantique, Abomey-Calavi, Benin*

Background: Curbing the epidemic of HIV in key populations can only be achieved by developing prevention methods in addition to traditional tools such as pre-exposure prophylaxis (PrEP) or community-based medical screening, two methods recommended by the WHO for which BESYP Network has carried out research projects and advocacy actions.

Benin Synergies Plus Network (BESYP) created in 2010, is one of the oldest LGBTI networks in Benin openly claiming the sexual orientation of its members and intervenes in the prevention and screening of HIV, medical orientation.

Description: BESYP Network carried out from October 2019 in December 2020 an experiment on community screening operated by LGBTI community workers in the cities of Cotonou, Porto-Novo and Abomey-Calavi.

The results were exceptionally convincing: 75% of people screened were for the first time and 95% of beneficiaries said they were satisfied, citing in particular the increased ease of communication and respect for confidentiality.

Upon completion, advocacy by BESYP Network with Plan International Benin and the Ministry of Health enabled the continuation of the strategy in the cities of the project, then its scaling up throughout the territory in June 2021.

Regarding PrEP, advocacy has enabled research.

After identifying barriers, BESYP Network in collaboration with Plan International Benin and POCAO of Canada developed arguments based on scientific evidence and institutional recommendations that it disseminated to the Ministry of Health.

This latter authorized Plan International Benin in collaboration with BESYP Network to conduct a pilot study on the feasibility of PrEP, jointly developed by the research and advocacy centers.

The study, targeting 200 MSM, began in August 2020. Its results are awaited by the Ministry of Health of Benin to decide on the means of implementation soon.

Lessons learned: These two examples show the correlation of research and advocacy. Advocacy makes it possible to implement research projects, the results of which legitimize and fuel advocacy.

Conclusions/Next steps: The common research and advocacy experience has already shown its impacts and it is important that it can continue.

Today, BESYP Network is trying to get support to achieve new goals such as the effective implementation of self-testing and community distribution of Antiretrovirals.

EPD210

Fostering flourishing communities: associations between collective empowerment, positive emotion, compassion, curiosity and HIV discrimination among rural Kenyans

M. Goodman[1], A. Elliott[1]
[1]*University of Texas Medical Branch, Internal Medicine, Galveston, United States*

Background: HIV stigma remains a persistent barrier to ending the HIV pandemic. People within respective cultures must be the ones to challenge norms supporting HIV stigma. Understanding community and psychological processes by which cultural insiders challenge HIV stigma is essential to building effective interventions to end HIV stigma.

The broaden-and-build cycle of attachment security hypothesizes secure social connections provide a secure base to explore, affirm the value of others, and challenge exclusive norms. We assess whether collective efficacy predict less HIV discrimination among semi-rural Kenyans, and whether this association is mediated by "broaden and build" constructs of positive emotion, compassion, and social curiosity.

Methods: We collected cross-sectional baseline survey data from participants in a Kenyan community empowerment program to assess an on-going pilot trial of a novel 6-month positive psychology-based curriculum (n=335). Survey included validated scales of collective efficacy, positive emotion, compassion, social curiosity and HIV discrimination.

Structural equation modelling was used to assess serial mediating paths between collective efficacy and HIV discrimination.

Results: Controlling for age, gender, wealth and education, higher collective efficacy significantly predicted lower HIV discriminatory views (β=-0.17; 95%CI: -0.28, -0.07). This association was mediated by positive emotion (24%), and further by compassion (34.7%) and social curiosity (14%).

Through various direct and indirect pathways, women held more HIV discriminatory views than men (β=0.07); older respondents were more likely to hold discriminatory views than younger people (β=0.09); people with more wealth (β=-0.03) and more years of formal schooling (β=-0.01) were less likely to hold HIV discriminatory views.

Conclusions: The study supports an on-going approach to integrate multiple developmental goals, including ending HIV pandemic, within a community empowerment program.

Further research is required to understand whether observed determinants can be modified and reduce HIV stigma and discrimination, and whether improvements can further support community-led change around HIV

stigma to end the HIV pandemic. Focus on enhancing collective efficacy, positive emotion, compassion and curiosity within the broader community in high HIV endemic areas may muster support for ending HIV stigma and advancing efforts to end the HIV pandemic.

EPD211

Community Advisory Board (CAB) ensure HIV Service Continuity in Binh Duong, Vietnam during COVID-19 pandemic

H.V. Thai[1], T. Pollack[2], N.V. Dang Thi[1], A. Nguyen[3], T.N. Vo Thi[1], M.T. Dao[4], T.L. Vuong[5], L. Cosimi[6]
[1]HAIVN, Ho Chi Minh City, Viet Nam, [2]HAIVN, Ha Noi, Viet Nam, [3]US CDC, Ha Noi, Viet Nam, [4]Community Advisory Board, Binh Duong, Viet Nam, [5]Binh Duong CDC, Binh Duong, Viet Nam, [6]HAIVN, Boston, United States

Background: In June-November 2021, Vietnam faced its most serious wave of COVID-19, Binh Duong (BD) province had the second-highest number of COVID-19 cases. The health system in BD was significantly overloaded, as a result, access to HIV-related services was impacted.
Treatment continuity for people living with HIV on antiretroviral viral therapy (ART) and key populations (KPs) utilizing (Pre-Exposure Prophylaxis) PrEP was threatened due to travel restrictions and clinic shutdowns. Many individuals were unable to utilize their social health insurance (SHI) to access ART.
Description: In April 2019, provincial CAB have been formed to improve service delivery and advise health facilities on improvement. CAB BD consists of 10 people living with, affected by, or at risk of HIV and was recruited by BD Centers for Disease Control (CDC). Due to COVID-19 restrictions, CAB promptly coordinated resources to ensure continuity of services for ART and PrEP clients. With the timely support from BD CDC in providing travel passes and vaccination, CAB members navigated patients to available clinics for ART pick-up if their regular clinic was closed. CAB delivered ART or PrEP to those in quarantine or under lockdown. For patients whose SHI had expired, CAB counseled on how to extend coverage or access SHI from alternative sources through phone calls and virtual platforms.
Lessons learned: Due to this rapid community-led response, 1500/1650 (~90%) clients were supported to continue ART or PrEP without interruptions, and more than 500/600 (~83%) clients maintained their SHI coverage. This response mechanism, under the direct support of BD CDC, shows the value of an HIV innovation to mitigate the impact of COVID on HIV clients and to support overburdened health providers. This demonstrates that a strong collaboration between governmental entities and the community provides a holistic and timely approach to fill in health system gaps, especially for continuity of care for KPs and other vulnerable groups.
Conclusions/Next steps: CAB can play a critical role in response to public health emergencies, helping to assure continuity of services for clients. Scaling up CABs and empowering community-driven initiatives is necessary to build a more resilient society in the face of COVID and HIV pandemic challenges.

EPD212

Digital transformation in community-based HIV programs – are we there yet? Integration of a digital information App for community health workers in 5 districts of Zimbabwe

K. Webb[1], T. Chikwaya[1], I. Nhiringi[1], M. Mayanga[1], A. Sibanda[1], K. Takarinda[1], K. Harrison[2], L. Gale[2], S. Moore[2]
[1]Organization for Public Health Interventions and Development, Harare, Zimbabwe, [2]Avert, Brighton, United Kingdom

Background: With rapidly changing guidelines and emergent public health threats such as COVID-19, reaching community health workers (CHWs) with appropriate, up-to-date information and myth-busters is a persistent challenge in large-scale HIV programs to reduce the 'know-do' gap. Digital transformation involves the use of digital technologies to improve the performance or reach of an organization or program. Boost is a mobile phone application designed in collaboration with CHWs intended to enhance confidence and client interactions through visual and interactive materials on HIV, sexual health and COVID-19. Our objective was to evaluate the use of Boost by CHWs in a large-scale HIV program.
Methods: We purposively sampled CHWs in the geographical catchment of 74 health facilities in 5 Districts of Zimbabwe where Boost was recommended for use. CHWs and their supervisors self-completed a survey on the installation, user-experience and reasons for (non) use of Boost on their smartphones using OpenDataKit. Survey data were analyzed descriptively using StataV15.1 and qualitative data analyzed thematically.
Results: From November-December 2021, 485 CHWs completed the survey. While the majority (66%; 319/485) of CHWs had used Boost, there were significant variations in App usage and frequency of use between rural/urban Districts, and clustered between sites within Districts. The most frequently cited reason for use of Boost by both CHWs and their supervisors was to increase their personal knowledge about a health topic (73%; 232/319); 98%(n=312) of CHWs reported use of the App had improved their confidence and communication with clients.
Additional support requested by CHWs to optimize Boost use included translation into local languages, mentorship/demonstration on App sharing/use with clients, and ensuring data-lite applications for download, storage and use.
Conclusions: We demonstrate the potential of digital applications for rapidly cascading information to CHWs when new evidence or guidelines are released. Reducing the 'digital divide' between rural/urban settings and normalizing digital technology use by CHWs at scale will require differentiated training and technical support strat-

egies. Community-based program implementers require user dashboards for targeted program remediation to improve coverage and implementation fidelity of digital strategies. Future research is required to evaluate the impact of digital tools upon the quality of services provided by CHWs.

EPD213

Randomized controlled trial of rise, a community-based behavioral counseling intervention that improves antiretroviral therapy adherence among Black/African American adults living with HIV

L. Bogart[1], M. Mutchler[2,3], K. Goggin[4], M. Ghosh-Dastidar[1], D. Klein[1], S. Lawrence[3], M. Gizaw[1], K. Tyagi[3], D. Thomas[3], J. Bailey[3], G. Wagner[1]
[1]RAND Corporation, Santa Monica, United States, [2]California State University Dominguez Hills, Dominguez Hills, United States, [3]APLA Health, Los Angeles, United States, [4]Children's Mercy Kansas City and University of Missouri Kansas City, Kansas City, United States

Background: Compared to other races/ethnicities, Black people living with HIV are less likely to adhere to antiretroviral therapy (ART) and to be virally suppressed. These disparities may result from structural inequities (e.g., poverty, discrimination) and Black Americans' responses to inequities (e.g., medical mistrust; internalized stigma). Few evidence-based ART adherence interventions have been culturally tailored for Black Americans.
Methods: Rise is a community-based culturally congruent behavioral counseling ART adherence intervention for Black Americans. From January 2018-June 2021, we conducted a randomized controlled trial of Rise among 166 (85 intervention, 81 control) Black adults living with HIV in Los Angeles County, California.
A peer facilitator conducted five individual counseling sessions over 6 months using problem solving and motivational interviewing strategies, and social service needs assessments and referrals, to address adherence barriers. Up to four additional sessions were provided to those who remained non-adherent after the first month. Culturally tailored topics included discrimination; medical mistrust; internalized stigma; and social support.
Adherence was assessed with electronic monitoring. Surveys (at baseline and 7- and 13-month follow-up) included sociodemographic characteristics, HIV stigma, and HIV-related medical mistrust (conspiracy beliefs). Repeated-measures logistic or linear intention-to-treat regression modeling was conducted analyzing all follow-up observations with adjusted standard errors for within-participant clustering and nonresponse weighting for missing data, including study arm indicator and baseline value of the outcome as predictors.
Results: At baseline, average age was 49.0 years (SD=12.2); 76% were male, 20% female, 4% transgender male or female, and 1% gender-nonconforming. Intervention and control groups were comparable at baseline, without significantly different socio-demographic characteristics. Compared to controls, intervention participants showed two times greater adherence likelihood (≥ 80% of prescribed doses), OR (95% CI)=2.0 (1.1-3.6), $p < .05$; lower stigmatizing beliefs about HIV, OR (95% CI)=0.57 (0.32-1.00), p=.05; and reduced HIV-related mistrust, b(se)=-.21(.09), $p < .05$, at follow-up relative to baseline.
Moderation analyses indicated that intervention effects on adherence were stronger for younger participants, log odds (se)=-.05 (.03), $p < .05$.
Conclusions: Rise showed strong long-term adherence effects. It is critical to implement culturally congruent interventions like Rise that respond directly to the needs of Black American populations living with HIV.

EPD214

Integrated community delivery model to improve PrEP uptake and continuation for AGYW in Mazowe district, Zimbabwe

B. Chiururwi[1], P. Moyo[1], E. Molande[1], J. Murungu[1], S. Nyakuwa[1], I. Mahaka[1], P. Manyanga[2], B. Mushangwe[2], M. Mutseta[3], G. Gonese[2], B. Makunike[2], T. Mharadze[4], S. Wallach[4], R. Malaba[4], R. Weber[4], S. Wiktor[5]
[1]Pangaea Zimbabwe AIDS Trust (PZAT), Harare, Zimbabwe, [2]Zimbabwe Technical Assistance, Training & Education Center for Health (Zim-TTECH), Harare, Zimbabwe, [3]Ministry of Health and Child Care (MOHCC), Harare, Zimbabwe, [4]Centers for Disease Control and Prevention (CDC), Harare, Zimbabwe, [5]International Training and Education Center for Health, University of Washington, Seattle, United States

Background: The Ministry of Health and Child Care (MOHCC) has been offering Oral Pre-exposure prophylaxis (PrEP) as part of combination HIV Prevention in Zimbabwe since 2017. PrEP is effective in reducing risk of HIV acquisition in high prevalence settings. Access to services including PrEP is a challenge for hard-to-reach rural communities, compounded by COVID-19 restrictions.
Pangaea Zimbabwe AIDS Trust (PZAT), in collaboration with MOHCC and Zimbabwe Technical Assistance, Training and Education Center (Zim-TTECH) embarked on integrated clinical outreach services to ensure PrEP uptake, effective use and continuation among vulnerable Adolescents Girls and Young Women (AGYW).
Description: From January to August 2021, integrated clinical outreach services were conducted around Mvurwi Hospital catchment area, Mazowe District to deliver a comprehensive package of services including oral PrEP, HIV testing and treatment, family planning, gender-based violence prevention and immunisation to community doorsteps.
Outreach points were identified based on remoteness. MOHCC and implementing partners collaboratively map points and plan the outreach visits. A PrEP Champion who is an AGYW mobilises clients and raises awareness on PrEP ahead of the outreach.

A multidisciplinary team including nurses and counsellors delivers services during the outreach. Outreach services are conducted monthly offering consistent and uninterrupted services. Data was captured and reported using standard MOHCC tools.

Lessons learned: Integrated delivery of services at community level improves access and utilization of services including PrEP. Between January and August 2021, 344/366 (94%) AGYW tested for HIV were negative, 157 were assessed for risk and 144 (92%) were initiated on PrEP. At outreach points, 296 AGYW collected PrEP refills.

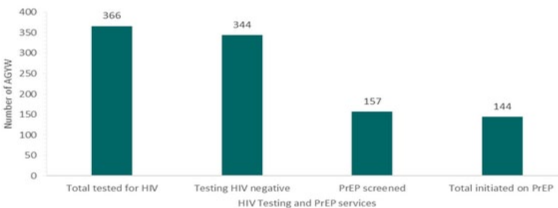

Figure. AGYW accessing HIV testing and PrEP services through community outreaches in Mvurwi, Jan-Aug 21

Conclusions/Next steps: Partners' collaboration in communities through integrated planning and implementation is essential for successful delivery of HIV prevention services including PrEP. Comprehensive HIV service provision can be effectively implemented with support from peer mobilisers. Under COVID-19 restrictions, communities can still access health services including PrEP using this delivery model.

EPD215

"Wumoja", an approach to increase sustainability in HIV prevention among children in primary schools in Nakivale refugee settlements

M. Hosborn Zziwa[1], N. Nabulumba[2], J. Ssemanda[3], C. Kamwiine[2]

[1]ALIGHT, Community Service, Nsingiro, Uganda, [2]ALIGHT, Protection, Nsingiro, Uganda, [3]University of Florida, Center for African/Latin American Studies, Gainesville, United States

Background: Refugee primary school children are becoming sexually active at a very earlier age and are at a risk of contracting STDS like HIV infection. Health education program like "Wumoja" could increase the level of knowledge, influence attitude and encourage safe sexual practices when implemented in schools.

"Wumoja" a Swahili word meaning together, is a practical approach used by ALIGHT to test the effects of an HIV/AIDS education program in Nakivale refugee's settlement.

Description: This intervention was started early 2018 after reviewing both the medical and education reports of primary schools in Nakivale refugee settlement, it was discovered that girls from the age of 14 to 16 are facing different sexual challenges both at school and outside school. These include early sexual practices within schools. The Wumoja approach was designed to reduce the children's risk of HIV infection and to improve their tolerance and care for the children with AIDS. Local teachers and health workers attended a 4 days' workshop pier to the implementation.

The intervention was targeting self-reported exposure to AIDS information, attitude towards children living with AIDS, having sexual intercourses for school going children, subjective norms regarding sexual intercourses that may affect girls at an early stage and the intentions of engaging in sexual intercourse by school going children.

The program was implemented for 6 months providing an average of 20 hours per school.

Lessons learned: Following the Wumoja approach, with direct involvement of children and teachers in schools, pupils reported significantly higher scores for the following outcome compared to the previous years before the program implementation: AIDS information 31% versus 12%, AIDS communication 29% versus 8%, AIDS knowledge 30% versus 5%, attitudes towards people with HIV 26% versus 2% .the program has improved the learning environment and also reduced the risks of HIV/AIDS among school going children.

Conclusions/Next steps: Wumoja has been an effective approach to providing AIDS education for primary school children in Nakivale Refugee settlement and this could be implemented to other schools across Uganda both primary and secondary and East Africa. Printing and distributing training materials among schools in remote villages is still a challenge.

EPD216

Fast-tracking viral load suppression among HIV positive children using a community-clinical collaborative approach in South Western Uganda

D. Nyombi[1], D. Nuwaaba[2]

[1]TPO Uganda, Monitoring, Evaluation and Learning Specialist, Kampala, Uganda, [2]TPO Uganda, Programs, Kampala, Uganda

Background: Whereas Uganda has attained significant gains towards HIV diagnosis and treatment, viral load suppression (VLS) among children remains unacceptably low. Data from Ministry of Health indicates that VLS among adults is performing better compared to children. Accordingly, VLS among children increased from 36% in 2016 to 48% in 2019 and fell far short of 2020 targets. USAID's Keeping Children Healthy and Safe (KCHS) is consortium project aimed at preventing new HIV infections and building capacity for lifelong ART.

Description: KCHS is a five-year project implemented in 17 districts of South Western Uganda by TPO Uganda in partnership with AVSI, REPSSI, ACORD and collaborating with USG funded Clinical Partners: TASO, UPMB, JCRC and RHSP supporting up to 64,910 beneficiaries who include children and adolescents living with HIV, HIV-exposed infants, biological children of female sex workers and children survivors of sexual violence. Signing and implement-

ing joint MOUs with health facilities, clinical partners has given birth to a Collaborative Approach. The approach involves pairing a Community Development Officers with Health Facility Counselors and community para-social workers to offer comprehensive services at household level which include; providing psychosocial support, responding to child protection and GBV, providing adherence counseling and clinical management.

Lessons learned: Viral load suppression for children consistently improved from 78% in quarter 1 of 2020 to 89% in the second quarter of 2021, to 90.3% in quarter 3 of 2021. Out of 4,725 children whose viral load was monitored in Quarter 3 a total of 4,265 were virally suppressing.

The project has intensified follow up of the 460 children with non-suppressed viral load status. Strengthening community-Health facility linkage is a key ingredient to fast-tracking viral load among HIV-positive children.

Conclusions/Next steps: Strong collaboration between community OVC mechanism with health facilities and clinical partners accelerates HIV prevention, care and treatment outcomes among children living with HIV since it enhances delivery of comprehensive package of services for vulnerable households where care is needed most.

EPD217

Clinic and community case finding to prevent and identify new HIV infections among children and adolescents at risk and improve treatment outcomes for those living with HIV in rural Malawi

L.F. Nyirenda[1], E. Geoffroy[2], J. Jere[1], N. Khozomba[1], C. Mwale[1], R. Kang'ombe[1], T. Chirinda[3]
[1]Global AIDS Interfaith Alliance, Blantyre, Malawi, [2]GAIA Global Health, San Rafael, United States, [3]Bantwana Initiative/World Education, Inc., Blantyre, Malawi

Background: In Malawi, 62,000 children 0-14 live with HIV, representing 6% of all infections - and a child prevalence of 0.7%, compared with 8.1% of adults - yet children represent 15% of AIDS-related deaths annually and 12% of new infections. Malawi is on track to achieve the UNAIDS 2025 95-95-95 goals, yet children and adolescents living with HIV (C/ALHIV) lag far behind adults in status awareness (88% overall vs. 75% among children) and viral suppression (97% vs. 74%).

Description: WEI/Bantwana and GAIA implement the USAID-funded Ana Patsogolo (Children First) Activity (APA) to prevent HIV infection and reduce vulnerability among OVCs and AGYWs (<18) in three high-burden southern Malawi districts.APA provides an evidence-based package of services delivered through community and facility-based active tracing and case management, and an integrated referral network across the HIV continuum.

To increase uptake of HIV and other health services GAIA: enrolls HIV+ participants into the programs; expands critical service provision to those most-at-risk (C/ALHIV and Children of parents living with HIV (CPLHIV)); strengthens health facility and community coordination; and extends the reach of evidence-based prevention interventions through hiring/training Community Linkage Facilitators, Child Protection Workers and Community Case Workers.

Lessons learned: From October 2020-September 2021, GAIA enrolled 15,546 OVCs and 6,448 AGYWs and increased the number of C/ALHIV receiving services by 143%, from 2,802 to 6,826. Individual case management ensured retention of 99% of enrolled CLHIVs and 80% achieved viral suppression.

Emergency nutrition, adherence counseling, home visits and case conferences were provided to CLHIVs with high viral load. ALHIV were enrolled in teen clubs to promote disclosure/adherence, provide recreational/psychosocial support and life skills, and support caregivers.

CPLHIVs participated in HIV prevention interventions, leveraging schools, community youth clubs, and faith-based networks to prevent sexual violence and reduce HIV risk. Risk assessments were conducted for 3,754 CPLHIVs, 51.3% with unknown status were tested, 2.3% tested positive and 100% enrolled in CLHIV programming.

Conclusions/Next steps: Layered programming including intensified clinic/community-based case finding, risk assessment and prevention, index testing, contact tracing and caregiver support present a promising approach to support CALHIV and their siblings and improve health outcomes among children to close HIV care continuum gaps.

EPD218

Using a two-stage crowdsourcing open call and Designathon to develop interventions for HIV partner services among men who have sex with men in China

X. Yan[1,2], Y. Xu[1,2], Y. Ni[3], W.C. Miller[4,1], R.K.J. Tan[1,2], J.D. Tucker[5,2,1], W. Tang[6,1,2]
[1]University of North Carolina at Chapel Hill Project-China, Guangzhou, China, [2]Social Entrepreneurship for Sexual Health (SESH) Global, Guangzhou, China, [3]University of North Carolina Project-China, Guangzhou, China, [4]The Ohio State University, College of Public Health, Columbus, United States, [5]University of North Carolina at Chapel Hill, Institute for Global Health and Infectious Diseases, Chapel Hill, United States, [6]Dermatology Hospital of Southern Medical University, Guangzhou, China

Background: Current HIV partner services (PS) in China use passive referral and encourage partners of clients to get tested at health facilities, failing to meet the needs of Chinese men who have sex with men (MSM) living with HIV. More effective partner services for MSM might be developed using crowdsourcing, which solicits ideas from large groups of people and shares the solutions with the public.

Description: We organized a two-stage crowdsourcing event that included an open call and a Designathon to solicit and develop intervention ideas to enhance partner services among MSM in China. The open call was an-

nounced online to call for submissions, including protocols addressing PS barriers, successful PS stories, expectations about ideal PS, and media messages for PS promotion purposes (images, videos, audios, etc.).
Exceptional submissions were recognized as semi-finalists and later used as the resources for the subsequent Designathon. The Designathon was a 48-hour challenge that brought together participants with different expertise (e.g., communications experts, healthcare providers, UI designers) to brainstorm as a team and deliver a comprehensive intervention plan.
Lessons learned: We found that the crowdsourcing approach empowered the MSM and people living with HIV (PLWH) communities to voice their demands. Of all participants, 14% (13/94) were MSM living with HIV, who shared their personal PS experiences and struggles.
During the Designathon, MSM and PLWH actively interacted with China CDC experts and healthcare professionals to co-create intervention plans and improve the feasibility. Second, the approach generated innovative strategies with minimal cost. From July to September 2020, the open call received 53 eligible entries; ten entries were designated as semi-finalists. Over two days in December 2020, the Designathon attracted 41 people who collaboratively developed eight detailed plans.
Promising intervention ideas included PLWH peer sharing and education, Internet-based partner services that allowed personalization of notification messages and improved follow-up linkage to care, third-party-initiated anonymous notification, and testing together without notification.
Conclusions/Next steps: The two-stage crowdsourcing approach mobilized MSM and PLWH community and fostered client-provider collaboration. The approach also produced high-quality content that could inform policy design. The effectiveness of the proposed partner service plans requires further evaluation.

EPD219
Navigating Quality of Life: effects of a peer navigation program for PLHIV in Australia

T. Krulic[1,2], G. Brown[3], A. Bourne[4], S. Graham[5]
[1]La Trobe University, The Australian Research Centre in Sex, Health and Society, Bundoora, Australia, [2]Living Positive Victoria, Health Promotion, Southbank, Australia, [3]University of New South Wales, Centre for Social Impact, Kensington, Australia, [4]La Trobe University, Australian Research Centre in Sex, Health and Society, Bundoora, Australia, [5]Living Positive Victoria, Peer Support, Southbank, Australia

Background: This paper explores the effects of a Peer Navigation Program (PNP) employing peer workers living with HIV to support the Quality of Life (QoL) of PLHIV in Victoria.
Methods: Our research took a community participatory approach, using mixed methods to observe program delivery and effects in real-world settings. Interviews with 27 clients were conducted July-October 2020, transcribed and thematically analysed. We also report analyses from the responses of a separate cohort of 36 clients to a validated measure of QoL (PozQoL), administered through a survey completed following first appointment and repeated at 2 and 4 months, between December 2018-2020.
Multiple linear regressions tested the significance of the relationship between time since baseline and changes in PozQol scores. Covariates were age, gender, sexuality and whether participants were Australian born.
Results: Interviews showed evidence that the PNP provided information, emotional support, positive identification and appraisal, which reduced felt stigma, social isolation and health-related concerns for newly diagnosed PLHIV. Timely linkage to community services and networks, migration and psychological services further supported psychosocial wellbeing and addressed concerns related to themes of life goals and expectations.
For participants who experienced discrimination in the migration system and high levels of social isolation and stigma in the community, the impact of an HIV diagnosis on life goals and expectations was more enduring.
Clients were able to access the PNP via phone or online during COVID-19 restrictions. Participants received welfare checks and help with access to medications and income support, but experienced challenges maintaining employment, social support and other activities which supported QoL.
Changes in PozQol scores were not statistically significant. Prior to COVID-19, PozQoL scores indicated improvements in social, functional, psychological and health concern domains. However, this plateaued during COVID-19 restrictions. Our ability to test for significance was limited by sample and effect size.
Conclusions: Our study found consistent qualitative evidence to suggest that the activities and strategies employed by the PNP can improve factors related to QoL.
Our ability to test the significance of observed improvement in PozQol scores was limited by confounders and sample size. These findings guide the aims, scope, activities and evaluation of similar programs.

EPD220

Valuing expertise: community and clinical collaboration in an Australian HIV peer navigation program

T. Krulic[1,2], G. Brown[3], A. Bourne[1], S. Graham[4]
[1]*La Trobe University, Australian Research Centre in Sex, Health and Society, Bundoora, Australia,* [2]*Living Positive Victoria, Health Promotion, Southbank, Australia,* [3]*University of New South Wales, Centre for Social Impact, Kensington, Australia,* [4]*Living Positive Victoria, Peer Support, Southbank, Australia*

Background: Our study examined how a peer navigation program (PNP), integrating insights and practices of peers living with HIV into clinical services, could improve the effectiveness of the HIV service environment in Victoria.

Methods: We conducted interviews and focus groups with 30 staff from a peer-based community organization implementing the PNP and its clinical partners. Interviews explored the quality of engagement and adaptation across diverse clinical settings and factors that influenced the program's effectiveness. Data were transcribed and thematically analysed.

Results: Participants highly valued peer navigator guidance to address the psychosocial complexities of a new HIV diagnosis and strengthen engagement with other support services and PLHIV community.

The PNP facilitated timely access to peer support and clinic-based appointments. The program also fostered greater appreciation among clinic staff of the practices, stories and experiences of peers working in these roles.

Participants reported that these factors contributed to stronger referral pathways between clinical and community services, reducing barriers such as cost, distance and hesitancy experienced by clients.

Participants reported in-depth consultation between community and clinical partners. This included introductory meetings with clinical and peer staff and the development of formal agreements outlining organisational obligations and program scope.

The PNP adapted service delivery based on assessments of client needs and service models, which required the delivery of flexible appointments available across clinical and community settings, phone and online.

Ongoing knowledge transfer between peer and clinic staff was recommended for learning and improvement and to address noted challenges in maintaining referral relationships for general practices and casual medical staff.

A peer-led workplace and employment frameworks in line with GIPA/MIPA principles guided policy, process and ethical considerations that arose in the recruitment, training and supervision of peer navigators. Adequate remuneration and employee assistance, cross-support from peers, mentorship, and additional development and employment opportunities all supported peer navigators to work most effectively.

Conclusions: The PNP met an identified need in Victoria's HIV care and support sector, providing stronger continuity of care between clinical and community services. This paper uses examples of successful engagement, adaptations and supportive peer-led workplace culture and frameworks to guide the implementation of similar programs.

EPD221

Determinants of viral load suppression among orphaned and vulnerable children on antiretroviral treatment in Tanzania

A. Ally[1], A. Exavery[1], J. Charles[1], L. Kikoyo[1], R. Mseya[1], A. Barankena[1], R. Fovo[1], A. Temu[1], M. Balampama[1]
[1]*Pact Tanzania, Dar es Salaam, Tanzania, The United Republic of*

Background: In Tanzania, only 47% of children on ART 0-14 years are virally suppressed (UNAIDS 2020). Although retention on and poor adherence to ART remain a challenge for children living with HIV (CLHIV), Orphans and Vulnerable Children (OVC) face greater limitations in accessing and utilizing comprehensive HIV care and treatment services.

In response to this, the current study assessed the determinants of Viral Load Suppression (VLS) among OVC aged 0-14 years living with HIV enrolled in HIV community-based interventions.

Methods: This study is based on data from the USAID Kizazi Kipya project (2016 – 2021) from 81 councils of Tanzania. Included in this study are 1,980 CLHIV on ART (0-14 years) with valid Care and Treatment (CTC) identification numbers, enrolled and served by the project for 24 months. VLS was defined as viral load <1,000 copies/mL. Data analysis involved multivariate logistic regression, with VLS as the outcome of interest and HIV interventions and household characteristics as the main independent variables.

Results: The overall viral suppression rate among OVC living with HIV was 85.3%. This rate increased with retention: 85.3%, 89.9%, 97.6% to 98.8% after 6, 12, 18 and 24 months of retention on ART, respectively. Similar rates were observed as the duration of adherence to ART increased. In the multivariate analysis, OVC attending PLHIV groups were 411 times more likely to be virally suppressed than those not attending (aOR=411.25, 95% CI 168.2–1005.4). OVC with health insurance were 6 times more likely to achieve viral suppression than those without (aOR=6.05, 95% CI 3.28–11.15). OVC from food secure households were almost 15 times more likely to be virally suppressed than their food insecure counterparts (aOR=14.93, 95% CI 8.76–25.45). OVC from households with five or more people were more likely to be virally suppressed than those in households with two people (aOR=2.97, 95% CI 1.25–7.07).

Conclusions: CLHIV reached by the different HIV community-based interventions were more likely to be virally suppressed than those who were not. To advance viral

suppression, efforts should be made so that all CLHIV are reached by HIV community-based interventions as well as integrating food support in HIV treatment interventions.

EPD222

Implementation of the local innovation spread through enterprise network model; lessons learned from male champions as a community of practice, Kiambu, Kenya

L. Ranji[1,1]
[1]*University of Nairobi, Education, Nairobi, Kenya*

Background: The National AIDS Control Council-Kenya (NACC) with support from Centre for Global Health Practice and Impact (CGHPI) of Georgetown University has been supporting Male Champions as a Community of Practice through the implementation of the Local Innovation Spread Through Enterprise Network (LISTEN) Model.

The Model focuses on Communities of Practice (CoP) using a Human Centered Design (HCD) approach to strengthen delivery of services (both Health and Non-Health) in the County. The model aims at:

1. Utilization of community formations/networks for health service delivery
2. Enhancing sustainability for HIV and Health programmes
3. Promoting accountability for results at all levels from community to County leadership
4. Enhancing Strategic information for timely decision making
5. Supporting the achievement of Universal Health Coverage (UHC)

Description: The Male Champions were first trained by the NACC as a channel to target men in non-health settings to respond to their health needs and address barriers for better health outcomes.

The Champions use community advocacy forums and peer to peer engagements to reach out to men where they are and provide information and services to address male gender health disengagement; vulnerabilities of men; societal perception of masculinity and promote sexual and reproductive rights.

Lessons learned:

1. Male Engagement has a potential to steer HIV response through advocacy, creation of awareness and neutralizing stigma.
2. Man to man talk enhances positive health seeking behaviors among the male gender.
3. HIV prevention tools like condoms are readily accepted by men when introduced to them by their peers.
4. Men generally have a poor health seeking behavior and the use of the Male Champions as advocates reverses negative masculinity perception.
5. Through HCD approach, men open to their fellow men and come up with implementable health solutions.

Conclusions/Next steps: Targeting men through peer-to-peer approach has greatly improved; identification and linkage to care and treatment of HIV+ males, Heath service uptake including HIV Testing Services and screening of basic non communicable diseases.

EPD223

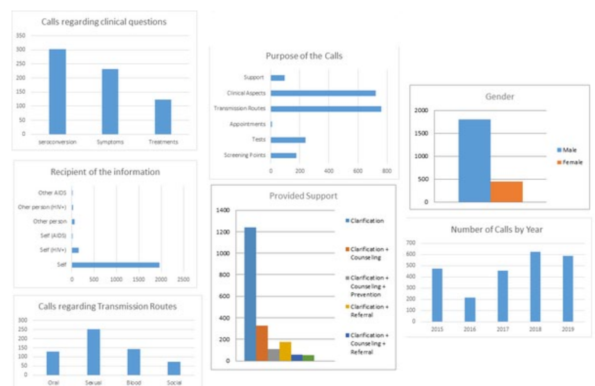
Are helplines effective in the current context of health services organization to answer HIV/AIDS needs?

A. Semedo[1], R. Dias[2], S. Melo Refoios[3], M.E. Saraiva[3]
[1]*ISPA, Lisboa, Portugal,* [2]*ISCTE - Instituto Universitário de Lisboa, Lisboa, Portugal,* [3]*Universidade Lusófona de Humanidades e Tecnologias, Lisboa, Portugal*

Background: "Linha SOS SIDA" is a helpline that was initiated in 1991 as the first service of the Portuguese League Against AIDS. This project was based on other similar experiences across Europe based on the important role developed supporting infected patients. Calls are free, anonymous, and confidential and the helpline works from Monday to Friday between 10AM to 9:30 PM.

Methods: This helpline aims to provide information on several aspects of the HIV and AIDS infection and/or other Sexually Transmitted Infections (STI), especially transmission routes, risk and safe behaviors, screening points as well as schedule specialized appointments, to provide emotional support for patients infected or affected by HIV and to refer for other community resources. Counseling is provided by specialized psychologists and according to WHO guidelines. Information was gathered through anonymous questionnaires and analyzed using SPSS, v.25.0

Results: Between January 2015 and December 2019, 2241 effective calls were received (excluding calls in which callers are not seeking to use the service), from which 1797 were made by men and 444 were women. Calls were analyzed using a data-sheet in which it's registered the age and gender of who is calling, the reason for each phone call, as well as the recipient of the information, the provided support.



Conclusions: There's been an increase of calls over the years, justifying the continuity of this helpline as a service. Women still rarely seek help about sexual relationships.

The main purpose to access this kind of service is to know about the of being infected after a risk behavior. Although there's an amount of information concerning HIV, remains an irrational worry about social transmission. The clarification process is an important strategy since it's an ideal opportunity to adjust misinformation and to recommend preventive measure.

EPD224

Understanding the survival of the unregistered community-based organization (CBO) in China's response to HIV/AIDS among men who have sex with men (MSM): HIV testing and beyond

Z. Sun[1,2], H. Zheng[2], L. Yang[3]
[1]Utrecht University, Department of Interdisciplinary Social Science, Utrecht, Netherlands, the, [2]Shanghai CSW&MSM Center (SCMC), Shanghai, China, [3]Minzu University of China, Department of Sociology, Beijing, China

Background: How MSM-centered CBO delivering HIV/AIDS services survived in authoritarian China has drawn much scholarly attention. Previous work has identified political, economic, and personal relationships with the government as three unique survival opportunities.
However, most of the studies were contextualized under the influx of Global Health Initiatives; little is known how the unregistered CBO survived after the international donors withdrew their support.
This study aimed to analyze how the unregistered CBO took advantage of the three identified opportunities to survive and the implications for the well-being of MSM.
Methods: This study involved a one-year ethnography in Eastern China from 2020 to 2021. Daily participant observations were conducted at a local MSM-centered CBO contracted by the local municipal center for disease control and prevention (CDC).
The researchers conducted unstructured (N=40) and semi-structured interviews (N=10) with the CBO and CDC personnel and MSM concerning the CBO's survival and service delivery during the observations. Thematic analysis was employed for data analysis.
Results: Although the CBO failed to obtain legal registration, it adopted "business registration" to ensure one of its' identities is legal and recognizable.
The political opportunity remained fundamental for it to participate and assist the local CDCs in tackling increasing HIV/AIDS concerns. However, some political constraints discouraged them from addressing "LGBT" issues.
Outsourcing HIV testing to the CBO from the municipal CDC ensured their fundamental "revenues" through performance-based financing. "China AIDS Fund" filled the international donors' withdrawal gap and became a significant financial resource.
Collaborations with the CDCs, academia, and pharmaceutical industries also contribute to fundraising. Diplomacy capability and constantly pleasing the donors attached to the Chinese "Guanxi" culture, especially being obedient to officials' requests from CDC and government-organized NGOs, is decisive for future fundraising and long-term viability.
Conclusions: While the CBO seized various opportunities and strategies to survive, the major drawback seems at the expense of improving the quality of the HIV/AIDS services.
Due to a lack of capacity building and cultivation towards a professional "social work organization," the CBO might replicate the biomedical and behavioral approach while dismissing the sociocultural and community responses to HIV/AIDS. This warranted future studies to go further analysis.

EPD225

Linking KP clients to care through a community to public partnership – how C2P works in Ho Chi Minh City, Vietnam

T. N.N. Nguyen[1], L. T. Nguyen[2], N. T. Truong[2], L. T.X. Hang[2], H. C. Nguyen[2], N. T.M. Vo[2], R. Frescas Jr[2]
[1]Centre for Promotion of Quality of Life (LIFE Centre), Ho Chi Minh, Viet Nam, [2]LIFE Centre, Ho Chi Minh, Viet Nam

Background: For Vietnam's largest city and urban province, reaching key populations (KP) has been a challenge. Engaging KP groups as active participants organized as community-based organizations (CBO) is a viable option. These CBOs help support finding clients and linking newly identified clients to HIV services though a community-public partnership (C2P) model.
Description: The C2P model is a partnership between CBOs, health facilities (HFs), and LIFE (a local implementer as the technical and coordinating organization) to support KP client access to HIV services. LIFE helped to train and support CBOs founded and operated by KP, organize partnerships, sensitize HFs, then arrange agreements, support meetings and referral logistics to account for clients referred from CBOs to HFs. CBOs work within the communities they serve to find cases, counsel, test, and refer cases, as appropriate. HFs receive those referred clients to provide services, track referrals, and share feedback to improve community services.
Monthly meetings review program performance, discuss concerns, review client level feedback on both services in the community and facility and strengthen coordination.
Lessons learned: The C2P model in HCMC province included 17 CBOs working with 18 district health facilities, 3 private clinics and 2 hospitals. Data reviewed from October 2020 through September 2021 showed 32,474 contacts were made, 21,559 people were tested (66.6%), of those 1,769 tested positive (8.2%) and nearly all, 1,768, were linked to ART (99.9%).
Contributing factors to this success include CBOs were comprised of KP who supported engaging KP clients. CBOs enter this partnership and support clients as an organization, versus individuals, which helps build trust with HFs and clients. CBOs can also support HF with additional

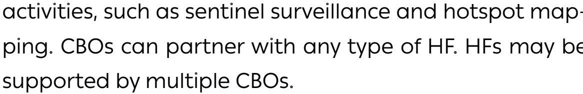
Oral abstracts

Poster exhibition

E-posters

Late-breaker abstracts

Author Index



activities, such as sentinel surveillance and hotspot mapping. CBOs can partner with any type of HF. HFs may be supported by multiple CBOs.

Conclusions/Next steps: The C2P model was highly effective at ensuring clients are identified and linked to care. CBOs, particularly KP-led and operated, play a key role in responding to KP needs. The model's success has shown the value of CBOs working in close collaboration with HF. This has led to an expansion of the model to other urban provinces for scale-up.

EPD226

HIV knowledge among prospective healthcare professionals

M. Ilktaç[1], Z.G. Çoşkun[2], A.A. Büyükyatikçi[2], Ö.B. Karazağ[2], G. Çelik[2]

[1]*Eastern Mediterranean University, Faculty of Pharmacy, Famagusta, Cyprus,* [2]*Bahcesehir University, Faculty of Medicine, Istanbul, Turkey*

Background: The study aimed to investigate the knowledge about HIV among medicine and pharmacy students and their attitudes towards HIV infected individuals.

Methods: The study was planned as a self-administered questionnaire. The knowledge about transmission and prevention were classified as low, moderate and high for those who scored <50%, 50-79% and ≥80%, respectively. Students who reported positive attitude to at least half of attitude questions were regarded to have positive attitude.

Results: 306 medicine and 348 pharmacy students were included. More than 90% of students from both faculty were aware of transmission via sexual intercourse, blood/blood product and semen/vaginal fluid. Awareness of transmission by anal and oral sex was significantly higher among medicine students.

The knowledge that the virus can transmit via deep kissing was low for both groups. Medicine students were highly knowledgeable that the virus cannot transmit via handshake, kissing/hugging or coughing/sneezing whereas the knowledge was intermediate for pharmacy students.

The median score of medicine students was higher than that of pharmacy students for transmission (81.8% and 72.7%, respectively) and prevention (71.4% and 64.4%, respectively). The rate of moderate/high knowledge of transmission and prevention was significantly higher among medicine students (97.7 and 91.8%, respectively) than pharmacy students (90.8 and 77% respectively).

No statistically significant difference was observed in terms of the transmission and prevention knowledge according to gender.Significantly higher rate of medicine students (87%) had positive attitude towards HIV infected individuals than pharmacy students (50%) (Table 1).

No difference was found in the attitude according to gender.

		Medicine	Pharmacy
Transmission	Low	7 (2.3)	32 (9.2)
	Intermediate	124 (40.5)	220 (63.2)
	High	175 (57.2)	96 (27.6)
Prevention	Low	25 (8.2)	80 (23)
	Intermediate	220 (71.9)	224 (64.4)
	High	61 (19.9)	44 (12.6)
Attitude	Positive	265 (86.6)	167 (49.6)*
	Negative	41 (13.4)	170 (50.4)*

Table 1. Knowledge and Attitude of Students.

Conclusions: There was misconception or a lack of in-depth knowledge in both prospective physicians and pharmacists. Increased knowledge on transmission and prevention was found to affect attitude towards HIV infected individuals positively. Increasing awareness on HIV and reducing stigma may be achieved with in depth education of prospective health care professionals.

EPD227

Maintaining the 'fourth 90' during the pandemic using online, community-based health and wellbeing programs

R. Uys[1]

[1]*Bobby Goldsmith Foundation, Client Services, Sydney, Australia*

Background: The World Health Organisation added the 'fourth 90' as a goal to ensure a satisfactory quality of life for people living with HIV, to be achieved by 2030. The SARS-CoV-2 pandemic has presented many challenges to PWHIV to maintaining wellbeing across the social, psychological, physical and financial determinants of health. In response, BGF successfully pivoted by digitising new and existing program delivery online.

These programs create a safe network where PWHIV can share their experiences when receiving social support, positive influences, healthy distractions, and if necessary, referrals for specialised care.

Description: During the height of the pandemic (2020-2021) eight health and wellbeing programs across the aforementioned determinants of health listed were implemented. Participants (n=58) were recruited from BGF's internal database, social media and professional health-care referrals. Weekly group sessions were held over six weeks online using Zoom conferencing software.

Upon completion of each program, an online questionnaire was sent to each participant to evaluate the program's outcomes.

Lessons learned: Overall, most respondents reported that they successfully engaged with the programs to improve their sense of health and wellbeing during the period. They reported experiencing improvement and increased connection in their social relationships (Creative Writing; 100%, n=7), (Novel Connections; 90%, n=10). Respondents also reported improvements in their mental health (Creative Writing; 71.5%, n=7), (Zen Movement; 73.3%, n=15), (Qigong; 87.5%, n=8) from several programs;

as well as a reduction in experienced stress and anxiety, (Novel Connections; 80%, n=10), (CBT Training; 66.7%, n=9). Better Money Management, a financial program, saw each participant receive individualised advice tailored to circumstances with all (100%, n=4) reporting the skills learned would be useful in the future.

Most respondents reported experiencing improvements in their physical health (Zen Movement; 93.9%, n=15), (Qigong; 62.5%, n=8), (Better Sleep Training; 75%, n=4).

Conclusions/Next steps: These programs created an opportunity for PWHIV to connect as peers, share their stories and their lived experiences, cultivate new skills, and helped achieve their personal goals. They proved highly beneficial to participants, notably in terms of their mental health during a period of much uncertainty and anxiety. Future programs will continue to be based on client's needs analysis and interests.

EPD228

"Leave no one behind" – expanded community-based outreach strategies among People Who Inject Drugs (PWID) in North India

S. Dutta[1], K. Krishnan[1], N. Sikdar[1], B.P. Kandpal[1], M. Singh[1], A. Krishna[1], A. Srikrishnan[1], R. Pollard[2], S.S. Solomon[2]

[1]YR Gaitonde Center for AIDS Research & Education, Chennai, Programmes, Delhi, India, [2]The Johns Hopkins University School of Medicine, School of Medicine, Baltimore, United States

Background: India's northern states bear a high HIV burden, especially among people-who-inject-drugs (PWID). HIV prevalence among PWID is estimated at 4.5% in Uttar Pradesh state and 16.2% in Delhi state (vs. 0.2% in general populations nationally). Prevention services uptake and treatment adherence among PWID in North India remains a challenge given structural barriers and lack of community engagement.

Description: An EJAF-supported program works to strengthen linkage to HIV prevention and care services among PWID in Uttar Pradesh and Delhi. Services include social networking and index testing approaches supported by community-oriented peers. The program identified PWID un-engaged with services at public facilities and facilitated linkage for opioid substitution therapy (OST) and testing for HIV, Hepatitis-C, and Tuberculosis. Staff engaged clients in prevention and treatment services based on test results. Staff elicited the sexual and injecting partners of clients through motivational interviewing-informed counselling, and facilitated HIV testing referral. The program regularly gathers PWID community input to inform service delivery.

Lessons learned: Between July to December 2021, the program reached 837 PWID in Uttar Pradesh and Delhi. Among them, 640 completed HIV testing, 147 (23%) were diagnosed as positive and 92 (63%) initiated ART. Among PWID reached, 136 were tested for Hepatitis-C, 66 (49%) tested positive and 23 (35%) initiated treatment. 528 clients were screened for Tuberculosis; and 06 (1%) tested positive and 05 initiated treatment. 247 PWID were linked to OST (164 newly linked and 83 re-linked). The program reached 115 sexual partners of PWID; among whom 82 were tested for HIV, 07 (9%) tested positive, and all initiated ART.

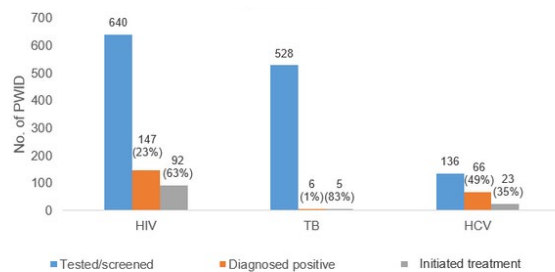


Figure 1. HIV, TB and HCV testing results among 837 PWID in UP and Delhi, India, July - Dec 2021

Conclusions/Next steps: Social networking and index testing approaches can complement existing public services to reach unengaged PWID and facilitate service access. Community engagement and peer-led outreach are critical to ensure community-friendly engagement with PWID and overcome barriers to access HIV and other health services.

EPD229

Finding men in need of HIV testing services who do not attend health facilities: a community-representative survey in Malawi

E. Lungu[1], M. Thorp[2], K. Balakasi[1], P. Kalande[1], J. Van Oosterhout[1,2], C. Stillson[3], S. Khan[3], B. Nichols[4,5], K. Dovel[1,2]

[1]Partners in Hope, Implementation Science, Lilongwe, Malawi, [2]University of California Los Angeles (UCLA), Division of Infectious Diseases, Los Angeles, United States, [3]Clinton Health Access Initiative, Boston, United States, [4]Boston University, Department of Global Health, School of Public Health, Boston, United States, [5]University of the Witwatersrand, Health Economics and Epidemiology Research Office, Department of Internal Medicine, Johannesburg, South Africa

Background: Men in sub-Saharan Africa have unmet needs for HIV testing services. Most community-based strategies target men at drinking spots, or sporting events. However, there is little evidence that the majority of men in need of HIV testing frequent these venues from a population perspective. To inform HIV outreach programs, we aimed to identify where men who had not tested for HIV *and* not attended a health facility in the last 12 months spend their time.

Methods: Men from 36 villages in rural Malawi completed a community-representative survey (n=1160). Inclusion criteria for the parent survey were: male; aged 15-65 years; never tested HIV-positive; and residing in a study village.

Oral abstracts

Poster exhibition

E-posters

Late-breaker abstracts

Author Index

We conducted a sub-analysis of men who had not attended health facilities using descriptive statistics to understand where men spent time when not working, and if they were willing to use HIV self-test kit (HIVST) in the community.

Results: 116/1160 (10%) of men had not tested for HIV and had not attended a health facility in the last 12 months. Among those, 56% had*never* tested for HIV. 53% were self-employed – most worked mornings (70%) and few worked on Sundays (10%). Only 28% reported drinking alcoholic beverages in the last 30 days and 10% spent time at drinking places. The most common place men spent time outside of work (with or without friends) was home (60%, usually on Saturdays and afternoons). The most common locations for socializing with friends were markets/trading posts (22%) and seated games (22%), both usually on Saturdays/Sundays. 91% of men were willing to use HIVST in the community (Table).

Conclusions: Reaching men in need of testing who do not attend health facilities may be most successful through targeted HIVST distribution on weekends at home, markets, trading posts and places where seated games are played.

Variables	n (%)	Day frequented
Demographics:		
Median Age, (IQR)	36 (21-49)	-
Married	82 (71%)	-
Work Type:		
Working Formally	2 (2%)	-
Self-employed (farming, business)	61 (53%)	-
Peace work	41 (35%)	-
Not working	12 (10%)	-
Health Behaviors:		
Never Tested	65 (56%)	-
Willing to test with HIVST*	106 (91%)	-
Drinking alcoholic beverages in past 30 days	32 (28%)	-
Time Spent		
Spend most of free time:		
Market/Trading post	7 (6%)	Sat, Sun
Home	70 (60%)	Sun
Bar/Drinking spot	6 (5%)	Sat
Seated games**	14 (12%)	Sat, Sun
Football/Active games	8 (7%)	Sat, Sun
Church	2 (2%)	Sun, Mon, Tue, Wed, Thu, Fri, Sat
Friend's/Relative's/Neighbor's home	5 (4%)	Sat, Sun
Other	4 (4%)	Sat, Sun
Hang out with your friends:		
Market/Trading posts	25 (22%)	Sat, Sun
Home	18 (18%)	Sun
Bar/Drinking spot	11 (10%)	Sat, Sun
Seated games**	26 (22%)	Sat, Sun
Football/Active games	16 (14%)	Sat, Sun
Church	3 (3%)	Sun, Mon, Tue, Wed, Thu, Fri, Sat
Friend's/Relative's/Neighbor's home	13 (11%)	Sun, Mon, Tue, Thu, Sat
Other	4 (4%	Sat

* HIVST refers to HIV self-test kit
** Seated games are games played while seated; mostly played at or near the market/business place.

Table: Characteristics of men who had not attended health facilities and where they spend their free time (n=116)

EPD230

Stepping Stones: creating safe spaces for addressing HIV, sexual and gender based violence (SGBV) and harmful substance use among vulnerable populations in South Africa

M. Matovu[1], K. Zaleski[2], K. Zimondi[3], A. Logan[4], M. Tewesa[5], R. Grey[6]

[1]Dr. B. R. Ambedkar University, Delhi, India, [2]Tulane University, New Orleans, United States, [3]University of Zimbabwe, Harare, Zimbabwe, [4]London School of Hygiene & Tropical Medicine. University of London, London, United Kingdom, [5]Business Management Training College of Southern Africa, Johannesburg, South Africa, [6]Harvard University, Cambridge, Massachusetts, United States

Background: In South Africa, adolescent girls and young women (AGYW) account for ¼ of all new HIV infections; only 60% know their status; and only 46% of those with HIV take antiretroviral drug treatment (ART). Sexual and gender based violence (SGBV), alcohol and drug abuse contribute to violence, risky sexual behaviors and infectious disease transmission through needle sharing among people who inject drugs (PWID), such as "Nyaope", a common street drug.

From 2020-2021, Humana People to People South Africa (HPPSA) implemented *Stepping Stones* (SS) in Ehlanzeni District, Mpumalanga Province to create safe spaces for key populations to address issues that affect them personally.

Description: HPPSA conducted a series of 17 sessions with same-sex peers over the course of a week. Topics included: healthy relationships; gender equality; HIV; SGBV; alcohol/drug harm; and dealing with grief and loss.

Results from pre-post assessments showed 96% of participants increased their knowledge of HIV and planned to get tested. During sessions, participants were linked to a variety of treatment and support services through referral chains and warm hand-offs.

Lessons learned: Collaboration with local partners, governmental, non-governmental and community based organizations was invaluable in developing tailor-made strategies to increase access to essential wrap-around services for HIV, SGBV and substance use.

AGYW's participation in FHI360's skills training, for example, demonstrates the effectiveness of linkages to both health and non-health services. Data gathered through testimonials show clear connections between integrated support (like SS), and improved mental health.

There were noticeable reductions in acceptance of SGBV from participating AGYW, including an increase from 6% pre- to 95% post-participation who would report rape or other forms of violence to police.

Conclusions/Next steps: Stepping Stones activities created safe spaces for peer groups to discuss sensitive issues. Education and awareness led to increased HIV testing, access to ART and SGBV services, and a decrease (self-reported) in harmful alcohol and substance use. Recommendations for future implementation include: offer-

ing sessions on weekends to make them more convenient for participants who work during the week; creating both indoor and outdoor spaces for sessions (providing a safer option during pandemics); and offering HIV tests during the course sessions.

EPD231

Gay community-led digital network-based secondary distribution of HIV self-testing among Chinese men who have sex with men: lessons learned from three consecutive trials

Y. Ni[1,2], Y. Lu[1,2], D. Wu[1,3], R.K.J. Tan[1], X. He[4], Y. Zhou[5,6], Q. Wang[1], W. Tang[1,2]
[1]*University of North Carolina at Chapel Hill, Project-China, Guangzhou, China,* [2]*Dermatology Hospital of South Medical University, Guangzhou, China,* [3]*London School of Hygiene and Tropical Medicine, London, United Kingdom,* [4]*Zhuhai Xutong Voluntary Services Center, Zhuhai, China,* [5]*Zhuhai Center for Diseases Control and Prevention, Guangzhou, China,* [6]*Macau University of Science and Technology, Macau, China*

Background: Digital network-based secondary distribution of HIV self-testing (SD-HIVST) among men who have sex with men (MSM) leverages digital platforms and social network to enhance testing coverage. We aimed to use community-based participatory research by sharing community leadership with a community-based organization (CBO) to increase the uptake of HIVST through secondary distribution programs among Chinese MSM.

Description: We conducted three phases of clinical trials (Figure 1) in China, from 2018 to 2021, to assess the effectiveness of digital network-based SD-HIVST in various scenarios among Chinese MSM, partnering with the local gay-led CBO.

Three trials were all conducted using our SD-HIVST model where participants (defined as "index") order multiple HIVST online, get self-tested or distribute the kits to members within their social network (defined as "alters"), and uploaded the results to the platform. The local CBO contributed to the initial intervention design (Phase 1) and enhancing implementation strategies (Phases 2 and 3).

The CBO led establishment and maintenance of the digital platform, participants enrollment, HIVST shipment, testing results verification, and linkage-to-care follow-up across all three phases.

Figure 1.

Lessons learned: Throughout the course of three phases, 909 index participants (phase 1: 371, phase 2: 309, phase 3: 229) ordered 2147 HIVST (phase 1: 1150, phase 2: 759, phase 3: 238) and referred 154 peer-referral links (phase 2: 75, phase 3: 79). Each index participant successfully motivated an average of 0.85 unique alters in phase 1, 1.11 unique alters in phase 2, and 1.31 unique alters in phase 3. CBO plays a vital role in providing HIVST and counseling services, transforming the interventions from "for the community" to "by the community." The partnership with CBO facilitates both community empowerment and solidarity and the effectiveness of SD-HIVST.

Conclusions/Next steps: Forming and maintaining shared community leadership is the key to the success and effectiveness improvement of our secondary distribution programs.

EPD232

Adolescents and young people's experiences with HIV testing and linkage to care: findings from the Yathu Yathu study in two communities, in Lusaka, Zambia

M. Gondwe[1], M. Simuyaba[1], C. Mwansa[1], M. Phiri[1], A. Schaap[1,2], L. Sigande[1], K. Shanaube[1], S. Floyd[2], S. Fidler[3], R. Hayes[2], B. Hensen[4], H. Ayles[1,4], M. Simwinga[1]
[1]*Zambart, Lusaka, Zambia,* [2]*London School of Hygiene and Tropical Medicine, Department of Infectious Disease Epidemiology, London, United Kingdom,* [3]*Imperial College and Imperial College NIHR BRC, London, United Kingdom,* [4]*London School of Hygiene and Tropical Medicine, Department of Clinical Research, London, United Kingdom*

Background: Adolescents and young people (AYP) aged 15-24 in sub-Saharan Africa face a high burden of HIV. In Zambia, 3.8% of AYP are HIV positive (women: 5.6% men: 1.8%). An HIV and sexual and reproductive health (SRH) intervention, co-designed with AYP, was implemented from August 2019 to September 2021 (Yathu Yathu study).

The intervention offered comprehensive HIV/SRH services including HIV testing to AYP through community spaces (hubs) by peer support workers (PSW). AYP earned points for rewards when they accessed services. We report AYP's experience with accessing HIV services.

Methods: Between March 2020 and March 2021, 32 interviews were conducted with AYP accessing services from the hubs. Of these, 24 were interviews with nine qualitative cohort participants (six young women and three young men - one of each diagnosed HIV-positive through the hubs) each interviewed at least twice and eight with AYP who had accessed services from the hubs at different time periods. The interviews were audio recorded and transcribed verbatim. Data were analyzed thematically.

Results: AYP appreciated accessing HIV testing services through community hubs, and described them as easily accessible, private and confidential. For most AYP, hubs were the main source of knowledge on HIV transmission,

Oral abstracts

Poster exhibition

E-posters

Late-breaker abstracts

Author Index

prevention, treatment, and correct use of condoms. Hubs were also convenient places for HIV testing, and two AYP started accessing pre-exposure prophylaxis after their partners tested positive. AYP's motivation to test was influenced by the need to know their HIV status, which motivated them to take preventative measures: "*I feel nice because I know my status and I know how I can protect myself*".

Other motivating factors included earning points for rewards, and encouragement from pre and post-test counselling offered by PSWs, *"...even if they (results) are positive, I can do this"*. The PSWs facilitated linkage to care for newly-diagnosed HIV-positive AYP. Although limited to siblings, parents and partners, HIV status disclosure facilitated partner testing and linkage to care.

Conclusions: HIV testing services offered through PSWs in community hubs are acceptable to AYP. Community-based HIV interventions are a useful source of information, promote uptake of HIV testing and facilitate linkage to care.

EPD233
Mobilizing key populations (KP) in demand generation of HIV services and community-led monitoring (CLM) through community journalism: the Ripples experience

E. Bagasol[1], D. Rozul[1], R. Domingo[1]
[1]*LoveYourself Inc., Mandaluyong City, Philippines, the*

Background: The "Ripples" online newsletter serves as an echo chamber of best practices in HIV service delivery and advocacy, especially in response to the COVID-19 pandemic where information sharing and community mobilization are critical.

Initiated by LoveYourself in 2020, the monthly newsletter has engaged over 70 contributors, including KPs from the Champion Community Centers network, and other advocacy groups and individuals, to produce and publish 14 issues with an average of 10-page-worth of news and feature stories per issue.

Description: As a community publication, Ripples covers a wide range of topics from community responses to regional and nationwide initiatives addressing the HIV and AIDS epidemic. Its coverage also includes topics with intersectionalities with HIV and AIDS like mental health, trans health, LGBTQIA-related issues, and women empowerment.

Aside from news and feature articles, community insights and human interest stories are delivered through literary, artworks, and opinion pieces. The online newsletter currently reaches 400-800 online readers monthly across the Philippines. It has also been receiving 20-30 reads daily with an average 5-minute reading time.

Lessons learned: Community journalism allows exploration of community issues in greater depth and context, and encourages active participation of community members in monitoring local activities. Through Ripples, community activities were documented, shared and recognized which we saw are integral motivating factors in increasing community participation in nationwide activities and in strengthening their collaboration with government and other local partners.

Trust and confidence are what drove high participation in the development and management of the online newsletter. Continued consultation and mentoring activities also encouraged greater ownership of the community publication among contributors. For some, sharing stories through Ripples has also become therapeutic amidst the pandemic and their HIV status.

Conclusions/Next steps: Government and community organizations should explore community journalism as both a demand generation strategy and a community-led monitoring mechanism.

This would imply focus on also enhancing the documentation and social marketing skills of community workers, not just on HIV service delivery.

Strengthening knowledge sharing and management initiatives, especially at the community-level, is equally important. Advocacy workers can collaborate with media and art institutions to diversify content and get greater amplification on these platforms.

EPD234
Thandizo mobile app: improved ART adherence, knowledge and leadership among young people living with HIV in Malawi

L. Essink[1], H. Madukani[2], N. Westerhof[1]
[1]*Aidsfonds, International, Amsterdam, Netherlands, the,* [2]*Coalition of Women Living with HIV and AIDS, Lilongwe, Malawi*

Background: The Thandizo mobile app supports community health volunteers (CHVs) in their consultations with young people living with HIV (YPLHIV) to identify risk factors for non-adherence to antiretroviral treatment (ART). Based on the outcomes, CHVs provide personal advice through animation videos and refer YPLHIV to services.

Additionally, the app helps facilitation of group sessions and provides information, e.g. through a quiz. Thandizo was developed in 2018-2019 based on research and through co-creation. It was piloted (2019-2021) in Chikwawa and Mangochi districts, Malawi.

Methods: In 2021, a qualitative study was conducted including eight focus group discussions with randomly selected support group members (48) and CHVs (12). In-depth interviews with YPLHIV (8) and key informants (5) gave a deeper understanding on the outcomes of Thandizo. Quantitative health center data was analyzed for triangulation.

Results: Thandizo improved ART adherence among YPLHIV and most defaulters were brought back to care with successful retention. "The number of youth that were defaulting was on the rise and that's when they brought in the app. In the support group we managed to return

them to ART", said a female support group member. Health centers saw numbers of young defaulters drop from 476 (2019) to 96 (2021).

The safe space in support groups, which saw their numbers increase from 395 (2019) to 1440 (2021), helped young people to live a healthy life with hope for the future. The app helps YPLHIV to deal with stigma and increase their knowledge, skills and confidence. During co-creation, young people identified CHVs as administrators of the app. More confident, they now feel young people themselves should have a leading role.

External challenges persist. Stigma, especially by families, remains. Referrals to nutrition services are not possible, as no such services are available. Through economic empowerment, some support groups try to address this gap.

Conclusions: The safe space and sense of belonging offered by support groups, in combination with the attractive way in which the Thandizo app offers a learning experience, enhanced treatment adherence, knowledge and quality of life. In upscaling to other districts and countries, young people should be considered to administer the Thandizo app.

EPD235

Mobilization of transwomen cultural groups through festivals for gender affirmative services to enhance HIV screening in Pune, India

L. Arora[1], C.K. Vasudevan[1], B. Maheshwari[1], A. Ukarande[1], D. Gohil[1], R. Khan[1], R. Takasal[1], S. Shaikh[2]

[1]YR Gaitonde Center for AIDS Research and Education, Chennai, India, [2]The Johns Hopkins University School of Medicine, Baltimore, United States

Background: In India, the HIV epidemic is heterogeneous, with the Key Population Groups being the most vulnerable. Maharashtra is one of the top ten states with the highest HIV prevalence (0.36%), the highest estimated number of PLHIV (3.96 lakh), and the new infections in 2019 is 8.54 thousand. With a prevalence of 3.14 percent, transgender individuals are one of the most vulnerable groups to HIV.

A study undertaken by the National AIDS Control Organization indicates that 70% of Transgender people primarily engage in sex work and 71% face stigma in healthcare settings. The movement of transgender persons from various regions to Pune and Mumbai is significant, as Maharashtra is a prominent center for them to earn a living. Transwomen Population in Pune, Maharashtra forms various cultural groups including Hijra, Jogti-Jogappa and Aradhi. All these cultural groups celebrate certain tailor-made festivals.

Methods: This exploratory assessment aimed to explore the ways to enhance HIV screening through transwomen cultural festivals. Transwomen of varied cultural groups were approached through purposeful sampling after developing rapport at festivals in Pune.

The 10 focused group discussions were conducted between August 2021 and December 2021 with transgender people aged between 22- 52 years and were translated and transcribed.

Thematic analysis was done after developing codebook inductively. The key themes emerged were preference for non-HIV services and low-cost Gender Affirmative Services.

Results: Most of the participants were disheartened about discussion around HIV and emphasized on their non-HIV needs and underserved status. Based on the findings, a model was framed through linkage networks for subsidized/insured Gender Affirmative Services and festivals acted as the mobilization point.

Transwomen cultural festivals in India are not much explored, yet an easy point to reach the underserved individuals who are in dire need of low-cost gender affirmation. HIV testing as a mandate for any surgical intervention enhanced the HIV screening in this community.

Conclusions: The policymakers and implementing agencies need to be accountable at systemic level for better enforcement of Transgender Protection Act, 2019 and ratified human rights treaties through provision of subsidized or insurance-covered Gender Affirmative Services which can be integrated with HIV screening in unreached high-risk people.

EPD236

Theatrical performance as a potential tool to identify stigmatizing encounters and build community trust among PLWHA

M. Arthur[1]

[1]University of Michigan, School of Social Work, Ann Arbor, United States

Background: Stigma is the result of negative cultural norms, values, and exclusionary practices toward individuals with multiple intersectional social identities and which affect negatively myriad areas of life and wellbeing. HIV-stigma may manifest as mistreatment or negligent provider behaviors in their interpersonal interactions with patients/clients.

Herein we introduce performance-based techniques to learn about and address HIV-stigma through.

Description: We held 10 sessions of performance exercises with 15 self-identified men in order to identify best strategies to spark affirmative discussions about what

1. Characterizes stigmatizing encounters, and
2. Support each other through community building and trust.

The sessions were held over zoom and included 2 sections of warm up, exercise, and discussion. Our goal was to build on existing theatre methodologies for community building and self-healing. During the sessions, participants engaged in acting out scenes and guided meditation to explore instances of HIV stigma they have experienced in their lives.

Oral abstracts

Poster exhibition

E-posters

Late-breaker abstracts

Author Index

Lessons learned: We collected interview data from participants to gauge if sessions built community trust and helped them identify HIV stigma in their lives. Some highlights of these lessons come from the participants musings, "As someone who is recently diagnosed, I feel stigma but these performance things helped me be calmer," or "I understand how stigma is grown from within and not external." We learned that the capacity of community building that comes from theatrical exercises was especially important for a group of otherwise strangers. The exercises helped them to bond, support each other, and to ultimately feel more empowered to confront stigmatizing situations in the future.
Conclusions/Next steps: We have developed a comprehensive performance method that when implemented in community health settings transform HIV stigma by initiating affirmative discussions about what counts as a stigmatizing encounter. This occurred through theatrical scenarios that spurred a conversation among participants about HIV stigma in their lives. Additionally, through meditative and mindfulness exercises, participants were able to reflect on the structural and social conditions surround those encounters as they experienced them internally. These new theatrical practices can help healthcare providers tackle stigma and ultimately to create improve the quality of the lives of those affected by stigma.

EPD237

Accelerating Viral Load Suppression among HIV positive children using a pairing approach in South Western Uganda

D. Nyombi[1]
[1]*TPO Uganda, Monitoring, Evaluation and Learning Specialist, Mbarara, Uganda*

Background: Despite significant gains Uganda has made towards HIV diagnosis and treatment, viral load suppression (VLS) among children remains unacceptably low. Data from Ministry of Health indicates that VLS among adults is performing better compared to children. Accordingly, VLS among children increased from 36% in 2016 to 48% in 2019 and fell far short of 2020 targets.
USAID's Keeping Children Healthy and Safe (KCHS) is a five-year consortium project aimed at preventing new HIV infections, reducing vulnerability and building capacity for lifelong ART
Description: USAID's Keeping Children Healthy and Safe (KCHS) is a five-year consortium project aimed at preventing new HIV infections, reducing vulnerability and building capacity for lifelong ART. Managed by TPO-Uganda KCHS is implemented in partnership AVSI, REPSSI, ACORD supporting up to 64,910 children during the first year across 17 districts in South Western Uganda. Signing and implementing joint MOUs with health facilities, clinical partners has given birth to a Pairing Approach that harnesses social workers and clinical staff capacities by jointly offering household-tailored services during home visiting: Intensive Adherence Counseling (IAC), clinical management, psychosocial support, child protection services, emergency food distribution aimed at addressing suppression barriers.
Lessons learned: Viral load suppression among children has consistently improved from 78% in quarter 1 of 2020 to 89% in the second quarter of 2021, to 90.3% in quarter 3 of 2021. Out of 4,725 children whose viral load was monitored in Quarter 3 a total of 4,265 were virally suppressing. The project has intensified follow up of the remainder 460 children with non-suppressed viral load status using a pairing approach.
Conclusions/Next steps: Strong collaboration between KCHS as a community OVC mechanism with health facilities and clinical partners has created enabling environment for achieving HIV prevention, care and treatment targets among children living with HIV since it enhances delivery of comprehensive package of services for vulnerable households where care is need most.

EPD238

Research as resistance:Struggle songs in community-based research with South African HIV-affected adolescent advisors

L. Gittings[1,2], S. Medley[2], C. Logie[1], E. Toska[2], J. Chen[3], N. Ralayo[2], L. Cluver[3]
[1]*University of Toronto, Factor-Inwentash Faculty of Social Work, Toronto, Canada,* [2]*University of Cape Town, Centre for Social Science Research, Cape Town, South Africa,* [3]*University of Oxford, Social Policy and Intervention, Oxford, United Kingdom*

Background: South African anti-apartheid protest songs were sung by activists and HIV-positive choirs to advocate for the implementation of a national anti-retroviral therapy programme. The use of song can create 'political alternatives' to the present, express difficult-to-articulate views, and offer a joint language to activists and researchers. We explore the use of song in HIV advisory activities with HIV-affected adolescents.
Methods: A long-standing group of adolescent advisors in the Western Cape of South Africa (n=16, ages 15-27) recruited from a longitudinal study of AIDS-affected children developed a musical theatre performance to reflect on their experiences of 12-years of HIV advisory activities.
Results: Participants re-wrote and performed struggle songs that had been used to advocate for HIV medicines by the Treatment Action Campaign (TAC). They conveyed their experiences of involvement in research through enacting a TAC-style support group, singing Senzeni Na 'What have we done?'. This song rhetorically asks 'What is our sin?' 'Is it AIDS'?
The second song, Jikelele ('Globally'/'Everywhere') was re-written by TAC and deployed to advocate for global access to the prevention of mother to child transmission. It was re-written by participants to describe the global nature of their involvement in research.

The third song, Nkosi Sikelela iAfrica was deployed to convey their desire to ameliorate the conditions of other young people on the continent. Historically, this song was engaged as a cry for change, unity and strength to fight oppression.

Adolescent advisors built upon the Treatment Action Campaign's approach of deploying 'culture as intervention' to interpret and share their experiences of participation in HIV-related research.

In (re)deploying struggle songs, they communicated that they understood their participation in research as a form of resistance to contemporary social and structural forms of oppression. They situated the issues on which their research is focused within ongoing histories rooted in apartheid, colonialism and the HIV-epidemic.

Conclusions: Through re-writing and singing songs, they demonstrated agency and suggested that the HIV research encounter is, and should be, a space of solidary and resistance.

This process of engaging song allowed for new meanings in the research encounter to be created, articulated and shared.

EPD239

Positive Living Program: a land-based support program to the Two-Spirited people living with HIV amid the COVID -19 in Toronto

S. Acharya[1], K. McCrady[2]

[1]2-spirited People of the 1st Nations, 2-Spirited HIV/AIDs Self-Testing, Treatment and Care & Support Program, Toronto, Canada, [2]2-Spirited People of the 1st Nation, Executive Director, Management, Toronto, Canada

Background: 2-Spirited People of the 1st Nations is a community-led organization of the Two-Spirited communities of the First Nations, Metis, Inuit, who are living with or at risk for HIV and related co-infections in Ontario.It is providing a land-based comprehensive package of HIV Self -Testing, Treatment, and Care and Support.

Positive Living Program is a holistic program designed to cater to Urban 2-Spirited communities affected by AIDS. This program was started in early 2020 April when COVID – 19 hits hard the country.

Description: The Positive Living programs have 5 components that service the immediate needs of the Urban Two-Spirited communities,

a. Food for Positive Living,

b. Technology of Positive Living – monthly telephone, internet, and phone and tablet support along with tech support on zoom,

c. Transportation for Positive living,

d. Bed bug free Sleeping for Positive Living,

e. Sweat Lodge and Talking circle for Positive Living.

As of December 2021, 1800, warm meals, 550 phone and tablets, 1200 TTC pass, Presto cards, and TTC tickets, 25 beds, and mattress were provided. 160 community members attended sweat lodges and sharing circles.

Lessons learned: A significant number of the Two-Spirited Urban indigenous communities are living in extreme poverty and unemployment due to the systematic barriers, strong stigma, and discrimination. Due to the technological illiteracy and inaccessibility, most of the members were struggling to navigate services amid the COVID-19 pandemic. Once the program was rollout, significant numbers of the community members reach out to the agency for the service.

When those programs were initiated, community the service utilization rate has been increased by the 400%. From this project, we learned that land-based teaching and need-based services increase the service utilization rate. As a result, the intervention rate of HIV/AIDS and STBBI has been increased significantly within the two-spirited communities.

Conclusions/Next steps: Learning from the Urban project, we are going to conduct a need assessment among the Two-Spirited Communities who are affected by AIDS across Ontario.

Based on the inputs and suggestions, we are going to scaling up the Positive Living program along with the HIV Self-Testing and enrolment to treatment cascade to meet the universal target of ending AIDS by 2030.

EPD240

Integrating sexual health, HIV/AIDS prevention, control and patient support in faith communities: a fast track cities project in the United Kingdom

R. Musomba[1,2], D. Cline[3], K. Khan[4], M.L. Mpungu[5], E. Phiri[1], D. Onyango[6], D. Groom[7]

[1]Africa Advocacy Foundation, Public Health, London, United Kingdom, [2]London School of Hygiene and Tropical Medicine, Public Health and Epidemiology, London, United Kingdom, [3]JEWISH AIDS TRUST, London, United Kingdom, [4]NAZ PROJECT, London, United Kingdom, [5]AAEGRO - Addington Afro-Ethnic Health Promotion Group, Public Health, London, United Kingdom, [6]Africa Advocacy Foundation, Programmes, London, United Kingdom, [7]NHS, FAST TRACK CITIES, London, United Kingdom

Background: 47% of the UK population identify as belonging to a faith community. However, testimonies of PLWHIV confirm that HIV and sexual health remain unspoken subjects in faith communities.

Year 1 and 2 project aimed at faith leaders driving awareness and acceptance of HIV-related issues whilst also improving pastoral support for PLWHIV within their respective communities in London.

Description: Faith Works is a 3-year project funded by NHS Fast Track cities UK, conducted across London by Africa Advocacy Foundation (AAF), Jewish AIDS Trust (JAT) and NAZ. Using quality improvement (QI) models in 2020 and 2021, we conducted a root cause analysis using fishbone (Figure 1) to determine HIV/AIDS and sexual health challenges within faith settings.

Oral abstracts

Poster exhibition

Late-breaker abstracts

Author Index

Social media platforms were used;
https://www.facebook.com/FaithWorks-London;
https://e-voice.org.uk/faithworks/
https://twitter.com/2020FaithWorks
for promoting health messaging in the conditions of lock-down and COVID-19 pandemic.
Furthermore, we drew from experiences of 6 Community Champions (PLWHIV) to design the training agenda. We carried out; one focus group discussion; 15 zoom meetings with purposively selected faith leaders; sent emails; made telephone calls and 16 virtual or in person training using applications such as Mentimeter and Jumboard

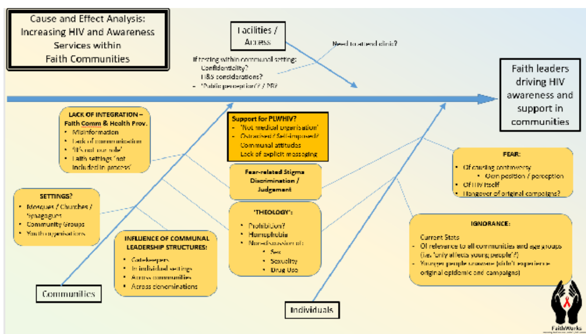

Figure 1. Faith Works project fishbone diagram for integrating HIV/AIDS and sexual health in faith communities.

Lessons learned: Persistence and experimentation with multiple approaches facilitated relationship-building and increased response rate from10% in October 2020 to 75% in October 2021. Social media engagement yielded 200 views via face book. 60 new contacts across the three religious communities were established. Using jumboard and mentimeter two themes emerged 1) Tackle HIV stigma , 2) Improve faith leaders' knowledge about HIV and sexual health.
Conclusions/Next steps: Accessing faith leaders, especially during the COVID pandemic, proved exceptionally difficult. Flexibility; personalising approaches for clients; development of cultural and theological insight and input into training settings for clergy achieved greatest impact. Public health should leverage relationships built with faith settings to influence HIV and sexual health education. Moreover, HIV and sexual health should be embedded into clergy training.

EPD241
Developing a training curriculum to build capacity in quantitative data analysis and interpretation for peer researchers

J.M. Lo Hog Tian[1,2], J. Watson[1], M. Deyman[1], B. Tran[1,2], P. Kerber[1], M. Magill[1], D. Norris[1], K. Samson[1], L. Cioppa[1], M. Murphy[1], A. Mcgee[1], M. Ajiboye[1], L.A. Chambers[3], C. Worthington[4], S.B. Rourke[1,5]
[1]Unity Health Toronto, MAP Centre for Urban Health Solutions, Toronto, Canada, [2]University of Toronto, Institute of Medical Science, Toronto, Canada, [3]University of Toronto, Factor-Inwentash Faculty of Social Work, Toronto, Canada, [4]University of Victoria, School of Public Health and Policy, Victoria, Canada, [5]University of Toronto, Department of Psychiatry, Toronto, Canada

Background: People living with HIV have been trained as peer researchers and have played a key role in the HIV response for decades. However, they are often less engaged in quantitative data analysis and interpretation, limiting their ability to take part in research studies.
To build capacity in these areas where peer researchers are less engaged, we designed and implemented an eight-week online training course teaching fundamentals of quantitative data analysis and interpretation.
Description: Eight peer researchers that were hired as part of the People Living with HIV Stigma Index team from British Columbia, Alberta, and Ontario participated in the training course. The course took place from February to March 2021 and the format involved 2-hour synchronous online lectures with time for group discussion and weekly homework assignments.
Key topics included research data terminology, asking analyzable research questions, understanding the data analysis process, statistical significance, interpreting visual representations of data, developing and delivering a research presentation, and knowledge translation skills. Focus groups were held and a 16-item pre- and post-training self-assessment survey was conducted to evaluate the training.
Lessons learned: Peer researchers' self-assessed knowledge and understanding of key training concepts significantly improved (Wilcoxon signed-rank tests; $p<0.05$) over the duration of the training. Focus groups revealed that peer researchers felt they gained the skills required to better understand quantitative research findings and developed the confidence to explain findings to community partners and study participants. The training also helped them to incorporate their existing lived experience into the data which brough the research findings to life and made them more relatable.
Conclusions/Next steps: Meaningfully engaging people living with HIV in all aspects of research will require building capacity in quantitative data and statistical analysis. Our training curriculum provides a template for research teams to utilize and adapt to build capacity in these areas of research in an engaging and easily accessible way.

EPD242

Improving acceptability, accessibility, feasibility and the uptake of sexual and reproductive health (SRH) services amongst young people through community safe spaces methodology

K. Mangoale[1]

[1]*Networking HIV/AIDS Community of Southern Africa (NACOSA), Non-Government Organisation, Cape Town, South Africa*

Background: NACOSA's Adolescent Girls and Young Women (AGYW) Programme implemented in schools, higher education and communities in South Africa seeks to increase retention in school, decrease HIV incidence, teenage pregnancy, gender-based violence and increase economic opportunities. The National Adolescent and Youth Health Policy 2017 prescribed Adolescent and Youth Friendly Services to improve the quality of care for adolescents and youth.

The Programme has established adolescent-friendly community safe spaces to scale the uptake of SRH services, bridge accessibility, and acceptability barriers, which were threatened by the COVID-19 pandemic. These were essential during lockdown restrictions when health system's resources were prioritising COVID-19 responses.

Description: Community-based interventions have been a great resource in ensuring continuity of SRH provision during the COVID-19 pandemic where the health system was overwhelmed. Safe Spaces increased the number of decentralised points that offer adolescent HIV prevention Programmes.

Leveraging on local infrastructures, Safe Spaces were set up in HIV high-burden areas in Tshwane 1, Rustenburg, and Klipfontein sub-districts.

Safe Spaces provided home work support, psychosocial support, skills and empowerment, an opportunity for peer engagements, socialisation and importantly SRH services to AGYW.

Lessons learned: Based on the 54272 AGYW that were tested for HIV, with 3048 receiving contraceptives, 5955 AGYW received PrEP, 14432 having received sanitary packs, community-based interventions seem to be acceptable and accessible to AGYW.

There is an opportunity for intersectoral partnerships with government departments to scale SRH services and Programmes in Safe spaces. Integrating activities such as art, gardening projects attracts AYP to Safe Spaces.

Having ambassadors and influencers also improved the demand for services and peer engagements. Smaller Satellite Safe Spaces, also widely improved physical access.

Conclusions/Next steps: Engaging parents and guardians of young people, promote further acceptability and advocacy of Safe Spaces in communities.

Expanding behavioural structured services to include Vhutshilo 3, Grassroots Soccer, Stepping Stones, OVC support and integration of activities that respond to the needs of adolescents boys and young men. Implementing Comprehensive Sexuality Education in primary and secondary school, to improve access to SRH information. Lastly, increasing mobile clinics to ensure frequency at Safe Spaces, expanding working hours.

EPD243

Leveraging social welfare scheme in improving accessibility of ART among PLHIV- Lesson learned from Vihaan Program

R. Sharma[1], S. Kumar[1], F. Khan[1], P. K[1], R. Mitra[1]

[1]*India HIV/AIDS Alliance, Vihaan-Care and Support, Kailash Colony Extension, India*

Background: In India, estimated PLHIVs are 2.3 million. These PLHIVs and families are in poor economic conditions due to reduced labor capacity, discrimination, fear of breach confidentiality, and increased medical expenses. These factors put the families or individuals at higher risk and exclude them from essential services. The low socio-economic strata of the PLHIV community affects the country's retention level towards ART.

To address this problem government employs social welfare and protections schemes to mainstream the PLHIV community as well as increase their ART retention. However, due to a lack of knowledge or essential documentation, the PLHIV community is not getting the available services.

Description: Vihaan care and support center (CSC) implemented across India is funded by GFATM and supported by NACO. The CSCs provide the following services such as counseling, support group meeting, and social protection (SP) camps to increase the knowledge among PLHIV for schemes. In all CSCs help desks were set up to facilitate the linkage of SP schemes for eligible PLHIV, referrals, and linkages made.

As a result, from April 2020 to March 21, a total of 89,449 clients were linked to various social protection scheme that includes financial protection, treatment and health check-up, education, policies regulations, and legislative support to PLHIV free of cost. Among the 89,449 clients, total male (45%), female (44%), Transgender (1%), children (11%) benefitted by the CSCs.

Lessons learned: Social protection and welfare are identified as a tactical priority in epidemic response and helping to alleviate the reverse impact on communities, households, and individuals. The social protection scheme tackles the insecurity by protecting PLHIV for being vulnerable, improved accessibility of ART along quality of life by contributing to livelihood. Improved socio-economic status helped the community to bring them in mainstream and increased adherence to ART, viral load suppression.

Conclusions/Next steps: Linkages with social welfare and protections schemes can lead to bringing all the PLHIVs in mainstream and decreasing the cases of stigma, discrimination, and AIDS-related deaths.

Further, these social protection schemes can be expanded to PLHIV and other Key populations with HIV-sensitive elements in India.

Community-led screening of depression among HIV-positive women in the EECA region

L. Vorontsova[1], S. Moroz[1], E. Nechesina[1]

[1]*Eurasian Women's Network on AIDS, Tbilisi, Georgia*

Background: The purpose of the study is to explore the prevalence of depression among HIV-positive women in the EECA region and relationship of depression with physical health problems and life circumstances. Hypothesis: depression is a real problem for the mental, physical and social well-being of HIV-positive women, however depression is invisible and ignored.

Methods: Two standard scales were used to screen depression through online questionnaire:

- Patient Health Questionnaire - 9,
- Zung Self-Rating Depression Scale.

The rapid assessment also considered two types of depression in HIV-positive women - maternal (postpartum) depression and suicide attempts as the most severe complication of depression. Inclusion criteria: HIV-positive, live in a country in the EECA region, expressed a voluntary, informed consent to be screened and share their stories.

Results: 720 HIV-positive women from 11 EECA countries took part in an online depression screening survey. Approximately half of the respondents have been living with HIV for more than 10 years (47.4%), from 5 to 10 years (23.3%) and from 1 to 5 years (24.6%).

Most of the participants do not have a diagnosed mental disorder (68.8%). One third of the respondents had been diagnosed with depressive (16.2%), anxiety (12.6%) or other disorders (2.3%) at least once.

According to the Patient Health Questionnaire - 9, about one fifth of the respondents have signs of moderate depression - 10 or more points, which corresponds to the "yellow flag". More than a third of the respondents noted signs that correspond to the "red flag" - moderate depression (15.7%) and severe depression (12.8%).

According to the Zung scale for self-reported depression, 5.4% of respondents have signs of subdepression or masked depression, about a fifth of the respondents - a mild form of depression (20.9%). The majority of women (81.7%) do not seek help for depression.

Conclusions: At least a quarter of the survey's participants have experienced depressive episodes of varying severity. Most of the respondents are in a state of mental distress, which can contribute to the development of severe forms of depression.

Particular attention and response should be directed to maternal depression and suicide attempts as the most severe complication of depression.

EPD245

Comparison of knowledge on HIV/AIDS and STIs and practices among in- and out of school young people in Acholi and West Nile sub-regions

V. Kiwujja[1], C. Kajungu[1], P. Bukuluki[2], S. Wandiembe[3], W. Mugwanya[1], C. Anena[1], R. Kindyomunda[1]

[1]*UNFPA, Sexual and Reproductive Health, Kampala, Uganda,* [2]*Makerere University, School of Social Sciences, Kampala, Uganda,* [3]*Makerere University, School of Statistics and Planning, Kampala, Uganda*

Background: Uganda currently has at least 1.4 million people living with HIV with an estimated 23,000 Ugandans dying of AIDS-related illnesses annually. Young people especially young women 15-25yrs are disproportionately affected with HIV prevalence being almost four times higher than among young men of the same age. Disturbingly HIV prevalence in Uganda still stands high at 6%, despite the high prevalence of risky sexual behaviours. This necessitated a study of the knowledge, attitude, and practices (KAP) on SRHR/GBV among young people.

Methods: A household study based on a mixed-methods approach was conducted between June-October 2021 to establish the KAP on SRHR/GBV among young people.8,021 young people aged 10-24 years, in and out of school were sampled and surveyed across 18 districts in West Nile and Acholi sub-regions.

Results: The study revealed low knowledge about HIV/AIDS/STIs among the 10-14 years (15% in-school and 16.7% out of school) compared to 15-24 years (42.5%). [H1] This is significantly low compared to 50% of out-of-school & 32.8% of in-school young people who had comprehensive knowledge about HIV/AIDS nationally (UDH, 2016)

Further, only 5% of the 10–14-year-olds and 47.3% (49.0% of male and 45.5% of female) of 15–24-year-olds mentioned at least two signs and symptoms of other STIs among men or women.

Further 1.7% (10-14-year) and 38.4% of adolescents (15-19 years) and 83% of young people 20-24 years have ever had sex. 55.8% of these had had sex at less than 18 years while 61.7% of those that have ever had sex had it in the past four weeks.

Unacceptably, 27.5% were coerced into their first sexual act. Only 37.9% (34.0% among in-school and 41.7% out of school) believed that it is alright for parents to hold open discussions about sex with their children.

Conclusions: The results suggest significantly low levels of knowledge about HIV likely a signal of lack of interventions and/or weak packaging of running interventions. Specifically, weak exploitation of the school platform that reaches more young people is noted.

More interactive, informal, and age-appropriate strategies are necessary to increase knowledge of particularly the very young adolescents.

EPD246

Church-based HIV Care among U.S. Blacks: Challenges and lessons in the era of COVID-19

S. Kenya[1], B. Young[1], S. Doblecki[2], A. Rodriguez[2], O. Carrasquillo[3]

[1]University of Miami Miller School of Medicine, General Medicine, Miami, United States, [2]University of Miami Miller School of Medicine, Infectious Diseases, Miami, United States, [3]University of Miami Miller School of Medicine, Clinical and Translational Science Institute, Miami, United States

Background: Church-based HIV interventions are a promising strategy to increase HIV awareness in high-risk Black communities. HIV care delivered by Community Health Workers (CHWs) has also been shown to increase HIV awareness and HIV screening uptake in diverse Black populations. In Miami-Dade County, a U.S. HIV epicenter, our established CHW team has established robust ties with local churches.

To expand HIV support in Miami's Black neighborhoods, our CHW team partnered with two historically Black churches to develop the Prevent & Reduce AIDS Infections through Spiritual Empowerment (PRAISE) study.

Description: In this pilot research, our street-based CHWs sought to train congregants to function as church-based CHWs, providing community members with HIV education, screening, and care linkage. Following study set-up in March 2020, the coronavirus pandemic emerged; both church partners ceased in-person services and substantial study design changes were made.

For the duration of the research, only one church congregant provided in-person services while the majority of activities were modified to occur through contactless interactions. In-person screening requests were replaced with a secure online submission form.

Community members completed a web-based request or used direct social media messaging to order free, same-day HIV screening. Within 30 minutes of each request, CHWs contacted participants to schedule contactless delivery of a home-based HIV testing kit. CHWs then used cellular-based visual conferencing applications (e.g. FaceTime, Zoom) to provide pre- and post-counseling, test administration support, and if needed, linkage to care.

Lessons learned: From June 2020 to January 2021, 1,571 people engaged in online HIV education and 100 individuals completed HIV screening. Most participants were Black (n=95) females (n=62), and the average age was 35-years-old. Nearly 70% of participants had condom-less sex in the past 12 months and 83% had prior experience with HIV testing. No participants tested positive.

Conclusions/Next steps: Despite coronavirus-associated limitations, PRAISE successfully adapted CHW services in a time of crisis. Effectively translating in-person strategies to contactless approaches was largely due to a resilient CHW team and unwavering support from church partners.In difficult times, when access to care is challenged, CHW interventions can serve as an adaptable, efficacious approach in the communities of greatest need.

EPD247

How are we doing? Using client satisfaction surveys to strengthen the quality of HIV care and treatment services among PLHIV in Zimbabwe

G. Kadziyanhike[1], C. Mademutsa[1], K. Takarinda[2], T. Makoni[1], S. Page-Mtongwiza[2], N. Nyathi[2], K. Webb[2]

[1]Zimbabwe National Network of People Living with HIV, Harare, Zimbabwe, [2]Organization for Public Health Interventions and Development (OPHID), Harare, Zimbabwe

Background: People living with HIV (PLHIV) are better retained in antiretroviral therapy (ART) care when they receive high-quality services meeting their needs. To support quality improvement initiatives, ZNNP+, designed and implemented monthly client satisfaction surveys (CSS) among its members in 15 districts of Zimbabwe. Information collected through the CSS was analyzed and used to strengthen client-centered services within public health facilities.

Methods: There were 315HIV-positive community HIV/AIDS service agents (CHASAs) recruited, trained, and equipped to administer monthly CSSs through a mobile-based application. These CHASAs sampled PLHIV accessing routine HIV services at health facilities or community outreach points and assessed the availability, affordability, accessibility, acceptability, and appropriateness of the HIV care and treatment services they received.

Client satisfaction questions were measured on a 10-point Likert scale with a satisfaction rating ≤5 triggering a probe into the reasons behind the rating.

Concerns raised by the client were recorded for qualitative thematic analysis. Data were consolidated and analyzed descriptively using Microsoft Excel.

Results: Between October-December 2021, 3,911 adults aged ≥18 years were interviewed across 260 health facilities and outreach service points, of whom 2,680 (69%) were female. Services like cervical cancer screening and PMTCT contributed to a higher female-to-male ratio.

The majority (92%; n=3,598) rated services as very good and good, 8% rated them as average, bad, and very bad. Among the 8% (n=313) reporting dissatisfaction, their reasons were categorized into 6 thematic areas: spent a long time before being served (39%); few staff serving clients (20%); bad attitude from healthcare workers (18%); slow service (9%); limited space/privacy for consultation (9%); late opening (5%).

Overall, satisfaction was better for outreach point users (98%, 597/610), compared to 86 % (2838/3301) for those accessing facilities, p<0.001. Outreach points were mostly rated for limited travel distances although disadvantages cited were lack of privacy, long waiting times, and lack of comprehensive services.

Oral abstracts

Poster exhibition

E-posters

Late-breaker abstracts

Author Index

Conclusions: Routineclient satisfaction surveys can ensure that PLHIV inform service quality improvement through documented feedback for healthcare providers to strengthen client-centered service provision and address challenges that result in reduced retention, adherence, and poor health outcomes.

EPD248

Let me tell you what we want! Qualitative considerations for expanding HIV Prevention using digital strategies among a sample of Black women at risk for HIV in rural America, US

D.M. Campbell[1], T. Williams[2], P. Cowlings[3], C. Davis[3], J.K. Stockman[4], T.H. Noel[2]
[1]*UCSD/SDSU, Medicine, San Diego, United States,* [2]*Guiding Right, Inc., Oklahoma City, United States,* [3]*Charles R. Drew University of Medicine and Science, Los Angeles, United States,* [4]*University of California, San Diego, United States*

Background: Black women in the United States are continuously and disproportionately affected by HIV, comprising nearly 60% of incident diagnoses. The Centers for Disease Control and Prevention indicated that half million women could benefit from the use of PrEP to prevent HIV acquisition. Despite this, Black women represent less than 1% of PrEP users. Considerations for expanded biomedical HIV prevention strategies have largely focused on key populations of women in the Western, Southern, and Northeastern regions of the US, effectively omitting women in rural America, US, who are also disproportionately impacted by HIV.

Description: This qualitative study aimed to:

1. Assess Black women's perceptions of knowledge and awareness of PrEP to
2. Inform components of a digital strategy designed to increase Black women's knowledge and awareness of PrEP in rural geographies using the community based organization as a tool for innovation.

Lessons learned: By and large, Black women were unaware of PrEP as a biomedical HIV prevention strategy. Women reported feelings of social disadvantage and being "left behind" other populations who have access to and benefited from PrEP use since being approval for use. Participants advised that any digital strategies aimed at increasing Black women's knowledge and awareness of PrEP should center women's sexual health empowerment and paradigms of sex positivity, and not focus on risk, disease, and fear.

Digital components should include a diverse representation of Black women across age, skin color, weight, and sexual orientation. Multiple engagement platforms should be utilized to disseminate the information to Black women by community based organizations with trusted relationships with Black women.

Conclusions/Next steps: Development of digital marketing and education strategy specific to considerations provided by rural US Black women is currently underway. Results will inform the development of a PrEP focused mobile (m)Health application to bridge the GAP between women's lack of access and rate of utilization in historically underserved areas of the US highly impacted by HIV.

EPD249

Art and creativity focused groups for people living with HIV. Lessons from community-based efforts in Mexico City

O. Mondragón González[1]
[1]*Universidad Nacional Autónoma de México, Ciudad de México, Mexico*

Background: Support groups for people living with HIV (PLWH) have proved critical sharing information developing strong networks and meeting peers. Most of the groups in Mexico City for PLWH take place either inside specialized clinics and other health centers, or are hosted by activist groups and collectives.

The project started by Ofender La Sociedad (OLS) collective is unique in its approach and centers on using creativity and arts as a means of building safe spaces and networks for PLWH and their allies (family members, partners, friends, etc.) The name of the collective alludes to the way certains identities, practices and livelihoods offend a part of the society.

Description: The workshops have opened a space to talk about HIV outside of the medical context, which can at times be intimidating, and have succeeded in invading spaces where talking about HIV and AIDS in groups is relatively new or unseen: museums, art centers, and cultural hubs. Participants, who average 20 to 25 people per group (around 80% of participants identify as male, 15% as female and 5% as non-binary) recognize valuable lessons learned through the group's activities and promote learnings in their own spheres.

The model developed by OLS also opens up the possibility of participants forming their own groups, one of the best examples of this is a group dealing with substance use and abuse for PLWH.

Lessons learned: Using tools from the arts and creative strategies allows PLWH to easily engage in conversation on previously taboo or difficult subjects and provides a common line of communication with their allies. These themes include fears, stigma, pleasure, self-care, with particular attention in the intersection of being Mexican and HIV positive. So far, the work within OLS has ventured into two kinds of workshops: first the themes addressed were explored through drawing, expanding then to include collage and in the last few groups, activities were designed using creative writing.

Conclusions/Next steps: Resulting from the group's work, both an exhibit and fanzine have been produced. Another issue of the zine is already in the making, as is another exhibit besides the next group centered around poetry written by PLWH.

Comprehensive sexuality education

EPD250

The prospects of CSE in HIV/AIDS prevention and treatment in Ghana

M.H. Musah[1], A.-H.S. Inusah[2]
[1]Tamale Teaching Hospital, Health Information Management, Tamale, Ghana, [2]Tamale Teaching Hospital, Pediatrics and Child Health, Tamale, Ghana

Background: Comprehensive sexuality education is the bedrock of tackling various SRHR issues in the world, but the effort and commitment to seeing it through in Ghana have always been met with backlashes from religious and cultural conservative groups with the caption; "You want to spoil our children". It is worth noting that CSE not only guides young people in and out of school to know about the consequences of various sexual expressions, but also promotes personal development through modules and sessions on communication and negotiation skills, tolerance, and empathy. In 2020, out of 18,928 new HIV infections in Ghana, a total of 5,211 are young people 15 and 24 years, and 83% female, a concern for all.

Description: Many young people are not aware of their rights and cannot access sexuality education and youth-friendly health services, GUSO raised awareness amongst young people of their rights and gave them a voice. As a Youth Champion with the Ghana SRHR Alliance, GUSO adopted varied approaches to advocacy in schools and communities through radio, plays, market visits, forums, capacity building, and special outreaches for instance on Menstrual Hygiene Day.

GUSO was implemented between 2015 to 2020 in Northern Ghana and;

1. 87,263 youth were reached with various SRHR services.
2. 947 young people, teachers, and service providers trained.
3. Over 3.8 million community individuals including PLV reached.

Lessons learned: The lessons included;

1. Working in an alliance and leveraging the experience of other partners helps to create synergy and effectiveness when implementing program activities.
2. Comprehensive Sexuality Education created safer school environments, strong referral systems to trusted counselors and health professionals.

Conclusions/Next steps: In achieving the 95-95-95 strategy to end the AIDS epidemic by 2030, sustainable and integrated efforts are required. For instance, household support is essential to give young people the needed information to make safe choices, and in case of HIV infection, we feel comfortable enough to seek treatment without stigma and discrimination.

For strategy, any sensitive project intervention should directly involve religious and traditional leaders or representatives within the community using empathy as a key tool, allowing them to see the issues from the perspectives of others clearly without judgment.

EPD251

Promising short-term outcomes among adolescent girls and young women participating in Zambia DREAMS

M. Walubita[1], S. Manjolo[1], B. Wataba[1], C. Siame[1], M. Siwela[1], T. Kipingili[1], A. Phiri[2], G. Lingenda[2], A. Koler[3], M. Wright[3]
[1]Pact Zambia, Lusaka, Zambia, [2]USAID Zambia, Lusaka, Zambia, [3]Pact USA, Washington DC, United States

Background: USAID/Zambia Community HIV Prevention Project (Z-CHPP) is a PEPFAR-funded project implementing Determined Resilient Empowered Aids-Free Mentored and Safe (DREAMS) programming for adolescent girls and young women (AGYW) in Zambia. While DREAMS is built on evidence-based interventions, gaps in the ways in which AGYW benefit from DREAMS activities remain.

Pact conducted an outcomes assessment survey to determine the extent to which the core DREAMS activity- a 13-week HIV education curriculum (Stepping-Stones)-has led to positive immediate outcomes.

Methods: Using single-stage cluster sampling, 2,392 AGYW aged 10-24 were recruited into the study between November 2019 and March 2021. Using a quantitative survey tool, data were collected by 11 randomly selected DREAMS mentors who administered the survey to AGYW at enrollment and at graduation. The tool included measures on resilience, HIV knowledge, and stigma.

Frequency analysis was used to compare distribution of categorical variables among the same cohort of AGYW before and after completion of the Stepping-Stones curriculum.

Results: Results demonstrate an increase in AGYW who reported resilience (i.e., social support and connectedness) from 51% (2,388) pre-intervention to 85% (3,964) post-intervention. Findings also showed an increase in HIV knowledge: 82% of AGYW post-intervention who believed that having multiple sexual partners increases the likelihood of contracting HIV compared to 60% pre-intervention and 94% (2,103) at post-intervention believed that HIV cannot be cured by ARVs compared to 63% (1,424) pre-intervention. Results also showed a decrease in perceived stigma of testing HIV positive from 39% (815) pre-intervention to 24% (509) post-intervention.

Conclusions: DREAMS, particularly the Stepping-Stones curriculum, resulted in positive short-term outcomes among AGYW. Further research will be conducted to assess the extent to which these gains are retained after completing the Stepping-Stones intervention.

Findings from both studies will be used to inform future HIV prevention programming for AGYW aged 10 – 24 years in Zambia.

EPD252

Applying universal design to learning to ensure access to comprehensive sexuality education for learners with disabilities

J. Hanass-Hancock[1], R. Johns[2], M. Bakaroudis[3], B. Carpenter[4]
[1]South African Medical Research Council, Gender and Health Research Unit, Overport, Durbn, South Africa, [2]SAMRC, Cape Town, South Africa, [3]UNFPA, Pretoria, South Africa, [4]SAMRC, Durban, South Africa

Background: Comprehensive sexuality education (CSE) is essential for young people to develop knowledge, skills, make informed decisions and practice safer sex. However, young people with disabilities (YPWD) lack access to CSE, despite their increased vulnerability to HIV, STIs, unintended pregnancies and violence. The exclusion of YPWD is driven by negative attitudes about their sexuality and disability and lack of skills and tools amongst educators to provide accessible CSE to YPWD.

Methods: We tested the feasibility of implementing the Breaking the Silence (BtS) approach to CSE. BtS aligns with the UN technical guidelines on sexuality education and teaches educators how to apply universal design to learning. We purposely selected one school for the Deaf and one for learners with intellectual disabilities. All staff members were invited to participate in the BtS training workshop and study.

We conducted a school situation analysis, 50 staff KAP surveys with the TSE-Q (validated scales) and key-informant interviews in both schools. We applied descriptive statistics and content analysis.

Results: In the pre-survey participants lacked accessible CSE material, training, and skills to teach CSE. They held misconceptions such as CSE sexualizes children, learners with disability are asexual or over-sexed and cannot learn how to make informed decisions. In the post-survey less educators believed misconceptions, they were more aware of their learners' vulnerabilities and increasingly agreed that their lessons should include information on sexual development, behavior, health and orientation.

Participants reported acquiring new skills and material to build correct vocabulary, talk about sensitive topics (masturbation) and demonstrate complex concepts with concrete material using multiple senses. They also identified opportunities brought by the COVID pandemic to teach about personal space, hygiene, touch, and violence.

Conclusions: Implementing CSE correctly and ensuring that it is accessible to all learners despite ability and disability type requires knowledge, skills and tools to do so. The BtS approach provides simple step by step instructions and tools that can be implemented by educators using local materials. The BtS approach continued engagement with educators attitudes, believes and cultural backgrounds starts to shift to negative attitudes and misconceptions. This shift needs to be strengthened through ongoing support.

EPD253

How Community-Based Participatory Research contributed to the development of Phénix: a sex education program for gbMSM that combines eroticism and risk reduction

M. Latendresse[1], J. Caruso[1], L. Veillette-Bourbeau[1], J. Otis[1], M. Blais[1]
[1]Université du Québec à Montréal, Sexologie, Montréal, Canada

Background: Phénix is an innovative sex education program for cis or trans gbMSM, regardless of their HIV status. Its goal is to teach participants how to better combine eroticism and risk reduction, without compromising on pleasure. It was developed in 2006, in accordance with the steps proposed by Intervention Mapping and based on evidence from studies on the needs and sexuality of gbMSM. The program was revised in 2015-2020 with the participation of communities:

1. Consultations with community organizations, and former facilitators and participants were held to assess the needs of gbMSM and implementation sites;
2. Advisory committees comprised of former facilitators and participants were set up to revise the program's structure, tools and contents,
3. The revised program was implemented in community and clinical settings, and evaluated with the help of the facilitators involved,
4. Based on the results of the evaluation, a final version of the program was created with the collaboration of the advisory committees.

Description: Phénix stands out for its risk reduction approach, which emphasizes sexual pleasure and eroticism. Participants are encouraged to explore their sexual preferences, identify their level of comfort with sexual risks, and create combinations of STBBI/HIV risk reduction strategies that fit the contexts of their sexual activities. Erotic educational videos illustrate erotic skills that participants can integrate into their sexuality. Over the course of the workshops, participants are led to set personalized goals that combine risk reduction strategies and erotic skills to improve their sexual well-being.

Lessons learned: The project has demonstrated the importance of community involvement in every step of the revision and evaluation process, which allowed to develop a program that is effective, appreciated and that meets the needs and realities of communities.

Although Phénix is available throughout Quebec in different formats (group and individual, French and English), program facilitation is subject to the will and capacity of the organizations to offer it.

Conclusions/Next steps: To ensure the sustainability of the program and to render it available to as many people as possible, the next step is to evaluate the acceptability and feasibility of a stand-alone, self-supporting online version.

EPD254

AMAZE global partnerships: development, integration, adaptation, and dissemination of animated, sexuality education videos for young people and digital resources for parents and teachers

N. Cheetham[1], D. Weaver[1], C. Chinchilla Angel[1], P. Gawhera[1]
[1]*Advocates for Youth, International Youth Health and Rights Division, Washington DC, United States*

Background: Today there are 1.8 billion young people in the world, and they are more connected through technology than all previous generations. Globally, knowledge of HIV prevention among young people remains low and access to comprehensive sexuality education (CSE) is critical to ensure young people have the knowledge they need to prevent new HIV infections and access treatment. With COVID-19 and the repeated suspension of in-person schooling across the globe, the need for digital resources for CSE has become greater than ever.
The AMAZE initiative seeks to respond to this need and leverage technology with the goal of increasing access to scientifically accurate, age-appropriate, culturally sensitive, gender-transformative, and inclusive sexuality education through short, animated videos that young people can access on their own or through schools and programmes, while equipping teachers with resources to support CSE delivery and parents with materials to encourage sharing of information and talking with their children about sexual and reproductive health, including HIV prevention, treatment, and support.
Description: Launched in the United States in 2016, AMAZE is implemented by Advocates for Youth and YouthTech Health, in partnership with organizations around the world, which seeks to respond to this need. Informed by young people, sexuality education experts, and the International Technical Guidance on Sexuality Education, AMAZE videos address a wide range of CSE topics, such as puberty, relationships, contraception, HIV, sexual violence, digital safety, bullying, sexual orientation, gender identity, and others. AMAZE provides partner organizations interested in using, translating, adapting, or creating new videos with information, technical guidance, and existing assets along with guidance and materials for dissemination through existing programming and digital platforms.
Lessons learned: AMAZE's CSE videos have reached approximately 52 million views, with 500 original, dubbed, or adapted, short, animated videos produced in 35 languages and 55 countries. Best practices include supporting a holistic approach and decentralized model led by local partners with regional and global efforts; meaningfully engaging young people; and developing processes and documentation for scale-up.
Conclusions/Next steps: AMAZE will work to strengthen its scaling-up model, support institutionalization of digital CSE resources with education and health sectors and address new and emerging topics impacting young people's lives.

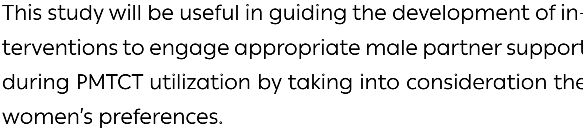
Couples- or family-centred approaches

EPD255

Kenyan women's preferences, expectations, and experiences with male partner support during pregnancy in the context of prevention of mother to child transmission services

B. Lapke[1], M. Maloba[2], C. Wexler[1], H. Acharya[1], S. Mokua[3], S. Babu[2,2], N. Maosa[2,2], K. Goggin[4], V. Staggs[4], S. Finocchario-Kessler[1]
[1]*University of Kansas Medical Center, Kansas City, United States,* [2]*Global Health Innovations - Kenya, Nairobi, Kenya,* [3]*Kenya Medical Research Institute, Nairobi, Kenya,* [4]*Children's Mercy Kansas City, Kansas City, United States*

Background: Male partner participation in prevention of mother-to-child transmission of HIV services (PMTCT) influences maternal and child outcomes. While many studies have sought to increase male partner attendance at PMTCT, few studies have evaluated female preferences for and experiences with male partner engagement.
This study assessed how women's preferences for male partner support throughout PMTCT of HIV services compares to their actual experiences with male partner support.
Methods: This was a prospective quantitative analysis nested within a larger cluster randomized control trial at 12 government hospitals in Kenya. All participants were surveyed at PMTCT enrollment, delivery, and 6 months postpartum. Variables in the survey included in this analysis include demographics, a 4-point Likert scale that assessed preferences for male partner support, and experiences of partner support. We used descriptive statistics and proportions to summarize data.
Results: Data from 1,173 women were evaluated. Of these, 1,007 (85.8%) reported a current relationship, 1,023 (87.4%) disclosed their HIV status to at least one person, 761 (65.0%) disclosed to their male partner, and 851 (73.2%) lived with their current male partner.
Among women with partners, the following were indicated as somewhat or very important to them: partner attendance at ANC appts (65.5%), provision of monetary support (87.9%), provision of advice (84.6%), partner help with household responsibilities (58.5%), reminders to take medication (77.8%), and partner encouragement (89.8%).
Among the 734 women who completed delivery surveys, 26.5% of women's partners attended any ANC appts.
Women were supported often or sometimes in the following ways: monetarily (77.3%), advice (62.9%), medication reminders (57.4%), help with household responsibilities (39.3%), and encouragement (70.3%).
Conclusions: Preferences for male partner support varied among women and included components of emotional, informational, and financial support. There is a gap between female preferences and experiences with male partner support.



This study will be useful in guiding the development of interventions to engage appropriate male partner support during PMTCT utilization by taking into consideration the women's preferences.

Future analyses will look at how preferences for male partner support in later phases of PMTCT (i.e. delivery, postpartum) align with actual experiences and how experiences impact retention.

EPD257

Engaging family members to support infant feeding, early child development, and ART adherence is acceptable to families with HIV-exposed uninfected children in Zambia

T.F.L. Matenga[1], M.P. Kasaro[1], J. Nyambe[1], R. Chabaputa[1], S. Chanda[1], D. Habinda[1], L. Mulenga[1], S. Sakanya[1], O.P. Adeniran[2], M. Lam-McCarthy[2], S. Maman[3], B.H. Chi[4], S.L. Martin[2]

[1]UNC Global Projects Zambia, Lusaka, Zambia, [2]University of North Carolina at Chapel Hill, Nutrition, Chapel Hill, United States, [3]University of North Carolina at Chapel Hill, Health Behavior, Chapel Hill, United States, [4]University of North Carolina at Chapel Hill, Obstetrics and Gynecology, Chapel Hill, United States

Background: HIV-exposed uninfected (HEU) children are at increased risk for poor health, growth, and development compared to HIV-unexposed uninfected children. Family members (including male partners) influence child care and feeding, and integrated family-centered interventions could improve outcomes for HEU children.

We assessed the acceptability of engaging family members to support postpartum women living with HIV (WLWH), with emphasis on ART adherence and infant care and feeding.

Methods: To inform the design of future family-centered interventions in Lusaka, Zambia, we conducted trials of improved practices, a formative research methodology that follows participants over time as they try new behaviors. We enrolled WLWH with infants <3 months of age and their family members.

We implemented an integrated nutrition, early child development, and ART counseling package, and conducted a series of in-depth interviews.

At visit 1, WLWH described adherence, care, and feeding practices. At visit 2, WLWH and family members received exclusive breastfeeding (EBF), early child development, and ART adherence counseling. At visit 3, WLWH and family members reported their experiences trying recommended practices for 2-3 weeks. Interview transcripts from each visit were analyzed thematically using Atlas.ti.

Results: Participants included 20 WLWH, 15 male partners, and 8 female family members. WLWH reported several barriers to EBF, the most common were concerns about insufficient breastmilk and fears about vertical HIV transmission through via—even with high ART adherence. This resulted in infrequent breastfeeding and mixed feeding.

Participants expressed appreciation about the counseling they received. Family members valued the opportunity to participate in counseling sessions and described improved knowledge about infant care and feeding support.

After counseling, most family members reported increased confidence to support EBF and early child development, and greater participation in responsive caregiving. This was confirmed by the index WLWH. Family members reported supporting ART adherence through reminders and encouragement.

Conclusions: Families with HEU children need tailored support. In this context, engaging family members to support infant care and feeding and ART adherence through an integrated counseling package was found to be acceptable. Family-centered approaches to support postpartum WLWH and HEU children are promising and should be considered for further evaluation.

EPD258

Mbereko+Men - partners for PMTCT! impact of male partner engagement on maternal mental health and care-seeking in rural Zimbabwe

L. Comrie-Thomson[1,2,3], K.A. Webb[4,5], D. Patel[4], P. Wata[4], Z. Kapamurandu[4], A. Mushavi[6], M.-A. Nicholas[1], P.A. Agius[7,3], J. Davis[1,3], S. Luchters[1,8,3]

[1]Burnet Institute, Maternal, Child and Adolescent Health Program, Melbourne, Australia, [2]Ghent University, Faculty of Medicine and Health Sciences, Gent, Belgium, [3]Monash University, School of Public Health and Preventive Medicine, Melbourne, Australia, [4]Organization for Public Health Interventions and Development, Harare, Zimbabwe, [5]London School of Hygiene and Tropical Medicine, Epidemiology and Population Health, London, United Kingdom, [6]Ministry of Health and Child Care, National PMTCT Program, Harare, Zimbabwe, [7]Burnet Institute, Melbourne, Australia, [8]Ghent University, International Centre for Reproductive Health, Department of Obstetrics and Gynaecology, Gent, Belgium

Background: Male partner involvement is associated with increased uptake of prevention-of-mother-to-child-transmission interventions. Mbereko+Men is a low-intensity, community-based program that engages women and men in separate, complementary activities to improve men's practical support for women and babies to increase care-seeking and maternal mental health.

Our objective was to explore the impact of Mbereko+Men and male involvement upon maternal mental health and health service uptake in rural Zimbabwe.

Methods: We conducted a cluster-randomised controlled pragmatic trial. Data were collected through two independent cross-sectional surveys before/after intervention or standard-care in communities of 8 rural health facilities in Mutasa District, Zimbabwe. Survey participants were women who had given birth within the previous six months and their male co-parents.

The primary outcome was women's mean score on the locally-validated Shona-language version of the Edinburgh Postnatal Depression Scale (EPDS), with cut-off score ≥12 for clinically significant symptoms of anxiety and depression. Data analysis was conducted using Stata 15.1. Models were adjusted for age, education, and number of pregnancies (for women) or number of children (for men), and clustering effects, with significance-level of p<0.05.

Results: From April-May2016 and Oct-Nov2017, 890 women and 315 male co-parents were interviewed. At endline, women's mean EPDS was 3.5/30 (95% CI 2.8-4.2); 8.9% (95%CI 6.1-12.8) had an EPDS≥12. Women's characteristics associated with EPDS≥12: HIV-positive status, intimate partner violence in previous 12 months and primipara.

Male partner behaviours and attitudes significantly associated with women's mean EPDS score: men sometimes/usually participate in ANC; men sometimes/usually hold/soothe baby at night; men's use of violence against intimate partner in previous 12 months (women's report) (worse EPDS); help obtain/prepare special food postnatally.

Decline in mean EPDS was 34% greater in the intervention arm compared to the control arm (aRR 0.66; 95% CI 0.48–0.90, p=0.008), with significant increases in early ante- and postnatal care and couples HIV testing.

Conclusions: We demonstrate the impact of male co-parent involvement on maternal mental health and care-seeking. Low-intensity gender-synchronised interventions to engage women and men can be effective to improve maternal mental health and care-seeking in the context of gender inequality and demand-side barriers to care.

EPD259

The feasibility and acceptability of engaging the brothers and sisters of Latinx gay men (LGM) to promote PrEP use

H.E. del Pino[1,2,3], P. Durán[1], E. Rojas[4], A. Martínez[1], N.T. Harawa[2,1]

[1]Charles R. Drew University of Medicine and Science, Los Angeles, United States, [2]David Geffen School of Medicine at UCLA, Los Angeles, United States, [3]Veterans Affairs Greater Los Angeles Healthcare System, Geriatric Research Education and Clinical Center (GRECC), Los Angeles, United States, [4]St. John's Well Child & Family Center, Los Angeles, United States

Background: We explored the feasibility and acceptability of engaging the siblings of Latinx gay men (LGM) in the promotion of PrEP to prevent HIV infection.

Family ties affect Latinx people's physical and mental health and can be leveraged in health interventions, but this resource has been overlooked for LGM. This study sought to address the dearth of HIV-prevention family-based interventions for LGM by focusing on sibling relationships. We answer the question: Can the siblings of LGM be engaged to promote PrEP as a strategy for HIV prevention?

Methods: We used a mixed methods design and we used the Information-Motivation-Behavioral Skills and Stages of Change models to create instruments. We conducted surveys and dyadic interviews with LMSM-sibling pairs (n=31) and three focus groups only with the siblings of LMSM (n=20) in Los Angeles *between March 2020 and January 2021.*

We explored how study participants described, interpreted, and understood their experiences of sibling support; how open they were to talking about HIV PrEP and sexual health; and how siblings might support LGM PrEP use.

Results: We enrolled 31 sibling pairs. We found:

1. *LGM can be motivated by their siblings to take PrEP.* Twenty-two (71%) LGM reported that they would take PrEP if it would make their sibling worry less about them and five (16%) started using PrEP after the interviews.
2. *Siblings are willing to provide instrumental and emotional support for PrEP use.* They were willing to go to the doctor with their LGM brother and remind him to take a pill every day. Nineteen (95%) siblings in the focus groups reported that they would take PrEP if it would help their brother get started.

Conclusions: The siblings of LGM can be engaged in PrEP promotion. To engage siblings, we recommend:

1. Create dissonance in siblings;
2. Empower siblings to talk about PrEP, not sex;
3. Clarify misconceptions around the side effects of PrEP, and;
4. Create informational materials specifically for siblings.

EPD260

Fatherhood and engaging men in Maternal, Neonatal and Child Health (MNCH) services in South Africa

C. Chinyandura[1], N. Davies[2], F. Buthelezi[3], A. Jiyane[3], H. Struthers[3], J. McIntyre[4], K. Rees[3]

[1]Anova Health Institute, Public Health, Johannesburg, South Africa, [2]Anova Health Insitute, Clinical, Johannesburg, South Africa, [3]Anova Health Insitute, Public Health, Johannesburg, South Africa, [4]Anova Health Insitute, Johannesburg, South Africa

Background: In South Africa, uptake of HIV services remains lower amongst men compared to women, resulting in poorer clinical outcomes. Several factors contribute to this situation, including stigma, confidentiality concerns, inconvenient clinic operating hours, fear of an HIV-positive test result, and long-waiting times. Additionally, women living with HIV are frequently identified whilst attending other routine services, particularly antenatal and well-baby care. Novel approaches and strategies are needed to increase men's routine utilization of health services. For many men, fatherhood is an important part of being a man. Maternal, neonatal and child health services (MNCH) present an opportunity to improve male engagement with routine health services and subsequent uptake of integrated HIV care.

However, men's involvement in MNCH services remains low. This study explored the concept of fatherhood and factors influencing men's involvement in MNCH services.

Methods: This was an exploratory, qualitative study. Three focus group discussions (FGDs), involving 33 male participants, were undertaken to collect data from men living in communities across Johannesburg. Men were recruited from local communities by male peer counsellors, employed by Anova Health Institute under the men's health programme. Data was transcribed and analysed thematically using NVivo software.

Results: The study found that the male participants were eager to be involved in MNCH services. They valued fatherhood and were making concerted efforts to be involved fathers. However, multiple factors influenced men's involvement in MNCH services. Barriers included sociocultural norms, employment commitments, boredom and disengagement while waiting for services, negative staff attitudes and long waiting times. Participants identified multiple facilitators that would encourage their attendance at MNCH services including: positive staff attitudes, quick service, active engagement, positive affirmations by health care workers (HCWs) and the visibility of male HCWs' in MNCH spaces.

Conclusions: The study highlights that men strongly desire to be involved fathers and included in MNCH services. HIV programmes should support and harness this to actively engage men in HIV services.

However, to encourage greater men involvement in MNCH, socio-economic and healthcare system related factors need to be addressed when designing strategies that would create more inclusive, family orientated, male-friendly and integrated MNCH services.

EPD261

Comprehensive family centered case management of children of sex workers: lessons learnt from the USAID supported OVC Children Tariro Program in Mutare District, Zimbabwe

B.D.C. Mukome[1], G. Shumba[1]

[1]*FACT Zimbabwe, Safeguarding and Sustainable Livelihoods, Mutare, Zimbabwe*

Background: Little attention has been drawn to the reality that sex workers are often parents whose children potentially face HIV vulnerabilities unique to their family situation. The USAID funded FACT OVC program seeks to contribute to the epidemic control by enhancing HIV and GBV prevention, care and treatment services to most at-risk sub-populations in selected districts of Manicaland and Masvingo Provinces from October 2020 to September 2021.

Description: FACT Zimbabwe implementing the OVC program targeting specific sub populations with highest risk to HIV such as children and adolescents living with HIV< 18 years; children of adults living with HIV at risk of treatment interruption; children of female sex workers (especially sex workers living with HIV); and survivors of sexual violence. In order to identify and address the unique vulnerabilities to HIV of children of sex workers, case management approach has been employed as one of the Most at risk to HIV in Mutare District.

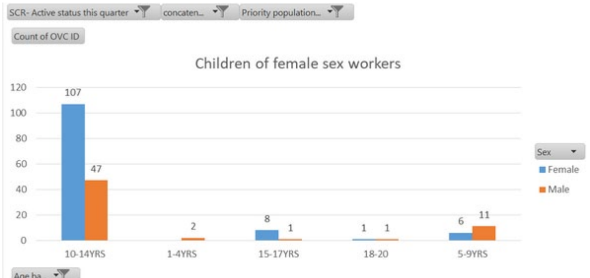


Figure.

Lessons learned: Through the family centered case management approach, assessments were done to identify the children's vulnerabilities and their needs leading to care plans development service provision and monitoring of 269 children in Mutare District. Unique care plans were developed according to age, sex, and vulnerability. 63 children were linked to education, 14 CLHIV were enhanced adherence support, 113 went through financial literacy and sexual violence prevention sessions and 2 underwent growth monitoring. The mothers of these children are participating in caregiver programs.

Conclusions/Next steps: Effective implementation of the case management approach will contribute to the reduction of HIV risk among children of sex workers.

While there is a standard package designed for the program, children of sex workers pose unique and multiple challenges that cannot be packaged and therefore requires a case management system that identifies and responds to each of the unique needs of children of sex workers.

EPD262

Preliminary impact of a brief, mHealth HIV/STI prevention intervention on creating a tailored risk-reduction plan among cisgender male couples who are in a new relationship

J. Mitchell[1], S. Escarfuller[2], K. Gamarel[3]

[1]*Florida International University Stempel College of Public Health and Social Work, Health Promotion and Disease Prevention, Miami, United States,* [2]*Florida International University Stempel College of Public Health and Social Work, Miami, United States,* [3]*University of Michigan, Ann Arbor, United States*

Background: We developed and pilot-tested OurPlan, a brief, theoretically guided mHealth intervention, to encourage cisgender male couples who are in a new relationship (i.e., 1 year or less) to develop a tailored, risk-reduction prevention plan that includes evidence-based strategies. OurPlan contained 4 modules (M1-M4) with a geo-locator sexual health resource finder; M1 focused on

communication and decision-making skills and M2 covered prevention strategies that included an activity to create a tailored prevention plan (outcome).
Methods: To evaluate the preliminary impact of OurPlan, we conducted a 2-month pilot randomized controlled trial (RCT) using a 30-day waitlist control condition with 42 cisgender male couples in the US. Targeted Facebook/ Instagram ads were used for recruitment. Upon eligibility, consent and as part of enrollment, each couple had to attend a brief, Zoom meeting to receive the study app that provided access to assessments (baseline, 2-month follow-up) and OurPlan (intervention).
After completion of the baseline assessment, couples were randomized via 1:1 block allocation to either immediately receive OurPlan to use for 2 months or be placed in a 30-day delayed waitlist before receiving access to use OurPlan. At month 2, all participants completed a follow-up assessment.
Preliminary impact of OurPlan was examined at the dyad-level by assessing changes in the primary outcome - couples' creation of a tailored, risk-reduction prevention plan - over time with three data sources: self-reports from baseline and 2-month follow-up assessments, as well as from paradata.
Results: Retention was 86% (36 couples) for the pilot RCT. Comparing self-reported baseline to follow-up data, there was a 28% increase (i.e., 37% to 65%, $p<0.05$) of partnered men who reported having a prevention plan in their relationship over time.
Applying the same comparison and using dyadic data, the number and proportion of couples with both partners who concurred they had a prevention plan in their relationship doubled over time (i.e., 25% to 50%, $p<0.05$). No significant differences were observed between trial arms.
Conclusions: Overall, the results showed potential promise for OurPlan to encourage cisgender male couples to create a tailored risk-reduction, prevention plan in their relationship.
Our next step is to conduct a Type 1 Hybrid Trial.

Harm reduction

EPD263

A qualitative study of people who use new psychoactive substances and harm reduction services in eight countries of the Eastern Europe and Central Asia region

E. Kurcevič[1], R. Lines[2]
[1]*Eurasian Harm Reduction Association, Vilnius, Lithuania,* [2]*School of Law, Swansea University, Swansea, United Kingdom*

Background: Research examines the use of new psychoactive substances (NPS) and the harm reduction response in eight countries of the Eastern Europe and Central Asia (EECA) region: Belarus, Estonia, Lithuania, Moldova, Serbia, Kazakhstan, Kyrgyzstan, and Georgia.
The aim is to generate a more accurate picture of current patterns of NPS use and harms associated with it in each country through recording the lived experience of people who use drugs and harm reduction service providers in order to inform the harm reduction response.
Methods: The study involved desk research and semi-structured interviews and focus groups with 166 people who use drugs and 69 health and harm reduction service providers in eight countries.
Results: People who use drugs in all countries were aware of NPS. Synthetic cannabinoids and synthetic cathinones are predominant groups of NPS and widely available, whereas synthetic opioids seem to be more present in Estonia and Lithuania. NPS users generally reflected two groups: those who have more experience with drug use, who have shifted to the use of NPS for a variety of reasons, and young people with no/ little previous history of drug use. A main risk of NPS is the absence of drug checking, because users don't know what they are actually consuming.
Other health-related risks include overdoses, mental health issues and increased risk of transmission of human immunodeficiency virus (HIV) and hepatitis C virus (HCV) caused by unsafe use of drugs (mainly by frequent injections, sometimes up to 30 injections per night), often combined with increased number of sexual contacts and riskier sex practices.
In most of countries providers of harm reduction, drug treatment programs and ambulance services are not prepared to provide people who use drugs with quality support and counselling to reduce risks associated with NPS use.
Conclusions: The study identified patterns of NPS use, risk behaviours and drug-related harms. It presented more accurate picture of NPS use in 8 countries of EECA region. Research identified gaps in the current treatment and harm reduction response. These findings may inform and improve current harm reduction services to meet the needs of people who use NPS.

Montreal overdose crisis: a collaborative response by and for communities

E. Roberge[1]

[1]Table des Organismes Communautaires de lutte contre le VIH/Sida, Montreal, Canada

Background: The covid pandemic has exacerbated the Quebec overdose crisis. The sanitary and repressive measures put in place and the concentration of public health efforts on covid issues have made access to health care more difficult, leaving people who use drugs more vulnerable to overdoses and STBBIs.

Community organizations have expressed the need to quickly access data on overdoses and the substances that cause them in order to prevent overdoses. The concerted efforts of 21 TOMS member organizations working in harm reduction and STI prevention led to the creation of the Programme d'Observation sur les Drogues et les Surdoses (PODS).

Description: Member organizations' workers, as well as drug users, participated in committees and consultations in order to meet everyone's needs. The PODS will help identify overdoses and the substances that cause them.

It is composed of a two-part questionnaire: identification of the substance and its adverse effects, and information on a possible overdose. It is intended for community workers, health professionals and people who use drugs.

Lessons learned: Offering a community response to community needs allows us to take ownership of the data, while remaining close to the issues experienced by the concerned communities . The need for an easy-to-use tool and to democratize access to data is essential to achieve our goal.

Some specific issues were named: confidentiality, the type of data to be collected or the "dope alerts" model for example. Bringing these different needs together required an even broader consultation than expected, particularly with the communities concerned.

Conclusions/Next steps: Next steps include to work with the groups so they adopt the tool, while carrying out various steps to make it known. As such, we are aiming for a double launch: a general public launch to which all people likely to be interested in the PODS platform, and a launch with community groups that work with people who use drugs.

A project of this magnitude, carried out in consultation with stakeholders, aims to provide an additional tool for people who use drugs, who may be at higher risk of HIV exposure, to take care of themselves while reducing the risks associated with drug use.

EPD265

Perspectives on perceived barriers and benefits of integration of harm reduction services and PrEP among people who use drugs in Uganda

B. Kamusiime[1], C.C. Twesige[1], A. Nalumansi[1], G. Nalukwago Kakoola[1], V. Kasiita[1], R. Kansiime[2], N. Chhun[3], S. Kandel[3], T.R. Muwonge[1], A. Mujugira[1], P. Kyambadde[2,4], H. Kadama[4], P. Mudiope[4], S. Glick[3], B. Lambdin[5], R. Heffron[3], K. Beima-Sofie[3]

[1]Infectious Diseases Institute, Makerere University, Kampala, Uganda, [2]Most-At-Risk Populations Initiative (MARPI), National STI Control Unit, Kampala, Uganda, [3]University of Washington, Seattle, United States, [4]Ministry of Health, Kampala, Uganda, [5]Research Triangle International, San Francisco, United States

Background: People who use drugs (PWUD) are at increased risk of HIV acquisition and often encounter barriers to accessing healthcare services. Understanding PWUD drug and harm reduction use experiences, along with HIV risk perceptions, may inform strategies to optimize integration of pre-exposure prophylaxis (PrEP) with harm reduction services and align with their needs and priorities.

Methods: We conducted semi-structured interviews with 23 PWUD in Kampala, Uganda, from May-November 2021. We recruited participants with and without previous experience accessing harm reduction services using purposive and snowball sampling. Interviews were audio recorded, translated, and transcribed. We used thematic analysis of structured debrief reports and a subset of full transcripts to identify drug and harm reduction use experiences, HIV risk perceptions, and perspectives of integrating PrEP into harm reduction services.

Results: PWUD were predominantly male (ages 20-53 years), with 4-39 years of drug use experience; all reported prior HIV testing. Overall, participants were knowledgeable about PrEP and trusted its efficacy, though few reported ever taking PrEP. Many reported willingness to use PrEP if available, and if they perceived themselves as being at risk. Most participants reported frequent HIV testing, were relatively aware of their personal HIV risk, and accurately identified situations that increased risk, including sharing needles and engaging in sex work to facilitate drug purchases. COVID-19 caused increased risk to participants, since traditional sources of income were limited by COVID-19 prevention measures. Participants supported integrating PrEP into harm reduction service delivery but advocated for changes in how these services are accessed. They described challenges in acquiring sterile needles and syringes, noting that high costs associated with individually purchasing them were prohibitive, as were existing policies within harm reduction centers that required exchanges.

Stigma experienced in healthcare facilities and challenges acquiring money for transportation presented additional barriers to accessing current facility-based harm reduction services.

Conclusions: Meeting the needs of PWUD in Uganda will require addressing barriers to accessing existing harm reduction services. Approaches to integrating PrEP into harm reduction services that are informed by PWUD experiences has the potential to prevent HIV acquisition among this key population.

EPD266

CHEMSEX: KONTAK & ImpakT, programs adapting to the reality and needs, of men who fuck men on drugs

F. Lambert[1]

[1]*Aids Community Care Montreal (ACCM), Chemsex Support, Montreal, Canada*

Background: Over the last decade, we have seen changing and growing needs for HIV/AIDS prevention in environments where sex and drugs are one for certain gbMSM communities. We realized that there was an urgent need for interventions around drug use in a sexual context, because there were no services, not even a strategy to prevent or support users who were facing this growing phenomenon. Moreover, it was the beginning of a specific substance becoming available on the market that came to play an important, if not the main role in CHEMSEX: crystal meth.

Knowing that the risks are changing, our approach to preventing these risks must also adapt. And to adapt, we must understand the basics of CHEMSEX and the needs of its communities. Within a prevailing medical and abstinence context, ACCM deemed it crucial to expand and diversify its prevention and support services and offer a diversity of harm reduction resources to chemsex communities.

Description: We offer harm reduction information sessions at parties, one-on-one support services and safer sex and safer drug material distribution and deliveries to gbMSM who practice chemsex. To meet our communities' needs and facing increasing demands, we recently developed the ImpakT program with a partnered organization to offer group support sessions (drop-in format) as well as harm reduction workshops that will include topics identified and selected by users themselves.

Lessons learned: During our interventions, what most often comes up from our users is that they feel misunderstood by health professionals. In the KONTAK and ImpakT programs, we use a holistic, harm reduction approach.

The main lesson we learned is that rather than trying to have people stop using, we focus on the human being in front of us and how they want to improve their quality of life, in a non-judgmental way.

Conclusions/Next steps: By meeting people where they are at, and forming bonds of trust, we can provide the harm reduction tools and information needed to be able to make informed decisions on their use, which will ultimately contribute to reducing the risk of HIV transmission.

EPD267

Building a harm reduction-based hospital

L. Hodge[1], E. Kucharski[1], A. Cardow[1], M. Kota[1], C. Schapel[1], M. Mahan[1], Y. Ismail[1], R. Bremmer[1]

[1]*Casey House Hospital, Toronto, Canada*

Background: Casey House is a small hospital in Toronto, Canada. Historically serving clients living with HIV, we now also care for those at risk of HIV, including a high proportion of people who use drugs (PWUD). Hospitals are often sites of stigma and discrimination for PWUD, resulting in early discharges, reluctance to access care, and follow up inequities.

Description: As result of internal advocacy, we initiated safer drug use kit (SDUK) distribution on a 24/7 bases in 2014. Over subsequent years we refined our harm reduction (HR) philosophy and practices. Organizationally we implemented mandatory all-staff training on HR, trauma-informed care and racial justice; Board-approval of HR-based policy advocacy statements; expansion of organizational mandate to include people at risk of HIV; partnered with peers and researchers to create new knowledge around HR-based hospital care.

Clinically we implemented a managed alcohol program; a drop-in community care clinic for SDUK clients; safer supply prescribing to inpatients; a low-barrier psychiatric clinic; non-abstinence-based substance use group programming; inpatient and outpatient supervised consumption services.

Our services are informed by and developed with involvement of clients and populations served. Throughout the COVID-19 pandemic we have seen a dramatic increase in clients and community members accessing HR-specific services. We believe this shows the value of embedding services in 24/7 facilities.

Lessons learned: We have designed and implemented hospital services with an explicit HR lens to provide services acceptable and sensitive to the needs of PWUD. Providing inpatient and community care in a HR framework allows for all patients to maintain continuity of care and achieve optimal health outcomes

Conclusions/Next steps: Providing hospital-based care within a HR framework is an ethical and practical way to address health inequities experienced by PWUD. Having HR permeate every aspect of our hospital reduces stigma and allows for clients to reach their health goals.

Our experience points to the promise and potential for hospitals to improve health care for PWUD by embracing a HR approach. Clients traditionally excluded from hospital care engage in multi-disciplinary care at our hospital and report high rates of satisfaction with the care they receive, with corresponding increases in retention in care.

EPD268

Utilization of harm reduction services following nonfatal overdose events during the COVID-19 pandemic in the United States: results from a cohort study of overdose survivors

S. Harris[1], S. Sherman[1], B. Saloner[1]
[1]*Johns Hopkins Bloomberg School of Public Health, Department of Health Policy and Management, Baltimore, United States*

Background: Maintaining access to harm reduction and substance use disorder treatment services during the COVID-19 pandemic remains vital in preventing overdose fatalities and mitigating the risk of HIV acquisition. Persons who use drugs with history of an overdose event are particularly vulnerable to having a fatal overdose. However, little is known about the events surrounding nonfatal overdose in the COVID-19 pandemic.

Methods: We conducted semi-structured interviews with persons who survived an overdose during the pandemic. Our sample was derived from a larger study of 570 people who were recruited from SUD treatment and harm reduction programs (N = 21) across nine states and Washington, D.C. Interviews followed timeline follow-back memory retrieval methods to elicit narratives about overdose events and health service utilization. Interviews were professionally transcribed verbatim, coded, and analyzed.

Results: The pandemic caused disruptions that contributed to study participants' overdose events, such as increased isolation, changes in the drug supply, and challenges receiving SUD treatment. However, harm reduction programs remained widely accessible. The majority of participants regularly accessed harm reduction services and were revived by a friend or family member with naloxone obtained from their program.

Additionally, respondents demonstrated knowledge about the risks of acquiring HIV, skin and soft tissue infection, and blood infections associated with intravenous drug use. Most were not aware of the content or potency of the drug that caused their overdose, and prior or current utilization of fentanyl test strips was mixed. Following overdose events, several respondents did not receive medical services. Commonly cited reasons included fears of being stigmatized and the belief that the hospital would not provide helpful assistance.

However, most informed their harm reduction program of their overdose and said they received adequate support from their program, demonstrating that relationships between programs and persons who use drugs are potentially life-saving.

Conclusions: Harm reduction programs play an essential role in reducing risk of overdose and HIV infection among persons who use drugs. This study finds that harm reduction programs have remained widely available during the pandemic.

Expanding access to harm reduction services is critically important in reducing drug related morbidity and mortality, especially during times of crisis.

EPD269

Antenatal care; an experience of pregnant women testing HIV positive in Koome Island, Mukono-Uganda

L. Namutebi Kakungulu[1], R. Nampewo Murwana[1]
[1]*Bugema University, Public Health, Kampala, Uganda*

Background: There has been an evolution and development of the role of midwives regarding the testing of HIV during pregnancy. This has created a debate on the provision of this screening over the past years moreover, there is no fully explored impact of the positive HIV test among pregnant women during antenatal in Uganda.

This study therefore, explored the real understanding of the experience of pregnant women after receiving a positive test during antenatal care.

Methods: The methodology was based on Heidegger's (1962) hermeneutic phenomenology to discover and examine the experience of testing positive in pregnant women during antenatal and what it means by this experience. Data was collected using in-depth interviews and the results were analyzed using the reflection by van Manen's (1990) hermeneutic phenomenology.

Thirteen women receiving antenatal care and HIV positive were used for the interviews. Recruitment was from one Health center IV in Koome Island and other HIV support organizations. National adverts were also carried out to increase the diversity of the experiences.

This was also accompanied by a number of literature reviews. Key informant interviews from the midwives attending to the pregnant women were also conducted to get their experiences about the women who test positive during the antenatal.

Results: Results indicated that there was a balance of major themes which included; acceptance, confidentiality and stigma issues, changed attitude, shock and disbelief; anger and turmoil, acceptance and resilience.

Primary and secondary themes included: hyper reaction, not believing the positive results, sorrowfulness and attitude change, abortion considerations, self-segregation from others, relationship breakups and suicide considerations.

A number of women reported stigma prevalence and how they dealt with both stigma and living with HIV; some developed resilience. They also developed strategies to cope up which included; being secretive with their status and their child or children and focusing on themselves.

Conclusions: It was concluded that caring skills of midwives were crucial and needed by the pregnant women during the HIV diagnosis. There was also a very big demand for midwives in the health centers.

EPD270

Challenges in informed consent and use of a decision support tool in HIV remission ("cure") trials: view of clinical trialists

H.L. Peay[1], E.A. Okumu[2], C. Golin[3,2], K.J. Kuczynski[4], N. Ormsby[4], G.E. Henderson[4]

[1]RTI International, Durham, United States, [2]UNC Center for AIDS Research, Chapel Hill, United States, [3]UNC Gillings Global School of Public Health, Health Behavior, Chapel Hill, United States, [4]University of North Carolina at Chapel Hill, Social Medicine, Chapel Hill, United States

Background: HIV remission ("cure") research has features that make informed consent challenging. Potential participants must understand risks to their own health, and in trials with analytic treatment interruption (ATI), risks of HIV transmission to partners. Few studies have explored these challenges from the perspective of clinical trial team members who recruit and educate trial participants.

Methods: We conducted an online survey of international remission trial teams. Survey items used 4-item scales to assess anticipated effect of decision aid use (negative/no/positive/unsure), and 7-point scales to assess attitudes (-3; 0; +3). Eligible respondents were experienced recruiting, educating and/or consenting participants to HIV remission trial(s), or actively planning HIV remission trial(s).

Results: 40 investigators responded to this portion of the survey. 45% rated it difficult for the average person to decide about trial enrollment, 25% neutral, and 30% easy. 87.5% perceived that trial participants make an informed choice about enrollment. Topics identified as most important to decision making were: voluntary nature of participation (mean 2.51); potential for partner transmission during ATI (mean 2.44); and anticipated risks/harms (mean 2.23). Topics for which understanding was rated as most difficult were: possibility for negative psychological impacts of participation (mean 0.18); uncertainty inherent in trials (mean 0.64); and potential for unexpected risks/harms (mean 0.68).

Study Coordinator or Other	9	22.5

Table 1. Respondent's socio-demographic characteristics (N=40) *Cell sizes under n=5 are combined.*

Percentages anticipating a positive effect of decision aids were: 67.5% decision making, 57.5% trial process/flow, 42.5% retention, and 30% recruitment rates. However, 52.5% expect decision aid use prior to consent would increase investigator time requirements.

Conclusions: Most investigators perceive that remission trial participants make informed choices. They identify priority topics and subjects for which achieving understanding is most difficult; these require particular attention in decision aids. Most reported positive or neutral attitudes about decision aid use, but they anticipate that use will require additional researcher time. These data inform our decision aid development.

EPD271

The Wellness Warriors: Indigenous-led HIV peer mentorship network

D. Wahpoosewyan[1], T. Campbell[2,1], C. Spence[3,4], C. Philips[5], S. Nicolay[1,5], S. Skinner[3,1]

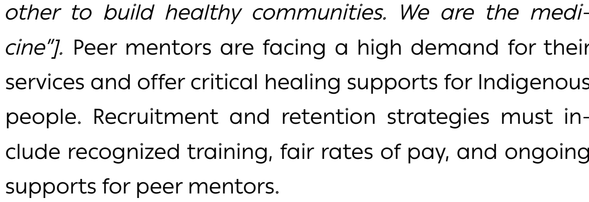
[1]Wellness Wheel Mobile Medical Clinic, Regina, Canada, [2]University of Saskatchewan, Public Health, Saskatoon, Canada, [3]University of Saskatchewan, Medicine, Saskatoon, Canada, [4]McGill University, Medicine, Montreal, Canada, [5]Saskatchewan Health Authority, Regina, Canada

Background: Peer mentorship is a pragmatic, relational, and culturally appropriate way to support People Living With HIV (PLWH) and is widely regarded as a critical support service and harm reduction strategy. Peers are positioned to identify otherwise unseen risks and reframe the understanding of patient experiences, supporting informed choices and self-determination.

As a relational approach to care, improving social connections and supportive networks is an important role offered by peer mentors.

Description: The 'Wellness Warriors' is an Indigenous-led peer mentorship network that provides peer-to-peer supports for PLWH in acute care settings, as well as in urban and on-reserve communities across Saskatchewan, Canada. The need for cultural supports, including traditional and land-based approaches, is an important part of the healing journey for this PLWH population. Indigenous peer mentors provide access to critical cultural connections and traditional ceremonies. The Wellness Warriors support both care providers and PWLE access treatment and receive needed clinical, social, and cultural care.

Lessons learned: The Wellness Warriors report impact in supporting PLWH: ["*This work is so rewarding... patients have said that if it wasn't for me helping them, they wouldn't have anyone"*],as a means to connect to one another for support [*"That's why we come together like this ceremony, listening to each other, being their supports. Think back to our traditional ways, our communal living. That's the way I follow"*]and to nurture healing practices within the community ["*I see our people helping one an-*



other to build healthy communities. We are the medicine"]. Peer mentors are facing a high demand for their services and offer critical healing supports for Indigenous people. Recruitment and retention strategies must include recognized training, fair rates of pay, and ongoing supports for peer mentors.

Conclusions/Next steps: Peer mentorship is a critical component of HIV care. Integrating and remunerating this work into the standard of care is culturally responsive, innovative, and impactful approach to supporting better patient outcomes for PLWH.

Intersectional identities and multiple vulnerabilities to HIV and co-infections

EPD272

"I feel they are left out of the discussion..." – Perspectives of health practitioners on adherence to Antiretroviral Therapy among Persons with disabilities living with HIV in Nigeria using Intersectionality

A.A. Philip[1], J. King[1], J. Durham[1]

[1]*Queensland University of Technology, School of Public Health and Social Work, Brisbane, Australia*

Background: This study argues that dominant sociocultural beliefs and the subsequent invisibility of people with disability within in population and health data are barriers to Nigeria meeting the UNAIDS Global 2030 goal. To meet these goals, people with disability living with HIV should be recognised as key populations in HIV surveillance data and health system planning.

Methods: This qualitative study adopted an intersectional lens. Fifteen healthcare practitioners were purposively sampled from 6 Nigerian states based on Nigeria's AIDS Indicator Impact Survey. Participants included medical doctors, nurses, clinical pharmacists, development workers, adherence counsellors and staff of donor organisations. Data collection employed semi-structured interviews with a consequent analysis using Reflexive thematic analysis conducted using NVivo 1.5.1.

Results: The findings revealed that sociocultural beliefs are still endemic and drivers for the stigma that negatively impacted ART adherence. Additionally, the lack of recognition of persons with disabilities as key populations has limited the collation of disability disaggregated data resulting in their invisibility within the HIV continuum of care and limited funding for HIV programmes.

The study also found that while antiretroviral therapy was available in Nigeria, persons with disabilities had financial challenges accessing ART, causing non-adherence.

The healthcare practitioners in this study held underlying reductionist views informed by the medical model of disability with the potential of affecting the quality of ART services they offered persons with disabilities living with HIV. Core constructs of intersectionality such as social inequality, power, social context, and social justice revealed the marginalisation experienced by persons with disabilities living with HIV.

Conclusions: This study adds new knowledge in understanding ART adherence in the Nigerian context. The study proposes a pathway for Nigeria in positioning itself as a global leader in accelerating the progress it has already recorded in HIV programmes. Healthcare practitioners will need to adopt the social model of disability lens, which has the potential to improve the quality of care offered to PWDLWH.

With Nigeria being the first country to conduct the largest population-based HIV survey, the findings of this intersectional study has a global significance for persons with disabilities having HIV.

EPD273

What shapes people living with HIV's experience of stigma? A qualitative exploration of social-structural conditions

X. Qiu[1], N. Brousseau[2], E. Hill[1], I. Medina[3], K. Swanson[4], A. Bincsik[4], V. Earnshaw[1]

[1]*University of Delaware, College of Education and Human Development, Newark, United States,* [2]*University of Connecticut, Storrs, United States,* [3]*Latin American Community Center, Newark, United States,* [4]*Christiana Care Hospital, Newark, United States*

Background: Evidence demonstrates that HIV stigma impedes the health and wellbeing of people living with HIV (PLWH). Yet, HIV stigma is often studied through psychosocial perspectives without considering social-structural conditions. A greater understanding of which social-structural conditions shape experiences of HIV stigma may strengthen intervention efforts.

The current study uses qualitative methods to explore how three social-structural conditions, including geography, social positions, and social relationships, shape the experiences of PLWH throughout the state of Delaware.

Methods: PLWH and providers were recruited in 2017 from an HIV care program within several locations in Delaware. Individuals were eligible to participate if they were age 18 or older, spoke English or Spanish, and received or provided care at one of three locations. Interviews with Spanish-speaking participants were conducted with an interpreter. All interviews were conducted in person, digitally recorded, and later transcribed. Participants included 42 PLWH and 14 providers. All interviews were transcribed in English and then analyzed using a grounded theory approach.

Results: Results suggest that HIV stigma is still prevalent across Delaware, and PLWH's experiences of HIV stigma are shaped by geographic location, social positions, and social relationships. Participants reported that PLWH in the southern part of the state and rural areas as well as Latinx and Haitian PLWH experience more pronounced HIV stigma. The study captures that some LGBTQ PLWH

experienced positive health outcomes and less anticipated stigma. Moreover, PLWH experienced stigma from healthcare providers and anticipated substantial stigma in employment settings.

Conclusions: The current study suggests that social-structural conditions, including geographical locations, social positions, and social relationships, may fundamentally shape experiences of stigma among PLWH.

Multi-level stigma interventions are recommended to best address the social-structural conditions that shape experiences of HIV stigma among PLWH. Inspired by the positive health outcomes of LGBTQ PLWH, it may be essential to integrate empowerment-based components to combat intersectional stigma.

EPD274

The context of stigma experienced by sexual and gender minority people with HIV in Dominican Republic: a qualitative study

J.M. Turan[1,2], H. Budhwani[1], J. Waters[3], P. Nash[4], C.L. Bond[1], R.M. Rodriguez-Lauzurique[5], N. Varas-Díaz[6], S. Naar[7], L. Nyblade[8], R. Paulino-Ramírez[5]

[1]University of Alabama at Birmingham (UAB), Department of Health Policy and Organization, Birmingham, United States, [2]Koc University, Department of Public Health, Istanbul, Turkey, [3]Caribbean Vulnerable Communities Coalition (CVC), Kingston, Jamaica, [4]University of Alabama at Birmingham (UAB), Department of Health Behavior, Birmingham, United States, [5]Universidad Iberoamericana (UNIBE), Instituto de Medicina Tropical & Salud Global, Santo Domingo, Dominican Republic, the, [6]Florida International University, Department of Global and Sociocultural Studies, Miami, United States, [7]Florida State University (FSU), Center for Translational Behavioral Science, Tallahassee, United States, [8]Research Triangle Institute (RTI) International, International Development Group, Global Health Division, Research Triangle Park, United States

Background: Stigma exacerbates health disparities affecting disadvantaged groups globally. Finding Respect and Ending Stigma around HIV (FRESH) is a healthcare setting stigma-reduction intervention developed in sub-Saharan Africa, adapted for the southern United States, and currently being tested via a pilot hybrid type 1 effectiveness-implementation study in Dominican Republic (DR). The goal of the DR adaptation is to reduce stigma experienced by sexual and gender minority (SGM) people living with HIV in clinical settings.

The purpose of the current analysis is to present themes related to HIV stigma, intersectional stigmas, and stigmatizing experiences in healthcare settings that guided FRESH intervention adaptation for HIV clinics serving SGM clients in DR.

Methods: Data collection occurred in Santo Domingo and Santiago, DR (2021) and included four focus groups with men who have sex with men with HIV (n=26), 14 in-depth interviews with transgender women with HIV, and 16 in-depth interviews with healthcare workers from HIV clinics. Following rapid qualitative analysis to inform intervention adaptation, two Research Associates thematically coded data using NVivo software.

Results: Major emergent themes included vulnerability of immigrant populations, the role of religion in fueling stigma, and strong intersectional stigmas related to HIV, sex work, gender, and sexual orientation in clinics and communities. An example quote on the experiences of transgender women and migrant workers is: "...[my friends] have been treated as if they were animals. In this country people treat [transgender women] and Haitians like garbage." Both health workers and clients recognized the persistence of stigma in clinics.

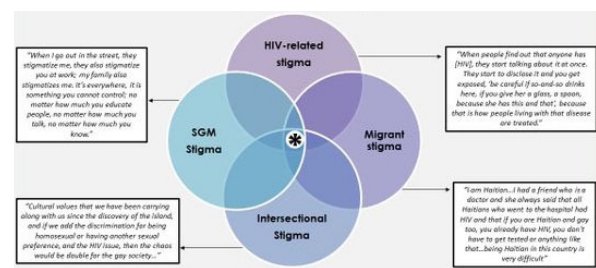


Figure 1. Intersectional stigmas experienced by sexual and gender minority (SGM) clients with HIV in Dominican Republic.

** Multiple experiences of stigma and descrimination.*

Conclusions: Programs aiming to reduce stigma experienced by SGM clients in healthcare settings need to address structural barriers, including local inner and outer contexts of HIV service provision. These findings offer insights for addressing stigma and thereby reducing health disparities experienced by SGM clients in Spanish-speaking settings.

Access to Indigenous cultural and health Services among Indigenous people living with HIV in Ontario, Canada: findings from the Ontario HIV Treatment Network Cohort Study (OCS)

S. Hillier[1], T. Bekele[2], R. Jackson[3], A. Kroch[2]

[1]York University, School of Health Policy & Management, Toronto, Canada, [2]Ontario HIV Treatment Network, Toronto, Canada, [3]McMaster University, School of Social Work and the Department of Health, Aging and Society, Hamilton, Canada

Background: Indigenous cultural services are critical in the health and wellbeing of Indigenous Peoples. We examined the utilization of these services among Indigenous Peoples living with HIV who participate in the Ontario HIV Treatment Network Cohort Study (OCS).

Methods: The OCS is a longitudinal study of people receiving HIV care at 15 clinics in Ontario, Canada. Sociodemographic and sociobehavioural data are collected through interviewer-administered questionnaires. Begin-

Oral abstracts

Poster exhibition

E-posters

Late-breaker abstracts

Author Index

ning in 2020, Indigenous participants (N=67) were asked if they accessed Indigenous cultural and health services, such as Indigenous ceremonies (e.g., smudging, sweats, powwows), traditional medicines, or gatherings with Elders or Knowledge Keepers.

Results: Of the 67participants (21 Cisgender women, 2 trans women, and 44 men), most were older than 45 years (57%), on ART (94%), and had annual income of <$20,000 (66%). About half, 35 (52.2%) accessed Indigenous cultural and health services in the past two years.

People who had received services in the past two years were more likely to be 45 years or younger (54.3% vs. 31.3%; p=0.057) and women/transwomen (51.4% vs. 15.6%; p=0.002) than those who did not access services.

Those who accessed services were more likely to report current depression (54.3% vs. 28.1%; p=0.030), less likely to rate their general health as excellent/very good/good (57.1% vs. 75.1%; p=0.068), and as likely to have accessed an HIV care provider in the past 18 months (68.6% vs. 75.0%; p=0.560) or to be on ART (94.3% vs. 93.8%; p=0.999).

Importantly, more than one-third (n=26, 38.8%) experienced barriers in accessing Indigenous cultural and health services, including long travel distance and lack of knowledge (about the services or where to access them).

Conclusions: HIV rates are persistent among Indigenous Peoples in Ontario, including additional challenges in accessing treatment and achieving viral suppression. Indigenous participants who experienced greater mental and physical health challenges accessed cultural services.

People who accessed services had equivalent HIV outcomes and are more likely to have HIV visits than their counterparts. Interventions that eliminate barriers and increase access to Indigenous cultural services will support HIV care and promote wellbeing, particularly for people with low income and experiencing mental health issues.

EPD276

Mechanisms linking Gender-Based Violence to worse HIV care and treatment outcomes among women in the United States

J. Jain[1], L. Sheira[2], E. Frongillo[3], T. Neilands[4], M. Cohen[5], T. Wilson[6], A. Chandran[7], A. Adimora[8], S. Kassaye[9], A. Sheth[10], M. Fischl[11], A. Adedimeji[12], J. Turan[13], P. Tien[14], S. Weiser[15], A. Conroy[16]

[1]University of California, Psychiatry, San Francisco, United States, [2]University of California, Berkeley, United States, [3]University of South Carolina, Department of Health Promotion, Education, and Behavior, Columbia, United States, [4]University of California, San Francisco, United States, [5]Stroger Hospital, Department of Medicine, Chicago, United States, [6]State University of New York Downstate Health Sciences University, School of Public Health, Department of Community Health Sciences, Brooklyn, United States, [7]Johns Hopkins University, Bloomberg School of Public Health, Department of Epidemiology, Baltimore, United States, [8]University of North Carolina at Chapel Hill, School of Medicine and UNC Gillings School of Global Public Health, Chapel Hill, United States, [9]Georgetown University Medical Center, Department of Family Medicine, Washington DC, United States, [10]Emory University and Grady Health System, School of Medicine, Atlanta, United States, [11]University of Miami, Department of Medicine, Miami, United States, [12]Albert Einstein College of Medicine, Dept. of Epidemiology and Population Health, Bronx, United States, [13]University of Alabama at Birmingham, Department of Health Care Organization and Policy, School of Public Health, Birmingham, United States, [14]University of California, Department of Veteran Affairs Medical Centerand Department of Medicine, San Francisco, United States, [15]University of California, San Francisco, Center for AIDS Prevention Studies, San Francisco, United States, [16]University of California, Center for AIDS Prevention Studies, San Francisco, United States

Background: Gender-based violence (GBV) and substance are enduring barriers to HIV care engagement among women living with HIV (WLHIV) in the United States (US). However, little is known about the mediating role of substance use in the relationship between GBV and worse HIV treatment and care outcomes in this population. To reduce this gap in research, we studied WLHIV in the Women's Interagency HIV Study (WIHS), to test the hypothesis that substance use mediates the association between:

1. GBV and suboptimal adherence to antiretroviral therapy (ART), and
2. GBV and poor engagement in HIV care.

Methods: From 2013-2016, WLHIV in the WIHS completed eight semi-annual assessments on GBV, alcohol and drug use, adherence to ART and HIV care engagement. Leveraging longitudinal data, multilevel logistic regression models were built to estimate adjusted associations be-

tween GBV and suboptimal (<95%) adherence to ART and at least one missed HIV care appointment without rescheduling. Mediation analyses were then performed to test whether hazardous drinking and illicit drug use (excluding Marijuana) mediated the associations between GBV and the two HIV treatment and care outcomes.

Results: Among a total of 1,717 women, 5% reported recent GBV, 17% reported suboptimal adherence to ART, and 15% reported at least one missed HIV care appointment.

Among those with suboptimal adherence or engagement in care, the proportion of those who engaged in hazardous drinking (18% and 16%, respectively), or any illicit drug use (22% and 19%, respectively), was higher compared to the overall sample (10% and 11%, respectively).

Women who experienced GBV had a significantly higher odds of suboptimal adherence (aOR=1.99; 95% CI=1.40-2.83) and missed appointments (aOR=1.92, 95% CI=1.32-2.33). Hazardous drinking and illicit drug use mediated 36% and 73% of the association between GBV and suboptimal adherence and 29% and 65% of the association between GBV and missed appointments, respectively.

Conclusions: Findings from this study suggest that substance use is a critical underlying mechanism through which GBV adversely impacts HIV treatment and care among WLHIV in the US. As such, to achieve optimal HIV continua outcomes among women, interventions should address the combined epidemics of GBV and substance use.

EPD277

The intersectionality of substance use and associated HIV risk among MSM and TGW population in India – learnings from a case-control study in India

S.R. Gullaiah Gari[1], A. Agarwala[1], A. Gupta[1], R. Sarkar[2], P. Doma Bhutia[3]

[1]*India HIV/AIDS Alliance, Strategic Information, New Delhi, India,* [2]*India HIV/AIDS Alliance, Programs- Sexuality Gender and Rights, New Delhi, India,* [3]*India HIV/AIDS Alliance, Institutional Engagement, New Delhi, India*

Background: Programmatic evidence shows a high risk of HIVamong Men who have Sex with Men (MSM) and Transgender Women (TGW) populations who use psychoactive substances. But the lack of scientific evidence and historically, traditional programs compartmentalizing either sexual or drug use, we miss the opportunity to address the intersectionality.

This study aims to understand this intersectionality and suggest recommendations to redesign the national program.

Methods: A case-control study was conducted among MSM (170) and TGW (94) residing in 5 states of India from MSM and TG programs. We enrolled 132 PLHIV beneficiaries identified in the last 6 months and matched them with controls who were screened HIV negative in the last 6 months.

A study tool was created using the WHO Family Health International tool (questions pertaining to sexual history, drug use, identity), NACO Integrated Biological & Behavioral Survey tool (drug use and socio-demographic profiles), and United Nations Office on Drugs & Crime book published by Dr. Ambekar(injecting substances) as a base to measure substance use and sexual history.

Results: The results shows, 86% of cases (MSM – 59%, TGW – 27%) and 82% of controls (MSM – 51%, TGW – 31%) were found to be substance users (p 0.40). The most popular substances were, Alcohol [cases – 80% (56% MSM & 24% TGW) controls 80% (49% MSM & 31% TGW)] followed by Cannabis [cases – 42% (29% MSM & 13% TGW) controls 49% (31% MSM & 18% TGW)] and Injecting substance users [cases 10% (MSM 6% & TG 4%) & controls 5% (MSM 4% & TGW 1%)]. 34% of Alcohol users, 38% of Cannabis users and 77% of injecting heroin used substances before/during sexual intercourse.

Those substance users who had previously been forced into performing sexual acts were 2 times (AOR: 2.48; 95% CI: 1.19 – 5.15) more likely to get HIV infection.

Conclusions: Considering the high prevalence of drug use and low knowledge on harm reduction services in the MSM and TGW program, these programs need redesigning by considering the intersectionality of substance use and HIV risk. In addition, special focus needs on those who have had traumatic experiences in the past.

EPD278

Improving viral load suppression rates among children and adolescents living with HIV through strong clinic community collaboration across 5 district in Southwestern Uganda

E. Tibananuka[1], S. Kajura[1]

[1]*World Education Bantwana, Integrated Child and Youth Development, Kampala, Uganda*

Background: Under the PEPFAR/USAID Integrated Children and Youth Development (ICYD) Activity (2020-2025) in Uganda, World Education/Bantwana Initiative delivers technical assistance to seven local OVC partners to close HIV treatment gaps for children and adolescents living with HIV (C/ALHIV). Nationally, at 68%, C/ALHIV viral load suppression (VLS) continues to lag behind adults at 92% (MOH Sept 2021). The ICYD Activity has improved VLS among C/ALHIV though close clinic coordination to address the clinical, structural, and interpersonal dynamics at the community level which contributed to poor VLS outcomes.

Description: The ICYD Activity actively enrolls C/ALHIV, delivers services, and monitors and tracks treatment outcomes with clinic teams from clinic to community level. Trained ICYD linkage facilitators placed in clinics coordinate clinic staff and social workers to review clinical data, jointly assess and address non-suppression root causes, develop care plans, and monitor and track progress on treatment goals at community level.

Oral abstracts

Poster exhibition

E-posters

Late-breaker abstracts

Author Index

In March 2021, ICYD Activity enrolled 188 unsuppressed C/ALHIV across 5 districts onto the OVC program; 100% were enrolled on optimal treatment regimens. Joint home visits found severe food insecurity in COVID-impacted families, poor understanding of treatment adherence, and unreliable caregivers.

Social workers mobilized churches for food relief and linked families to local farmer resources, scheduled adherence and nutrition counseling with trained clinicians, helped families strengthen coping skills, intensively monitored unsuppressed children, and helped caregivers and adolescents better manage HIV treatment over the long term. By December 2021, 94% of these children were virally suppressed.

Lessons learned: Tested, promising practices include:

1. Upskilling the community workforce as frontline HIV service providers;
2. Data sharing and joint monitoring by clinic and community teams during home visits for complex cases;
3. Engaging community, government, and faith-based social protection partners to expand access to critical resources;
4. Introducing and upskilling the community workforce to simple HIV treatment data collection tools for ongoing monitoring.

Conclusions/Next steps: ICYD will scale up these strategies and document outcomes, including deepening capacity of organizations to build strong, coordinated clinic partnerships, collect and utilize data to monitor HIV treatment outcomes, and strengthen community social protection and safety net networks for ongoing support.

EPD279

Exploring the multi-dimensional and intersectional inequalities in healthcare utilisation among openly identifying and non-identifying MSM in KwaZulu-Natal, South Africa

L. Rambally Greener[1], L. Zwake[1], S. Malone[1], P. Letona[1], P. Pitsillides[2], B. Sibeko[2], M. Simelane[2], N. Hasen[1]

[1]Population Services International, HIV / TB, Johannesburg, South Africa, [2]Matchboxology, Johannesburg, South Africa

Background: Significant inequities in health care utilization exist among men who have sex with men (MSM) who balance multiple, intersecting social groups and identities. This is especially true for non-identifying MSM, who despite their disproportionately high risk, remain underserved by existing HIV programs.

Methods: In-depth interviews were conducted with MSM in KwaZulu-Natal, South Africa using a human centred design approaches that sought to learn more about participant's beliefs, relationships, interactions, and practices. Interviews were cconducted in isiZulu and/or English. Participants were sampled using snowball sampling, and purposively screened to ensure both openly identifying and non-identifying MSM were sampled. Research activities were approved by the Foundation for Professional Development Research Ethics Committee (FPDREC) [Reference 01/2021]. Data were analysed thematically using an integrative inductive-deductive framework approach. Healthcare utilization and healthcare needs were explored across intersectional categories, such as, identifying, and non-identifying MSM.

Results: Between May and August 2021, 41 IDIs were conducted, participants had a mean age of 29 years (min: 20 and max: 48), 83% African, 54% rural and 45% urban, 59% engaged in sex with men but did not identify as MSM or gay. MSM are not a homogenous group and constantly navigate multiple and sometimes-contradictory religious and cultural expectations. Participants reported experiences of vulnerability, a sense of alienation and discrimination from family, friends, community members.

Additionally, non-identifying MSM expressed persistent feelings of guilt, shame, and fear. Resulting in infrequent testing for HIV, little to no STI service access and sparse awareness of oral PrEP. Key disparities in awareness and access emerged along indicators of inequality, namely, younger men, those with few financial means, non-identifying men, men with multiple partners.

Fewer opportunities for testing as well as social and system-wide barriers such as harmful gender norms, inaccessible or unfriendly services contributed to a lower uptake of HIV services.

Conclusions: The intersection of race with age, sexuality, and identity (identifying vs non-identifying), can negatively affect ones vulnerable mens' risk of HIV.

These findings highlight the importance of multi-dimensional and cross-cutting healthcare access interventions to address the intersectional barriers experienced by MSM. MSM need to be involved as co-designers of interventions.

Behavioural factors impacting acceptability and uptake of an HIV vaccine

EPD280

Understanding participant motivation to participate in HIV prevention vaccine and monoclonal antibody trials in South Africa

M.R. Cobbing[1], J. Hanass-Hancock[1]

[1]South African Medical Research Council, Durban, South Africa

Background: South Africa has the largest HIV epidemic worldwide, with 13,5% incidence. Volunteering participants are pivotal to conduct research on HIV vaccines and eliminate new HIV infections. Little data exists in South Africa on what motivates participants to volunteer for trials, what links socio-demographic and HIV risk profile to motivation, and on staff perceptions of participant motivation.

This study aimed to explore participant motivations and discouraging factors compared to staff perceptions on participant motivation and identify demographic and behavioral links to motivation in South Africa.

Methods: Participants included those who enrolled/screened/declined into one of five HVTN trials (HVTN100, HVTN111, HVTN108 and HVTN702, HVTN703/HPTN081) at four clinical research sites in KwaZulu-Natal, South Africa, within the greater eThekwini area including urban precincts and semi-rural settings.

This study included mixed-methods: quantitative analysis of 78 participant case report forms compared to a matching questionnaire completed by 38 staff. Qualitative analysis of 25 participant interviews explored motivation to participate.

Results: Staff strongly perceived reimbursement, free medical tests and vaccine protection to be the greatest motivational factor whereas participants reported altruistic factors and receiving information to avoid high-risk behavior as more significant. Qualitative findings revealed that free healthcare tests and reimbursement motivated all participants, but not as significantly as staff perceived. Receiving information to reduce HIV risk and helping to find a vaccine were deemed more important by participants.

Women, especially those with high HIV-risk partners, were motivated by gaining information on HIV protection, wished behaviors and receiving encouragement for good conduct and were discouraged by stigma, negative community perceptions and safety risk. Only women, from all HIV-risk groups, reported being motivated from knowing somebody living/died with HIV.

Conclusions: Misalignment exists between staff and participants around motivations to participate in clinical trials. Gender, social factors, individual and partner HIV-risk influenced participants volunteering for trial participation in South Africa. Understanding these multi-factorial influences can assist in improving staff-participant relations and positively impact recruitment and retention in HIV clinical trials.

A greater focus should be placed upon the community desire to learn and be provided with educational stimuli (including decliner or screened out participants), which may be lacking in resource-scarce areas.

EPD281

A qualitative interview study to explore perceptions of a prophylactic vaccine for human immunodeficiency virus (HIV)

N.V. Aldhouse[1], H. Kitchen[1], T. Al-zubeidi[1], S. McKee[1], V. Oriol Mathieu[2], A.C. El khoury[3], E.K.H. Chan[3]

[1]*Clarivate, London, United Kingdom,* [2]*Janssen Vaccines and Prevention B.V, Leiden, Netherlands, the,* [3]*Janssen Global Services, Raritan, United States*

Background: Despite high unmet need, universal acceptability of an HIV vaccine is not guaranteed. This study developed a conceptual model of perceptions of a future prophylactic HIV vaccine by adults across the United States (US).

Methods: Participants were identified through research databases and social media advertisement. Sampling quotas purposively targeted demographic diversity. Interviews were conducted by experienced qualitative interviewers, lasted approximately 60-minutes, were audio-recorded and transcribed. Open-ended questions explored decision-making factors regarding willingness to receive an HIV vaccine. Data were thematically analyzed using Atlas.ti v7.5 following Kaufman et al's socio-ecological model of HIV prevention.

Results: Fifty-five participants were interviewed; n=23 from demographic groups considered by the US Center for Disease Control as at 'higher risk' for HIV than the 'general population' (n=32). N=23/55 were also parents/caregivers who discussed vaccination of their children aged 9-17 years. Participants were mean 37 years (range 20-75); 51% female, 38% male, 11% non-binary/other gender; 42% identified as White, 35% Black or African American, 22% of Hispanic/Latino origin; 15% current PrEP users.

While participants acknowledged vaccination would be beneficial to prevent HIV (n=54/55 [90%]) and provide emotional 'peace of mind,' perceived HIV susceptibility was the most frequently reported decision-making factor ('general population,' n=29/32 [91%]; parent/caregiver, n=22/23 [96%]; 'at-risk,' n=17/23 [74%]). The clinical profile/practicalities of the vaccine were reported as important, e.g., risk of adverse events (n=54/55 [98%]), perceived vaccine efficacy (n=47/55 [85%]), administration schedule (n=23/32 [72%]), duration of immunity (n=15/55 [27%]). Parents/caregivers would consider their child's opinion/preference (n=9/23 [39%]). Few participants reported fear of stigma (n=12/55 [22%]), but many were concerned by vaccine-induced seropositivity (VISP) (n=34/55 [62%]).

Few subgroup differences were observed. Participants who considered themselves at risk of HIV generally reported no barriers to vaccination, and more frequently discussed potential improved relationships/sex-life. Participants receiving/considering PrEP discussed unique factors e.g., comparative efficacy/side effect profile of a vaccine versus PrEP, and risk of a gap in protection.

Conclusions: Individual perceptions of HIV susceptibility most influenced willingness to receive a future HIV vaccine. The perceived primary benefit of vaccination was

Oral abstracts

Poster exhibition

E-posters

Late-breaker abstracts

Author Index

protection against HIV and consequent emotional reassurance/reduced fear. Perceived concerns included side effect risk, VISP, administration schedule, and duration of immunity.

EPD282

The moderating effect of HIV-stigma on the relationship between sources of perceived social support and self-efficacy among adult patients living with HIV, in KwaZulu-Natal, South Africa

M.Q. Luthuli[1], J. John-Langba[1]

[1]University of KwaZulu-Natal, Social Work, Durban, South Africa

Background: For people living with HIV (PLWHA), treatment adherence self-efficacy is considered as a critical predictor of psychosocial well-being and adherence to antiretroviral therapy (ART). Through previous studies social support and HIV-stigma have been noted to be independently linked with adherence to ART among adult PLWHA. However, the process through which the HIV-stigma moderate the relationship between sources of perceived social support and HIV adherence self-efficacy is not fully known.

Therefore, the study investigated whether the relationship between sources of perceived social support and HIV adherence self-efficacy is moderated by HIV-stigma.

Methods: The study was conducted in November 2019 at King Edward VIII hospital based in Umbilo Durban, KwaZulu-Natal, South Africa. Using a cross-sectional survey design a total of 201 adult patients 71% (n=142) female and 29% (n=59) male, aged 18-75 years receiving ART completed a self-administered questionnaire measuring self-efficacy (Adherence Self-Efficacy Scale [ASES]), social support (Multidimensional Perceived Social Support [MPSS]), and HIV-stigma (Short Version of HIV Stigma Scale [HSS]). The data were analysed using hierarchical multiple regression analyses through SPSS version 27.

Results: The results showed that treatment adherence self-efficacy was significantly and positively predicted by social support from family (r= .47, p <0001) friends (r= .37, p <0001), and significant other (r= .35 , p <0001).

Furthermore, the results of hierarchical moderated regression analyses indicated that HIV-stigma moderated the direct relationship of social support and self-efficacy from both sources of support namely family (B= -0.027, t= -2.58, p <.011) and friend (B= -0.029, t= -2.65, p <009). The analyses also revealed that the relationship between social support from significant other and self-efficacy was not moderated by HIV-stigma (B= -0.004, t= -0.351, p >.726).

Conclusions: The findings suggested that the sources of social support remain an invaluable resource to bolster treatment adherence self-efficacy among PLWHA, however the future interventions should also consider targeting HIV-stigma to improve adherence to ART among this population.

EPD283

The relationship between depression, HIV-stigma and adherence to ART among adult patients living with HIV at tertiary Hospital in Durban, South Africa: the mediating roles of self-efficacy and social support

M.Q. Luthuli[1]

[1]University of KwaZulu-Natal, Social Work, Durban, South Africa

Background: Although, numerous factors predicting adherence to antiretroviral therapy (ART) among people living with HIV/AIDS (PLWHA) have been broadly studied on both regional and global level, up-to-date adherence of patients to ART remains an overarching, dynamic and multifaceted problem that needs to be investigated overtime and across various contexts. There is a dearth of empirical studies on the interactive mechanism by psychosocial factors predict adherence to ART among PLWHA in South Africa.

This study investigated the relationship between depression, HIV-stigma, and adherence to ART among adult patients living with HIV at a tertiary Hospital in Durban, South Africa and the mediating role of self-efficacy and social support.

Methods: A total of 201 male and female adult patients aged between 18-75 years receiving ART at King Edward VIII Hospital's ARV clinic were sampled, using time location sampling (TLS) and data were collected using self-administered questionnaire. Guided by Health Locus of Control Theory and Social Support Theory, data were analysed using SPSS through bivariate, logistic regression and mediational analyses.

Results: Chi-square analysis showed that there was a statistically significant difference found between depression and ART adherence ($\chi 2$ (4) = 16.140; p < .003), while between HIV stigma and ART adherence no statistically significant difference was found ($\chi 2$ (1) = .323; p >.570). Binary logistic regression indicated that depression was statistically associated with adherence to ART (OR= .853; 95% CI, .789–.922, P 0.31).

However, the findings showed that the effect of depression on adherence to ART was not significantly mediated by self-efficacy (Sobel test for indirect effect, Z= 1.01, P> 0.31). The effect of HIV stigma on adherence to ART was not statistically significant (OR= .980; 95% CI, .937– 1.025, P>.374), but the effect of social support on adherence to ART was statistically significant, only after the effect of HIV stigma was controlled for (OR= 1.017; 95% CI, 1.000– 1.035, P<.046).

Conclusions: The results revealed that depression is a significant predictor of adherence to ART. Thus, the findings also suggested that in effort to alleviate the psychosocial impact of depression on adherence to ART, a special consideration of self-efficacy and social support should be taken.

EPD284

Dual oral therapy in France (PROBI study): the acceptability of switch among HIV patients and physicians

M. Duracinsky[1], A.-S. Petit[1], C. Allavena[2], D. Zucman[3], L. Houcqueloux[4], O. Rousset-Torrente[1], G. Roucoux[1], O. Chassany[1]
[1]URC ECO - Hôpital Hôtel-Dieu, Paris, France, [2]SMIT - CHU Hôtel Dieu, Nantes, France, [3]Hôpital Foch, Suresnes, France, [4]CHR Orléans, Orléans, France

Background: Oral dual therapy aims to maintain a similar efficacy to triple antiretroviral therapy while reducing toxicity in the management of people living with HIV (PLWH). The PROBI qualitative study evaluated the acceptability determinants when switching from tritherapy to oral dual therapy, among HIV patients and physicians in France.

Methods: Semi-structured interviews (N=30) were conducted between November 2020 and February 2021 with PLWH (n=15) and physicians (n=15) residing in metropolitan and overseas France. The physicians' experience was considered (young vs. experienced) along with the duration of HIV infection among PLWH. The interviews underwent lexicometric analysis (Iramuteq software) followed by a thematic content analysis (NVivo 12 software). The methods were triangulated.

Results: The interviews highlighted three common expectations when switching to dual therapy: maintenance of efficacy, simplification of treatment in daily life, and maintenance of quality of life.

The acceptability of switching to dual oral therapy was the result of a two-faceted assessment process:

1. Motivational process, aiming "to do better" which is influenced by the physician's experience and the patient's duration of HIV;
2. Process of comparison with other available simplification strategies, through a benefit/risk balance.

The representations on dual therapy play an important role in the acceptability. Physicians considered the switch from an evidence-based approach. Patients acknowledged the switch in laymen terms and considered the possibility of dual therapy as a sign of their good health.

Conclusions: The acceptability of a change in treatment to dual oral therapy depends on motivations related to the elimination of adverse effects and the simplification of treatment.

However, the qualitative approach highlighted that the acceptability of treatment change depends on an evaluative cognitive process to be considered in treatment changes.

Interventions to reduce stigma and discrimination

EPD285

Acceptance-based, intersectional stigma coping intervention for people with HIV who inject drugs: an RCT in St. Petersburg, Russia

S. Rossi[1], J. Luoma[2], Y. Sereda[3], N. Pavlov[4], O. Toussova[5], M. Vetrova[5], S. Bendiks[1], T. Kiriazova[3], E. Krupitsky[5,6], D. Lioznov[5,7], E. Blokhina[5], S. Lodi[8], K. Lunze[1]
[1]Boston Medical Center, Medicine, Boston, United States, [2]Portland Psychotherapy Clinic, Research, and Training Center, Portland, United States, [3]Ukrainian Institute on Public Health Policy, Kyiv, Ukraine, [4]Life in Balance Psychotherapy Clinic, Toronto, Canada, [5]Pavlov University, St. Petersburg, Russian Federation, [6]V.M. Bekhterev National Medical Research Center for Psychiatry and Neurology, St. Petersburg, Russian Federation, [7]Smorodintsev Research Institute of Influenza, St. Petersburg, Russian Federation, [8]Boston University School of Public Health, Biostatistics, Boston, United States

Background: People with HIV who inject drugs experience multiple, intersecting forms of stigma which adversely impact care utilization needed to ending the HIV epidemic. This RCT evaluated a behavioral stigma coping intervention's effects on stigma and care utilization.

Methods: We randomized 100 adults with HIV and past 30 days injection drug use (IDU) at a harm reduction non-governmental organization (NGO) in St. Petersburg, Russia. The control group had access to usual services at the NGO. The intervention group received three weekly 2-hour group sessions of an adapted Acceptance and Commitment Therapy intervention, in addition to usual services at the NGO.

Primary outcomes were changes in HIV and substance use stigma scores 1 month after randomization. Secondary outcomes were self-reported initiation of antiretroviral therapy (ART), engagement in substance use care (outpatient, inpatient, or 12-step program), and change in total number of injections in previous 30 days at 6 months post randomization.

We used linear regressions and linear probability models with robust standard errors to estimate the effect of the intervention on continuous and binary outcomes, respectively. We adjusted primary outcomes for baseline stigma scores, injection frequency, history of ART, and depressive symptoms. We used unadjusted analysis for secondary outcomes except for a change in injecting frequency adjusted for baseline score.

Results: There were no major imbalances across arms. Participants were 47% female with a mean age of 38 years ± 5.4 at baseline. At 1 month, HIV and substance use stigma changes did not differ between groups (p=0.141, and 0.112, respectively). At 6 months, participants in the intervention group were more likely to initiate ART (20% vs. 3%, OR=0.17, 95%CI [0.05, 0.29], p=0.005) and to engage in

Oral abstracts

Poster exhibition

E-posters

Late-breaker abstracts

Author Index

substance use care (23% vs. 7%, OR=0.17, 95%CI [0.03, 0.31], p=0.017) than control participants. Intervention participants had less frequent injections in the previous 30 days (adjusted mean frequency of injection -8.58, 95%CI [-17.15,-0.01], p=.0497).

Conclusions: This brief stigma-coping intervention did not change how stigma manifests in people with HIV and current substance use stigma. However, it reduced stigma's impact as a care barrier, improved HIV and substance use care, and decreased IDU, which warrants further investigation.

EPD286

HIV and drug use stigma among patients and providers in Vietnam

L. Li[1], C. Lin[1], T.A. Le[2], T.A. Nguyen[2]

[1]University of California, Los Angeles, Semel Institute Center for Community Health, Los Angeles, United States, [2]National Institute of Hygiene and Epidemiology, Hanoi, Viet Nam

Background: The "twin epidemics" of HIV and drug use have synergistically posed severe public health challenges in Vietnam. People living with HIV who use drugs (PLHWUD) combat both drug use stigma and HIV stigma in healthcare and treatment settings.

This study examined different layers of stigma that PLHWUD and their healthcare providers reported and explored relevant factors and associations.

Methods: Data were collected from 60 communities in four provinces of Vietnam. A total of 241 PLHWUD and 120 community health workers (CHW) were recruited and participated in the study. For both PLHWUD and CHW participants, we use two sets of identically-worded questions to measure the stigma attached to drug-using and the stigma associated with HIV infection.

In addition to comparing levels of stigma toward HIV vs. drug-using, we examined associations between PLHWUD perceived stigma and their mental health, as well as CHW stigma and their levels of confidence in service provision.

Results: For PLHWUD, drug-related stigma measures were significantly higher than their corresponding HIV stigma. HIV-related stigma was negatively associated with mental health status (standardized estimate: $\beta = -0.23$, $P = 0.0164$). However, we did not find a significant relationship between drug use stigma and mental health (standardized estimate: $\beta = -0.11$, $P = 0.1977$).

The majority of the CHW reported higher levels of stigma associated with drug-using than towards HIV infection. Compared to the CHW reporting higher stigma towards drug-using, those with higher stigma towards HIV infection were significantly less confident in service provision (Estimate = −0.41, SE = 0.11, $p < .001$).

Conclusions: We observed that, for both PLHWUD and CHW, stigma toward drug use was significantly higher than HIV. The relatively lower level of HIV stigma could be explained by the evolvement of the legislative environment and scientific advancements and education in Vietnam. This study's higher drug-using stigma reflects a more significant social devaluation of drug use than HIV. Nevertheless, our findings suggest that HIV stigma reduction should be prioritized for improving PLHWUD's mental health and CHW's service delivery.

EPD287

Associations between and intersectional implications on openness about HIV status and suicide thoughts in a diverse national sample of young people living with HIV in Sweden

A.C. Schindele[1,2], M. Nanneson[3], D. Ljungcrantz[1], V. Svärd[4], H. Källberg[5], J. Rubin[3,6], L. Navér[3,6]

[1]The Public Health Agency of Sweden, Unit for Sexual Health and HIV Prevention, Department of Communicable Disease Control and Health Protection, Solna, Sweden, [2]Malmö University Sweden, Centre for sexology and sexuality studies, Department of Social Work, Faculty for Health and Society, Malmö, Sweden, [3]Karolinska University Hospital, Department of Pediatrics, Stockholm, Sweden, [4]Karolinska Institutet, Division of Insurance Medicine, Department of Clinical Neuroscience, Stockholm, Sweden, [5]The Public Health Agency of Sweden, Unit for Analysis, Department of Public Health Analysis and Data Management, Solna, Sweden, [6]Karolinska Institutet, Department of Clinical Science, Intervention and Technology (CLINTEC), Stockholm, Sweden

Background: The focus in HIV care so far have been to reach good physical conditions and through the UNAIDS 90-90-90 target. However, health also includes mental and social well-being as well as the absence of stigma and discrimination.

The overall aim of this study is to explore the association between living as open with HIV as one wants and suicide thoughts among 16-29-year old young people living with HIV in Sweden. A secondary aim is to see how this can be understood in the intersections of gender and sexual identity.

Methods: This study is based on a national survey of young people living with HIV conducted at HIV-clinics in 2018. The survey had 173 respondents, giving a response rate of 36 percent. Logistic regression models were used to calculate odds ratios (OR) using suicide thoughts as the outcome variable and open with HIV status, gender and sexual identity as exposure variables. Gender and sexual identity was combined to investigate intersections.

Results: The results show that suicidal thoughts are more common among young people who report that they were not as open as they wanted to be with their HIV status (OR 1.71 95% CI : 0.90 – 3.25). The analysis also indicate that the associations of suicide thoughts intersects with gender, sexual identity and openness with one's HIV. In general, men had higher odds ratios of suicide thoughts if they reported not being as open as they wanted to with their

HIV status, or belonging to a sexual minority, compared to heterosexual men being as open as they wanted. In women, the groups were smaller and the same pattern was not observed.

Conclusions: The findings add to previous knowledge and guide policy and practise as it point not only to the possibilities if being as open as one wants with HIV status but also to how this has different implications depending on the intersection of sex and sexual identity. The results pinpoint the need of larger studies to investigate intersections further.

EPD288

Gender and sexual minority inclusive healthcare services: a satisfactory though temporary policy. The perspective of the community

F. Vissicchio[1], P. Radusky[2,3], N. Cardozo[2,4], V. Zalazar[1], I. Aristegui[1,5], M. Pecheny[6,7]

[1]Fundación Huesped, Research Department, Buenos Aires, Argentina, [2]Fundación Huésped, Research Department, Buenos Aires, Argentina, [3]University of Buenos Aires, Faculty of Psychology, Buenos Aires, Argentina, [4]Asociación de Travestis, Transexuales y Transgéneros de Argentina (A.T.T.T.A.), Buenos Aires, Argentina, [5]University of Palermo, Buenos Aires, Argentina, [6]University of Buenos Aires, Buenos Aires, Argentina, [7]CONICET (Consejo Nacional de Investigaciones Científicas y Técnicas), Buenos Aires, Argentina

Background: In Argentina, prevalence rates of HIV among transwomen (34%) and men who have sex with men (MSM, 12%-15%) greatly exceed the rate among general population (less than 1%). Gender and sexual minority (GSM) friendly or inclusive healthcare services were initially designed as public policies to facilitate access to HIV/STIs prevention and care. Such services currently provide comprehensive healthcare to GSM people in a free of stigma and discrimination context.

The purpose of this study was to assess these services from the perspective and perceptions of the community and users.

Methods: A qualitative study was conducted in eight GSM inclusive healthcare services in Buenos Aires Province, Argentina. Thirteen semi-structured interviews with GSM leaders and four focus groups with healthcare users: gay/bisexual cisgender men (n=6), trans femininities (n=4), trans masculinities (n=7) and lesbian/bisexual cisgender women (n=6). Data were analyzed by three researchers, using thematic analysis and organized by identity group to explore for specific needs.

Results: In all GSM groups, participants consider that inclusive healthcare services are a public policy that has facilitated GSM access health: HIV and other STIs testing and treatment; hormone therapy, and general healthcare consultations. However, GSM leaders and service users highlighted the importance of making themselves visible in other health settings and warned that having differential services may inadvertently contribute to perpetuating barriers to healthcare, such as negative attitudes towards GSM and health workers' lack of knowledge of their health needs.

In turn, they identify the need to promote full inclusion of these populations in the general healthcare system, especially for trans people, by including peer navigators and addressing stigma and discrimination towards this community.

Conclusions: GSM inclusive healthcare services are perceived by the community as a satisfactory, though temporary and insufficient policy. Efforts should still be oriented to address barriers to access to the general healthcare system by reducing stigma and discrimination in health settings, including training on gender perspective, and increasing awareness of GSM specific characteristics to better adjust services. To do so, it is important to recognize the expertise that comes from lived experience from the GSM community.

EPD289

Feasibility and acceptability of a stakeholder-informed intervention to reduce internalized stigma and shame as barriers to HIV self-care among men who have sex with men with substance use disorders

A. Batchelder[1,2], J. Foley[3], H.J. Shin[3], A. Madhu[2], K. Mayer[2], C. O'Cleirigh[3,1]

[1]Harvard Medical School, Psychiatry, Boston, United States, [2]Fenway Community Health Center, The Fenway Institute, Boston, United States, [3]Massachusetts General Hospital, Psychiatry, Boston, United States

Background: Men who have sex with men (MSM) with HIV and substance use disorders (SUDs) are likely to have inconsistent engagement in HIV care and ultimately suboptimal viral suppression, in part due to the behavioral and emotional consequences of internalizing stigma related to HIV, substance use, and being MSM.

Feasible and acceptable interventions are needed to address these behaviorally influential psychological barriers to HIV self-care.

Description: We are conducting a pilot randomized control trial of a novel stakeholder-informed and theory-based text-enhanced psychobehavioral intervention to reduce the impact of internalized stigma and shame on engagement in HIV care among MSM with SUDs who were sub-optimally engaged in HIV care (i.e., virally detectable, recently missed and not rescheduled HIV care appointments, or nonadherent to antiretrovirals) in Boston, Massachusetts.

The intervention includes five one-on-one therapy sessions focused on increasing emotional and cognitive awareness, compassionate self-reappraisal, and self-efficacy of behavioral goal setting, plus personalized bi-directional text daily messaging designed to extend the impact of the intervention.

The study involved an additional five research visits.

Lessons learned: Of the 42 randomized participants to date, 50% identified as Black, Native American, or biracial; 20% self-described as Hispanic; 63% reported <$20,000/year income; and 52% reported limited access to affordable housing. Participants attended an average 93% of study visits and responded to an average of 76% of the daily text messages. Participants randomized to the intervention group indicated a mean score of 2.7 on the Client Satisfaction Survey (0=quite dissatisfied-3=very satisfied). Preliminary data suggest that those who completed the intervention were more likely to be virally suppressed at the final 6-month follow-up-visit (100%) compared to the control group.

Additional differences in engagement in care were also identified, including the intervention group reporting an average of 1.6 versus 3.6 consecutive days between antiretroviral doses in the past 30 days.

Conclusions/Next steps: Preliminary results indicate this stakeholder-informed and theory-based intervention is feasible and acceptable for MSM living with HIV and SUDs who are sub-optimally engaged in care. Promising pilot data also indicate that the intervention may be associated with a higher proportion of viral suppression at final follow up compared to the control group.

EPD290

The impact of stigma and discrimination on people living with HIV in Homa Bay County, Kenya

E. Barongo[1]

[1]Kenyatta University, Department Of Population, Reproductive Health & Community Resource Management, Nairobi, Kenya

Background: In Kenya, more than 1.5m individuals live with HIV. At least 20,000 people died while 41,000 new infections were documented in 2019 alone. Homa Bay County recorded an HIV prevalence rate of 26.0% and contributed to 14.0% and 15.1% of new infections among adults and children respectively. The persistent HIV-related stigma and discrimination have proved to impede a successful HIV response. Even with increased access to ART, HIV-related stigma and discrimination are rampant resulting in low HIV-testing among men, slowed engagement with care, and increased attrition from care. To attain the UNAIDS proposed world targets (of 95-95-95), the world needs to redouble the efforts to avert the projected 7.7m deaths in 10 years, decrease the amplified HIV infections, and overturn the slowed public health response towards HIV.

Methods: The study was conducted in Homa Bay County between November 5, 2021 and December 5, 2021. Using a phenomenological research design, 47 women and 40 women who were HIV-positive and 10 healthcare providers were recruited to participate in in-depth interviews. The study was granted permission by the ministry of health (Homa Bay County) and the respective hospitals from which the healthcare professionals were drawn. The information collated was analyzed using thematic analysis technique and the themes were presented.

Results: The findings showed that stigma and discrimination are highly gendered and more prevalent in communities that record how the incidence of HIV. Enacted stigma such as verbal discrimination, segregation, humiliation, physical violence, and rejection was documented as some of the past experiences. The majority of the interviewed women indicated acute internalized stigma like shame, worthlessness, and embarrassment that results in depression and anxiety. Anticipated stigma among women depicted marital dissolution, physical and verbal abuse, public ridicule, and gossip. Anticipated stigma was salient among women with internalized stigma and those that had faced enacted stigma from their partners. As a result, anticipated stigma resulted in avoidance of care, seeking care in remote areas, and hiding HIV medications.

Conclusions: Reflecting on these findings, the government policymakers and other organizations will devise suitable strategies to avert stigma and discrimination among HIV-infected people and increase testing and treatment.

EPD291

Managing stigma: a qualitative analysis of sustainability in NYS healthcare facilities

A. Karbasi[1], D. Ikeda[2], L. Ahmadi[3], D. Abai[3], P. Carneiero[4], A. Fortenberry[5], F. Gbadamosi[6], R. Glushefski[7], R. Green[7], M. Higgins[6], A. Kiener[6], P. Meacher[5], A. Nagaraja[8], L. Reid[8], D. Spier[3], A. Baim-Lance[9], B. Agins[1]

[1]University of California at San Francisco, Institute for Global Health Sciences, San Francisco, United States, [2]Harvard Medical School, Boston, United States, [3]Lenox Hill Hospital, New York, United States, [4]CUNY Graduate School of Public Health and Health Policy, New York, United States, [5]Callen-Lorde, New York, United States, [6]Evergreen Health, Buffalo, United States, [7]Institutes for Family Health, New York, United States, [8]Sun River Health, Hudson Valley-Long Island Division, Peekskill, United States, [9]Veterans Health Administration James J. Peters VA Medical Center, Bronx, United States

Background: Although several stigma-reduction interventions have been implemented for decades for People Living With HIV (PLWH) and key populations (KPs), many of these interventions do not focus impacting or adaption to long-term changes in systems of care that promote non-judgmental, welcoming care preventing discrimination. This short-term focus directly and adversely impedes interventional sustainability intended to reduce and eliminate stigma within healthcare settings.

Description: To understand the factors leading to institutionalization of system-wide activities, we identified five (5) facilities that implemented multiple stigma reduction

strategies into their routine servicing and care beginning in 2017. Facilities were purposively selected based on awareness of the authors and colleagues of voluntary continuation of both stigma measurement and reduction interventions, following an initial quality improvement (QI) activity within New York State. Key staff from each facility participated in virtual interviews that were recorded, transcribed, and reviewed by the authors.
Thematic analysis revealed attributes of sustainable interventions and their respective enabling and hindering factors, each of which was later grouped into domains.
Lessons learned: The strongest facilitator of embedding stigma reduction into clinic processes was co-production, characterized by involving PLWH and KPs in the design and implementation of interventions through participation in both short-term initiatives and long-term committees.
Other important domains included: support from agency and program leadership; organizational structures such as stigma plans and committees; expansion of education throughout the entire organization; visualization of PLWH and KPs in educational materials and posters; integrating multiple stigma reduction interventions within the organization (e.g., mental health, equity, & drug use); creating structured fields and templates in information systems; online reporting systems; and, allocation of resources and linking activities with agency QI activities.
Although the statewide initiative was identified as a catalyst for initiating a structured measurement system, the intervention sustainability was attributed to clinic-driven efforts leading to change in organizational culture.
Conclusions/Next steps: Sustainable stigma reduction interventions within healthcare settings are driven by organizational culture, commitment, and responsiveness to people receiving care.
Meaningful participation of PLWH and KPs in planning and implementation of stigma reduction interventions and actualization of co-production are important strategies to mitigate barriers to achieve desirable technical and experiential health outcomes.

EPD292

Reducing discrimination faced by MSM and Transgender Women in public hospitals: preliminary efficacy of a pilot workshop-delivered intervention among healthcare providers in India

S. S[1], S. Nair[2], K. Ranade[2], R. Nelson[3], M. Shunmugam[3], B. Mohan[4,3], S. Rawat[4], U. Das[5], A. Nuken[6], V. Verma[5], C. Das[5], V. Chakrapani[3]
[1]Madras Medical College, Community medicine, Chennai, India, [2]Tata Institute of Social Sciences, School of Social Work, Mumbai, India, [3]C-SHaRP, Research, Chennai, India, [4]The Humsafar Trust, Research, Mumbai, India, [5]National AIDS Control Organisation, New Delhi, India, [6]International Centre for Research on Women, New Delhi, India

Background: Indian government is aiming at 'zero discrimination' in public healthcare settings. Studies have documented discrimination experiences of men who have sex with men (MSM) and Transgender Women (TGW) in public healthcare settings, hindering access to health/HIV services.
To contribute to scalable interventions, we developed and tested the efficacy of a theory-based pilot intervention to reduce stigma/discrimination faced by MSM and TGW in public healthcare settings.
Methods: In November 2021, we conducted two half-day workshops for clinical (n=24) and non-clinical staff (n=28) of a government hospital in Chennai. The sessions aimed to improve knowledge and attitude towards MSM/TGW through interactive sessions, speeches by role models (popular opinion leader strategy), exercises, and discussions with MSM/TGW activists ('contact' hypothesis).
A self-administered questionnaire assessed knowledge, attitude, practices, and comfort level before and after workshop. Paired t-tests and chi-square tests were conducted.
Results: Participants' mean age was 39.1, and mean years of practice was 12.5.The majority (86.5%) reported no prior friends/colleagues who are MSM/TGW, and none had prior training on MSM/TGW. There was no significant difference in the mean attitude score (7 items) before and after the intervention among clinical/non-clinical staff, although attitude in relation to certain items improved; e.g.,13% of clinical staff endorsed the statement 'sex between two men is just plain wrong' before training, which reduced to 7.7% after the training.
Among non-clinical staff, there was a significant increase in the proportion who reported being comfortablein providing care to MSM/TGW (pre-training=46.4%; post-training=81.8%, $p<.01$). Post-training, a higher proportion of clinical (65.2% to 91.7%, $p=.02$) endorsed the statement that healthcare providers should challenge misinformation about MSM/TGW.
Similarly, clinical (95.8%) and non-clinical staff (81.0%) endorsed the need for a hospital non-discrimination policy to protect MSM/TGW.

Author Index

Conclusions: This pilot intervention shows preliminary evidence for improving certain aspects of attitude and comfort level. COVID-19 pandemic prevented having an intervention of longer duration.

As part of the intervention, we also shared four videos and text messages after the training to promote acceptance, and follow-up data are being collected. The intervention will be replicated in another site to further evaluate its effectiveness before potential scale up.

EPD293

Community-level HIV stigma a driver for HIV interventions

M. Mokgatle[1]

[1]Sefako Makgatho Health Sciences University, Pretoria, South Africa

Background: HIV related stigma is a barrier to seeking treatment for people living with HIV (PLWH) it further imposes a concerning threat to the interventions in place to prevent and manage HIV. The attitudes and perceptions of South African communities is a key driving force of HIV related stigma. The aim of this study was to assess the level of stigma among community members and the acts of stigmatising that PLWH are subjected too.

Methods: A cross sectional descriptive survey using semi-structured research administered questionnaire was conducted among 670 clients from 16 primary health facilities in Tshwane, Gauteng. The 12-item short version of the Berger HIV stigma scale was adapted to fit South African communities and employed in order to analyse the stigma factors from the community.

The HIV stigma factors studied included personalised stigma, disclosure concerns, negative self-image, and concern with public attitudes.

Results: The median age was 27 (IQR= 17-60) with majority (n=425, 92.4%) having done an HIV test within the last three years. The findings indicate that the level of overall stigma was low (n=338, 50.4%) in the community.

However with high levels of stigma being scored for sub-components such as disclosure concerns (n=376, 56.5%) and public attitude (n=351, 52.8%). Having tested before was significantly associated with higher levels of stigma. Community members attributed lack of knowledge, fear of infection as key causes of stigma, and the key stigmatising act being moral judgement.

However community members maintained that if they received more education, stigma could be prevented.

Conclusions: Despite the overall level of stigma in the community being low, concerns of disclosure and community attitude carry a high level of stigma.

Advocacy message: Stigma that emanates from the community is detrimental to the successful roll out of programs or interventions geared at improving prevention and management of HIV. Improving the knowledge of communicates on disclosure and attitudes may yield in even lower levels of stigma.

EPD294

Implementation of trauma informed care, harm reduction and gender affirmative care among HIV service organizations in the U.S. South: an analysis of regional survey data

M. Stanton[1], S. Ali[2], K. McCormack[3], S. Reif[4]

[1]Eastern Connecticut State University, Sociology, Anthropology, Criminology and Social Work, Willimantic, United States, [2]University of Houston, Graduate College of Social Work, Houston, United States, [3]University of Texas at Austin, School of Social Work, Austin, United States, [4]Duke University, Center for Health Policy and Inequalities Research, Durham, United States

Background: The U.S. South is disproportionately impacted by HIV compared to other U.S. regions. Ending the epidemic in the South requires sustained engagement in HIV care. Trauma-informed care (TIC), harm reduction (HR) and gender affirmative care (GAC) are person-centered approaches that have been proven to reduce stigma and enhance healthcare utilization.

This study examined the extent to which HIV service organizations (HSOs) in the U.S. South implement these approaches.

Methods: 207 organizations completed a survey which asked about organizational characteristics, services provided, perceived service gaps, and implementation of TIC, HR and GAC. HSOs in the South were identified from the U.S. National Prevention Information Network and the Substance Abuse and Mental Health Services Administration databases and included if they served people living with HIV. Data were analyzed using frequency distributions.

Results: *TIC.* 57% of organizations self-reported taking a trauma-informed approach to care. 43% screened clients for trauma and 29% provided specific trauma interventions. 36% addressed trauma in their policies and procedures documents. 21% do not address trauma in these or other ways.

HR. Half of organizations reported harm reduction-oriented organizational policies. 58% reported that their community-facing documents reflect HR. Only 26% provide specific HR services.

GAC. 70% of organizations reported that their organizational documents use the client's preferred/chosen name and pronoun.

Training. Fewer than half of the organizations completed an organization-wide training in TIC, HR, or GAC (44%, 36% and 33% respectively). Most organizations reported interest in receiving training in all three.

Barriers. The most commonly cited barrier for implementation of all approaches to care was funding (70% for TIC; 55% for HR; 43% for GAC), followed by expertise (65%; 37%; 41%) and capacity and staffing (60%, 36%; 37%).

Conclusions: To the authors' knowledge, this is the largest survey of HSOs in the U.S. South which captures data on person-centered approaches to care. Our findings reveal significant gaps in implementation of these criti-

cal approaches and the need for organizational systems change. Author recommendations include prioritization of funding for in-depth and long-term capacity building with tailored implementation coaching for HSOs in the U.S. South.

EPD295

Stigma reduction through forum engagement in a digital health intervention for young Black and Latinx men and transwomen who have sex with men

S.K. Choi[1], M. Mulawa[2], A. Rochelle[3], C. Li[3], D. Watson[1], S. Hirshfield[4], L. Hightow-Weidman[3], K. Muessig[3], J. Bauermeister[1]

[1]University of Pennsylvania, Philadelphia, United States, [2]Duke University, Durham, United States, [3]University of North Carolina, Chapel Hill, United States, [4]State University of New York Downstate Medical Center, Brooklyn, United States

Background: Promoting online forum engagement in digital health interventions (DHI) has demonstrated preliminary efficacy in reducing HIV and sexuality stigma among young Black and Latinx men and transwomen who have sex with men (YBLMT).

We explored forum engagement and whether forum engagement was associated with stigma reduction from baseline to 3-month follow-up in an mHealth intervention.

Methods: HealthMpowerment 2.0 was designed to reduce stigma and promote social support through user-generated content among YBLMT (ages 15-29) active (contributors) and passive (observers) users.

We summarized participants' weekly, real-time forum interactions and time spent on HealthMPowerment 2.0 over 12 weeks. Linear regression tested the effect of forum engagements on stigma and social support levels at 3-month follow-up.

Results: Average duration of forum engagement was 12.85 (range 0.06-214.97) minutes. Among 232 participants, 97 contributors either generated posts or commented on others' posts.

Over 12 weeks, contributors posted 1.49 times and commented 3.87 times, on average. Participants engaged with the forum most during their first two weeks of the study (see graph).

There were no differences in demographic characteristics between contributors (32.8%, spent 5+ minutes and posted >=1 post or comments) and observers (67.2%, spent < 5 minutes or did not post).

Compared to contributors, observers (passive readers and non-users) in the forum experienced a significant change in measures of challenging stigma (β =0.17; p=0.01) and had marginally significant improvements in emotional support (β =2.21; p=0.067).

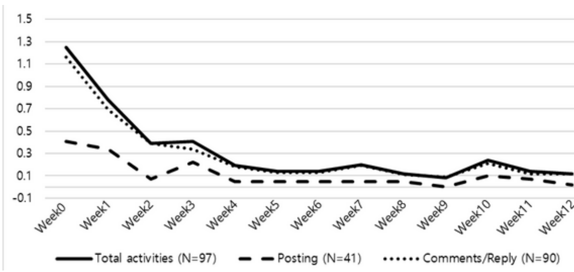

Figure. The number of activities in the Forum.

Conclusions: Contributors and observers may have different gains from engaging in forums as part of a stigma reduction intervention. Given the key role of forum engagement in stigma reduction, analyzing active versus passive forum participation is warranted. Finally, implementation strategies to sustain participants' forum engagement throughout the intervention are needed.

EPD296

Interventions to address HIV-related internalized stigma, stigma and discrimination in healthcare and in laws and policies: a systematic review

L. Ferguson[1], S. Hempel[2], M. Bolshakova[2], N. Fu[3], M. Rozelle[2], S. Yagyu[2], N. Cabrera[2], K. Kasoka[4], T. Oraro-Lawrence[4], L. Stackpool-Moore[5], A. Motala[2], S. Gruskin[1]

[1]University of Southern California, Institute on Inequalities in Global Health, Los Angeles, United States, [2]University of Southern California, Southern California Evidence-Based Practice Center, Los Angeles, United States, [3]Shanghai University of Finance and Economics, School of Economics, Shanghai, China, [4]International AIDS Society, Geneva, Switzerland, [5]Watipa, Sydney, Australia

Background: While efforts have been made to evaluate stigma reduction interventions, there is little consolidation of existing evidence.

Methods: We carried out a systematic review to address two questions: What is the effectiveness of interventions that aimed to reduce internalized stigma, stigma and discrimination experienced in healthcare settings, and stigma and discrimination entrenched in national laws and policies? What common 'critical factors for success or failure' can be identified that might inform future interventions? Random effects meta-analyses summarized results on each type of stigma and discrimination where possible.

We assessed the risk of bias in individual evaluations and applied GRADE criteria to the body of evidence. The protocol (PROSPERO CRD42021249348) incorporates stakeholder input, and the data are available in the Systematic Review Data Repository.

Results: Seventy intervention evaluations met inclusion criteria: 36 addressed internalized stigma, 19 stigma and discrimination in healthcare settings, and 15 stigma and discrimination in law and policy. Interventions to address internalized stigma focused primarily on education, counselling and support, with only seven including par-

ticipants other than people living with HIV such as family members. Across these studies, we found a reduction of internalized stigma (SMD 0.50; CI 0.28, 0.90; 16 studies). Intervention focus and study designs varied, as did the stigma measures used. Interventions to address stigma and discrimination in healthcare settings focused on sensitization and capacity building of health workers, sometimes alongside other staff and/or clients or students.
Effect estimates varied considerably but most studies showed positive effects (SMD 0.71; CI 0.60, 0.84, 8 studies). Interventions to address stigma and discrimination in law and policy were geographically diverse and ranged from court decisions and policy directives to advocacy efforts and legal empowerment. Positive impacts documented include reductions in stigma and discrimination, even as study designs precluded meta-analysis.
Conclusions: Interventions have had success in reducing all types of stigma and discrimination reviewed. Nonetheless, heterogeneity of interventions, measures and follow-up time impedes comprehensive meta-analysis. There is a need and opportunity to facilitate learning across interventions to facilitate replication and adaptation in other contexts. These lessons can inform initiatives to address stigma and discrimination at scale to help attain global HIV-related goals.

EPD297

A cross-sectional analysis of U=U as a potential educative Intervention to mitigate HIV stigma among youth living with HIV in South Africa

L. Nkosi[1], J. Gwar[2], T. Tsafa[2], I. Agaku[3]
[1]Sefako Makgatho Health Sciences University, Pretoria, South Africa, [2]Benue State University, Makurdi, Nigeria, [3]Harvard School of Dental Medicine, Boston, United States

Background: The HIV educative campaign *Undetectable Equals Untransmissible* (U=U) is a potential gamechanger to address HIV stigma. We investigated what percentage of South African adolescents were aware of U=U, and the associations with perceived HIV stigma and past-year HIV testing.
Methods: We used a cross-sectional design. Data were from the 2017/2018 South African National HIV Prevalence, Incidence, Behaviour and Communication Survey. HIV status was measured using both laboratory confirmation and self-reports.
Among adolescents aged 15-18 years, we calculated the percentage who believed that "the risk of HIV transmission through sex can be reduced by an HIV-positive partner consistently taking drugs that treat HIV." Data were weighted to yield nationally representative estimates.
Results: Overall, 49.8% of all adolescents aged 15-18 years (and 49.2% of those HIV seropositive) believed that the risk of HIV transmission through sex can be reduced by an HIV-positive partner consistently taking drugs that treat HIV. After adjusting for HIV status, geographic location, race, sex, and orphanhood status, those with belief in U=U were less likely to endorse stigmatizing statements that teachers with HIV should not teach (IRR=0.63, 95%CI, 0.47-0.84), pupils with HIV should not attend class (IRR=0.62, 95%CI, 0.45-0.84), or that children with HIV in general should be in segregated schools (IRR=0.55, 95%CI, 0.41-0.74).
Among those reporting not living with HIV, U=U belief was associated with increased likelihood of past-year HIV testing (IRR=1.19, 95%CI, 1.01-1.41).
Conclusions: U=U belief was associated with reduced stigma perceptions and increased HIV testing. Adoption of U=U into clinical practice guidelines in South Africa may benefit public health.

EPD298

#SácateLaDuda: a transmedia strategy to promote the reduction of HIV stigma and discrimination through community interventions among MSM

A. Becerril[1], K. Muñoz[1], A. Rojas[2]
[1]Inspira Cambio, Social Communication, Mexico city, Mexico, [2]Inspira Cambio, Programs and Education, Mexico city, Mexico

Background:
Mexico has a concentrated HIV epidemic. The prevalence indicates MSM as the principal group (17.3%), CENSIDA (2019). The HIV panorama in Mexico remains uncertain: there is shortage of ARVs, an inefficient PrEP program implementation, as well as HIV new cases while facing the COVID-19 pandemic.According to the Needs Assessment for the Repositioning of Telsida Study (2011); there is low appropriation and awareness on HIV among MSM, due to the lack and inaccuracy of information on risky behavior, detection, care and treatment.
This issue has led to two principal barriers for MSM to access HIV screening tests: fear and shame.#SácateLaDuda's (Zero Hesitation) objective is to increase awareness among MSM on HIV and STIs prevention through a human-centered approach, focusing on pleasure and self-care. By creating safe spaces and implementing accesible information in order to reduce discrimination and stigma through a transmedia strategy.
Description: #SácateLaDuda is a digital platform launched in June 2020 designed upon 7 lines of action:
- Serophobia and discrimination
- Living with HIV
- U=U
- Pleasure and prevention
- PrEP and social justice
- Sexism and self-care
- Substance intake

With health professionals supervision, an interactive website was created, as well as original content and pedagogical tools. A digital marketing strategy was implemented to reach potential and targeted populations.Our key activities include: HIV testing and counseling, virtual

drawing rooms for people living with HIV and coffee talks with activists and health professionals. Covering a wide range of expressions on living with HIV, encouraging prevention as pleasure and self-care, as well as making information on the topic accessible.

Lessons learned: By transforming science data into accessible information, we reached the following impacts:

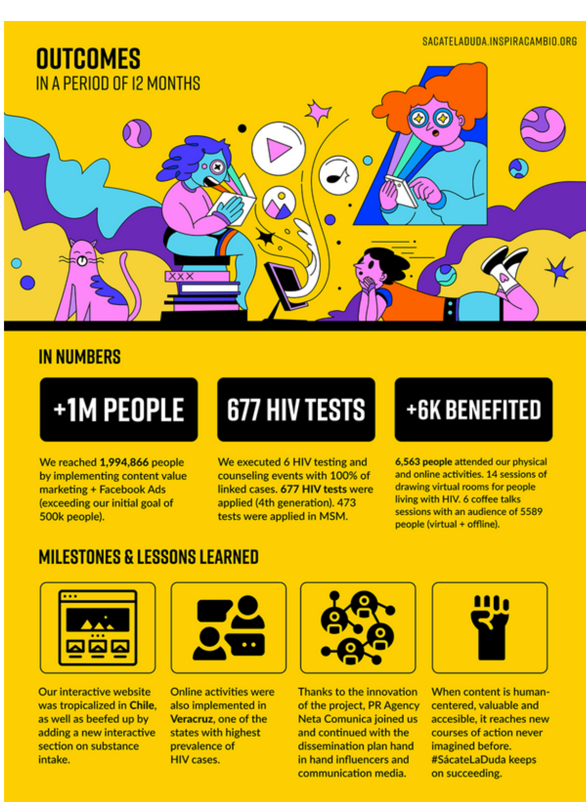

Figure. Outcomes in a period of 12 months.

Conclusions/Next steps: Due to its transmedia nature, #SácateLaDuda not only reached its quantitative goals, but a significant change in the behavioral and awareness paradigm within affected communities, while contributing to its own sustainability.

EPD299

Does online educational video intervention reduce HIV related stigma among international students studying in language schools in Japan?

D. Gautam[1], P. Shakya[2], T. Sawada[3], H. Zhang[4], T. Kitajima[4]

[1]WHO, Kathmandu, Nepal, [2]Save the Children, Global Fund, Kathmandu, Nepal, [3]University of Tokyo, Tokyo, Japan, [4]Kyorin University, Tokyo, Japan

Background: HIV related stigma is a major human right related barrier to achieve the global goal of ending HIV epidemic by 2030. HIV stigma and discrimination prevent vulnerable population to access the HIV related services. Migrants are more vulnerable to HIV related stigma in the host country than the general population. Evidence is scarce on interventions to reduce such stigma among migrants.

The objective of this study is to examine the role of online educational video to reduce HIV related stigma among international students studying in language schools in Japan.

Methods: We conducted a longitudinal study among 183 students from China, Vietnam and Nepal studying in Japanese language schools in Japan. Out of them, 85 watched the online educational video about HIV testing services in Japan and 98 students watched the educational video about TB diagnosis. To measure the HIV related stigma, we assessed "desires for social distance" and "anticipated stigma" during baseline and follow-up after 7 days of watching the online video. We conducted bi-variate analysis using Chi-squared and t test.

Results: At baseline, the intervention and control groups had similar characteristics for HIV knowledge score (mean 22.6 vs. 23.4, p=0.06), perceived risk of HIV score (mean 15.0 vs. 15.9, p=0.247), presence of desires of social distance stigma on HIV (26.8% vs. 26.2%, p=0.241), and presence of anticipated stigma on HIV (33.9% vs. 40.4%, p=0.692).

At follow up, compared to control group students, fewer students in the intervention group had anticipated stigma on HIV (31.6% vs. 43.4%, p=0.024). However, at the follow up, we did not find any statistically significant differences for HIV knowledge score, perceived risk of HIV score, and presence of desires of social distance stigma on HIV.

Conclusions: This study shows that the online video educational intervention about HIV testing services in Japan is associated with decrease in HIV related stigma among international students studying in language schools in Japan. Such finding will be helpful in designing HIV program and improve the access to HIV testing services for international migrants living in Japan.

EPD300

Forum engagement within app-delivered stigma reduction interventions: Insights from HealthMpowerment 2.0

M.I. Mulawa[1,2], K.E. Muessig[3], C. Li[3], A.E. Rochelle[4], S.K. Choi[5], L.B. Hightow-Weidman[4,3], S. Hirshfield[6], J.A. Bauermeister[5]

[1]Duke University, School of Nursing, Durham, United States, [2]Duke University, Duke Global Health Institute, Durham, United States, [3]University of North Carolina at Chapel Hill, Gillings School of Global Public Health/Health Behavior, Chapel Hill, United States, [4]University of North Carolina at Chapel Hill, Medicine/Infectious Diseases, Chapel Hill, United States, [5]University of Pennsylvania, School of Nursing/Family & Community Health, Philadelphia, United States, [6]SUNY Downstate Medical Center, Brooklyn, United States

Background: Mobile app-delivered HIV stigma reduction interventions increasingly offer opportunities for interactions among participants through forums and message boards. Participation in online forums typically demonstrate a similar pattern; a few core users (superusers) contribute most of the content, many peripheral users con-

Oral abstracts

Poster exhibition

E-posters

Late-breaker abstracts

Author Index

tribute less frequently (contributors), and a larger number of users participate without posting (observers). Forum engagement and resulting network structure have not been well-characterized for app-delivered stigma reduction interventions.

Methods: We analyzed data from HealthMpowerment (HMP) 2.0, an app-based intervention that promotes user-generated content and social support to reduce intersectional stigma and improve HIV-related treatment and prevention outcomes among young Black and Latinx men and transwomen who have sex with men (ages 15-29 years). The HMP 2.0 forum was seeded with posts generated by participants in a prior trial (HMP 1.0) and youth advisory board (YAB) members engaged in the forums to facilitate conversation. Data were extracted from the HMP 2.0 SQL database. Network data were analyzed and visualized using the igraph packages in R.

Results: The HMP 2.0 forum contained 1,606 unique posts across 365 top-level forum threads created by study participants (40.2%), seeded participants from HMP 1.0 (28.5%), YAB members (24.0%), and study administrators (7.2%). Of the 226 study participants, 6 were superusers (posting to >=20 threads), 42.0% were contributors (authoring >1 post/comment/reply), 43.5% were observers, and 12.8% were non-users (spending <1 min. in the forum). Superusers and YAB members were highly central in the forums (average betweenness 335 and 143, responsively), with YAB members effectively seeding threads to current study participants (see graph).

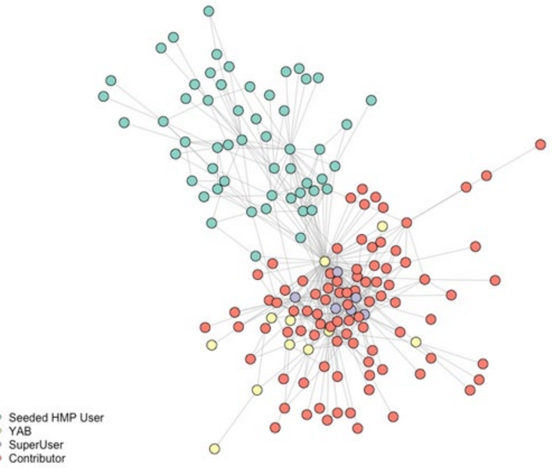

Figure. Network structure of forum engagement within HealthMpowerment 2.0

Conclusions: Forum engagement within HMP 2.0 has been strong, with nearly half of all study participants actively contributing. Youth advisory board members and superuser participants play a key role in fostering a cohesive and engaging online community.

EPD301

Impact assessment of a Faith-based strategy for HIV mitigation in Nigeria

I. Nwakamma[1,2], A. Erinmwinhe[3], J. Ogugua[4]

[1]INERELA+ Nigeria, Program Management, Abuja, Nigeria, [2]Caritas Nigeria, Prevention, Care and Support, Umuahia, Nigeria, [3]INERELA+ Nigeria, Prevention, and Community Mobilization, Abuja, Nigeria, [4]Carita Nigeria, Prevention, Care and Support, Umuahia, Nigeria

Background: Stigmatization of persons living with HIV (PLHIV) has continually been reinforced by religious condemnation of premarital and extramarital sex, which contributes to feelings of guilt, default in treatment, denial and shame. It also results to defensive behaviour, fatalism and self-stigmatization among PLHIV. Nigerian Network of Religious Leaders Living with or personally Affected by HIV and AIDS (NINERELA+) and her partner Christian Aid UK, Nigeria implemented a two year project, "Strengthening Faith-based HIV Response", in Anambra, and Benue States Nigeria, between April 2017 and March 2019.

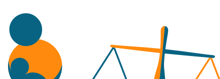
The intervention focused on empowering faith communities with right information on HIV, addressing faith interferences to HIV service uptake and empowered faith leaders to work as advocates of HIV stigma mitigation.

This Study is an impact assessment of the faith-based strategy for HIV mitigation implemented in two Nigerian States.

Methods: Data from a cross-sectional representative survey of 510 faith community members in 20 intervention congregations and 500 congregants in 20 control congregations in same locations were analyzed in comparison with the baseline data. The key outcomes of interest were congregants' willingness to accept HIV result if tested positive, willingness to share communion with PLHIV, knowledge of HIV prevention, care and treatment at: baseline (April, 2017); project close (March 2018); and follow-up (July to September, 2021).

Results: From comparative data analysis of intervention and control congregations, a total 1010 respondents (52.6 female) were in post follow up survey, and 430 (female 51,2%) in the baseline survey. There was an estimated 26.7% increase in likelihood to accept HIV positive result from baseline to follow up in intervention group and 18.3% increase when control group. Compared to the control group, there was significant increase on willingness to receive communion with PLHIV in the intervention group (OR 0.6445, 95% CI: 0.5245to0.7920, P=0.0001).

Conclusions: The intervention was able to achieve positive attitudinal shift at the community level, and significant effect of the intervention was found in improving HIV literacy and community level stigma. Replication of the initiative in other communities and for public health response are recommended.



EPD302

Framing of HIV/AIDS in selected newspapers in Nigeria from 2019

C. Odenigbo[1], I. Anorue[1]
[1]*University of Nigeria, Mass Communication, Nsukka, Nigeria*

Background: The study's overall goal was to determine how HIV/AIDS articles were framed in selected Nigerian newspapers from 2019 to 2021. Framing focuses on how the media draws public attention to specific themes. Invariably, how a story is presented to the media audience can influence how they perceive the issue and, consequently, how they will digest this piece of information.
This research examined the extent of coverage of HIV/AIDS stories compared to other stories in the newspapers, the sources of these reports, the frames utilised in the reportage, and the themes under which stories on HIV/AIDS were covered.
Methods: Four national newspapers were examined: The Daily Sun, The Guardian, The Nation, and Vanguard. The study employed the content analysis research method, and adopted the constructed week sampling technique to select 112 editions (Two weeks per year) of the four newspapers for two years (14 days x 4 newspapers x 2years = 112 editions).
Results: The data collected from the newspapers indicated that articles on HIV/AIDS were inadequately reported, as most of the stories were under the straight news category and were snippets from reports on health programmes at the federal and state levels.
This study also aimed to determine the veracity of the allegations levelled against the Nigerian media about the stigmatisation of people living with AIDS. Stories on HIV/AIDS were reported with a significant level of insensitivity, as in a similar study I conducted on mental health.
Conclusions: Health communication is a sensitive topic, and in an attempt to enlighten the public, panic and discrimination can be established without intending. Thus, it becomes imperative to consider the vulnerability of HIV/AIDS patients while gauging the story to avoid the superficiality that can cause misinformation.
Framing the story is as substantial as the information itself. If the stories are framed to respect people's privacy and be polite towards others, this notion will be ingrained in the masses.

EPD303

Affective characteristics as predictors of attitude towards people living with HIV in Cross River State, Nigeria

C.I. Offiah[1], F. Eyam[1], C. Obi[1], P. Agada[1], A. Ndep[1], E. Isang[1]
[1]*Family Health International, Calabar, Cross River State, Nigeria*

Background: People living with HIV/AIDS usually face discrimination and are now and then disregarded due to antagonistic perspectives of their condition. Adopting correlational research design, the study investigated affective characteristics as predictors of attitude towards people living with HIV (PLHIV) in Cross River State, Nigeria.
Specifically, the study investigated the combined and relative predictive impact of affective characteristics such as emotional intelligence, anxiety disorder, self-esteem, depression disorder, bipolar disorder, and self-confidence on attitude towards PLHIV in Cross River State.
Methods: The study adopted Krejcie and Morgan (1970) sample determination method in selecting a sample of 758 individuals living with PLHIV. The instrument used in data collection for the study was a questionnaire titled; "Affective Characteristics and Attitude Towards PLHIV Scale" (ACATPLHIVS).
The data collected for the study were analyzed using descriptive statistics and Multiple Linear Regression analysis tested at .05 level of significance.
Results: The results revealed that emotional intelligence, self-esteem, and self-confidence had significant positive impact on attitude towards PLHIV, while anxiety disorder, depression disorder and bipolar disorder had significant negative impact on attitude towards PLHIV.
Conclusions: It was concluded that affective characteristics play significant roles on attitude towards people living with HIV (PLHIV) in Cross River State.
It was recommended among others that; counselling services should be provided for households of PLHIV to minimize the discrimination against PLHIV.

Positive Linkage Initiative (PLI) for young populations in Zambia to help with the HIV response

S.M. Diangamo[1], R. Kalamatila[1], G.C. Chungu[1]
[1]*National HIV/AIDS/STI/TB Council, Communication, Lusaka, Zambia*

Background: Adolescents aged 10-19 comprise 23 percent of the total Zambian population. There are approximately 1.7 million adolescents aged 15 to 19 years in Zambia. In 2014, there were around 856,000 adolescent girls aged between 15-19 according to the 2010 National Census 2014 estimates. Young people as a whole along with other sub groups defined as key populations in the 2017-2021 National HIV and AIDS Strategic Framework, will continue being a primary concern of the Government of Zambia. In the 2016 Zambia Population Based HIV Impact Assessment showed that while the HIV incidence in the adult age group 15-49 years was 3.6 times higher in women than men, in the same age bracket, the incidence among young women, aged 15-24 years, was 11.8 times higher than among young men of the same age group.
It is in view of this that the National HIV/AIDS/STI/TB Council (NAC) introduced an initiative known as the Positive Linkage in order to improve the uptake of HIV services among young people both negative and positive.
Description: NAC with support from UNICEF trained young people in Peer Education & theatre for development as a way of imparting skills which they would be using in their day to day activities with the adolescents and young people.
The focus of the initiative is on linking HIV Positive trained peer supporters who are experienced with supporting adolescents living with HIV to peer educators in health centers to help mentor and develop their capacity to support adolescents living with HIV.
Lessons learned: Adolescents now have understanding and motivation to form possible solutions to solve these issues and provides an atmosphere where adolescents can voice out, defend themselves and encourage their families to accept who they are. It's helped to reduce stigma among young between those who are negative and positive.
Conclusions/Next steps: The PLI envisions itself contributing significantly to the transformation of adolescents to become more assertive and take charge of their health thereby reducing HIV infections through promotion of healthy behaviors which will translate into an increase in the uptake of access to HIV and SRH services.

EPD305
MINA. For Men. For Health – applying private sector consumer marketing approaches to strengthen behaviour change communications for men living with HIV in South Africa

A. Manchia[1], R. Shekhar[1], S. Meiring[1], A. Hartz[2], A. Subramanian-Montgomery[2], E. Nsiki[3]
[1]*Project Last Mile, Johannesburg, South Africa,* [2]*Ipsos, New York, United States,* [3]*Ipsos, Johannesburg, South Africa*

Background: Despite considerable gains, South Africa has not yet achieved 90-90-90 targets to achieve HIV epidemic control. A variety of societal and psychosocial factors that limit men's uptake of HIV services, means the gap between men and women in HIV treatment (-12%) and viral suppression (-8%) has persisted and grown over time. Despite adult men making up only 34% of the PLHIV population, men make up 60% of AIDS deaths.
Description: PEPFAR engaged Project Last Mile (PLM) to apply private sector consumer marketing best practices to test a new behavior change communications approach for MLHIV. Historically, there have been limited behaviorally-driven, national-scale communications targeting men in South Africa. Leveraging best practices from The Coca-Cola Company, PLM applied an insights driven strategic marketing process.
Through this process - "MINA. For Men. For Health" (MINA) was developed as a national brand to encourage men to take responsibility for their health. MINA was endorsed by the National Department of Health (NDoH) in South Africa for a national scale-up, and launched via a national media and in-clinic campaign at the end of 2020.
Lessons learned: In the first 3 quarters after launch, men's HIV testing accelerated 22% versus 14% for women in facilities where MINA was activated. Men's treatment initiation grew 10% vs 2% for women in the same period. This campaign has been the first effort at developing a national-scale, NDoH endorsed, targeted communications effort for MLHIV using a consumer-marketing approach. Initial results suggest a positive link between men's exposure to the MINA campaign and positive HIV health-seeking behaviors.
Conclusions/Next steps: Initial findings suggest that a targeted consumer marketing approach, coupled with national scale media and sustained investments can support behavior change amongst priority HIV population segments. As MINA was designed to support long-term behavior change, the campaign will continue to be monitored to assess how initial gains are sustained and scaled. The next phase of the project will continue testing how consumer-marketing approaches can influence health behaviors, with a focus on integrating U=U messaging to motivate viral suppression and outline a strategy for reaching men more effectively outside health facilities.

EPD306

Feasibility and efficacy of telephone-based psycho-educational intervention on psychological distress among people living with HIV in Ibadan, Nigeria

M.A. Alabi[1], P.O. Adejumo[1], J.T. Moskowitz[2], L.M. Khuns[2,3], A.G. Ishola[1], V.O. Lasebikan[4], A. Ogunniyi[1], B. Taiwo[2]
[1]University of Ibadan, Oyo State, Nigeria, [2]Feinberg School of Medicine, Northwestern University, Chicago Illinois, United States, [3]Ann & Robert H. Lurie Children's Hospital of Chicago, Illinois, United States, [4]University of Ibadan, Oyo state, Nigeria

Background: In 2020, Nigeria had an estimated 1,700,000 people living with HIV (PLWH) with 86,000 new cases, and 49,000 deaths from AIDS-related illnesses. Psychological distress is common in PLWH with serious implications on disease progress. In order to control this ongoing epidemic and optimize antiretroviral treatment (ART), attention is increasingly focused on mental health as an important correlate of HIV-associated outcomes.
The objective of the study was to determine the initial feasibility and efficacy of psycho-educational intervention on psychological distress in a pilot trial among PLWH in Nigeria.
Methods: This was a two-arm study where 22 PLWH were assigned, balancing age and gender, to the intervention versus control groups. The study took place at the Infectious Disease Institute, Adeoyo Maternity Teaching Hospital, Ibadan, Nigeria between July and November 2021.
The intervention consisted of nine weekly psycho-educational sessions focused on basic HIV education, medication adherence, the role of psychological distress on well-being, and mental and emotional skill-building. Sessions were delivered via telephone by clinic nurses, who received training on the intervention approach.
Outcome variable was psychological distress which was measured by general health questionnaire (GHQ-12) and Hospital Anxiety and Depression Scale (HADS). Assessments were carried out at baseline and two-weeks post intervention. A difference in difference approach using analysis of covariance (ANCOVA) and partial eta squared was used to compare outcomes between groups.
Results: The mean (SD) age of the participants was 54 (13.30) years, females (59%), males (41%). Ninety percent were on dolutegravir-based ART with an average of 90% adherence (based on self-report). The completion rate of intervention was 100%, however 27% of the participant rescheduled their intervention to a later date. An average of 5 hours (in total) was spent in completing the telephone-based psycho-educational intervention per individual in each of the groups.
Comparison of change in outcomes of interest between groups demonstrated a significant improvement in GHQ and HADS in the intervention arm compared to the control condition with an effect size of 0.50 and 0.57 respectively for GHQ and HADS.
Conclusions: Telephone-based psychological intervention was feasible and demonstrated initial efficacy to reduce psychological distress in PLWH in Nigeria.

EPD307

Psycho- social factors as predictors of psychological wellbeing of people living with HIV/AIDS in Oyo State

G. Akinola[1], C. Asuzu[1]
[1]University of Ibadan, Counselling and Human Development Studies, Ibadan, Nigeria

Background: It has been observed that people living with HIV/AIDS have poor psychological wellbeing in Nigeria and this has resulted to lethargy, suicidal ideation, poor adherence to treatment regimen and, poor clinic attendance. Previous studies have not adequately addressed this and its influencing factors.
Hence, this study examined self-concept, social support, emotional intelligence, self-blame and socio-economic status as predictors of psychological wellbeing of people living with HIV/AIDs in Oyo State, Nigeria.
Methods: The study utilized survey research design of expos facto type and structured questionnaires were used to gather data. The study adopted multistage sampling procedure to select three hundred (300) people living with HIV/AIDS from three major clinics that provides healthcare services for them. Three research questions were raised and answered. Data collected were analyzed using descriptive and inferential statistics.
Results: The result revealed that female respondents dominated the study with 240 (80.0%) while the rest 60 (20.0%) were male. The result revealed that self-concept ($r = .250$, $p<0.05$), social support ($r = .299$, $p<0.05$), emotional intelligence ($r = .211$, $p<0.05$) and socio-economic status ($r = .410$, $p<0.05$) positively and significantly correlated with psychological wellbeing while self-blame ($r = -.192$, $p<0.05$) negatively and significantly correlated with psychological wellbeing of people living with HIV/AIDS. The result also indicated that self-concept, social support, emotional intelligence, self-blame and socio-economic status had significant joint influence on psychological wellbeing of people living with HIV/AIDS on treatment in Ibadan, Oyo State, Nigeria ($F(5,294)= 29.084$; $p<0.05$).
Conclusions: The study concluded that self-concept, social support, emotional intelligence, self-blame and socio-economic status have relative and joint contribution to psychological wellbeing of people living with HIV/AIDS in Ibadan metropolis, Oyo State, Nigeria. Thus, it was recommended that psycho-educational intervention should be organized for people living with HIV/AIDS to boost their self-concept and emotional intelligence and mitigate self-blame.

Keywords: Self-concept, Social Support, Emotional intelligence, Self-blame, Socio-economic Status Psychological Wellbeing, People living with HIV/AIDS

EPD308

Needs and contents of a customized digital tool to improve retention in care: a mixed methods study among pregnant and breastfeeding women living with HIV in Tanzania

R. Maro[1,2], L. Masika[3], K. Ngowi[4], A. Mtenga[1], E. Kiwelu[1], K. Wilhelm[1], B. Mtesha[1], M. Sumari de Boer[4]
[1]Kilimanjaro Clinical Research Institute, Data Management Unit, Moshi, Tanzania, The United Republic of, [2]Nelson Mandela African Institute of Science and Technology, School of Life Science and Biomedical Engineering, Arusha, Tanzania, The United Republic of, [3]Kilimanjaro Christian Medical Center, Kilimanjaro, Tanzania, The United Republic of, [4]Kilimanjaro Clinical Research Institute, Mhealth Department, Kilimanjaro, Tanzania, The United Republic of

Background: Retention in care and adherence to medication among pregnant and breastfeeding women living with HIV (PBWLH) is crucial for prevention of mother to child transmission (PMTCT) of HIV. Due to the wide coverage of mobile phones, digital tools have been described as a potential intervention to improve adherence.
Therefore, the main objective of the study was to understand the needs and contents for a customized digital tool for retention in care and medication adherence among PBWLH.
Methods: A mixed-methods study was conducted from September 2021 to January 2022 at four health facilities. PBWLH (15-50 years) receiving PMTCT services were enrolled in a survey using a semi-structured questionnaires. The questions focused on exploring the adherence, clinic visits and mobile phones experience. Twenty breastfeeding participants were purposively selected and enrolled to use an internet enabled medication dispenser for one month, the so-called Wisepill dispenser. They also received different types of SMS reminders for a period of four weeks and after that feedback on their adherence patterns from a nurse counselor.
They used an automatically generated adherence report from Wisepill. In-depth interviews (IDI) were conducted to explore: barriers, needs and contents of digital tools and contents of tailored feedback on adherence patterns. We conducted descriptive analyses of quantitative data and thematic content analyses of qualitative data.
Results: Among 142 women interviewed, 42 (29.5%) were pregnant and 100 (70.5%) were breastfeeding. The majority 134 (95%) had access to mobile phones and used SMS daily. Ninety-six percent were interested in receiving reminder messages.
However, 31 (22%) reported to have network challenges. Nearly 82 (58%) preferred to be reminded daily before medication intake time. Showing adherence graphs during tailored feedback sessions was highly appreciated. Preliminary analyses of IDIs showed that SMSs were very helpful to remind taking medications and all wished to continue using the device. Also, health educational messages on HIV, sexual, alcohol use, nutrition, breastfeeding and entrepreneurship were preferred to be added.
Conclusions: Tailored digital tools seem to be feasible and acceptable in this group. This study helps to construct useful content for future digital adherence tools to support the health of pregnant and breastfeeding women living with HIV.

EPD309

Association of unmet social needs with uncontrolled viremia in people living with HIV

D.B. Hanna[1], U.R. Felsen[2], K. Anastos[1,2,3], L.J. Bauman[4,5], K.P. Fiori[4,6], M.S. Ginsberg[1], D. Watnick[4], E.C. Chambers[1,6]
[1]Albert Einstein College of Medicine, Epidemiology and Population Health, Bronx, United States, [2]Albert Einstein College of Medicine, Medicine, Bronx, United States, [3]Albert Einstein College of Medicine, Obstetrics & Gynecology and Women's Health, Bronx, United States, [4]Albert Einstein College of Medicine, Pediatrics, Bronx, United States, [5]Albert Einstein College of Medicine, Psychiatry and Behavioral Sciences, Bronx, United States, [6]Albert Einstein College of Medicine, Family and Social Medicine, Bronx, United States

Background: People living with HIV (PLWH) often have unmet social needs that put them at risk for uncontrolled viremia, disease progression, and HIV transmission.
Methods: The Einstein-Rockefeller-CUNY Center for AIDS Research (ERC-CFAR) Clinical Cohort Database contains electronic health record (EHR) data on patients within the largest health system providing HIV care in the Bronx, New York.
Using a 10-item social needs assessment tool based on the validated Health Leads Screening Toolkit and integrated into the EHR, we determined the self-reported prevalence from 4/2018-12/2019 of social needs among a sample of adults living with HIV (N=377) or without HIV (N=27,833). Among PLWH, we examined the association of the presence of each social need with HIV virologic suppression (<200 copies/mL).
We determined prevalence ratios (PRs) and 95% confidence intervals (CIs) by modified Poisson regression, adjusting for age, sex, race/ethnicity, language preference, and insurance status.
Results: PLWH were 55% women, 41% Black, and 44% Hispanic, with median age 53 (IQR 44-60). One-third of PLWH reported at least one social need, nearly twice the percentage among people without HIV (33% vs. 18%, $p<0.001$).
Among those reporting at least one social need, 58% of PLWH had multiple needs, compared with 50% of people without HIV.
Compared with people without HIV, PLWH reported a higher prevalence of all social needs assessed, with healthcare transportation and housing needs significantly higher ($p<0.05$) in adjusted analyses (Table).
PLWH reporting transportation needs were 26% less likely to have a suppressed viral load (adjusted prevalence ratio 0.74, 95% CI 0.56-0.98, p=0.03) than PLWH without transportation needs.

Social need	Social needs by HIV status			Association of each social need with virologic suppression (N=377 PLWH)	
	PLWH (N=377), N (%)	Without HIV (N=27,833), N (%)	P-value	Adjusted prevalence ratio (Ref. = without social need), 95% CI	P-value
Transportation for healthcare	47 (12)	1,389 (5)	<0.001*	0.74 (0.56-0.98)	0.03*
Housing stability	44 (12)	1,336 (5)	<0.001*	0.90 (0.72-1.14)	0.39
Food security	40 (11)	1,612 (6)	<0.001	1.05 (0.87-1.27)	0.61
Housing quality	39 (10)	1,420 (5)	<0.001*	1.02 (0.83-1.25)	0.87
Paying for healthcare	28 (7)	1,215 (4)	0.004	0.85 (0.62-1.18)	0.33

*P<0.05 after adjustment for age, sex, race/ethnicity, language preference, and insurance status. Other social needs that differed significantly between PLWH and those without HIV were legal help (P<0.001), getting along with partner/family (P=0.02), and interpersonal violence (P=0.001).

Table.

Conclusions: PLWH reported more social needs than those without HIV, with healthcare transportation a considerable barrier to virologic suppression. Addressing social needs including transportation may be an important means to help End the HIV Epidemic.

EPD310

Knowledge and attitude towards HIV prevention measures among pharmacy students at the University of Cyberjaya

A.A.J. Sapie[1,2]
[1]*Centre of Excellence for Research in AIDS, Kuala Lumpur, Malaysia,* [2]*University of Cyberjaya, Faculty of Pharmacy, Cyberjaya, Malaysia*

Background: A pharmacist is a profession that potentially plays a role in HIV response. The services include HIV testing, dispensing PrEP, clean needles, antiretroviral, and performing medication therapy management.

This research study is to assess the HIV knowledge, attitude, and prevention among BPharm students at the University of Cyberjaya.

Methods: A cross-sectional study was undertaken in May 2021 involving 50 BPharm students. Participants were given an online questionnaire on knowledge and attitude towards HIV/AIDS and its prevention. The HIV knowledge (HIV-KQ-18), a score of 1 was assigned for a correct and 0 was assigned for wrong and unsure answers. For each item, the percent of the correct answer is calculated.

Attitude towards HIV/AIDS Use a 5- point Likert scale and negative attitude statements are the reverse. The data were analysed using SPSS version 23 statistical software.

Results: The mean HIV Knowledge (HK) score for females is significantly higher than males, 6.2 and 5.9 respectively, while for the attitude score, the male is higher than females, 43 and 40 respectively. The scores ranged from 0 to 18. The majority, 46 (92%) had at least 14 questions correct and 4(8%) score all correct.

The study found many students still have a misunderstanding on HIV transmission including oral sex and deep kissing. In addition, the students have a misconception on the window period of the HIV testing which one-week risk behaviour will tell whether the person has HIV or not. The attitudes of the showed more than half of them believe that a person can get HIV by sitting in a hot tub or a swimming pool with a person who has HIV.

Finally, there is no correlation were found between HIV knowledge score and attitude score in the cohort (R=0.141, P=0.328).

Conclusions: Overall, the study found lower knowledge and prevention towards HIV/AIDS among first- and second-year students compare to third and fourth students. However, all students showed positive attitudes towards HIV/AIDS. Training and strengthening of education syllabus can convey accurate information and produce a competent pharmacist.

EPD311

The social and behavioral impact of the parenting for lifelong- health program to caregivers and teens in Eswatini

S. Makama[1], Z. Nhlabatsi[2], Z. Dlamini[1], N. Gwebu Storer[3], D. Kisiyombe[4], S. Ginindza[1]
[1]*PACT, Programs, Mbabane, Eswatini,* [2]*PACT, Research, Mbabane, Eswatini,* [3]*PACT, Chief of Party, Mbabane, Eswatini,* [4]*PACT, Strategic Information, Dar es Salaam, Tanzania, The United Republic of*

Background: Parent-child communication and healthy relationships are important in combating risky behaviours that may lead to HIV infection among youth. In Eswatini parents do not spend time with their children to provide sexual education at household level (Mgadi:2003), reflecting poor parent-child relationships. Eswatini Ready, Resourceful, Risk Aware Project is implementing the Parenting for Lifelong Health (PLH) program targeting teens and caregivers of teens to promote positive parenting and reduce risky HIV behaviours.

The hypothesis tested in this study is to provide evidence that caregivers and teens will have positive parental attitude after participating and completing the PLH program.

Methods: Secondary data analysis of routine data collected within ongoing implementation was explored to assess parental behavior and perception before and after program participation. 1832 caregivers and 1587 teens completed a pre PLH survey. Both participated in the 14 weeks parenting for teens program between October 2020 to September 2021. Upon completion, 1130 caregivers and 846 teens completed a post PLH survey. Regression models were conducted to assess pre-post differences programme effects using base package installed by default in R Studio (version 4.0.3). Variables that were not normally distributed were square root transformed. A significant ($p<0.05$) regression coefficient was considered to indicate programme impact on the outcome of interest.

Results: The regression results shows that caregiver (726 females (64.25%) and 404 males (35.75%) and teen (10-19 years) was associated with an improvement in child be-

haviors (caregiver-report: *b*= -0.11, p=0.00; teen-report: *b* = -0.20, p=0.00), parental mental health (caregiver-report: *b* = -0.17, p=0.04), and financial condition (caregiver-report: *b* = -2.07, p=0.00) at post-intervention.

Although we did not detect any difference between the pre- and post-caregiver reports in terms of parenting style (b =0.66, p=0.10), the teen-reported data indicated that they experienced more positive parenting practices (b = 1.00, p=0.00) after the programme.

Conclusions: Evidence suggests that exposure to PLH program influences positive parenting practices amongst parents and teens. The PLH intervention may also be adapted for teenagers and caregivers in prison. Future studies should investigate differences in HIV infection rate of participants exposed to PLH compared to those not.

EPD312

Perceptions of weight gain from use of dolutegravir-based regimens in women living with HIV in Uganda

Y. Nagumse Alhassan[1], A. Twimukye[2], T. Malaba[3], L. Myer[3], C. Waitt[4,2], M. Lamorde[2], A. Colbers[5], H. Reynolds[4], S. Khoo[4,6], M. Taegtmeyer[1,6]

[1]Liverpool School of Tropical Medicine, International Public Health, Liverpool, United Kingdom, [2]Makerere University, Infectious Diseases Institute, Kampala, Uganda, [3]University of Cape Town, School of Public Health and Family Medicine, Cape Town, South Africa, [4]University of Liverpool, Molecular and Integrative Biology, Liverpool, United Kingdom, [5]Radboud University Medical Centre, Radboud Institute for Health Sciences, Nijmegen, Netherlands, the, [6]Royal Liverpool University Hospital, Tropical Infectious Diseases Unit, Liverpool, United Kingdom

Background: Dolutegravir (DTG)-based regimens have been recommended by the WHO as the preferred standard first-line HIV treatment in low- and middle-income countries. Evidence suggests an association with weight gain, particularly among black women.

Our study investigated perceptions of weight gain from DTG-based regimen use on body image and adherence of antiretroviral therapy in women living with HIV (WLHIV) in Uganda.

Methods: Between April and June 2021, we conducted semi-structured interviews involving 25 WLHIV (adolescents, women of reproductive potential and post-menopausal women) and 19 healthcare professionals (clinicians, nurses, ART managers and counsellors) purposively selected from HIV clinics in Kampala.

The interviews explored perceptions of body weight and image; experiences and management of weight related side effects associated with DTG; and knowledge and communication of DTG-related risks. Data was analyzed thematically in NVivo 12 software.

Results: Our findings indicate WLHIV in Uganda commonly disliked thin body size and aspired to gain moderate to high level body weight to improve their body image, social standing and hide their sero-positive status. Both WLHIV and healthcare professionals widely associated weight gain with DTG use, although it was rarely perceived as an adverse event and was unlikely to be reported or to alter medication adherence. Clinical management and pharmacovigilance of DTG-related weight gain were hampered by the limited knowledge of WLHIV of the health risks of being over-weight and obesity; lack of diagnostic equipment and resources; and limited clinical guidance for managing weight gain and associated cardiovascular and metabolic comorbidities.

Conclusions: The study highlights the significance of large body-size in promoting psychosocial wellbeing in WLHIV in Uganda. Although weight gain is recognized as a side effect of DTG, it may be welcomed by some WLHIV. Healthcare professionals should actively talk about and monitor for weight gain and occurrence of associated comorbidities to facilitate timely interventions. Improved supply of diagnostic equipment and support with sufficient guidance for managing weight gain for healthcare professionals in Uganda are recommended.

EPD313

Suicide ideation and attempt among people living with HIV in South Carolina: 2005-2016

T. Mi[1], J. Zhang[1], X. Yang[1], S. Chen[1], S. Weissman[1], B. Olatosi[1], X. Li[1]

[1]University of South Carolina, Columbia, United States

Background: Risk factors for suicidality among people living with HIV (PLWH) could change over time, along with the development of combination antiretroviral therapy (cART). Only a few studies have investigated the trajectories and leading risk factors of suicidality along with the advance of cART with longitudinal data.

This study aimed to examine the leading risk factors of suicide ideation/attempt among PLWH in South Carolina, overall and stratified by different cART eras (early period:2005-2008 and late period: 2009-2016).

Methods: Retrieved from the HIV/AIDS electronic reporting system at the South Carolina Department of Health and Environmental Control (DHEC), the statewide PLWH who were diagnosed between 2005 and 2016 were included for this study. Suicide ideation/attempt was defined based on ICD-9/10 codes. Cox proportional hazards model was employed to examine the association of suicide ideation/attempt and predictors including demographics, HIV-related characteristics, and mental health conditions.

Results: Among a total of 8,567 PLWH, the incidence of suicide ideation/attempt increased from 717.1 per 100,000 person-years (95% Confidence Interval [CI] 497.6-936.7) in the early cART era (2005-2008) to 861.8 (95% CI 738.6-984.9) in the late cART era (2009-2016). Across cART eras, PLWH with suicide ideation/attempt were consistently less likely to have AIDS diagnosis, and more likely to be 18-39 years of age, have a diagnosis of major depressive disorder, co-

caine use, and alcohol use (*ps*<.05). Leading risk factors of suicide ideation/attempt could also change across cART eras. In the early cART era, PLWH with suicide ideation/attempt were more likely to be White and diagnosed with bipolar disorder (*ps*<.05).

In the late cART era, suicidal ideation/attempt was positively associated with transmission through injection drug use, anxiety, post-traumatic stress disorder, schizophrenia, and personality disorder (*ps*<.05). Neither initial CD4 nor viral load was not associated with suicide ideation/attempt in any cART eras.

Conclusions: The overall suicide ideation/attempt rate has increased, and mental health conditions became more prominent risk factors of suicide ideation/attempt in the late cART era. Improved access to psychiatric care may have facilitated the identification of mental health conditions. Timely counseling or pharmaceutical interventions of these conditions might have prevented escalation to the severe end of the suicide ideation/attempts spectrum.

EPD314

Loneliness and its correlates in older people living with HIV in Wuxi, China: a cross-sectional study

B. Wang[1], X. Peng[1], B. Liang[1], L. Fu[1], T. Tian[1], Y.-F. Lin[1], X. Meng[2], H. Zou[1,3]

[1]Sun Yat-sen University, School of Public Health (Shenzhen), Shenzhen, China, [2]Wuxi Center for Disease Control and Prevention, Wuxi, China, [3]University of New South Wales, Kirby Institute, Sydney, Australia

Background: Loneliness is common among older people living with HIV (PLHIV). However, little is known about the prevalence of loneliness and factors that impact loneliness. This study aimed to explore factors affecting loneliness among older PLHIV.

Methods: A cross-sectional study was conducted among PLHIV attending the Fifth People's Hospital of Wuxi, Jiangsu Province, China from March to October 2021. Eligible participants were men and women living with HIV who were 50 years and older (older PLHIV).

Loneliness and aging perceptions were measured using the short-form of the UCLA Loneliness Scale, and Brief Aging Perceptions Questionnaire, respectively. Correlates of loneliness were assessed using multivariable logistic regression analyses.

Results: A total of 200 older PLHIV (148 men and 52 women, median age 59.5, IQR 54.0-67.0) were recruited. Participants were predominately heterosexuals (75.5%, n=151), and all homosexuals were men. Over half (54.5%, n=109) reported loneliness symptoms. Loneliness was associated with aging perceptions (adjusted odds ratio =1.12, 95% confidence interval =1.06-1.19).

No statistically significant association was found between loneliness and age. Older PLHIV who self-identified as homosexual were more likely to report loneliness (adjusted odds ratio =3.397, 95% confidence interval =1.48-7.79).

Conclusions: Our findings highlight the high burden of loneliness among older PLHIV. Mental health healthcare for older PLHIV should be taken by aging perceptions specific rather than age. Homosexual older PLHIV may require extra mental health care compared to their bisexual and heterosexual counterparts.

Further researches are needed to verify these findings and examine novel interventions to reduce loneliness in older PLHIV.

EPD315

Predictors of viral load suppression among key populations: evidence from a low resource setting in Bulawayo, Zimbabwe

B. Ndlovu[1], I. Moyo[2], J. Mavudze[2], M. Munjoma[2], M. Pako[2], P. Dube[2]

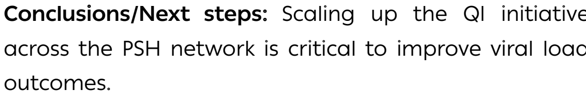
[1]Population Solutions for Health, Evidence, Harare, Zimbabwe, [2]Population Solutions for Health, Harare, Zimbabwe

Background: Statistics from the United States Agency for International Development (USAID) show that viral load suppression rates among key populations remain below the target 95%.Beginning of 2018, clinics supported by PSI through Population Solutions for Health (PSH) with funding from USAID on the Going the Last Mile for HIV Control program showed a combined viral load suppression rate of 92% between 90% and 93%.

This enquiry sought to identify factors associated with viral load suppression and evaluate the contribution of Quality Improvement (QI) initiatives at Bambanani New Start Centre (NSC) in Bulawayo.

Description: A cross-sectional and longitudinal analysis of data from key populations served by Bambanani NSC, prioritized clients who were on ART for at least 12 months and had at least one unsuppressed viral load result from 2015 to 2021.PSH introduced structured QI initiatives at the beginning of 2020 to improve viral load outcomes. A comparison of outputs before and after implementing the intervention was conducted. Data were generated from PSH's electronic medical record and analysed using STATA V13. Hazard ratios were calculated to identify factors associated with viral load suppression and a t-test compared mean uptake of unsuppressed viral load outcomes before and after QI implementation.

Lessons learned: Men who have sex with men and high-risk men were both 1.5 times (95%; C.I: 1.06 – 2.27), (95%; C.I: 1.06 – 2.28) more likely to have an unsuppressed viral load compared to their counterparts who are female sex workers, transgender, and females respectively. Clients initiated on ART at static site were 78% (95%; C.I: 0.13 – 0.39) less likely to have an unsuppressed viral load result compared to clients initiated from outreach points. Significant mean uptake of 5 and 1 (95%; C.I: 2.42 - 4.8) showed that before QI initiatives the mean number of clients to have an unsuppressed viral load result was higher compared to after the implementation of structured QI.



Conclusions/Next steps: Scaling up the QI initiative across the PSH network is critical to improve viral load outcomes.

EPD316

Social and clinical outcomes of adolescents and young adults living with HIV transitioned from pediatric to adult centered care at University Teaching Hospital of Kigali (CHUK)

F. Mushimiyimana[1], J. Uwinkesha[2], A. Kanyamuhunga[1]
[1]University Teaching Hospital of Kigali/CHUK, Pediatrics and Child Health, Kigali, Rwanda, [2]Ministry of Health, Pediatric and Child Health, Kigali, Rwanda

Background: In Rwanda, the prevalence of HIV has been stable since 2005 (3% among adults 15-49 years)(4). The introduction of highly Active Antiretroviral Therapy (HAART) had a great impact on the outcome of patients living with HIV in general, many children with HIV are surviving up to adulthood(6)(7). This represents the need for transition from pediatric to adult care(8). The transition period has been associated with high drop-out rates with resultant poor retention in care and increased morbidity and mortality(8)(9).
Since 2016, the pediatric HIV clinic at CHUK has transitionned adolescents and YA to the adult-centered clinic, but no evaluation of their outcomes has been done. Our aim is to determine their outcomes and to assess their retention in care.
Methods: A cross-sectional study was conducted at the University Teaching Hospital of Kigali (CHUK), which is a public referral tertiary level hospital located in Kigali. Participants were HIV-infected adolescents and YA transitioned from January 2016 to December 2019. Data was collected in their clinical records and by in-person interview. Descriptive statistics were used to describe the study population and paired T-test was used to compare pre-and post-transition viral loads (VL).
Results: During the study period, 85 adolescents and YA were transitioned from pediatric to adult HIV clinic at CHUK. Among them, 57 consented to the study. The median age at the time of transition was 19 years.
More than half of the youth (69.6%) confirmed that they were sexually active, 7% stated that they had STI (s) other than HIV since the time of transition and 15.8% stated that they had opportunistic infection (s) since the time of transition.
At 3 years post-transition, the VL suppression had increased from 82.5% to 94.7% and the mean VL had decreased from 4454.3 to 3867.9. The difference in means of viral loads was not proven to be statistically significant. The majority of our population (96.5%) were still engaged in care.
Conclusions: In the third year post transition, there was good outcome as the VL load suppression was higher and the mean VL went below the baseline. There was a high rate of retention in care among our participants.

EPD317

Gender dimensions of adolescent intervention acceptability: lessons from a systematic review of studies with young adults in Africa

O. Somefun[1], M. Casale[2]
[1]University of the Western Cape, School of Public Health, Cape Town, South Africa, [2]University of Oxford, Oxford, United Kingdom

Background: Intervention acceptability has been linked to more targeted interventions, better implementation and effectiveness, and higher participation rates. However, acceptability studies with adolescents in low- and middle-income countries (LMICs) are relatively scarce, and no existing reviews aggregate the evidence from Africa.
Methods: We conducted a systematic review to identify studies assessing acceptability of HIV prevention, testing and adherence interventions in sub-Saharan Africa, with young people aged 10-24, published over the past decade.
We synthesized quantitative and qualitative findings across studies, through descriptive synthesis and inductive thematic analysis, to determine which HIV interventions young people found acceptable or unacceptable, their reported reasons for acceptability or unacceptability, and gender differences in acceptability findings.
Results: Review search generated 6196 records, and 55 final eligible studies assessing 60 interventions for acceptability. Acceptability was high among 49 of the 55 studies. Of the 41 studies that included male and female participants, 14 disaggregated results by (male versus female) gender. Six of these studies (3 quantitative and 3 qualitative) highlighted gender differences in acceptability findings.
The three quantitative studies respectively showed higher acceptability for HIV testing at school and for male circumcision among females, and higher acceptability of the HPV vaccine among males. Instead, three qualitative studies revealed gender differences regarding reasons given for SRH intervention acceptability.
For instance, in an HIV vaccine study, friends and family members were strong motivators for vaccine uptake among adolescent women, while young men were more likely to see vaccines as an opportunity to stop condom use and engage in multiple sexual partnerships.
A second HIV vaccine study revealed adolescents' preferences for a vaginal ring and HIV vaccine because of young women's desire for greater agency and autonomy, and male distrust of female partners.
Conclusions: Our results highlight gender-related factors among the key influencers of acceptability or unacceptability of SRH interventions with young people in Africa. However, most existing study designs do not allow for a disaggregated analysis of acceptability by gender. Moreover, not one of the studies in this review referred to a broader conceptualisation of gender or worked specifically with minority populations such as LGBQTI or young adults living with disabilities.

EPD318

Generating demand for the test that counts: community-led campaigns to increase routine viral load testing

B. Killingo[1], H. Etya'ale[1], P. Pilane[2], S. Perez[3], W. Jallow[1]
[1]International Treatment Preparedness Coalition, Johannesburg, South Africa, [2]Mathaba Media, Johannesburg, South Africa, [3]AIDS Strategy, Advocacy and Policy, Hanoi, Viet Nam

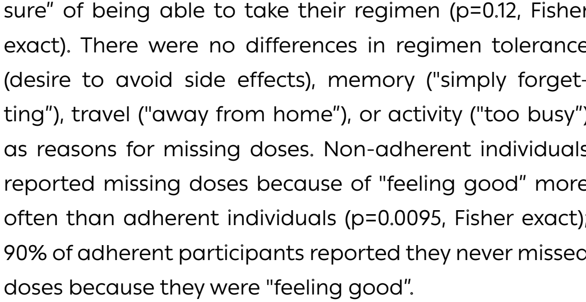
Background: Routine viral load testing (RVLT) is key to effective HIV treatment monitoring for people living with HIV (PLHIV). Scaling up RVLT is essential to achieving viral suppression for people on antiretroviral treatment.
However, uptake of RVLT among PLHIV remains low, hindered by a mix of demand and supply-side barriers; a significant barrier is the lack of awareness of the need for RVLT. Innovative, targeted community-led approaches are needed to generate demand.
Description: Building on a three-month pilot phase, the International Treatment Preparedness Coalition and six community organisations developed stepwise campaigns in the Democratic Republic of Congo, Kenya, Sierra Leone, South Sudan and Zimbabwe. Community, lab and health ministry representatives jointly identified country-specific barriers to RVLT and affected populations.
Audience and context-specific multimedia communication campaigns were rolled out by communities between July and December 2021. A post-campaign survey assessed campaign receptivity and changes in behaviour.
Lessons learned: Overall, communication campaigns reached over 78,000 adults, youth and expectant mothers living with HIV. Tailored messaging was disseminated across varied media: WhatsApp, Facebook, Twitter, Instagram, radio, virtual and peer-educator engagement meetings. Of the 188 people polled, peer educator meetings (50%), virtual meetings (14.5%), WhatsApp (14.4%) and Twitter (10%) were rated most effective in conveying the messages. The information was best received when it was easy to understand, fun and interactive and presented by community members.
Additionally, knowledge gain led to relevant action, including taking a viral load test (82%, n=186), telling one's friends (83%, n=188) and asking for interpretation of results (76%, n=185). Coupling the messaging with the Undetectable=Untransmittable campaign and ensuring that recipients of care understood the results were deemed critical in encouraging behavioural change. However, lab reagent stockouts, non-functioning machines and prioritization of COVID-19 testing emerged as barriers to RVLT.
Conclusions/Next steps: Context-specific communication campaigns are effective tools in creating demand for viral load testing, particularly when informed and adapted to local realities. While dissemination through social media channels gained traction, in-person meetings were preferred for greater engagement and understanding of the messages. Documenting and addressing persistent systemic barriers to RVLT is critical to ensuring increased demand improves treatment outcomes for PLHIV.

EPD319

Assessing antiretroviral adherence in highly treatment-experienced individuals

A. Savramis[1], N. Winchester[2], J. Earhart[1], E. Laidlaw[3], M. Adan[1], S. Kuriakose[4], C. Rehm[3], U. Santamaria[5], A. Pau[4], C.-Y. Lau[1], F. Maldarelli[1]
[1]National Institute of Health, HIV Dynamics and Replication Program, Bethesda, United States, [2]National Institute of Allergy and Infectious Diseases, Division of Clinical Research, Bethesda, United States, [3]National Institute of Allergy and Infectious Diseases, Division of Intramural Research, Laboratory of Immunoregulation, Bethesda, United States, [4]National Institute of Allergy and Infectious Diseases, Division of Clinical Research, Intramural Clinical Management and Operations Branch, Bethesda, United States, [5]National Institute of Allergy and Infectious Diseases, Division of Intramural Research, Bethesda, United States

Background: Non-adherence to antiretroviral therapy (ART) is the most common reason for rebound viremia. Assessment of regimen adherence has not been extensively investigated in highly treatment-experienced individuals. Studies identifying reasons for non-adherence for this group are necessary. We previously conducted a study of highly treatment-experienced individuals with ongoing viremia and identified non-adherent individuals during inpatient directly observed therapy (DOT). Participants completed an adherence survey at entry. We herein analyzed baseline adherence survey responses in adherent and non-adherent individuals.
Methods: Twenty HIV-1 infected individuals with documented viremia >1000 copies/ml on ART enrolled in a clinical study of DOT. Participants completed the ACTG baseline adherence questionnaire II during screening and were admitted to the NIH Clinical Center for 7-8 days of self-guided DOT. Participants were instructed to request their ARV drugs. Participants were considered adherent during the DOT period if ART was requested for >90% of prescribed doses. Questionnaire responses in adherent vs. non-adherent individuals were analyzed using T- and Fisher exact tests.
Results: Seven participants were non-adherent and 13 adherent during DOT. Average participant age was 45.5 years (range 26.0-51.3), median CD4 54.0 (13.8-90.3), median viral load 4.46 $\log_{10}$ copies/mL (4.32-5.00), mean years on ART 17.2 (SE 6.1), and mean number of ART drugs 11.8 (SE 4.5). No differences in education level, current alcohol or substance use were present between groups. Reported regimen confidence was high in both groups with no differences in number of individuals who were "extremely



sure" of being able to take their regimen (p=0.12, Fisher exact). There were no differences in regimen tolerance (desire to avoid side effects), memory ("simply forgetting"), travel ("away from home"), or activity ("too busy") as reasons for missing doses. Non-adherent individuals reported missing doses because of "feeling good" more often than adherent individuals (p=0.0095, Fisher exact); 90% of adherent participants reported they never missed doses because they were "feeling good".

Conclusions: Most self-reported answers regarding reasons for missing doses did not discriminate between adherent and non-adherent individuals in this group of highly treatment-experienced individuals. Development of new tools in assessing ART adherence, including questions regarding individual well-being may be useful.

Conceptualizing social and structural factors and their impacts

EPD320

Prevalence and factors associated with risky sexual behaviors among female adolescents in Zambia

Q. Sserwanja[1], D. Mwamba[2], P. Poon[3], J. H Kim[3]

[1]GOAL Global, Programmes, Khartoum, Sudan, the, [2]Centre for Infectious Disease Research, Programmes, Lusaka, Zambia, [3]The Chinese University of Hong Kong, Center for Global Health, JC School of Public Health and Primary Care, Hong Kong, Hong Kong, SAR of China

Background: Despite decades-long commitment to women's reproductive health rights, sexually-transmitted diseases and unintended pregnancies continue to be major public health concerns in sub-Saharan African. To address the dearth of a nation-wide studies in the African continent, this study aims to explore the prevalence and factors associated with risky sexual behaviors (RSB) among Zambian female adolescents.

Methods: Data on adolescent females, aged 15-19 (n= 3000), were obtained from the 2018 Zambia Demographic and Health Survey, an interviewer-administered, nationally representative survey that used multistage sampling. The study conducted multivariable logistic regression to explore the correlates of RSB.

Results: Of respondents, 49.7% reported ever having sexual intercourse and 35.3% (71.1% of sexually active respondents) reported engaging in RSB. The following RSB percentages were reported: intercourse before age 16 (25.1%), non-use of condoms at last intercourse (18.8%), engaging in transactional sex (3.1%), alcohol use at last intercourse (2.3%) and multiple sexual partners (0.9%).

Educational attainment and household wealth showed strong inverse trends with RSB risk and there were notably large geographic differences in RSB within Zambia (22.1% in Lusaka region versus 62.4% in Western province). The multivariable results of the of all respondents revealed that those who were older, employed, less educated, less wealthy, residing in Southern, Western and North Western provinces and those with no exposure to print media were significantly more likely to have engaged in RSB (AOR: 1.28-4.11, p<0.05).

Among sexually-active females, similar trends were noted except that younger, non-married adolescents without internet access were at higher risk of RSB.

Conclusions: Given the negative health outcomes associated with RSB, Zambian adolescent health care programs may strategically target limited resources to the identified risk groups.

EPD321

"Things are easy and faster" - Client and healthcare worker experiences with Differentiated Service Delivery in western Kenya

J. Lewis-Kulzer[1], F. Odhiambo[2], R. Onyango[2], A.R. Mocello[1], A. Aoko[3], R. Joseph[3], P. Musingila[3], E.A. Bukusi[2], C.R. Cohen[1]

[1]University of California San Francisco, Department of Obstetrics, Gynecology, and Reproductive Sciences, San Francisco, United States, [2]Kenya Medical Research Institute, Centre for Microbiology Research, Nairobi, Kenya, [3]U.S. Centers for Disease Control and Prevention, Division of Global HIV&TB, Center for Global Health, Kisumu, Kenya

Background: Kenya implemented treat-all in 2016 for people living with HIV, increasing treatment access but further over-burdening health facilities. To relieve impacted clinics,the Kenya Ministry of Health (MOH) rolled-out Differentiated Service Delivery (DSD), allowing stable adult clients on antiretroviral therapy (ART) to attend clinics less frequently through facility- and community-based models.

This study sought an in-depth understanding of ART client and healthcare worker (HCW) experiences with DSD to assess impact.

Methods: In August 2020, nine Focus Group Discussions (FGDs) were conducted at three MOH facilities in Kisumu County. An urban, semi-urban and rural facility were selected with each conducting HCW, adult (≥18 years) male client, and adult female client FGDs. Ten participants per FGD were purposefully selected representing multiple DSD models for client groups and client interaction variety among HCWs. Client FGDs were conducted in their language preference (English, Kiswahili, Dholuo), while HCW FGDs were in English.

Discussions focused on DSD experiences, barriers, satisfaction, and recommendations. FGDs were led by a trained facilitator using a guide and were audio-recorded, transcribed, translated, coded and analyzed in Dedoose software, version 9.0, by qualitative researchers.

Results: High satisfaction with the efficient clinic services was the predominant theme. Clients appreciated spending less time at the clinic, while HCWs appreciated the reduced workload, less congested facilities, and more time

for clients requiring clinical care. Both clients and HCWs indicated improved staff attitudes and more meaningful client encounters with the reduced workload. Perceived stigma with community-based models was a common thread due to privacy concerns; therefore facility-based models were overwhelmingly preferred.

Clients and HCWs agreed that DSD services add to clients' motivation to adhere and stay virally suppressed. Recommendations centered on further spacing of refill and clinical visits, improved privacy measures for discrete community delivery, and adherence support for suppression.

Conclusions: This study provides important insights on how well DSD is received by clients and HCWs and the efficiencies it brings to service delivery.

This study also elucidates initiatives to consider including further spacing of clinic and refill visits, addressing privacy concerns to bolster community-based DSD, and strengthening adherence support to optimize client-centered care and health outcomes.

EPD322

Sexual, gender and racial minority stigma as barriers to HIV prevention services and research

M. Guzman[1], S. Azhar[1], C.B. Fisher[2]

[1]Fordham University, Graduate School of Social Service, New York, United States, [2]Fordham University, Center for Ethics Education and Department of Psychology, New York, United States

Background: Although sexual and gender minorities (SGM) of color in the United States are at increased risk for HIV acquisition, previous research has not fully identified the challenges that participants face to more fully engage in HIV prevention services or research. Applying Meyer's Minority Stress Theory (MST) as our conceptual framework to the lived experiences of SGM of color, we explored barriers to HIV prevention services and research engagement.

Methods: We conducted a qualitative thematic analysis of responses from an online survey (N=222) administered between December 2019 and February 2020 on Qualtrics XM. Criteria for eligibility included: assigned male sex at birth; had sex with a cisgender man in the past year; resided in the U.S.; over the age of 18; self-reported HIV-negative serostatus; and self-identified as Asian, Black/African American, or Hispanic/Latinx. Responses were coded by a research team of eight coders, including five Community Advisory Board members. Quotes from survey responses were selected to illustrate emerging themes.

Results: Of 2,193 individuals who completed the eligibility screener, 381 (17.4%) met eligibility criteria, and 222 (10%) completed the survey. The majority of participants (66.7%) identified as cisgender men, followed by transgender women (21.8%); transgender men (5.6%); and gender-nonconforming (GNC) (6.0%). In terms of sexual orientation, the majority of participants identified as gay (44.1%) or bisexual (36.9%). Across racial/ethnic groups, there were no significant differences by age, income, or education. Emerging themes included fear of exposure of SGM identity; a lack of education, leading to a failure to adopt safer sex practices; stigma and discrimination during participation in HIV prevention research; access to care and racial discrimination; and the sustainability of medication and financial incentives. Some participants felt singled out, targeted or blamed for HIV transmission trends within their community while other participants felt disregarded or ignored by current HIV research and service mechanisms.

Conclusions: By tailoring HIV prevention research and services to the needs of SGM of color, health care providers and researchers can better address health disparities within this population. Themes can be utilized to more effectively engage research participants and HIV prevention service recipients.

EPD323

The impacts of sleep-related breathing disorders on sleep architecture, physical and psychological health in HIV infection: a matched case-control study

Y.-C. Chen[1], C.-C. Chen[2], N.-Y. Ko[2], C.-Y. Lin[3]

[1]National Cheng Kung University Hospital, College of Medicine, National Cheng Kung University, Nursing, Tainan, Taiwan, Province of China, [2]National Cheng Kung University, Nursing, Tainan, Taiwan, Province of China, [3]National Cheng Kung University Hospital, College of Medicine, National Cheng Kung University, Otolaryngology, Tainan, Taiwan, Province of China

Background: Sleep-related breathing disorders (SRBDs) is a common sleep disorder in HIV-infected persons, which is not only associated with loud snoring and excessive daytime sleepiness but also increase the risk of anxiety and depression. However, the impacts of SRBDs on physical and psychological health in HIV infection have not been fully evaluated.

We aimed to investigate the impacts of SRBDs on sleep architecture and the development of loud snoring, excessive daytime sleepiness, and affective disorders in HIV-infected and non-infected men.

Methods: A secondary data analysis using matched case-control study was conducted. 54 HIV-infected persons (case group) were enrolled from 2016 to 2019. A control group with HIV uninfected men were matched for SRBDs severity and were selected for comparison. For both cohorts, an overnight sleep study using a Somte 32 V1 monitor was done.

Results: The mean age of the 108 patients (including 54 cases and 54 matched controls) was 33.75 years. Study participants had different levels of SRBDs severity, 40 (37.0%) had apnea and hypopnea index (AHI) < 5 events/hour, 36 (33.3%) AHI between 5 and 15, and 32 (29.7%) AHI ≥ 15. HIV-infected persons with SRBDs had lower mean

Oral abstracts

Late-breaker abstracts

Author Index

body weight (kg/m2) (23.74 vs. 27.22) and mean neck size (cm) (36.45 vs. 38.85) compared to matched controls. Central-apnea index (CI) was higher in the case group rather than matched controls (mean CI, 0.34 vs. 0.17, p = 0.049). The mean percentage of slow sleep stage included stage 3 sleep (10.26% vs. 13.94%, p=0.034) and rapid eye movement sleep (20.59% vs. 17.85%, p=0.011), and were significantly lower in the HIV-infected persons than among matched controls.

No differences in anxiety and depression between HIV-infected persons and matched controls were identified. Only louder snore and excessive daytime sleepiness showed significantly lower in HIV-infected persons compared to matched controls.

Conclusions: HIV-infected persons with SRBDs appeared to have a high CI and may relate to a lower percentage of slow sleep stage than matched controls. However, it does not confer a higher risk for affective disorders. A longitudinal study is recommended to examine the impact of SRBDs on health outcomes in HIV-infected persons.

EPD324

Communicating about PrEP use within interpersonal relationships: qualitative experiences of gay, bisexual and other men-who-have-sex-with-men in England

A. Jajja[1], R. Horne[2], W. Nutland[3,4], S. Wayal[5], B. Rice[3], S. McCormack[6], M. Gafos[3]

[1]School of Public Health London, Kent, Surrey and Sussex, Health Education England, London, United Kingdom, [2]University College London, School of Pharmacy, Practice & Policy, London, United Kingdom, [3]London School of Hygiene and Tropical Medicine, Faculty of Public Health and Policy, London, United Kingdom, [4]PrEPster, London, United Kingdom, [5]University College London, Institute for Global Health, London, United Kingdom, [6]University College London, Medical Research Council Clinical Trials Unit, London, United Kingdom

Background: Oral pre-exposure prophylaxis (PrEP) use among gay, bisexual and other men who have sex with men (GBMSM) is crucial to ending the HIV epidemic by 2030. This qualitative study explores how the first wave of PrEP users in the UK PROUD study communicated about their use of PrEP within interpersonal relationships.

Methods: Between Feb-2014 and Jan-2016, 41 in-depth interviews were conducted with GBMSM and a transwoman at sexual health clinics in England. Interviews were conducted in English and audio-recorded. Recordings were transcribed, coded and analysed using thematic analysis. Interviews explored participants' communication about PrEP, reasons for communicating or not, and societal attitudes towards PrEP.

Results: Participants discussed their PrEP use across a range of interpersonal relationships, with most speaking to at least one person which was usually a sexual partner or friend.

Discussions took place in-person and on-line. Motives for choosing who to discuss PrEP with and how to discuss it, varied depending on the interpersonal relationship and included making decisions about starting PrEP, navigating sexual behaviours and relationships, and raising awareness about the benefits of PrEP.

Responses to discussions about PrEP varied across and within social groups, from some people being supportive and interested in PrEP for themselves, to others disapproving of PrEP completely. Discussions with sexual partners were usually supportive and positively influenced adherence. Discussions within social networks were mostly positive and recognised as a primary source for information-sharing. However, negative social attitudes including PrEP-stigma, condomless sex as a taboo, and a general lack of awareness of PrEP among GBMSM were reported. The novelty of PrEP in the UK at this time was noted as a contributing factor to these responses.

Conclusions: These findings highlight that it was important to most PrEP users, to discuss PrEP with partners and friends. As the first wave of PrEP users in the UK, interactions were mostly positive but tainted by a lack of awareness about PrEP and resistance to an HIV prevention method perceived to facilitate condomless sex.

These findings provide insights into how early PrEP adopters communicated about PrEP and could inform the introduction of current and future PrEP products in new settings.

EPD325

Countering fear, phobias, stigma, lack of knowledge: designing and implementing appropriate HIV awareness and testing strategies and interventions for people with hepatitis C - Georgian experience

S. Gogochashvili[1], M. Sologashvili[2]

[1]Ilia State University, Psychology, Tbilisi, Georgia, [2]Tbilisi Medical University, Tbilisi, Georgia

Background: Hepatitis C prevalence in Georgia is7% (Georgian National Centre Disease Control). UNAIDS estimates HIV prevalence in Georgia at 2.2% (www.aids.uanaids.org) but little is known about the knowledge of HIV among injecting drug users (IDU's) with HepC or the uptake of HIV testing amongst this key population.

Hepa plus, the first NGO HepC Georgian patient organization put in place an intervention to explore with HIV negative IDU's with HepC their knowledge and attitudes to HIV, the barriers to testing and or/accessing treatment, as well as their attitudes to their Hepatic C self-management.

Methods: IDU's with Hep C, clients of our service, were invited (through self-selection) to take part in an intervention; a series of participatory focus group discussions and 30 individual in-depth interviews.

60 individuals came forward as participants; 30% were women 70% men and ages ranged from the mid-twenties 20's to 60's.

4 focus groups (2 men only, 1 women only, and 1 mixed) of an hour or so in length. The format of these groups was that of an open (facilitated) discussion.

Both focus groups and the interviews were conducted to ensure confidentiality and establish ground to allow for open/non-judgmental discussion.

Results: Attitudes to, and knowledge about, HepC and HIV varied widely in both the focus and interviews. Many expressed the following:

Participants viewed HepC as a non-stigmatized condition ('it is curable') but HIV as a death sentence and stigmatized condition.

The view that someone looking healthy 'probably not having HIV' was still prevalent as was the fear that if known to be HIV+ this would mean exclusion from the IDU community; the sharing of drug equipment though reduced was not universally absent.

Gaps in knowledge of HIV transmission routes were evident, access to commodities and strategies for maintaining good sexual heath was an issue.

Conclusions: Resulting from this work we are putting in place a specific HIV testing program for our clients, attuned to their fears and concerns, as well as interventions to support our clients to make more informed choices that will assist them in reducing their vulnerability to HepC and HIV

EPD326

Internalized HIV stigma decreases for newly-diagnosed people living with HIV in Rwanda during their first 6 months in care

S. Hill[1], C. Zhang[1,2], G. Murenzi[3,4], E. Remera[5], C. Ingabire[3,4], F. Umwiza[3,4], A. Munyaneza[3,4], B. Muhoza[3,4], G. Rwibasira[5], M. Yotebieng[1,2], K. Anastos[1,2], J. Ross[1,2]

[1]*Albert Einstein College of Medicine, Department of Medicine, Bronx, United States,* [2]*Montefiore Health System, Department of Medicine, Bronx, United States,* [3]*Research for Development (RD Rwanda), Einstein-Rwanda Research and Capacity Building Program, Kigali, Rwanda,* [4]*Rwanda Military Hospital, Einstein-Rwanda Research and Capacity Building Program, Kigali, Rwanda,* [5]*Rwanda Biomedical Center, Institute of HIV Disease Prevention and Control, Kigali, Rwanda*

Background: Stigma remains a key barrier to care engagement for people living with HIV (PLHIV), particularly early in the disease course. There are limited data characterizing trajectories of HIV stigma for newly-diagnosed PLHIV.

We aimed to describe change in anticipated, enacted, and internalized HIV stigma after diagnosis among PLHIV in three health centers in Kigali, Rwanda.

Methods: We included data from the baseline and 6 month visits of an ongoing pilot study comparing differentiated HIV care models (NCT04567693). Participants were newly-diagnosed, adult PLHIV on antiretroviral therapy (ART) who enrolled between October 2020-May 2021. The HIV Stigma Scale and HIV/AIDS Stigma Instrument were used to measure anticipated (expectation of negative actions related to HIV-status), enacted (experience of negative actions related to HIV-status), and internalized (application of negative HIV-related feelings and beliefs to self) stigmas. We used paired t-tests to assess significance of change in stigma scores from baseline to 6 months and Chi-squared tests to examine associations between demographic and clinical factors and decrease in internalized stigma (vs. no decrease).

Results: Among 90 participants, 60% were female, mean age was 31, and 93% initiated ART within 7 days of enrollment in care. Among 85 participants with baseline and 6 month data, there was no significant change in mean anticipated stigma score (Baseline 2.40, 6 Month 2.49, $p = 0.33$), a small decrease in mean enacted stigma score (Baseline 1.05, 6 Month 1.02, $p=0.04$), and a substantial decrease in internalized stigma score (Baseline 1.93, 6 Month 1.35, $p < 0.001$). A higher proportion of participants who were formally employed had a decrease in internalized stigma, compared to those who were self or unemployed (71% vs. 42%, $p=0.01$); no other factors were associated with a decrease in internalized stigma.

Conclusions: In this cohort of newly-diagnosed PLHIV, we observed a significant decrease in internalized stigma over the first 6 months in care. These findings suggest early engagement in HIV care and use of ART may contribute to a reduction in internalized stigma. Subsequent studies should further explore the relationship between formal employment and internalized stigma as well as other mechanisms of change in internalized stigma over time.

EPD327

Global online interest in HIV/AIDS and STI before and during the COVID-19 pandemic: an infoepidemiology ecological study

R.S. Regner[1], P. Eustaquio[1]

[1]*LoveYourself, Mandaluyong, Philippines, the*

Background: In an increasingly connected world through the internet, HIV and STI transmission seems easier. Likewise, the internet has been a major source of health-related information and interventions, especially amid the COVID-19 pandemic. While online search traffic has been investigated for non-communicable diseases, particularly relating to health interventions, this has not been done for HIV and STI.

We looked into how COVID-19 has changed public interest in HIV and STI and determined associations between search patterns and country-specific characteristics.

Methods: We did an ecological study using secondary data from the Google Trends™ dataset. We analyzed the search volume index (SVI) for terms "HIV/AIDS", "Sexually Transmitted Infection", and "COVID-19" from 2004-2021 in all countries. Mean differences in SVI between HIV and STI, and pre-pandemic and during the pandemic were deter-

Oral abstracts

Poster exhibition

E-posters

Late-breaker abstracts

Author Index

mined using t-test. Correlations between SVI and country-level socioeconomic and HIV-related attributes using Spearman's rank-order correlation.

Results: In the past two decades, SVI for HIV/AIDS were significantly different from that of STI (p<0.001). There was a gradual decline in search in HIV/AIDS, whereas a sustained volume was noted with STI.

Interest in both HIV/AIDS (p<0.001) and STI (p<0.001) were significantly different in pre-COVID-19 pandemic in 2019 and during the pandemic in 2020. Individuals were mostly searching for its signs/symptoms, diagnosis, and transmission; HIV treatment interest was low. SVI was negatively correlated with the country's GDP, GDP per capita, proportion of internet users, percent change in HIV and AIDS-related death incidence, and estimated number of PLHIV. SVI was highly positively correlated with adult HIV prevalence rate.

Conclusions: This is the first infoepidemiology ecological study in HIV. Individuals were generally more interested in HIV than STI as a whole. Significant drop in search interest were noted during the COVID-19 pandemic. As country development core indicators were negatively correlated with SVI, it affirms the disproportionate HIV burden and lack of access among low- and middle-income countries.

Moreover, the high positive correlation between adult disease prevalence and SVI suggests the internet as a significant source of information. These emphasize the need for health promotion information accessible online and commensurate support for holistic development and wellbeing.

EPD328

HIV care engagement among people living with HIV receiving food assistance in the United States: a qualitative analysis

J. Bleasdale[1], G.D. Morse[1,2], L. Leone[1], Y. Liu[3], S.M. Przybyla[1]
[1]School of Public Health and Health Professions, University at Buffalo, Department of Community Health and Health Behavior, Buffalo, United States, [2]School of Pharmacy and Pharmaceutical Sciences, University at Buffalo, Department of Pharmacy Practice, Buffalo, United States, [3]School of Medicine and Dentistry, University of Rochester, Department of Public Health Sciences, Rochester, United States

Background: There is a strong population-level association between socioeconomic factors and HIV infection. Resource-poor environments often endure structural impediments, including low median household income, limited access to healthcare, and food insecurity, which have negative consequences on health behaviors associated with HIV. It is likely that the COVID-19 pandemic has exacerbated these concerns, particularly among people living with HIV (PLH). The relationships between food assistance, food insecurity, and care engagement among PLH have significant implications for public health; yet the lack of qualitative work in resource-rich settings has not allowed for a nuanced understanding of this phenomenon.

The purpose of this study was to explore socio-contextual factors that influence care engagement among PLH receiving food assistance in the United States.

Methods: Twenty-five PLH receiving food assistance were recruited from January-October 2021. First, enrolled participants completed a survey assessing socio-demographic characteristics, medication adherence, and food insecurity.

Second, semi-structured interviews discussed various socio-contextual factors that influence engagement in HIV-related care. A thematic content analysis reported semantic level themes describing factors influencing HIV care following an integrated inductive-deductive approach.

Results: Most participants self-identified as male (52%), Black/African American (68%), and straight/heterosexual (60%). Ages ranged from 24-85 years (*M*=39.9 years, *SD*=17). Past-month antiretroviral therapy (ART) adherence ranged from 75%-100% (M=95.5%, SD=6); the majority self-reported viral suppression (64%). More than half of participants were food insecure (56%), with 4%, 24%, and 28% indicating mild, moderate, and severe food insecurity, respectively. Qualitative analysis revealed two themes.

First, participants described the impact of food insecurity on their HIV care through various mental health and behavioral pathways. Food insecurity eroded participants' mental wellbeing which affected their ART adherence and HIV care.

Second, participants described the positive influence of social support on the facilitation of care. Support from clinicians, friends, and family helped participants adhere to ART and encouraged care engagement.

Conclusions: Results indicate the need to prospectively study socio-contextual factors influencing HIV care among PLH receiving food assistance.

Through a more nuanced understanding of these factors, interventions at the individual, community, and policy levels can be implemented to address food access with the goal of increasing engagement in HIV care.

EPD329

Resilience, social support, and healthcare empowerment on HIV care engagement and viral suppression among young Black sexual minority men with HIV in the US South: overcoming social and structural barriers

E. Storholm[1], L. Pollack[2], D. Siconolfi[3], S. Kegeles[2], W. Vincent[4]
[1]San Diego State University, School of Public Health, San Diego, United States, [2]University of California, San Francisco, United States, [3]RAND Corporation, Pittsburg, United States, [4]Temple University, Philadelphia, United States

Background: In the United States (US) South, young Black sexual minority men (YBSMM; ages 18-34) are the most disproportionately impacted by HIV. HIV transmissibility

is heightened by less engagement in the HIV care continuum (CC) and lower viral suppression among YBSMM living with HIV (YBSMM+). Informed by Minority Stress Theory and Syndemic Theory, this exploratory analysis of data from a community cohort of (N=224) YBSMM+ in the US South sought to shed light on the impact of socioeconomic distress, intimate partner violence, depressive symptoms, HIV-related social support, resilience, and healthcare empowerment on CC engagement.

Methods: We first conducted bivariate analyses which established associations of each of the above latent predictor variables of interest and the latent outcome variable HIV CC engagement defined as: being on antiretroviral therapy, being retained in care, and having an undetectable viral load. We then constructed a structural equation model (SEM) in Mplus predicting HIV CC engagement and assessed for the potential mediating effect of healthcare empowerment.

Results: We found higher socioeconomic distress (b=-0.25, SE=0.10, $b*$=-0.29, p=0.013), intimate partner violence (b=-0.23, SE=0.09, $b*$=-0.30, p=0.007), and depressive symptomatology (b=-0.05, SE=0.01, $b*$=-0.40, p<0.001) were associated with lower engagement in the HIV CC. In contrast, higher resilience (b=0.31, SE=0.11, $b*$=0.31, p=0.006) and healthcare empowerment (b=0.69, SE=0.14, $b*$=0.62, p<0.00 1) were associated with higher HIV CC engagement.

We tested an SEM model and found the data fit the model well: RMSEA=0.04; CFI=0.98; SRMR=0.07. HIV-related social support and resilience were found to have significant indirect effects such that higher HIV-related social support (b=0.09, SE=0.05, p=0.076) and resilience (b=0.20, SE=0.08, p=0.019) were associated with higher HIV CC engagement through their respective impact on healthcare empowerment. Depressive symptoms maintained a significant direct effect on the outcome but no indirect effect via healthcare empowerment. Higher healthcare empowerment was associated with higher HIV CC engagement (b=0.57, SE=0.18, $b*$=0.58,p<0.001) in the mediation model.

Conclusions: The findings from this exploratory analysis of the impact of individual, social and structural Barriers on HIV CC engagement suggest that there is hope for overcoming the deleterious effect socioeconomic distress and intimate partner violence have on HIV CC engagement by targeting healthcare empowerment among YBSMM+.

EPD330

Developing a validated scale to measure PrEP stigma among adolescent girls and young women in Western Kenya

S.T. Roberts[1], C. Bann[2], M. Hartmann[1], S. Otticha[3], L. Nyblade[4], T. Marton[1], M. Ochillo[3], K. Agot[3]

[1]RTI International, Women's Global Health Imperative, Berkeley, United States, [2]RTI International, Division of Statistical and Data Sciences, Research Triangle Park, United States, [3]Impact Research and Development Organization, Kisumu, Kenya, [4]RTI International, Global Health Division, International Development Group, Washington, DC, United States

Background: Qualitative research suggests stigma is a barrier to effective pre-exposure prophylaxis (PrEP) use among adolescent girls and young women (AGYW) in sub-Saharan Africa. However, no validated scales are available to measure the prevalence of PrEP stigma in this population or evaluate the impact of stigma-reduction interventions. We developed and validated a scale to measure PrEP stigma experienced by AGYW using PrEP in Siaya County, Kenya.

Methods: An initial scale was developed from a conceptual framework, literature review, and participatory workshops with AGYW, revised after cognitive interviews with 13 AGYW PrEP users, and pilot tested with 200 AGYW receiving PrEP through Ministry of Health (MoH) and DREAMS programs. Confirmatory factor analysis (CFA) was used to test the hypothesized 4-factor structure characterized by stigma forms (perceived, anticipated, enacted, and internalized). We assessed convergent validity by examining correlations with HIV, gender, and sexuality stigma measures, and construct validity by comparing scale scores between groups of AGYW categorized by recruitment site and PrEP disclosure outside the household.

Subscale	Number of items	Cronbach's Alpha	Example item
Perceived stigma	5	0.83	People in my community think taking PrEP means you have HIV
Anticipated stigma	4	0.73	I worry that finding out I take PrEP would cause others to tease or insult me, call me bad names, yell at me, or scold me
Experienced stigma	5	0.76	People have avoided or left me out of social events because I take PrEP
Internalized stigma	3	0.73	I feel ashamed about using PrEP

Table 1: PrEP stigma measure subscales

Results: The final scale included 17 items (Cronbach's alpha=0.81) with 4 subscales (Table 1). The four-factor structure fit well based on CFA results and correlations with other types of stigma (rho=0.08 to 0.43) indicated that PrEP stigma is a distinct construct. Prevalence of perceived stigma was highest (79%), followed by anticipated (68%), experienced (42%), and internalized (23%) stigma.

Friends and female community members were the most common sources of perceived, anticipated, or experienced stigma, followed by male partners, family outside

Oral abstracts

Poster exhibition

E-posters

Late-breaker abstracts

Author Index

the household, and other male community members. AGYW receiving PrEP from MoH had higher perceived stigma (p=0.03) and internalized stigma (p=0.11) scores than those from DREAMS. AGYW who disclosed PrEP outside the household had higher experienced stigma scores (p<0.001).

Conclusions: Psychometric results support the validity and reliability of our PrEP stigma scale among AGYW in Kenya. The high prevalence of each form of PrEP stigma suggests a need for interventions targeting PrEP users, social networks, and the community-at-large.

EPD331

Sociostructural influences on HIV-related injection risk behaviors among women who trade sex in Tijuana, Mexico: a venue-based, multi-level analysis

R.K.J. Tan[1,2], P. González-Zúñiga[3,4], K. Lazos[3], B.S. West[5]
[1]University of North Carolina Project-China, Guangzhou, China, [2]National University of Singapore, Saw Swee Hock School of Public Health, Singapore, Singapore, [3]Wound Clinic Tijuana, Tijuana, Mexico, [4]University of California San Diego, Division of Infectious Diseases of Global Public Health, La Jolla, United States, [5]Columbia University, School of Social Work, New York, United States

Background: Most studies focus on interpersonal factors associated with injecting risk behaviors,; however, work on socio-structural factors and place shape such HIV-related injection risks is more limited. In particular, characteristics of injection venues, the places where injection occurs (e.g. homes, brothels, shooting galleries, outdoor spaces, etc.), can play an important role in drug-related outcomes, including HIV, and will be examined here.

Methods: Women aged 18 years old and older residing in Tijuana and who reported past-month injection drug use and sex work (N=150) completed surveys between April 2016 and December 2018. Measures chosen for this analysis were guided by the socioecological model (See Figure 1).

Using multilevel modelling, where 271 venues were nested within 150 participants, we examined the association between a composite measure of injection risk (i.e. frequency of injection risk behaviors), injection venue characteristics, and sociodemographic factors.

Results: In multilevel models, older participants (β=-.02, 95% CI [-.04,-.01]) and higher safe injection self-efficacy scores (β=-.05, 95% CI [-.08,-.02]) were negatively associated with, while reporting an average monthly income of ≥3500 Pesos (β=.40, 95% CI [.11,.68]) was positively associated with injection risk.

The proportion of people who encouraged the sharing of needles at venues was positively associated with injection risk when the proportion was report as half (β=.42, 95% CI [.11,.74]), more than half (β=.57, 95% CI [.16,.99]), or all (β=.77, 95% CI [.40,1.14]), relative to none. Injecting at hotels or pensions was negatively associated with injection risk scores (β=-.44, 95% CI [-.80,-.08]), and the presence of police or military patrols at venues were positively associated with injection risk scores (β=.35, 95% CI [.06,.63]).

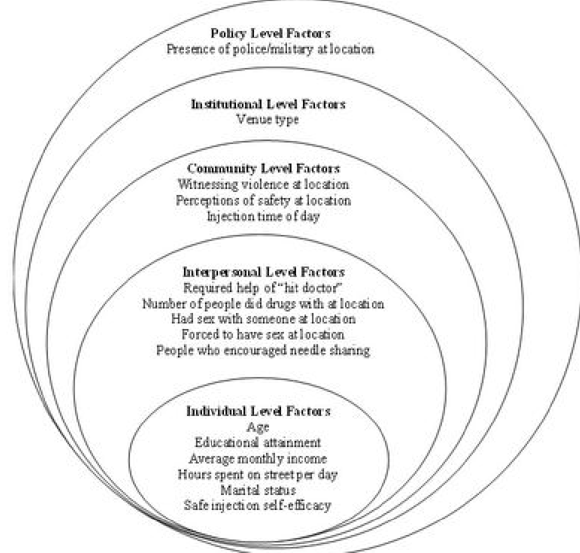

Figure 1. Socioecological influences on injection risk behaviours among female sex workers in Tijuana, Mexico: A venue-based, multi-level analysis.

Conclusions: Venue characteristics play an instrumental role in determining potentially risky injection behaviors. The findings of this study have implications for interventions that seek to reduce injection risk behaviors among women who inject drugs in Tijuana, Mexico.

EPD333

Engaging city councillors to address social and structural drivers of HIV in Blantyre City: a formative study

E. Bosire[1,2], V. Mwapasa[2], S. Allinder[1], D. Hoege[1], P. Chirambo[2], E. Kanjunjunju[3], G. Kawalazira[4], Y. Kamwigira[1,5], C. Holmes[1]
[1]Georgetown University, Center for Innovation in Global Health, Washington DC, United States, [2]Kamuzu University of Health Sciences, Department of Public Health, Blantyre, Malawi, [3]Blantyre City Council, Director of Health and Social Services, Blantyre, Malawi, [4]Blantyre District Council, Director of Health and Social Services, Blantyre, Malawi, [5]National AIDS Commission, Blantyre, Malawi

Background: Blantyre City has the highest HIV prevalence in Malawi. The 2021 HIV epidemiological estimate in Malawi reported that Blantyre City records the highest number of people living with HIV (10%), despite its contribution to only 4.5% of the national population in Malawi. Rural-urban migration, poverty, under-employment, lack of basic social amenities, and under-regulated industries such as bars are some of the major drivers for HIV transmission in the city.

However, interventions aimed to address HIV risks are largely biomedical, with little focus on addressing the structural drivers of HIV. Elected city councillors have the

potential to provide oversight of HIV programmes in their wards and can address the structural drivers of HIV. However, they are not optimally utilized.

Objectives: To identify opportunities and gaps for engaging councillors to address social and structural drivers of HIV in Blantyre City.

Methods: Between November and December 2021, we conducted a qualitative study in Blantyre City, involving 58 purposively sampled participants: 22 city councillors; 14 representatives from the District HIV and AIDS coordinating committee (DACC) and City AIDS coordinating committee (CACC); 7 partners from various non-governmental organizations (NGOs) working on HIV programmes; and 15 community leaders. Data were collected through in-depth interviews, transcribed verbatim and analyzed thematically with the aid of MAXQDA software.

Results: DACC and CACC members, as well as NGO partners were knowledgeable about HIV/AIDS including the current trend. Councillors and community leaders had limited knowledge about HIV/AIDS.

Councillors reported that they play critical roles in community development programmes in their wards including formulation of bi-laws and mobilization of resource. However, they were not actively engaged in HIV/AIDS programmes.

Poverty, easy access of alcohol and other substances from unregulated bars, prostitution and early marriages were key structural drivers of HIV infections reported by all participants. Gender based violence, HIV stigmatization, poor access to healthcare facilities and low HIV sensitization were said to hinder uptake of HIV preventive methods.

Conclusions: Stakeholders involved in the fight against HIV/AIDS should invest more on capacity building the councillors through training and provision of HIV/AIDS information to enable them initiate HIV risk reduction changes in their communities.

EPD334

"Protective, private, proud": elucidating identity and stigma processes among gay and bisexual men who inject drugs in Australia

S.E. Schroeder[1,2], A. Bourne[3], M. Stoove[1,2], C. Treloar[4], J. Doyle[1,2,5], A. Pedrana[1,2], M. Hellard[1,2,5]

[1]Burnet Institute, Disease Elimination, Melbourne, Australia, [2]Monash University, Melbourne, Australia, [3]La Trobe University, Melbourne, Australia, [4]University of New South Wales, Centre for Social Research in Health, Syndey, Australia, [5]Alfred Hospital, Department of Infectious Diseases, Melbourne, Australia

Background: Gay and bisexual men (GBM) report higher rates of sexualised and injecting drug use compared to heterosexual men, with established associations to HIV infection. Stigmatisation of people who inject drugs is linked to negative health outcomes, but sexual minority perspectives remain underrepresented. This study explored injecting drug use among GBM in Melbourne, Australia, focussing on identity and stigma processes at the intersection of drug use and sexualities, and their implications for wellbeing.

Methods: In-depth qualitative interviews were conducted with nineteen GBM who inject drugs between June-October 2020. Interviews explored participants' experiences and concerns related to drug use, pleasure, risk, and relationality in drug using contexts and beyond. Data were analysed using grounded theory methods.

Results: Interviewees were between 24 and 60 years old. Seventeen men identified as gay and two as bisexual. Injecting histories ranged from two to 32 years. Most interviewees injected methamphetamine (n=18) in sexual settings and eleven were living with HIV. Four themes were identified:

1. Early experiences of stigmatisation were reproduced through *"othering discourses"*, suggesting a hierarchical organisation of local gay communities by drug practices, HIV status, and masculine ideals.
2. *"Group membership"* was facilitated through sexualised/injecting drug use, enabling sexual identities to be self-actualised.
3. "*Dynamic self-hood"* distinguished narratives of men who spoke of themselves as 'drug addicts' from others rejecting such labels; who protected their wellbeing through benevolent self-acceptance irrespective of drug use and/or HIV status.
4. Emotional pain resulting from internalised stigma was seen to feed negative experiences and outcomes, but *'understanding who I was, was curative'*.

Conclusions: Findings revealed that social exclusion processes resurface within gay communities through intrasex competition and hegemonic masculinities; influencing GBM's sense of self and drug use careers. Inhabiting a positive self-concept appears critical to holistic wellbeing, beyond any benefits experienced from sexualised drug use. Fostering *"dynamic self-hood"* should be prioritised when engaging with GBM who inject drugs, including through further de-stigmatisation of drug use and HIV-diagnosis.

Findings highlight that health disparities arise not from within gay communities but society at large, and more attention must be paid to disrupt broader power dynamics and harmful social processes.

Barriers and enablers toHIV self testing in the private sector among sexually active females and males in Kenya, Uganda, and Nigeria: findings from qualitative market research

S. Malaba[1], K. Hatzold[2], C. Pahe[3], W. Adamba[3], B. Wango[3], I. Nzuki[3], G. Omoregie[4], D. Aizobu[4], B. Adesina[4], P. Omodele[4], B. Abdullahi[4], D. Ukaga[4], P. Buyungo[5], M. Luyiga[5], B. Lukwago[5], D. Nakimuli[5], J. Oriokot[5], M. Mugambi[6], A. Ikpeazu[7], G. Taasi[8], T. Chimulwa[8]

[1]Population Services International, HIV/TB, Nairobi, Kenya, [2]Population Services International, HIV/TB, Cape Town, South Africa, [3]Population Services Kenya, HIV, Nairobi, Kenya, [4]Society for Family Health, HIV, Abuja, Nigeria, [5]Population Services International, HIV/TB, Kampala, Uganda, [6]Ministry of Health, Kenya, NASCOP, Nairobi, Kenya, [7]Nigeria Federal Ministry of Health, Nigeria Federal Ministry of Health, Lagos, Nigeria, [8]Ministry of Health, Uganda, Ministry of Health, Uganda, Kampala, Uganda

Background: HIV self-testing (HIVST) has been proven to be effective in increasing demand for HIV testing among populations that are at risk of HIV acquisition. While HIVST products are penetrating the market in many countries, there are unanswered questions on how to develop consumer demand and how to ensure linkage into care, treatment, and prevention post HIVST.

We conducted qualitative research to understand the enablers and barriers to uptake, use, post-test linkage and results reporting among current and potential users of HIVST in the private sector.

Methods: 104 In-depth interviews (IDIs) and 15 group discussions (FGDs) were conducted among sexually active males and females of 18 – 29 years. Purposive sampling was used to enroll sexually active males (89) and females (95) into the study. Research was carried out July – September 2021 in Kenya, Nigeria, and Uganda.

Thematic analysis was used to analyze and code the data using NVivo. We analyzed patterns of themes within the data and identified enablers and barriers to HIVST uptake, use, post-test linkage and results reporting.

Results: Respondents identified key enablers including social media advertising as a key source of information on HIVST. Bundling of HIVST kits with other products eased the purchasing moment.

Users had confidence in the efficacy of HIVST which made them trust the test results. The implications of a reactive results influenced users to link into confirmatory testing. Users suggested they were willing to report their results to strengthen HIV programs and research.

Respondents cited the following key barriers: fear of a reactive result which made HIVST unattractive to non-users, lack of awareness that the kits were sold in pharmacies and concerns of user errors which resulted in the lack of confidence to self-test. Participants recounted delays in linking into confirmatory testing following the shock of a reactive result.

Lack of information on how to report HIVST and concerns over data privacy were cited as key hinderances to reporting.

Conclusions: These results provide the basis for co designing interventions that will support HIVST users complete the HIVST journey in terms of purchase, use, post-test linkage and results reporting.

Perspective of healthcare workers in Nigeria on the introduction of new pediatric antiretroviral drugs: experiences, enablers and barriers

O. Sowale[1], W. Eigege[1], O. Abudiore[1], B. Levy-Braide[1], N. Otubu[1], A. Inyang[1], J. Campbell[2], D. Rathakrishnan[3], I. Amamilo[1], F. Lufadeju[1], C. Amole[4], O. Wiwa[5], C. Adesigbin[6], E. Etiobhio[6], A. Ikpeazu[6], O. Agbaji[7], S. Akanmu[8], U. Lawal[9], S. Ochigbo[10], J. Conroy[4]

[1]Clinton Health Access Initiative, HIV Access Program, Abuja, Nigeria, [2]Clinton Health Access Initiative, Research & Labs - Applied Analyics, Boston, United States, [3]Clinton Health Access Initiative, HIV Access Program, Kigali, Rwanda, [4]Clinton Health Access Initiative, HIV Access Program, Boston, United States, [5]Clinton Health Access Initiative, Global Resource for Health, Abuja, Nigeria, [6]Federal Ministry of Health, National AIDS and STI Control Program, Abuja, Nigeria, [7]Jos University Teaching Hospital, Jos, Nigeria, [8]Lagos University Teaching Hospital, Lagos, Nigeria, [9]Ahmadu Bello University Teaching Hospital, Zaria, Nigeria, [10]University of Calabar Teaching Hospital, Calabar, Nigeria

Background: Nigeria recently introduced pediatric dolutegravir (pDTG) based regimen as the preferred first-line antiretroviral therapy (ART) among children <20kg. Prior to this introduction, the country has implemented over 3 regimen transitions within the last decade, the most recent being transition to lopinavir/ritonavir-based regimen. With the imminent transition to pDTG based regimen, feedback from healthcare workers (HCW) on their experiences, enablers, and barriers to introducing new antiretrovirals (ARVs) to patients is important to guide ART transition in-country.

Methods: In June 2021, focus group discussions (FGDs) were conducted among HCWs as part of an operations research on pDTG in 7 ART facilities across 7 states (Akwa Ibom, Benue, Cross River, Lagos, Plateau, Rivers and Sokoto). Participants included clinicians, pharmacists, nurses, and adherence counsellors directly involved in prescribing/dispensing ARVs to patients. The FGDs were facilitated using a guide designed to elicit responses on barriers/enablers to prescribing new pediatric ARVs. Discussions were recorded, transcribed, and a codebook developed on MS Excel. This was then analyzed by 2 independent reviewers to assess for major themes.

Results: 31 HCWs participated in 7 FGDs (4 – 7 participants per FGD).64% of respondents noted that bitter taste will discourage them from prescribing new drugs, while 45%,

36% and 14% respectively stated difficulty with administration, high pill burden and frequent dosing as barriers. Other limitations to prescription of new ARVs and the proportion of respondents that indicated them are frequent introduction of new ARVs in-country (63%) and concerns on sustained availability (25%), misconceptions (21%) and initial fears among patients about side effects (14%).
65% of respondents indicated that availability of scientific evidence on superiority of the new drug is a key enabler for prescription, while 60% and 38% respectively sweet taste and capacity building for HCWs on the new drug as enablers. The participants considered pDTG as an improvement on the current pediatric ARV in terms of taste, frequency of dosing, ease of administration.
Conclusions: Findings from the FGDs provided insight into the perspective of HCWs on the introduction of new pediatric ARVs. This will inform scale-up plans for transitioning clients to pDTG and increase preparedness for future ARV transitions.

EPD337
Factors associated with antiretroviral treatment interruptions among people living with HIV in British Columbia, Canada

C. Tam[1], T. Shen[1], J. Chia[1], D. Moore[1,2], K. Salters[1,3], T. Wesseling[1], S. Grieve[1], T. McLinden[1,3], T. Pakhomova[1], N. Dawydiuk[1], P. Sereda[1], R. Hogg[1,3], R. Barrios[1,2]
[1]British Columbia Centre for Excellence in HIV/AIDS, Epidemiology and Population Health, Vancouver, Canada, [2]University of British Columbia, Faculty of Medicine, Vancouver, Canada, [3]Simon Fraser University, Faculty of Health Sciences, Burnaby, Canada

Background: Treatment interruptions (TI) limit the therapeutic protection offered by modern antiretroviral therapy (ART), thereby leading to poorer clinical outcomes and increased risk of HIV transmission. We evaluated factors associated with time-to-first TI among people living with HIV (PLWH) in British Columbia (BC), Canada.
Methods: Between January 2016-September 2018, we purposively recruited a representative sample of PLWH aged ≥19 years in BC into the STOP HIV/AIDS Program Evaluation (SHAPE) study. Participants completed surveys at enrolment and followed through time with data linkages to the BC HIV Drug Treatment Program.
Surveys collected sociodemographic information, drug use, homelessness, and incarceration history. TI were defined as >60 days late for ART refill and pharmacist-reviewed TI alert sent between enrolment and December 2020.
We conducted bivariate analyses comparing baseline data from participants who did and did not experience TI. Multivariable Cox proportional hazards regression was used to model time-to-first TI.
Results: Among 639 PLWH included in this analysis, 21.3% were women, 59.0% identified as men who have sex with men, 69.6% identified as Caucasian, and 15.5% self-identified as Indigenous. The median age at enrolment was 50 years (Q1-Q3:42-57) and median follow-up time was 4.15 years (Q1-Q3:2.98-4.65). Of 154 (24.1%) participants who experienced a TI since enrolment, the median time to their first TI was 15.9 months (Q1-Q3:8.1-29.3), and median length of their first TI was 96 days (Q1-Q3:76-154).
We found a higher proportion of those reporting recent homelessness (64.3% vs. 45.4%; p<0.001), recent injection drug use (34.4% vs. 15.9%; p<0.001), food insufficiency (79.2% vs. 59.4%; p<0.001), lifetime violence (87.0% vs. 72.0%; p<0.001), and incarceration history (54.6% vs. 29.1%; p<0.001) experienced a TI during the study period.
In the multivariable Cox model, lifetime experiences of incarceration (adjusted hazard ratio [aHR]:1.97, 95%CI:1.33-2.91) or violence (aHR:1.94, 95%CI:1.12-3.37) had increased risk of TI during study follow-up, while those aged ≥60 years (vs.<40; aHR:0.39, 95%CI:0.20-0.77), and greater than high school education (vs. less than high school; aHR:0.68, 95%CI:0.42-1.12) had a reduced risk.
Conclusions: We found lifetime experiences of incarceration or violence to be associated with TI, illustrating the impact of pervasive structural inequities across the life-course on ART treatment.

EPD338
Shared mechanisms underlying elevated risk for HIV and overdose among women who use drugs: a scoping review

B.S. West[1], S. Jain[1], O. Cordingley[1], J. Craddock[2], T. Nadel[3], M.M. Philbin[4], P.M. Mauro[4]
[1]Columbia University, School of Social Work, New York, United States, [2]University of Maryland Baltimore, School of Social Work, Baltimore, United States, [3]New York University, New York, United States, [4]Columbia University, School of Public Health, New York, United States

Background: Despite our often singular focus, the overdose epidemic is only one part of a set of epidemics, which may impact women in unique ways. These epidemics have shared antecedents, including the use of unregulated drugs and HIV: macro and micro social, economic, physical and policy factors create risk environments that increase women's vulnerability to HIV and overdose, but little is known about the mechanisms underlying this intersection.
As a step to fill this gap in knowledge, we conducted a scoping review to explore linkages between risks for overdose and HIV among women.
Methods: We searched PubMed, PsycINFO, CINAHL, Web of Science, and SOCIndex to identify papers that address both HIV and overdose among women who use drugs, as well as barriers to engagement in health care and social services.
Articles that reported disaggregated data for women, analyzed both overdose and HIV, were published in English, and that published empirical findings were included for review.

Oral abstracts

Poster exhibition

E-posters

Late-breaker abstracts

Author Index

Results: The search yielded 311 abstracts, of which 18 were eligible and included in the review. Overlapping risks for HIV and overdose were especially pronounced among women experiencing structural inequities related to racism, houselessness, incarceration, and engagement in sex work.

Studies also demonstrated a need for greater awareness of stimulant use as it relates to both overdose and risk for HIV through sexual risk taking among marginalized women, as well as a need for integrated health and social services that address HIV and overdose prevention, alongside reproductive health and violence.

Supervised consumption sites are also an important tool for addressing structural vulnerabilities that underlie overdose and for improving linkage to HIV prevention and care.

Conclusions: Scoping review findings demonstrate that there are few studies focused on overlapping risks for HIV and overdose among women, suggesting a missed opportunity for developing coordinated responses to interrelated epidemics.

Given the profound impact that both overdose and HIV have on women, their families and communities, the identification of the shared causes and consequences of these co-occurring health conditions is a critical first step towards mitigating harms to women's health through comprehensive intervention, programs and policy.

EPD339

Motivations for starting and stopping PrEP: experiences of AGYW in the HPTN 082 study

L. Mills[1], N. Khoza[1], M. Atujuna[2], M. Chitukuta[3], F. Scorgie[1], S. Hosek[4], J. Velloza[5], H. Chauke[1], P. Musara[3], N. Mangxilana[2], S. Gumede[1], P. Mutero[3], L. Makhale[1], L. Nobula[2], T. Tauya[3], C. Celum[5], S. Delany-Moretlwe[1]

[1]Wits RHI, Johannesburg, South Africa, [2]Desmond Tutu Health Foundation, Cape Town, South Africa, [3]University of Zimbabwe Clinical Trials Research Centre, Harare, Zimbabwe, [4]Stroger H. Hospital of Cook County, Chicago, United States, [5]University of Washington, Seattle, United States

Background: Consistent daily use of oral pre-exposure prophylaxis (PrEP) for prevention of HIV infection presents a significant challenge for adolescent girls and young women (AGYW). We explored AGYW's motivations for starting, stopping, and restarting PrEP.

Methods: HPTN 082 was an open-label PrEP study that enrolled AGYW between 2016 and 2018 at sites in Johannesburg and Cape Town, South Africa and Harare, Zimbabwe. Participants were aged 16-25 years, HIV-negative, sexually active and PrEP-eligible.

Participants were randomised to receive standard adherence support (counselling, two-way SMS, monthly adherence clubs) or enhanced support with drug-level feedback plus the standard adherence support. All attended quarterly follow-up visits over 52 weeks. Serial in-depth interviews were conducted at the 13- and 26-week study visits. Participants were purposively sampled from each site to include PrEP adherers, decliners, and special cases such as those reporting social harms. A Grounded Theory approach was used to guide the analysis.

Results: There were 67 AGYW interviewed (Harare, n=25, Johannesburg, n=22, Cape Town, n=20) of which 66% (n=44) reported declining, delaying, pausing, intentionally skipping and/or discontinuing PrEP. Of those that skipped or paused PrEP, more than half (n=25) restarted PrEP during the trial.

In decisions to initiate PrEP, almost all AGYW were motivated by perceived risk of HIV, and many were influenced by the presence or absence of support from family, peers and partners. Changes in HIV risk perception were less important in decisions to stop and restart PrEP. AGYW most commonly cited HIV- and PrEP-related stigma as motivation for stopping PrEP.

The fear or experience of side effects caused some participants to decline, delay or stop PrEP. Motivations for restarting PrEP included retention events, encouragement from clinic staff, and support from female relatives.

Conclusions: HIV risk perception only influenced some AGYW's decisions to stop and restart PrEP use. The dominant role of HIV stigma and social influence in decisions to stop and restart PrEP suggest the need for community and family-level interventions geared towards destigmatizing HIV prevention, and the potential benefit of embedding PrEP delivery within youth friendly services that create opportunities for peer support.

EPD340

Social determinants of health exacerbate implementation and access barriers to telehealth HIV care in the Southern United States. Results from a scoping review of research and intervention needs

V. Yelverton[1], S. Weissman[2], S. Qiao[3], B. Olatosi[1], N. Natafgi[1], J. Ostermann[1]

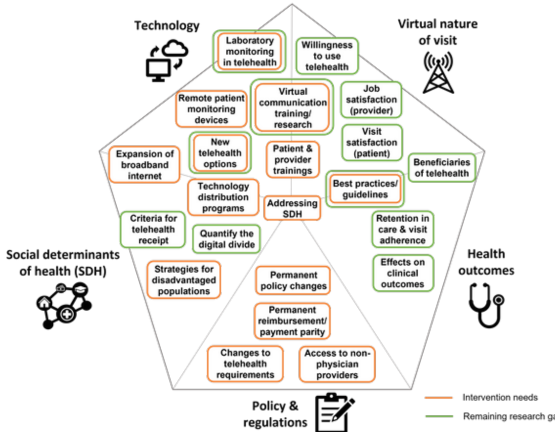
[1]University of South Carolina Arnold School of Public Health, Department of Health Services Policy and Management, Columbia, United States, [2]University of South Carolina School of Medicine, Department of Internal Medicine, Columbia, United States, [3]University of South Carolina Arnold School of Public Health, Department of Health Promotion, Education, and Behavior, Columbia, United States

Background: The South is the epicenter of the HIV epidemic in the US, with a disproportionate burden of HIV among racial and ethnic minorities and rural-living communities. Telehealth was rapidly implemented to mitigate widespread interruption of HIV care services due to COVID-19, however not all persons with HIV (PWH) benefited from telehealth.

This study sought to understand how intervention needs and research gaps described in the academic literature related to telehealth barriers experienced by PWH and HIV care providers in Southern US.

Methods: In August 2021, PubMed, Embase, CINAHL, PsycINFO, and Web of Science were searched for publications describing telehealth in HIV care during COVID-19 following PRISMA-ScR guidance. Search terms were organized in three domains: *HIV*, *telehealth*, and *COVID-19*. Literature was analyzed and synthesized using thematic analysis and meta-synthesis methodology.

Results: Thirteen peer-reviewed articles were included in this study; four of which described implementation and access barriers to telehealth HIV care in the South; and twelve outlined intervention needs and research gaps to sustain and improve telehealth HIV care. Reported barriers to telehealth HIV care were categorized into four domains: technology-related barriers, virtual nature of HIV care visits, policies and regulations, and social determinants of health (SDH). SDH were reported to amplify other barriers to telehealth HIV care such as limited access to technology, lack of rural connectivity, low digital literacy, and feeling uncomfortable with virtual visits. Intervention needs and research gaps identified in the literature were mapped by barrier domains and extended by a health outcomes domain (see Figure 1).



Notes: Implementation and access barrier to telehealth domains are: technology, virtual nature of HIV care visit, policies and regulations, and social determinants of health (SDH). The health outcomes domain was added to map related research gaps and intervention needs. Intervention needs and remaining research gaps may address multiple barrier domains.

Figure 1. Telehealth in HIV care: Intervention needs and remaining research gaps by barrier to telehealth HIV care domains.

Conclusions: SDH interact with other barriers to telehealth HIV care in the Southern US. While the identified intervention needs and research gaps address multiple telehealth barrier domains, recommended interventions to improve SDH remain unspecific. Future telehealth research and interventions must include foci on SDH and the effects of telehealth on HIV care outcomes.

EPD341

"The way the nurse talked to me I will not go there again:" a qualitative comparative analysis of the reasons for interruption in care of people living with HIV in Ghana

E. Bruce[1], E. Adiibokah[1], D.T. Nartey[1], J. Eyiah[1], H. Tagoe[1], T. Ayoumah[2], Y.A.A. Rahman[1], H. Nagai[1], K. Eifler[1]
[1]JSI Research & Training Institute, Inc., USAID Ghana Strengthening the Care Continuum Project, Takoradi, Ghana, [2]Ghana Health Service, Effia Nkwanta Regional Hospital, Sekondi-Takoradi, Ghana

Background: Understanding how people perceive and conceptualize health system challenges is important when considering the effectiveness of solutions for public health challenges. There is increasing acceptance in contemporary literature of the competition between powerful expert technical views and the lived experiences of clients.

This is a comparative analysis of competing views among three health system actors:

1. Health care providers,
2. Civil society organizations (CSOs),
3. And people living with HIV, concerning the reasons for why HIV clients in Ghana experienced interruptions in care.

Methods: The study is a cross-sectional exploratory qualitative research conducted by the USAID Strengthening the Care Continuum project (Care Continuum), implemented by JSI Research & Training Institute, Inc., supported ART sites in two regions of Ghana: Western and Western North. From October to December 2020, healthcare staff (n=10), clients (n=10) who had interrupted care, and CSO staff (n=8) were selected and engaged in in-depth interviews to inform the Care Continuum's back to care campaign. A thematic comparative data analysis approach was employed.

Results: Analysis of the data showed a clear divergence in opinions among the three groups. While clients expressed a lack of satisfaction with care due to the condescending attitude of health care staff, coupled with last mile issues such as distance and lack of financial means, health care staff blamed clients for being worrisome, superstitious and engaged in harmful health seeking behaviors. CSO staff attributed the high levels of interruption in care to structural factors, such as the lack of differentiated service delivery modalities, and called for more collaboration with heath facilities to roll out community ARV delivery, to address challenges.

Conclusions: The results of the study highlight the need for researchers and consumers of researchto conscientiously coalesce the views of various actors and take into account differing interests and power dynamics when finding practical solutions to pressing public health problems. The lived experiences of clients deserve particular attention.

EPD342

The prevalence and correlates of alcohol use and alcohol use disorders among young people (15 – 24 years) and adults in Eswatini, Malawi and Zambia

Z. Msibi-Mamba[1,2], J. Kagura[1], J. Francis[3]

[1]School of Public Health, University of the Witwatersrand, Division of Epidemiology and Biostatistics, Johannesburg, South Africa, [2]Eswatini Ministry of Health, MOH/CDC Cooperative Agreement, Mbabane, Eswatini, [3]School of Medicine, University of the Witwatersrand, Department of Family Medicine and Primary Care, Johannesburg, South Africa

Background: Excessive alcohol use is a remarkable trouble in public health worldwide. It is escalating in Sub-Saharan Africa due to marketing aggressively and lack of individual and policy level interventions. We used the national representative population-based HIV Impact Assessment (PHIA) data to determine the prevalence and correlates of alcohol use (AU) and alcohol use disorders (AUD) in young people and adults in Eswatini, Malawi and Zambia.

Methods: PHIA surveys 2015 – 2017data was analyzed. The surveys employed multistage sampling strategy to recruit study participants at household level. The sample in each country dataset were as follows Eswatini(n=9885) Malawi(n=19405), and Zambia(n=27,382). The analysis utilized multivariable models of logistic regression models that identify the correlates of AU and AUD.

Analyses was adjusted for weights, stratification, and clustering using the survey platform analysis in Stata version 15. P-value of <0.05 was considered statistically significant.

Results: Alcohol use prevalence in young people and adults was 17.9% and 23.3% in Eswatini, 10.9% and 22.1% in Malawi, and 14.6% and 32.4% in Zambia. The prevalence of AUD in young people and adults was 9.1% and 14.2% in Eswatini, 3.5% and 11.2% in Malawi, 7.6% and 20.6% in Zambia. The correlates of alcohol use and AUD encompass being male (aOR: 4.62 (95% CI: 3.35 -5.79), age group, higher education level (aOR: 1.70, 95% CI: 1.16 -2.48), divorced or separated or widowed in all 3 countries (aOR: 1.96, 95% CI: 1.55 -2.48), HIV positive status in Zambia (aOR: 1.49, 95% CI: 1.12 -1.99), multiple sexual partners in Malawi (aOR: 11.90, 95% CI: 6.76 -20.93), employed class in Zambia (aOR: 2.06, 95% CI: 1.64 -2.59) and engaging in commercial sexual relations in Malawi.

Conclusions: The reported alcohol use and AUD are common in youth and adults in Eswatini, Malawi and Zambia. Both alcohol use and AUD are related with being male, age group 20 – 24 years old, educational level (higher), HIV status, transactional sex and multiple sexual partners, widowed or separated and HIV status and risky sexual behaviours in the three countries.

There is an urgent need for targeted alcohol interventions and such interventions could be integrated with sexual and reproductive health programs.

EPD343

How sociodemographic factors, types of stigma, and protective factors impact uptake of the Undetectable Equals Untransmittable (U=U) campaign message among people living with HIV

J. Cotnam[1], B. Tran[1,2], J. Watson[1], J.M. Lo Hog Tian[1,2], A. McGee[1], A. Boni[1], A. Fraleigh[1], G. Da Silva[1], J. Gough[1], L. Cioppa[1], M. Mwalwanda[1], M. Murphy[1], M. Ajiboye[1], M. Hodge[1], S. Smith[1], W. Bristow[1], J.P.-H. Wong[3], D. Grace[4], S.B. Rourke[1,5]

[1]Unity Health Toronto, MAP Centre for Urban Health Solutions, Toronto, Canada, [2]University of Toronto, Institute of Medical Science, Toronto, Canada, [3]Ryerson University, Daphne Cockwell School of Nursing, Toronto, Canada, [4]University of Toronto, Dalla Lana School of Public Health, Toronto, Canada, [5]University of Toronto, Department of Psychiatry, Toronto, Canada

Background: In 2016, the Prevention Access Campaign launched the Undetectable equals Untransmittable (U=U) campaign based on evidence that people living with HIV who are on antiretroviral therapy (ART) and maintain an undetectable viral load cannot transmit HIV to others. However, there is a need for increased uptake of U=U campaign messages and a lack of understanding around factors that create barriers to uptake.

This study examines the impact of sociodemographic factors, stigma, and protective factors on the awareness and perception of the U=U campaign message in Canada.

Methods: Participants from Ontario (n=240) were recruited from September 2018 to August 2019 as part of the People Living with HIV Stigma Index. The survey contained questions about awareness and understanding of the U=U message, different types of stigmas, and protective factors. Binary logistic regression models were created to examine the impact of demographic factors, stigma, and protective factors on awareness, perception, and belief in the U=U message, as well as whether participants discussed U=U with their healthcare provider.

Results: Participants were aware of the U=U message (n=231, 96%), however only 42% (n=100) had discussed U=U with their primary healthcare provider. Most participants said that U=U has affected their lives in a positive way (n=136, 57%) and that promotion of U=U would reduce HIV stigma (n=174, 74%). Participants with high enacted stigma were less likely to believe U=U can reduce HIV stigma (OR: 0.37; 95% CI: 0.16, 0.85) while those with high self-efficacy were more likely (OR: 4.86; 95% CI: 1.52, 15.54). Individuals with high self-efficacy also said that U=U affected their lives in a positive way (OR: 4.21; 95% CI: 1.31, 13.57) while older individuals, women, and gay/bisexual participants were less likely to feel that way. Older individuals were less likely to have discussed U=U with their healthcare provider (OR 0.29, 95% CI: 0.12, 0.73).

Conclusions: Identifying barriers to the uptake of the U=U message is key to reducing HIV stigma and promoting initiation of and adherence to ART. These findings shed light

on the population groups that may need support around the U=U messaging and protective factors that may help with uptake of these messages.

EPD344

Health care services (Malaria, TB, HIV and AIDS prevention treatment, care and support for LGBTIQs persons and other vulnerable groups (sex workers, female drugs users) a challenge in Liberia context

R. Willie[1]
[1]*The Lesbian and Gay Association of Liberia, Monitoring and Evaluation Manager, Monrovia, Liberia*

Background: The HIV Epidemic is a big and serious problem in Liberia for LGBTIs Persons and other vulnerable groups. 47, 000 people living with HIV in Liberia, the prevalence rate of HIV among key population had significantly increased to 37.9% in MSM,27% in TG; 16.7% in FSW and 9.8 in PWID also with a high prevalence among uniform personnel of which we have started working with Law enforcement as the protective arm of the LGBTIQ community and other vulnerable groups. Because of lack of limited access to health care services members of the LGBTIQ (MSM) community and other vulnerable groups have suffered issues of violence, abuse at health facilities discrimination at health facilities.

Description: Based upon the challenges LGBTIQ members and other key populations faced in accessing health care services we were able to have stakeholders' dialogues with relevant health care practitioners where members of LGBTIQ (MSM) and other vulnerable groups go for HIV services. We also had a face to face interaction with those direct PLHIV beneficiaries who were able to have an engagement on issues affective them to access HIV and other related services. Conducted joint stakeholders' consultative meetings with Health care workers which included nurses, ART dispensing officers for a dialogue using the human rights based approach and also the international human rights instruments.

Lessons learned: The engagements through advocacy is gradually addressing issues the LGBTIQ (MSM) community and other vulnerable groups are facing in Liberia in terms of accessing HIV services and other related HIV services which has to do with the inclusion of MSM and other vulnerable groups within the National strategic plan of HIV in Liberia and it has been included into decision and policy making also has instituted policy that discriminated LGBTIQ (MSM) and other vulnerable groups. The usage of the international instrument and the human rights based approach with health care practitioners have sharped the intervention in Liberia.

Conclusions/Next steps: The prevailing stigma around HIV can have a significant impact based on the high prevalence rate amongst these populations. Based upon this, HIV-related stigma needs to be address through human rights advocacy using the Human rights based approach.

EPD345

Transport to HIV-care centers as a determinant for adherence to HIV-care in adult women living with HIV in the State of Chiapas, Mexico

M. Ferrara[1], L.S. Berra[2], A. Martin-Onraet[3], P.F. Belaunzarán-Zamudio[4], A. Rivera-Marroquín[5], A. Evangelista[6], A. Amuchástegui[7], A. Piñeirúa-Menéndez[8]
[1]*Centro de Investigacines y Estudios Superiores en Antropología Social, Mexico City, Mexico,* [2]*Rollins School of Public Health, Department of Global Health, Atlanta, United States,* [3]*Instituto Nacional de Cancerologia, Mexico City, Mexico,* [4]*Bethesda, Bethesda, United States,* [5]*Secretaría de Salud de Chiapas, Tuxtla Gutiérrez, Mexico,* [6]*El Colegio de la Frontera Sur, San Cristóbal de las Casas, Mexico,* [7]*Universidad Autónoma Metropolitana - Xochimilco, Mexico City, Mexico,* [8]*San Andrés de la Cal, San Andrés de la Cal, Morelos, Mexico*

Background: A fifth of people living with HIV in Mexico are women. Chiapas, is a State in the southern border with the highest female/male ratio of HIV-infection, is among the poorest and highest concentration of indigenous peoples in Mexico, and has a roughed geography. The HIV epidemic among women in Mexico has been associated to conditions of social vulnerability, but little is known about social determinants of access to HIV-care.

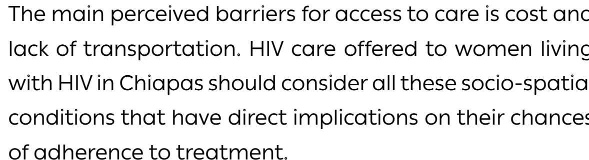
We describe transport-related characteristics as potential barriers to access HIV-care for women living in the State of Chiapas, Mexico.

Methods: We conducted a cross-sectional study in a random sample of 216 uninsured, adult women attending any of the 13 HIV-care centers managed by the Chiapas Ministry of Health. We applied structured questionnaires during November-December 2020 to collect information on socioeconomic characteristics, time and cost of transportation to the centers, type and number of vehicles and roads used, and perceived difficulties to reach centers.

Results: Median (IQR) age was 27 yo (22-32yo). Most were married (n=132, 61%) or widowed (n=42, 20%), and had children (n=200, 92%). 72.1% lived in households with monthly income ≤3,000 Mexican pesos ($150USD). The remaining (27.9%) lived in households earning 3,001-6,000 pesos (Minimum wage was 4,251 pesos per month). 34.8% of participants spent between 0-30 min in getting to the HIV-care center, 19.5% between 31-60 min, 18.6% between 61-80min, and 26.9% ≥90 min per visit.

Also, 18.6% needed riding ≥3 vehicles to reach their center. 97.7% used public, collective transportation: 53.4% used buses, 35.3% collective taxis, 20% walked, 26% used minivans, 11.16% motorcycle taxis, and only 2.3% their own vehicle. The main perceived transport barriers to the HIV-care centers are insufficient money (68.3%), lack of transportation (33.5%), roads in bad condition (23.7%), roadblocks (14%), and family difficulties (7%).

Conclusions: Even when HIV care centers are relatively close for women living with HIV in Chiapas, cost is high relative to their income.



The main perceived barriers for access to care is cost and lack of transportation. HIV care offered to women living with HIV in Chiapas should consider all these socio-spatial conditions that have direct implications on their chances of adherence to treatment.

EPD346

Social determinants associated with HIV misconceptions: hierarchical linear modelling of weSpeak survey data from heterosexual Black men in Ontario

E. Etowa[1], F. Omorodion[1], I. Luginaah[2], P. Mkandawire[3], B. Ghose[4], J. Etowa[4], W. Husbands[5], J. Wong[6]

[1]University of Windsor, Department of Sociology, Anthropology and Criminology, Windsor, Canada, [2]University of Western, Department of Geography and Environment, London, Canada, [3]Carleton University, The Institute Interdisciplinary Studies, Ottawa, Canada, [4]University of Ottawa, School of Nursing, Ottawa, Canada, [5]University of Toronto, Dalla Lana School of Public Health, Toronto, Canada, [6]Ryerson University, Daphne Cockwell School of Nursing, Toronto, Canada

Background: HIV responses in Ontario do not adequately engage and address the needs of Black men. weSpeak is a 5-year research program to address HIV vulnerabilities of Black men and promote their collective resilience.

In this paper, we present the results of the factors associated with misconceptions about HIV among ACB men from the weSpeak program.

Methods: We used mixed methods comprising of surveys, focus groups and individual interviews. This paper reports on the survey results. A total of 866 participants completed the questionnaire: Ottawa (n=210), Toronto (n=343), London (n= 157) and Windsor (n=156). HIV misconception was measured as the number of statements on the HIV Knowledge questionnaire with incorrect answers. Misconception scores ranged from 1 to18.

We used a hierarchical linear regression model (HLM) to predict HIV misconceptions while controlling for the effect of the city of residence. At p <.05, factor coefficient (β) > 0 associated with more misconceptions, and β < 0 associated with fewer misconceptions.

Results: HIV misconceptions are associated with many social determinants. Of the 236 participants with HIV misconceptions, 11.4% (n=27) had many misconceptions (7-13) while 88.6% (n=209) had fewer misconceptions (1-6). All independent variables jointly contributed 23% (R^2= .23, p<.001) variation in HIV misconceptions. Association of misconceptions and city of residence was not statistically significant (R^2= .02, p>.05). Men who experienced more discrimination (β= .24, p<.05, 95%CI = .02, .46) and had negative attitudes to condoms (β= .06, p<.05, 95%CI = .01, .12) had more misconceptions. Being born in Canada (β=-1.01, p<.05, 95%CI = -1.86, -.18), having higher education (β=-.37, p<.001, 95%CI = -.53, -.22), and being more resilient (β=-.04, p<.05, 95%CI = -.07, -.01) are associated with fewer misconceptions.

Conclusions: Access to education alongside HIV literacy, anti-discrimination policies including anti-racism in healthcare, and resilience-building are critical to developing effective HIV responses and debunking HIV misconceptions among Black men.

Dynamics of social status and power: Sex, gender, age, race/ethnicity, sexual orientation and disability

EPD347

Disparity in HIV medication and viral suppression change for recent Venezuela immigrants living with HIV migrating to Miami

Y. Pan[1], V.E. Horigian[1], J. Saavedra[2], S.A. Safren[3], E. Alonso[1], X. Liao[1], M. Manrique[2], E. Ruiz[2], M. Ruscalleda[2], Y. Sosa[2], D.J. Feaster[1]

[1]University of Miami, Public Health Sciences, Miami, United States, [2]AIDS Healthcare Foundation, Miami, United States, [3]University of Miami, Psychology, Miami, United States

Background: Recent Venezuela immigrants living with HIV (VILH) migrating to Miami may have faced the challenge of medication disruption and barriers to care due to economic crisis in Venezuela that may worsen their HIV outcomes in Miami.

Methods: The objectives of this study were to examine and compare HIV medication and virologic suppression change among VILH over time and others new to care in the Miami area. Medical records related to HIV medication histories, diagnosis, and lab tests were abstracted for the first, second, and last clinic visits from four major HIV clinics in Miami. HIV-infected patients were eligible if their first visit falls in 2015-2019. Three groups of new enrollees were compared: VILH, US-based, and migrants from elsewhere.

Results: 528 (238 VILH, 114 US-based, and 176 migrants from elsewhere) medical records were abstracted until January 2022. Ninety percent (155/172) of VILH left Venezuela after 2012. The average age of VILH was 37.6 and majorities were male (96%).

Overall, 64% (149/232) VILH had HIV/ARV medication history prior to their first visit to the clinic, significantly higher compared to 37% (35/95) for US-based and 33% (55/168) for migrants from elsewhere. 25.6% (61/238) had insurance (42% for US-based and 46% migrants from elsewhere). Viral suppression (viral load < 200 copies/ml) increased from 55% (127/232), to 89% (102/114), and then to 94% (194/206) for VILH, at first, second, and last clinical visits, respectively, compared to 23% (25/108), 82% (56/68), 93% (69/74) for US-based, and 27% (46/171), 84% (105/125), 92% (133/145) for migrants from elsewhere. HIV medication change was also high for VILH, at first 22% (40/225), second 15%

(32/219), and last 41% (83/202), respectively, compared to 13% (12/118), 12% (12/98), 37% (34/91) for US-based, and 4% (7/170), 10% (15/156), 43% (65/150) for migrants from elsewhere.

Conclusions: VILH had higher rates of both prior treatment and initial viral suppression, but all groups achieved high rates of suppression by the last visit. VILH did have a higher rate of medication change, which may indicate problems from prior treatment. The initially higher success rates of VILH may reflect the higher economic resources of those able to migrate to the US.

EPD348

The effect of internalized homophobia on social well-being among black sexual minority men living with HIV in the United States: the mediating roles of LGBT community connectedness and racial/sexual self-identity

C. Hong[1], A.M. Ochoa[1], G. Garth[2], I. Holloway[1]

[1]University of California, Los Angeles, Department of Social Welfare, Los Angeles, United States, [2]Los Angeles LGBT Center, Los Angeles, United States

Background: Little is known about social well-being among people living with HIV, especially black sexual minority men living with HIV (BSMM+), a population with multiple minoritized identities. We explored factors associated with social well-being among a sample of BSMM+ and examined the impact of internalized homophobia and social well-being and explored the mediating roles of LGBT community connectedness and racial/sexual self-identity between this association.

Methods: Data were derived from a randomized comparison trial of a community-developed, web-based mobile app intervention that aimed to address the social work and legal needs of BSMM+ (n=102). Descriptive statistics were used to understand levels of internalized homophobia, social well-being, LGBT community connectedness, and racial/sexual self-identity. Multivariable linear regression was used to examine factors associated with social well-being.

In addition, we conducted mediation analyses to determine the effects of LGBT community connectedness and racial/sexual self-identity on the relationship between internalized homophobia and social well-being, adjusting for sociodemographic characteristics.

Results: The average age of our sample was 38.09 years, and more than half (51/0%) had an annual income of less than $12,000. One in three (34.3%) reported ever engaging in sex work and nearly all (92.2%) were receiving antiretroviral therapy.

Greater social well-being was associated with older age, having initiated ART, and ever engaging in sex work ($p<0.05$ for all). Greater social well-being was also associated with lower internalized homophobia, higher LGBT community connectedness, and a greater sense of racial/sexual self-identity ($p<0.01$for all).

Mediation analyses revealed that LGBT community connectedness and racial/sexual self-identity *fully* mediated the effect of internalized homophobia on social well-being ($p<0.01$ for both).

Conclusions: Efforts to reduce internalized homophobia may positively impact social well-being among BSMM+, a population that experiences intersectional minority stressors and multilevel stigma. LGBT communities can play a vital role in providing social support and developing identities among and a strong sense of racial/sexual self-identity could increase self-acceptance and self-esteem in sexual minority individuals, especially among communities of color.

Efforts to promote social well-being among BSMM+ by reducing internalized homophobia should consider developing and implementing community-level programs and interventions that promote self-affirmation and access to community resources and opportunities to foster social engagement.

EPD349

Surpassing the UNAIDS 3rd 95 goal through a peer led Adolescent-friendly HIV care at the largest HIV clinic in Uganda

I. Nankya[1]

[1]Makerere University, Kampala, Uganda

Background: Adolescents 10-19 years living with HIV need sustained antiretroviral therapy to achieve viral load-suppression and long term survival. In Uganda, the national HIV viral suppression rate for adolescents is suboptimal at 76%, way below the UNAIDS third 95 goal. The major contributors to the low viral load suppression among adolescents in Uganda include: loss to follow up and ART adherence related barriers such as stigma, discrimination,non-disclosure, travel and unfavorable waiting times at clinics. Peer led adolescent friendly services may provide an opportunity in facilitating sustained ART, good adherence and viral load suspension.

Methods: Over the last 3 year, Makerere University Joint AIDS Program has implemented a peer led model of adolescent friendly services at Mulago ISS, the largest HIV clinic in Uganda.ISS clinic provides ART to 16574 PLHIV, of whom 522 are adolescents. At baseline,the viralsuppression among adolescents at ISS clinic was low at 71%.

This prompted us to develop and implement a peer led model of adolescent friendly HIV services. The peer led model of adolescent friendly services include: planning for establishment and running of an adolescent corner with a peeradolescent present at all times to welcomeadolescents who come to the clinic, adedicated clinic day Wednesday for adolescents, a pool of healthcare providers toreview the adolescents all the time having established a working relationship, aspecial appointment book to track appointment for adolescents, follow up of missed appointment by an adolescent peer, viral load monitoring and demand creation by peers, intensive adherence

counseling for adolescent with non-suppressed viral load by peers, synchronizing appointments with school holiday, and adolescent friendly psychosocial support forums.

Results: The peerled model of adolescent friendly services has improved viralsuppression from71% to 91% in one year Jan 2021 to Jan 2022. This evidence suggests that addressing the barriers to viralsuppression among adolescents living with HIV requires an adolescent peerled approach. This approach should be tailored to the needs of adolescents while leveraging the available resources. In addition, peers are pivotal actors in ensuring that adolescents enroll and continue in HIV care.

Conclusions: Positive engagement of peers in the delivery of HIV services should be promoted for improved outcomes. Governments and other stakeholders in HIV endemic countries should have guidelines which include adolescent friendly peerled HIV service delivery models

EPD350

Prevalence estimates of disabilities, associated socioeconomic characteristics, and HIV status among men who have sex with men in Chicago

J.Q. Freeman[1,2], D. Nolasco-Magana[2], A.D. Jimenez[3], I. Tabidze[2]

[1]University of Chicago, Department of Public Health Sciences, Chicago, United States, [2]Chicago Department of Public Health, Syndemic Infectious Disease Bureau, Chicago, United States, [3]University of Illinois at Chicago, Chicago, United States

Background: Persons living with disabilities experience increased socioeconomic challenges, affecting health outcomes. Data on men who have sex with (MSM), especially HIV-positive MSM, living with disabilities in the U.S. is lacking.

Our objective was to estimate prevalence of disability types, overall and by HIV status, and examine socioeconomic characteristics associated with any disability among MSM in Chicago.

Methods: Cross-sectional data were obtained from the Chicago National HIV Behavioral Surveillance, MSM cycle 5, that used venue-based sampling to interview and offer HIV testing to MSM in 2017. The following types of disabilities were assessed: hearing, vision, cognition, ambulation, self-care, errands, and any disability.

Any disability was defined as having reported any of the six disabilities. Frequencies and percentages were tabulated, with *p*-values calculated using Chi-square or Fisher's exact tests.

Results: Of 570 MSM (Table 1), 14.6% reported having any disability; those with any disability were more likely to be unemployed (27.7% vs. 16.6%, *p*=0.016), below the federal poverty level (24.7% vs. 14.5%, *p*=0.020), homeless (14.5% vs. 3.5%, *p*=0.0003), and experience same-sex discrimination (49.4% vs. 37.1%, *p*=0.034), than those without. Among HIV-positive MSM (Figure 1), 23.1% reported having any disability; cognition was the most prevalent (15.4%), followed by ambulation (8.7%), errands (6.7%), hearing (3.9%), vision (3.9%), and self-care (2.9%).

Characteristic	Total (N=570) N (%)	No disabilities (n=487) n (%)	Any disability[a] (n=83) n (%)	p^b
Age group (years)				0.347
18-29	162 (28.4)	139 (28.5)	23 (27.2)	
30-39	173 (30.4)	149 (30.6)	24 (28.9)	
40-49	116 (20.4)	103 (21.2)	13 (15.7)	
≥50	119 (20.9)	96 (19.7)	23 (27.7)	
Race/Ethnicity[c]				0.083
Hispanic	126 (22.2)	112 (23.1)	14 (16.9)	
Black	196 (34.6)	158 (32.6)	38 (45.8)	
White	211 (37.2)	182 (37.6)	29 (34.9)	
Other races	34 (6.0)	32 (6.6)	–	
Employment status				0.016
Not employed	104 (18.3)	81 (16.6)	23 (27.7)	
Employed full- or part-time	466 (81.8)	406 (83.4)	60 (72.3)	
Current health insurance coverage				0.284
No	76 (13.3)	68 (13.96)	8 (9.64)	
Yes	494 (86.7)	419 (86.04)	75 (90.36)	
Federal poverty level[d]				0.020
Above poverty level	475 (84.1)	414 (85.5)	61 (75.3)	
At or below poverty level	90 (15.9)	70 (14.5)	20 (24.7)	
Experienced homeless in the past 12 months				0.0003
No	541 (94.9)	470 (96.5)	71 (85.5)	
Yes	29 (5.1)	17 (3.5)	12 (14.5)	
Experienced same-sex discrimination in the past 12 months[e]				0.034
No	347 (61.1)	305 (62.9)	42 (50.6)	
Yes	221 (38.9)	180 (37.1)	41 (49.4)	

[a]Defined as having reported any of the six disability types: hearing, vision, cognition, ambulation, self-care, and errands.
[b]*p*-values were calculated using Chi-square or Fisher's exact tests.
[c]Other races included American Indian or Alaska Native, Native Hawaiian or Pacific Islander, and multiple races.
[d]Defined based on the 2017 U.S. Department of Health and Human Services guidelines. https://www.govinfo.gov/content/pkg/FR-2017-01-31/pdf/2017-02076.pdf
[e]Defined as having been called names or insulted; received poor service than other people in restaurants, stores, other businesses, or agencies; treated unfairly at work or school; denied or given lower quality health care; or physically attacked or injured because someone knew or assumed they were attracted to men, in the past 12 months.
Abbreviations: MSM, men who have sex with men; NHBS, National HIV Behavioral Surveillance.

Table 1.

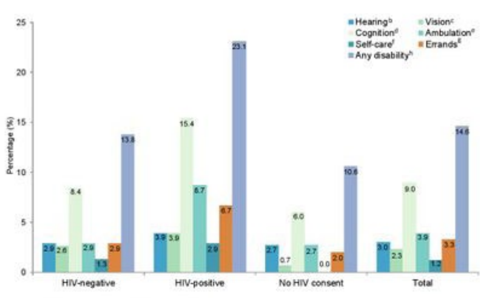


Figure 1. Prevalence estimates of disability types among MSM overall and by HIV status[a], Chicago NHBS, 2017

Conclusions: Disabilities were prevalent among MSM in Chicago, particularly among HIV-positive MSM. MSM with any disability tended to have low socioeconomic status

and experience same-sex discrimination. Future studies addressing socioeconomic challenges and improving social support and HIV care among MSM with disabilities are needed.

EPD351

Factors associated to HIV high risk behaviors among adolescents and youth living with disability in context of limited resources: evidence from a comparative study conducted in Bujumbura, Burundi

L. Nsabimana[1]

[1]Institut de Formation et de Recherche Démographique, Demography, Yaoundé, Cameroon

Background: After many years of hesitation about HIV vulnerability among people with disabilities, there are growing evidences showing that people with disabilities are not only sexually active but that global action against AIDS continues to not be adapted or accessible to them which increases their vulnerability. This paper brings new evidence on factors associated to HIV high risk behaviors among adolescent and youth living with disability. The main objective of this paper is to elucidate factors associated to HIV high risk behaviors among adolescent and youth living with disability.

Methods: We used data from The HANDISSR project carried out by IFORD and its partners in Bujumbura from 2017 to 2018. The project collected data on the interactions between Disability and HIV infection. It is a randomized trial of a representative sample of 600 adolescent and young people including 300 people with disabilities and 300 control people.

The variable on HIV high risk behaviors was dichotomized by assigning the value 1 to each person who had several sexual partners during the last 12 months and who does not use a condom during sex with a casual partner and 0 for the rest.

Disability was operationalized using the Washington group standard questionnaire

Factors associated with very high risk sexual behaviors for HIV infection were determined using logistic regression.

Results: The results show that adolescents and young people with disabilities are more likely to engage in HIV hign risky sexual behavior due to the fact that they begin sexual intercourse earlier; they have less wealth and less knowledge in terms of HIV prevention and transmission methods.

Factors	Odds ratio	P-value
Age	1.062	0.520 ns
Sex	2.050	0.113 ns
Education	0.58	0.307 ns
Wealth index	0.31	0.031 **
Age at first sex	0.25	0.023 **
Knowledge of HIV prevention methods	0.23	0;021 **
Knowledge of HIV transmission ways	0.46	0.042 **
Disabily	3.012	0.022**

Table.

Conclusions: After several decades of responding to HIV, these evidence shows that strategies have not taken into account that PWDs require specific actions, especially in the context of limeted resources.

EPD352

The intersectionality of stigma, masculinity and the life-course in men's experiences of Pre-Exposure Prophylaxis (PrEP) in Eswatini and Antiretroviral Therapy (ART) in Malawi

A. Berner-Rodoreda[1], E. Ngwira[2], K. Bärnighausen[1], R. Dambe[3], S.A. McMahon[1], B. Chione[3], A. Hettema[4], S. Matse[5], M. Taegtmeyer[6], Y. Alhassan[6], S. Phiri[7], T. Bärnighausen[1], F. Neuhann[1]

[1]Heidelberg University, Heidelberg Institute of Global Health, Heidelberg, Germany, [2]Lilongwe University of Agriculture and Natural Resources, Lilongwe, Malawi, [3]The Lighthouse Trust, Blantyre, Malawi, [4]Clinton Health Access Initiative, Manzini, Eswatini, [5]Ministry of Health, Mbabane, Eswatini, [6]Liverpool School of Tropical Medicine, Department of International Public Health, Liverpool, United Kingdom, [7]Partners in Hope, Lilongwe, Malawi

Background: Neglecting men who have sex with women (MSW) reduces their access to and engagement in HIV interventions. This study explores their views and experiences of antiretroviral drug-based HIV interventions in two high prevalence settings: in Blantyre, Malawi with antiretroviral treatment (ART) and in the Hhohho region of Eswatini with pre-exposure prophylaxis (PrEP).

Methods: We conducted 72 semi-structured in-depth interviews in Malawi (MSW on ART, stakeholders, and men from surrounding communities) and 70 in North-west Eswatini (MSW on PrEP, male stakeholders (SH), PrEP providers (PP) and local leaders (LL)). Interviews were audio-recorded, translated and analyzed in NVivo drawing on reflexive grounded theory.

Results: Stigma, masculinity and life-course intersected for MSW on ART and MSW on PrEP with societal views of older and younger MSW diverging.

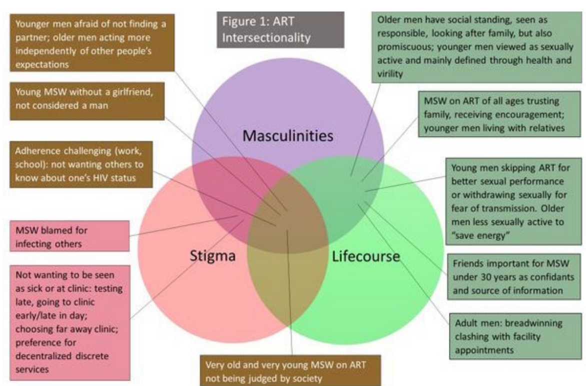

Figure 1. ART Intersectionality.

In Malawi, older and younger MSW feared being recognized as people living with HIV (PLHIV); for younger MSW on ART, anticipated stigma and concerns about reduced

Oral abstracts

Poster exhibition

E-posters

Late-breaker abstracts

Author Index

virility led to responses from social withdrawal to forgoing ART, while men with social standing could draw on more masculinity expressions, see figure 1.

MSW took PrEP to stay "clean" but feared being mistaken for PLHIV when taking pills. PrEP was linked to taking sexual opportunities, experiencing problems with condoms and living in serodifferent relationships. Older men were regarded as less sexually active and not in need of PrEP (Figure 2).

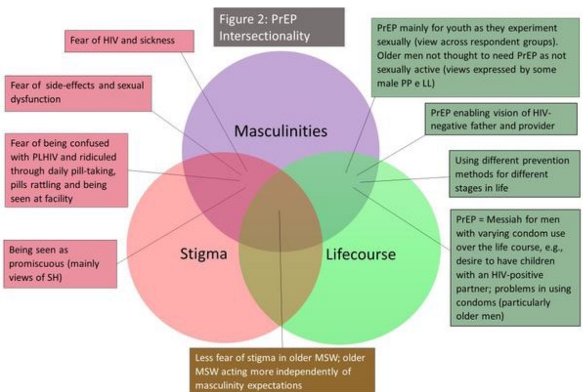

Figure 2. PrEP Intersectionality.

Conclusions: Masculinity, the life-course and stigma affect MSW's experience of ART and PrEP and should be considered when planning and implementing HIV interventions.

EPD353

Forgotten agenda: sexual and reproductive health and rights and young women with disabilities under COVID-19 in South Africa, a longitudinal cohort study

J. Hanass-Hancock[1,2], A. Nzuza[1], A. Clyde[1], S. Willan[1], K. Dunkle[1], M. Machisa[1], T. Padayachee[1], B. Carpenter[1,2]
[1]*South African Medical Research Council, Gender and Health Research Unit, Durban, South Africa,* [2]*University of KwaZulu-Natal, College of Health Sciences, Durban, South Africa*

Background: Research on the impact of the COVID-19 pandemic revealed that access to sexual reproductive health and rights (SRHR) services declined. Others also show a severe breakdown of support for people with disabilities, who lacked necessities such as food/nutrition and information on keeping safe. Some were forced to battle against significant barriers to receiving healthcare. The SRHR needs of women with disabilities were silent in all these reports.

Methods: We conducted a longitudinal cohort study with young women with (n=35) and without (n=37) disabilities aged 18-25. Following them through the COVID pandemic, we conducted a series of telephonic and face-to-face interviews with participants using validated scales, open-ended questions, and photovoice. We collected data on their experience with COVID-19; demographics; socio-economic and relationship status; food security and living conditions; mental health and coping; access to SRHR services/products; and exposure to and management of violence. We conducted descriptive and content analysis and developed case studies.

Results: Women with and without disabilities experienced mental health challenges, food or income insecurities, and less frequently accessed SRHR services.

However, this was exacerbated for women with disabilities, who lacked access to COVID information, were increasingly dependent on others at home, and were turned away from or did not dare to go to clinics and access SRHR services. The hard lockdown period saw a reduced reporting of intimate partner violence for all as participants did not live with their partners.

However, more household arguments were observed. Young women with disabilities reported communication challenges at home when their family members could not communicate with them. These challenges led to increased isolation, frustration, and abuse.

Conclusions: Emergency responses need to better integrate the needs of people with disabilities through accessible response services. Emergency healthcare has to include SRHR, and these services have to be accessible to all people with disabilities. Disability audits on healthcare services and disability inclusion measures and resource allocation in SRHR policies and strategic plans need to be developed and implemented urgently.

EPD354

Community mobilization to differentiated care clinics through a communication strategy focused on indigenous LGBTIQ communities in Guatemala for PrEP / PEP

B. Zapeta[1]
[1]*Asociación de Investigación, Desarrollo y Educación Integral IDEI, Quetzaltenango, Guatemala*

Background: In recent years, technology has made easier to find new effective Prophylaxismethods to prevent HIV, in some societies, the use of this methods has reduce considerably the new HIV infections, however, The inequality gap for access to information and treatment is still very large. in societies where the lack of sex education and actions by government entities are minimal and centralized as Guatemala, where 45% of the population is indigenous.

The new communication technologies are tools that bring innovation to the processes of comunicate at a time when the COVID-19 pandemic affects our life and complicates access to supplies for prevention and medical care

Description: Through the implementation of a comprehensive marketing and relevant communication strategy in Mayan languages, supported by UNAIDS, combined prevention services are offered that include advice and counselling, and the deliver of HIV prevention kits, wich includes condoms and lubricants, in addition to supplies for the prevention of COVID19 and the production of au-

diovisuals to bring information in Mayan languages of PrEP and PEP. mainly on Facebook, Instagram, Grindr and WhatsApp from November 2020 to January 2021
Lessons learned:
1. A communication strategy with an impact of 28,246 users.
2. Kits for the prevention of HIV and COVID 19 are delivered to homes during the quarantine period,
3. The goal of 300 kits for deliveries was exceeded and 800 kits. 43% of which were requested by women, including grandmother midwives, and 57% by men and diversity.
4. Prior to the communication strategy, Clínica Kabawil had aprox 20 visits per month. Medical care and prophylactic methods are currently provided to 463 patients from indigenous and diversity populations, of which 12% receive medical attention for PrEP and PEP since November 2021 and supplying 3,000 condoms and lubricants monthly .
Conclusions/Next steps: It is decisive to continue in the fight against HIV the elimination of inequality in access to information and supplies for prevention, especially to take in consideration the indigenous population.
The evolution of communication channels is essential. It is the responsibility of the organizations and society that work together to eradicate HIV to take in consideration interculturality and the decentralization of health services.

EPD355

Engaging trans community to prevent prevalence of sexually transmitted diseases: a qualitative study of Pakistani Hijra community

M.A. Awan[1], I.H. Syed[2], A. Amin[3], L. Ali[4], S. Ahmed[5]
[1]Jinnah Sindh Medical University, Public Health, Karachi, Pakistan, [2]Allama Iqbal Open University, Sociology, Islamabad, Pakistan, [3]Pakistan Housing Authority, LAW, Islamabad, Pakistan, [4]Aman Foundation, Operation, Karachi, Pakistan, [5]ILO, Project Management, Islamabad, Pakistan

Background: Hijra community also referred as transgender is one of the most vulnerable groups for the sexually transmitted infections (STIs) in Pakistan with 3% prevalence rate of HIV/AIDs. They are socially deprived, excluded, and isolated which limit their access to services including health. Resultant they live in isolation and commonly earn their livelihood by means of dancing, sex work, begging and alms collections. The prevailing pandemic situation has increased their vulnerabilities in term of accessing health services and livelihood.
Methods: This is a formative research based on exploratory research design to discover suitable means to engage hijra community for protection from STIs. This research was conducted from June to September 2021 in Karachi Pakistan by means of using IDIs (21) and FGDs (4) with the hijra people while expert interviews (7) were conducted with concerned stakeholders.
Results: This research reveals that most of the hijra respondents were aware that unprotected sex can transmit HIV/AIDS but not aware about the other STIs. However, majority among them were not sensitive about the protected sex due to client's pressure who used to pressurize for unprotected sex.
Moreover, transgenders were also reluctant to visit health service providers because of the past experiences of discrimination and disrespect. They were also fearful to undergo the medical tests which may reveal if they are already infected.
Study shows that the association, attachment, and rapport between hijra people and health service provider can play vital role in term of improving the access of hijra people to health services.
Similarly, reduced cost of traveling, instant access, privacy can also improve their health seeking behavior along with bringing the improvement in the traditional health services.
Conclusions: Transgender people are vulnerable to acquire and transmit STI because of engagement in prostitution, client's pressure and unprotected sex. While they face challenging situation to access the health services due to their health seeking behavior, past experiences with health services provider and financial constraints.
In the given context technology-based health intervention through mobile app in Urdu language not only improved their knowledge but can also connect health service provider with hijra community for access to services.

EPD356

The road to HIV Racial Justice Now!: Lessons for HIV advocacy and racial equity in the United States

D. Hawkins[1]
[1]Emerson College & HIV Racial Justice Now!, Communication Studies, Boston, United States

Background: Despite claiming to be a champion for HIV, a myriad of Trump's actions reinforced a hierarchy where the most marginalized were left in the shadows. As Trump's rhetoric of hate rang loudly, many organizations and conferences related to HIV stayed silent.
Enraged by this silence, in November 2017, a group of BIPOC HIV activists in the United States of America convened and strategized. In turn, the coalition, HIV Racial Justice Now! (HRJN) was born.
Description: HJRN emerged from an analysis that decades into the HIV epidemic, leadership and political priorities across the HIV response did not sufficiently reflect communities most impacted by the domestic HIV epidemic.
While there have been tremendous advancements in HIV prevention, treatment, research, and care, vast health disparities still exist across race and ethnicity. Efforts to dismantle white supremacy and to address racism within institutions have been underway in the HIV movement,

but through conversations, HRJN discovered the movement for racial justice in HIV felt disjointed and fragmented and therefore needed to consolidate our power.

Lessons learned: Using Emergent Strategy as the facilitation model, the group developed The Declaration of Liberation. The document, which was drafted and edited by over 20 HIV movement leaders of color from across the country, serves as a lens for analyzing racial equity in HIV and future implications of this approach. The document is designed to be used in a range of HIV organizations and spur organizing in philanthropy, HIV services, and advocacy. The framework argues a racially just lens in the HIV movement must:

1. Integrate racial justice into organizations and political strategies
2. Center communities most impacted
3. Push for increased accountability
4. Ensure equity in the allocation of resources (human, material and financial)
5. Transform and dismantle institutions embedded in White Supremacy.

Conclusions/Next steps: This presentation will provide a brief overview of HRJN's history, its membership, and recruitment strategies. Then, we will unpack the framework, revealing the concrete and tangible ways the framework can and should be used to achieve racial justice.

Finally, we offer implications and recommendations for mobilization, public policy, and public health.

Economic transitions and social and cultural changes affecting HIV and the HIV response

EPD357

From adolescent to adult HIV: a facility-based comparative analysis of determinants of successful transition from adolescent to adult HIV treatment, in Zambia

T. Chabu[1]

[1]University of Lusaka, Lusaka, Zambia

Background: There is inadequate data on transition outcomes in Zambia that is focused on the decentralised facility-level type, facility Location and facility Ownership. The objective of this study was to assess facility-type based performance in the transition of adolescents to adult HIV care, as well as to determine the association between facility-based socio-demographic factors and successful transition to adult care.

Null Hypothesis: 3rd level facilities have a higher successful transition performance of adolescents to adult care compared to lower-level facilities.

Alternative Hypothesis: 3rd level facilities do not have a higher successful transition performance of adolescents to adult care than lower-level facilities.

Methods: A Retrospective descriptive cross-sectional study was carried out with a population of 7275 patient files that were successfully transitioned in 718 PEPFAR supported sites, across the 10 provinces. Data was extracted from the National Electronic Health Record (E.H.R) system, later uploaded into STATA_SE v-16 for analysis. Socio-demographic traits and facility-level based performance was calculated using descriptive statistics and expressed using frequency tables. Logistic regression was conducted to assess whether 3rd level facilities had a higher transition performance in relation to lower facilities. Chi-square was used to test the Association between Socio-demographic Traits and successful Transition Outcome, at 5% confidence level.

Results: A total of 43.2% (N=3145) had successfully transitioned to adult care, from (N=7275) individuals that were extracted from the E.H.R database, in 718 PEPFAR supported sites. The Mean Age of clients transitioned was 18.3, (SD-1.55). Health Posts had the highest transition performance of 57.3%. There was an association between transition outcome and the following socio-demographic variables; facility-type (Health Posts), ownership (Private), Location (Rural) and Province (Muchinga) with p-values of 0.0001, 0.01, 0.000 and 0.000, respectively. Logistic regression analysis found that there was an increase in higher successful transition performance from facility-level-health post (aOR, 1.599398, 95% CI,1.213436-2.108125, p=0.000).

Conclusions: The null hypothesis is rejected. There was a 59.9% increase in higher successful transition performance from a lower-level facility compared to 3rd level facility, at 95% Confidence Interval. Similarly, health posts had highest transition success at 57.3%.

EPD358

Reduction of precariousness among People Living with HIV (PLHIV) through a collaboration with the National Employment Fund (NEF), in the city of Douala, Cameroon

J.L. Ngando Eke[1], D. Dondbzanga[2]

[1]ALTERNATIVES Cameroun, Littoral, Douala, Cameroon, [2]Coalition PLUS, Dakar, Senegal

Background: Alternatives Cameroun takes care of an active file of approximately 1000 people. In 2019, approximately 50% of these people were in a precarious situation due to the fact that they either do not have a job or have lost their job, both of which are directly related to their HIV status. Economic insecurity has a negative impact on their compliance and quality of life.

Alternative Cameroon set up a pilot project whose main objective was to improve the standard of living of our patients in precarious situations.

Description: In order to recruit the project's beneficiaries, a tool was created and set up to find out if the patients wanted to develop a commercial activity or find a job. We were thus able to have 200 people wishing either to be self-employed or to benefit FNE support.

A collaboration with the FNE was initiated and allowed counselors to accompany the patients without travelling for them and face unfamiliar environments and people. The FNE then set up a three-pronged support program: writing CVs, preparing for job interviews and creating income-generating activities.

Lessons learned: This project has enabled 50 people to find work and 80 people to become self-employed through the establishment of 8 savings and credit associations and the initiation of income-generating activities.

In addition, the project evaluation shows that 60% of the non-observant patients who benefited from these services say that their physical and mental health has improved.

Our project has highlighted the need to offer specific support to PLHIV for their socio-professional integration or reintegration. Also, autonomy favors the well-being of PLHIV. Once autonomous, more than half of the non-observant patients who benefited from the project saw their physical and mental health improve. Self-stigmatization remains a real obstacle to socio-professional integration for PLWHA.

Conclusions/Next steps: Alternatives Cameroon intend to accelerate the mobilization of people for this program and especially to extend this activity in all the cities where there are ALTERNATIVES Cameroon branches.

We also want to set up this kind of collaboration with companies directly so that we can refer our beneficiaries ourselves according to the needs of these companies.

EPD359

Economic livelihoods interventions as a strategy to reduce HIV vulnerability risks

T. Pillay[1], A. Ambrose[2], M. Lotvonen[3], M. de Vos[4]

[1]*NACOSA, Global Fund- AGYW Programme, Durban, South Africa,* [2]*NACOSA, Global Fund AGYW Programme, Pretoria, South Africa,* [3]*NACOSA, Global Fund AGYW Programme, Cape Town, South Africa,* [4]*NACOSA, Global Fund - Executive Director, Cape Town, South Africa*

Background: The Global Fund grant NACOSA has piloted the Economic Strengthening Livelihoods (ESL) as part of the "My Journey Programme". ESL project is aimed at AGYW who are not in education, employment or training (NEETs) aged 15-24 and therefore marginalized and vulnerable. By providing socio-economic support and access to opportunities resulting in reduced HIV risk.

Description: The ESL project is implemented in urban, peri-urban and rural sub-districts in South Africa namely, Tshwane (Gauteng), Mbombela (Mpumalanga) and Nelson Mandela Bay (Eastern Cape) targeting 2000 NEETs. ESL provides a 6-day skills training and streaming to opportunities *(employment, education or entrepreneurship e.g. Learner Support Agents in schools, dressmaking, completion of grade 12)* and provision of support incentives. AGYW's are encouraged to save individually or in groups which has resulted in 435 NEETs receiving matched funding for savings. A condensed iteration ESL Light was implemented in the third year in Rustenburg (North West) and Mitchells Plain (Western Cape) due to uptake with ESL Pilot.

Lessons learned: After 18 months of implementation, 72% of the NEETs who received ESL skills training had completed their livelihood opportunities. These results have proven that mentoring support and relationship building from role-players have played a pivotal role in opening up livelihood opportunities for AGYWs.

Preliminary findings show that ESL participants are more likely to access HIV testing services and use PrEP compared to those NEETs who only received the core package of services (HTS: 36% compared to 26%; PrEP: 15% compared to 5%). Furthermore, ESL participants, if tested reactive, are more likely to be linked to care (75%) compared to non-ESL NEETs (69%).

In addition, when ESL is implemented in conjunction of other layered services it provides a holistic development opportunity for AGYWs. Two thirds of the ESL participants in Tshwane also completed a self-defense rape-prevention training.

Conclusions/Next steps: ESL Light will be scaled up to include adolescent boys and young men. Stakeholder engagement at community levels will be prioritized to obtain buy-in to the ESL project.

In addition, establishing a mentoring support structure at the community spaces for young people to become economically active whilst reducing risky behaviours.

Humanitarian crises and HIV

EPD360

Integration of HIV prevention and treatment services within primary health care humanitarian responses in conflict-affected settings of Africa: a systematic review

L.-A. Omam[1], E. Jarman[2], K.N. O'Laughlin[3], R.P.-R. Parkes-Ratanshi[1,4]

[1]*University of Cambridge, Department of Public Health and Primary Care, Cambridgeshire, United Kingdom,* [2]*Reach Out Cameroon, Health, Buea, Cameroon,* [3]*University of Washington, Departments of Emergency Medicine and Global Health, Washington, United States,* [4]*Makerere University College of Health Sciences, Infectious Diseases Institute, Kampala, Uganda*

Background: Globally, 8-10% of people living with HIV are affected by conflict (Hanson *et al*, 2010). However, HIV prevention and treatment services seldom reach internally displaced persons and refugees living in fragile and conflict settings and these populations are at risk of poor outcomes related to HIV. Different models of care are used to provide primary health care including HIV

services in humanitarian settings (McGowan *et al* 2020; Miller *et al* 2020), yet evidence on these delivery models by humanitarian organisations is limited.

We conducted a systematic review to synthesise currently available evidence on models of care used in conflict-affected settings in Africa to understand different modalities of service delivery which could be leveraged to optimize HIV services in conflict settings.

Methods: We conducted a systematic review using the Preferred Reporting Items for Systematic Reviews and Meta-analyses (PRISMA) guidelines. The protocol for this review was registered with the International Prospective Register of Systematic Reviews. We searched Embase, MEDLINE, PubMed, Global Health, Web of Science, Scopus, and EBSCOhost for manuscripts published from 1992 to December 2020. Quality assessment was conducted using the Critical Appraisal Skills Program and the Critical Appraisal Tool for Cross-Sectional Studies.

Results: A total of forty eight articles were included for analysis from which 33 were rated as good quality. The results showed that the models of primary care in place in these humanitarian settings include health facility based, community based interventions, mobile clinics, outreach and home visits. Twenty four articles reported the delivery of primary health care services using stand-alone (vertical) approaches.

Only 11 articles reported the delivery of HIV services from which 08 where integrated with other services. HIV services are provided by international and national non-governmental organisations, Governments, UN agencies, community-based organisations, faith-based organisations and academic institutions.

Conclusions: Few HIV services were reported in conflict settings, a concerning finding given the reality that many conflict-affected populations are living with HIV. A move towards integration of services should be considered by humanitarian organisations as this is an opportunity to consider increasing HIV service delivery. Rigorous assessments on integrated service delivery models in conflict settings should be conducted.

EPD361

Closing HIV case finding gaps amidst COVID, natural disasters, cross border migration, and socioeconomic challenges in Burundi

R. Golin[1,2], P. Vinayak[1], E. Baramperanye[3], A. Kavungerwa[3], F. Kavabushi[4], J. Wakana[4], J. Martin[5]

[1]U.S. Department of State, Office of the U.S. Global AIDS Coordinator and Health Diplomacy, Washington, United States, [2]United States Agency for International Development, Office of HIV/AIDS, Washington, United States, [3]United States Agency for International Development, Bujumbura, Burundi, [4]U.S. Department of Defense HIV/AIDS Prevention Program, Bujumbura, Burundi, [5]U.S. Department of Health and Human Services, Geneva, Switzerland

Background: Burundi has recently endured COVID surges, floods, poor harvests, and substantial cross border migration, and additional epidemics including malaria and tuberculosis. These socioeconomic stressors have challenged the country's HIV achievements and progress.

The PEPFAR/Burundi program directly supports 95% of the national HIV treatment cohort across the country's 18 provinces, and PEPFAR/Burundi has an overarching goal to support the government to achieve and sustain equitable epidemic control. The program's HIV testing services are focused swiftly closing the 1st 95 gaps. The largest case finding gaps exist among children, adolescents, and young men ages 15-30 years.

Description: Despite limitations with in-person meetings, PEPFAR/Burundi leveraged virtual platforms to coordinate with the Ministry of Health, Global Fund, and implementing partners to support facility- and community-based HIV testing services. From October 2020 through September 2021, the program directly supported 15 testing modalities, and made a concerted effort to ensure standard of care HIV testing services were available in emergency departments, outpatient departments, inpatient wards, malnutrition units, STI clinics, TB clinics, PMTCT service delivery points, and in communities.

Additionally, efforts were made to offer safe and ethical index testing services to all people living with HIV. In-person and virtual mentorship and support visits were conducted as feasible. PEPFAR/Burundi conducted 117 site visits to support program quality assurance, and challenges related to testing services were identified and addressed.

Lessons learned: Analyzing routine PEPFAR program data, the PEPFAR/Burundi team achieved 143% (8,617/6,028) of the annual case finding target. Index testing contributed the most to case finding achievements for adult females and males (46% and 65% contribution, respectively) and children and young adolescents (82% contribution). Index testing services resulted in the highest testing positivity across all implemented testing modalities (12% for facility-based index testing, 13% for community-based index testing). Additionally, 99% (8,525/8,617) of diagnosed PLHIV were linked to treatment.

Conclusions/Next steps: Collaboration with Ministries of Health, implementing partners, and broader stakeholders is critical to program success. Increased attention to the implementation of person-centered HIV testing services continues to be necessary until the 1st 95 is achieved and maintained across age and sex bands, and geographies.

EPD362

Differentiated service delivery to mitigate the effect of Armed conflict on ART: lessons learned in Cameroon from 2018-2021

J.d.D. Anoubissi[1], E. Temgoua[1], L. Bonono[1]
[1]National Aids Control Committee, Yaounde, Cameroon

Background: In 2016, a socio-political crisis started in two regions of North-west and South-west regions of Cameroon. The aggravation of the conflict in 2018, led to massive displacement of the population, and the closing of many services. Between 2017 and 2018, the number of patients on ARV declined from 60216 to 56383 in the two regions. To mitigate the impact of the crisis, a contingency plan for health has been developed and implemented by the programme.

Description: In 2018, a mitigation plan for the two regions was developed and implemented. The main interventions were:

1. Community ARV dispensation using health care providers;
2. Multi-month dispensation of ARV;
3. Opening of health facility just for a few hours in the most at-risk zone for treatment refill;
4. Use of reference card to link displaced patient on treatment in the host region.

To analyze the effect of the strategy, we examine tree indicators from the routine data reported by the ART program between 2018 and 2020. The number of patients on treatment, the number of patients maintained in care at 12 and 24 months after the initiation of ARV treatment.

Lessons learned: Data from 2018 to 2021 from the two regions show an improvement in the ARV treatment indicators compared to 2017. The number of patients maintained on ARV 12 months after the initiation, increases from 68% in 2019 to 80% in 2021 in the North-west region and from 71% to 78% in the South-west.

The retention in 24 months after initiation increases from 63% to 69% in the north-west and from 53% to 67% in the south-west. The total number of patients on treatment in the two regions increase from 33645 to 40469 in north -west and from 23775 to 30055 in the south-west between 2018 and 2021.

Conclusions/Next steps: The measures taken to mitigate the impact of the conflict have yielded significant results. The country needs to develop a broader plan to cover other aspects; such as viral load testing which is still difficult to provide to displaced patients and those living in red areas. Similar strategies can be undertaken for hard-to-reach patients in other settings.

EPD363

Adherence to two HIV programs in a conflict-affected setting: lessons learnt from CAR

P. Cuenca[1], X. Vallès[2,3], S. Ouanekpone[4], V. Toungou Scholastique[4], F. Gooudouhountv[5], B. Andjigbodepou[5], S. Ouarassinou[6], T. Ningatalet[6], A.N. Mweze[4], L. Palacios[1], A. Llosa[1], L. Moretó Planas[1]
[1]Médecins Sans Frontières Spain, Medical Department, Barcelona, Spain, [2]Programa de Salut Internacional, Institut Català de la Salut, Barcelona, Spain, [3]Institut per la Recerca en Ciències de la Salut Germans Trias i Pujol, Barcelona, Spain, [4]Médecins Sans Frontières CAR, Bangui, Central African Republic, the, [5]Médecins Sans Frontières CAR, Batangafo, Central African Republic, the, [6]Médecins Sans Frontières CAR, Kabo, Central African Republic, the

Background: Despite having the highest HIV prevalence in the region, 2.9% in adults, <50% of the people living with HIV (PLHIV) in CAR received antiretroviral therapy (ART) in 2020. Consequently, HIV remains one of the leading causes of mortality. Conflict is a well-known factor impacting adherence to HIV programs. MSF Spain in collaboration with the Ministry of Health (MoH) supports HIV diagnosis and care in Kabo and Batangafo hospitals since 2008. Batangafo has regularly been exposed to inter-community clashes between herders- and farmers-affiliated armed militias, but the MoH and other NGOs have managed to keep a presence in the area despite the repeated attacks. Kabo, closer to the border with Chad, has often been destabilized by episodes of banditry and cross-border smuggling due to the armed group heavy presence in the area.

The aim of this study was to identify the main demographic and clinical factors associated with HIV adherence in the two supported cohorts.

Methods: Descriptive and survival analyses were conducted on routinely collected programmatic data of HIV cohorts between 2017 and 2021 in Batangafo and 2020 in Kabo.

Results: While sex ratio and mean age at ART initiation were similar across projects (mean(SD) (32.3(10.4) in Batangafo vs. 33.2 (10.9) in Kabo), women tended to be younger in Kabo ($p<0.001$). PLHIV in the Kabo project presented with more advanced WHO stage at diagnosis ($p<0.001$), lower CD4 count ($p<0.001$) and lower body mass index (BMI) ($p<0.001$); loss-to-follow-up (LTFU) was also more common, hazard ratio 1.70[(CI 95%=1.1-2.5).

Combined project data revealed several factors associated with LTFU: male sex (HR=1.30, p=0.07), younger age (HR=1.45, p=0.05) and more advanced stage (stages 3-4 vs. 1-2 HR 1.4) (p=0.05), at initiation.

Conclusions: Despite similarities in care, those in Kabo presented with more advanced disease indicators and adhered less well. Greater stigma and cross-border movement may explain this. Targeted interventions should be put in place to combat stigma in the community and facilitate access to care in case of instability,

including reinforcing health promotion and community engagement, decentralization and patient support, education and counselling, with special attention to patients at higher risk of abandon: males, younger PLHIV and patients with more advanced WHO status.

Intergenerational and/or transactional sex

EPD364
Pathways for women's engagement in transactional sex with a non-primary sex partner: the role of partner type

S. Magni[1,2], A. Hatcher[3], A. Gibbs[4,5], K. Dunkle[6], J. Wamoyi[7], N. Christofides[1]
[1]University of Witwatersrand, School of Public Health, Johannesburg, South Africa, [2]Genesis Analytics, Johannesburg, South Africa, [3]University of North Carolina, Chapel Hill, North Carolina, Department of Health Behavior, Gillings School of Global Public Health, North Carolina, South Africa, [4]South African Medical Research Council, Pretoria, Gender and Health Research Unit, Durban, South Africa, [5]University of KwaZulu-Natal, Centre for Rural Health, School of Nursing and Public Health, Durban, South Africa, [6]South African Medical Research Council, Gender and Health Research Unit, Pretoria, South Africa, [7]National Institute for Medical Research, Department of Sexual and Reproductive Health, Mwanza, Tanzania, The United Republic of

Background: Transactional sex is a risk factor for HIV acquisition in women in sub-Saharan Africa. Little research into the longitudinal predictors of transactional sex has been undertaken.
This study aimed to quantitatively explore the pathways which contribute towards women's engagement in transactional sex in South Africa.
Methods: We used longitudinal data drawn from self-selecting respondents participating in a randomised controlled trial in informal settlements in eThekwini. Respondents were asked five questions on transactional sex with a *kwapheni*(an isiZulu term that translates as "side dish" and denotes a concurrent partner) or casual partners. Control in a main relationship was measured using the Sexual Relationship Power Scale and alcohol use using the Alcohol Use Disorders Identification Test (AUDIT).
We used multivariable regression and structural equation modelling (SEM) to assess associations and pathways longitudinally associated with transactional sex over two years.
Results: 677 women aged 18-35 years enrolled at baseline and 545 were followed up two years later. At follow-up, 45% of respondents reported past-year transactional sex with a casual partner or *kwapheni*. Women who reported being in more controlling main relationships had higher odds of engaging in transactional sex with a non-primary partner at follow-up (AOR=1.11, 95%CI 1.06-1.16). Accounting for baseline education, food security and transactional sex, three pathways were associated with endline transactional sex:
a. More controlling main relationships had strong effects on transactional sex with a *kwapheni* (d=0.6);
b. Hazardous drinking at baseline was moderately associated (d=0.45);
c. Increased food insecurity had small but significant effects (d=0.24).
The SEM fit the data well (RMSEA=0.03, 90%CI 0.02-0.04; CFI=0.97; TLI=0.96).
Conclusions: Nearly half of women engaged in past-year transactional sex with a non-primary partner in South African informal settlements. Being in a highly controlled main relationship is associated with transactional sex with a casual partner or *kwapheni*.
Women who are in main relationships with high degrees of control, may attempt to assert their agency by choosing with whom, and partially, what the terms are, for a transactional sexual relationship.

Media, cultural and religious representations of HIV and of key populations

EPD365
STUDIO DHANAK: a screen writing workshop to groom aspiring LGBTQ+ writers and filmmakers to tell their stories through short films and advocate HIV & LGBTQ+ rights in mainstream Indian media

S. Abbasi[1], T. Chopade[2], S. Latad[2], S. S[3], V. Anand[4]
[1]The Humsafar Trust, Co-Founder & Chairperson, Mumbai, India, [2]The Humsafar Trust, Advocacy, Mumbai, India, [3]The Humsafar Trust, Capacity Building, Mumbai, India, [4]The Humsafar Trust, Mumbai, India

Background: The Humsafar Trust (HST) is community-based organization working on the health and human rights of the LGBTQ+ community since 1994. Identifying the lack of factual and empathetic visual content representing stories of people living with HIV (PLHIV) as well as other vulnerable groups, HST designed the STUDIO DHANAK (SD) (DHANAK means Rainbow in Urdu language) – A screen writing workshop for nurturing script writing and film-making capacities of aspiring LGBTQ+ identified scriptwriters and filmmakers from all over India.
Description: In October 2021, SD commissioned four successful media industry professionals as mentors/trainers to strengthen capacities of 20 LGBTQ+identified filmmakers on fictional and sensitive representation in regional languages over a 3-day screen-writing workshop. Various experienced professionals from entertainment industry also shared their experiences and approach to story writ-

ing with the participants. The workshop aimed to create content in different formats for promoting awareness/social acceptance toward LGBTQ+ and PLHIV via structured sessions on screenplay writing, storyboard creation, casting, direction, cinematography, editing and post-production procedures. Participants were trained to develop preliminary ideas via intra-group discussions, one-one guidance from mentors, and interactions with community leaders. Participants were also trained by mentors to develop their story ideas into a full-fledged screenplay over two months via online mentoring.

Lessons learned: It is essential to strengthen community voices as they are experience based, authentic and impactful. The initiative provided a platform to strengthen the voices of LGBTQ+ youth from rural and semi-urban India to express freely through the medium of screen writing. Effective mentoring and peer learning plays a significant role in enhancing the productivity of the participants to develop engaging scripts. The participants explored various themes including social acceptance, empowerment, health awareness and mental health issues. The completed scripts presented authentic personal feelings and real life experiences.

Conclusions/Next steps: With appropriate guidance, aspiring community filmmakers can be honed to create content that is sensitive and factually representative of lived experiences of PLHIV and LGBTQ+ individuals. 5 best scripts will be chosen and awarded STUDIO DHANAK FELLOWSHIPS to produce short films.

These films can be used as an efficient advocacy tool to mainstream the issues and promote social acceptance of PLHIV and LGBTQ+ population.

EPD366

#LiveAIDS – online concert in memory of AIDS victims as a way to destroy myths among the living

Y. Chechotkina[1], M. Rovinskyi[1], K. Rivera[1], N. Smolianets[1]
[1]Charitable Organisation "100% Life", Department of Communications, Kyiv, Ukraine

Background: The Media analysis in Ukraine showed that 40% of HIV-related information was negative, reflected old prejudices. Reaching the people outside of HIV-sphere is a challenging communication. In 1992, the concert in memory of Freddie Mercury and all AIDS victims was held in London. Thirty years later, the HIV epidemic is still a challenge. We aimed to show the positive changes related to HIV by voices of PLWH. Using the pop icon image as well as the stories of real PLWH, we showed the positive side of HIV treatment and a modern view of the problem. The combined approach allowed us to reach the general population and communities.

Description: Before AIDS Memorial Day 2020, we conducted the concert in memory of #LiveAIDS - a tribute concert of Queen performed by a famous Ukrainian band. The concert was streamed on "100% Life's" and PIANOBOY's Facebook. HIV activists and partners were speaking between songs. Stories of PLWH living a full life were published under #LiveAIDS. The largest TV channel announced the concert and showed a story with a PLWH who dispelled myths about HIV. The title LiveAIDS is a reference to Live Aid, a charity music festival, where Queen performed in 1985.

Lessons learned: More than 18,000 users watched the video on Facebook. The indicators of views and involvement are statistically comparable to top bloggers, who are relevant according to subscribers; this shows the interest in the format and topic. The total coverage was almost 150,000. The appeal to the image of Freddie Mercury allowed us to place the audience in context without additional communication. The known Ukrainian artist with an active social position, attracted a wider audience.

The PLWH was presented in a positive modern connotation. The online concert proved to be a good tool for capturing a wider audience during COVID's restrictions.

Conclusions/Next steps: A creative approach to coverage of HIV-related issues allowed us to compete with the COVID19 news. The concert is freely available on Facebook and YouTube and the number of views continues to grow, achieving the main goal - to broadcast modern messages about HIV and reduce stigma against the PLWH.

EPD367

PrEP messaging in South Africa over time: a content analysis of PrEP-based digital news media from 2012-2021

S. Coelho[1], G. Schulz[1], K. Meek[2], L. Shipp[3], C. Singh[4], K. Willis[3], A. Best[5], M. Mcingana[5], J. Mcloughlin[4], H. Hausler[5,6], C. Beyrer[3], S. Baral[3], S. Schwartz[3]
[1]Johns Hopkins Bloomberg School of Public Health, Department of Population, Family, and Reproductive Health, Baltimore, United States, [2]Johns Hopkins Bloomberg School of Public Health, Department of International Health, Baltimore, United States, [3]Johns Hopkins Bloomberg School of Public Health, Department of Epidemiology, Baltimore, United States, [4]TB HIV Care, uMgungundlovu, South Africa, [5]TB HIV Care, Cape Town, South Africa, [6]University of Pretoria, Pretoriasou, South Africa

Background: Public discourse surroundingpre-exposure prophylaxis (PrEP) has increased globally in recent years. Messaging can play a vital role in promoting and inhibiting PrEP engagement among readers. We examined the evolution of South African news media representations of PrEP over the past decade to understand the content and tone of PrEP-related messaging.

Methods: English, isiZulu, and Afrikaans Newspapers in South Africa were screened based on distribution volume with the top twenty selected. Digital articles published between 2012-2021 containing at least one of four PrEP-related search terms were deemed eligible. A thematic coding approach was used; a qualitative codebook was

developed to classify information being conveyed. Articles were subsequently categorized according to theme and overall tone towards PrEP.

Results: 249 articles mentioning PrEP were identified and thematically coded. The tone of PrEP messaging was largely positive (n=130, 52%), though over 40% were neutral (n=92, 37%) or negative (n=27, 11%). Among PrEP-focused articles (n=125), PrEP messaging was most commonly related to PrEP as one of several HIV prevention options, awareness of what PrEP is, access to PrEP, and PrEP as an empowerment tool (Figure 1). Themes were largely consistent, with a greater emphasis on increasing awareness of what PrEP is over time. Key populations commonly mentioned as benefactors of PrEP were adolescent girls and young women (n=96), men who have sex with men (n=86), and female sex workers (n=77).

Conclusions: Digital media representation of PrEP was largely positive over the past decade, however, over 40% of articles had neutral or unfavourable representations of PrEP. Priority populations were frequently noted, potentially contributing to the unintentional stigmatization of PrEP. Efforts to generate demand for PrEP in media may be leveraged to improve PrEP uptake and decrease PrEP stigma. Focusing prevention campaigns on PrEP as a user-controlled HIV prevention option may further direct media attention and decrease PrEP stigma.

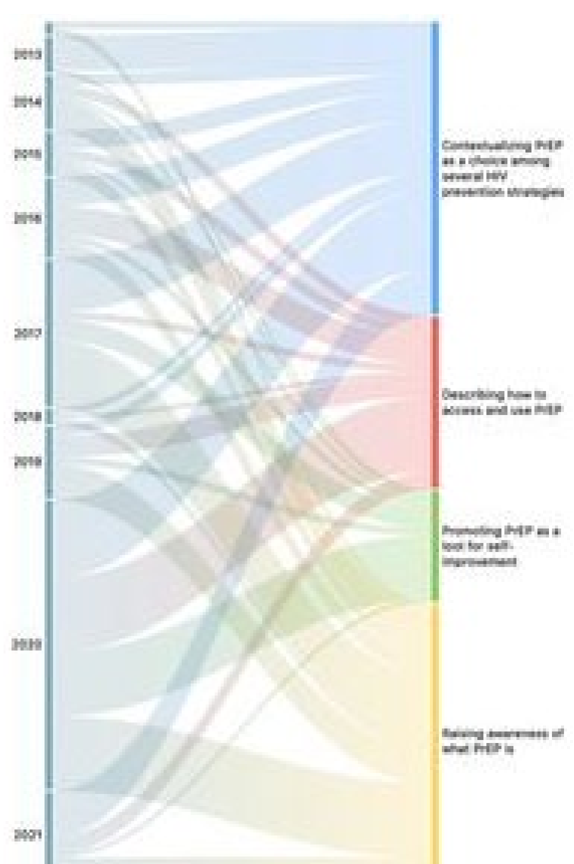

Figure 1. Sankey diagram depicting key messaging themes in PrEP-focused South African digital news media (2012-2021) (n=125)

Migration and HIV

EPD368

Addressing the migrant gap: maternal healthcare perspectives on utilizing prevention of mother to child transmission (PMTCT) services during the COVID-19 pandemic, South Africa

M. Bisnauth[1,2], A. Coovadia[3], M. Kawonga[1,4], J. Vearey[1,5]

[1]University of Witwatersrand, School of Public Health, Dept of Health Sciences, Johannesburg, South Africa, [2]Anova Health Institute, Public Health, Johannesburg, South Africa, [3]University of Witwatersrand, Clinical Medicine, Dept of Health Sciences, Johannesburg, South Africa, [4]Charlotte Maxeke Johannesburg Hospital, Community Health, Johannesburg, South Africa, [5]University of Witwatersrand, African Centre for Migration and Society, Social Sciences, Johannesburg, South Africa

Background: The COVID-19 pandemic has interrupted the South African prevention of mother-to-child transmission of HIV(PMTCT) programme. In 2020, the International Organization of Migration estimated there were 4 million cross-border migrants in South Africa, some of which are women living with HIV, are highly mobile, and located within peripheral and urban areas of the city of Johannesburg.

The impact of the COVID-19 pandemic on both, internal and cross-border migrants utilization of PMTCT services and, on how the changes to services may have effected adherence - is unknown.

The purpose of this research was to qualitatively explore the experiences of different typologies of migrant women accessing PMTCT services during the pandemic, at a public hospital located in a high mobility context of Johannesburg.

Methods: A qualitative approach was used, involving semi-structured interviews with 40 HIV positive and pregnant migrant women from June 2020-June 2021. Participants were recruited through purposive sampling at the antenatal and postnatal clinics in a public hospital in Johannesburg. A thematic approach was guided by The Utilization of PMTCT Healthcare Services Conceptual Framework to analyze interviews.

Results: Forty interviews were conducted with 22 cross-border and 18 internal migrants. Highly mobile women in cross-border migration patterns expressed more fear to utilize health services due to xenophobic attitudes from healthcare workers, were unable to receive ART with border closures during lockdown, and relied on SMS reminders to adhere to ART during the pandemic. All 40 women struggled to understand the importance of adherence post-delivery, because of the lack of counselling from support staff, too busy attending to the influx of COVID-19 hospital admissions.

The overburdened clinical environment lacked infrastructure to properly educate all women on breastfeeding because of social distancing protocols.

Conclusions: COVID-19 amplified existing challenges for cross-border migrant women to utilize PMTCT services. There needs to be explicit narrative when addressing the challenges and HIV health system response for highly mobile women during the pandemic.
Future pandemic preparedness should be addressed with differentiated service delivery models which include multi-month dispensing of ARVs, virtual educational care, and language sensitive information to assist in alleviating the burden on the healthcare system and migrant women.

EPD370

"I always imagined my future only here" - How the HIV residence ban affects international migrants in the Russian Federation

D. Kashnitsky[1], K. Barskiy[2], Y. Kalancha[3], M. Pilinger[4]
[1]National Research University Higher School of Economics, Institute of Social Policy, Moscow, Russian Federation, [2]Moscow Scientific and Practical Center for Narcology, Department of Prevention of Social Diseases, Moscow, Russian Federation, [3]TB Europe Coalition, Secreteriat, Kyiv, Ukraine, [4]O'Neill Institute for National and Global Health Law, Georgetown University, Global Health Policy and Politics Initiative, Washington DC, United States

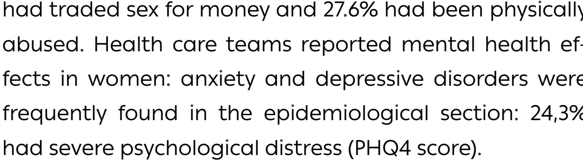
Background: Russia has the highest HIV incidence in Eastern Europe and Central Asia.It is also one of only 19 countries that deports migrants living with HIV. In 2008, the United Nations announced that such discriminatory policies are unacceptable—they serve no public health interest and instead only make migrants living with HIV more vulnerable and less likely to access life-saving HIV care and other medical treatment.
This study examines the effects of Russia's HIV deportation policy on HIV+ migrants, especially undocumented migrants, to better understand how this policy is being implemented and how migrants cope with the challenges it creates in the Russian context.
Methods: Our analysis draws on in-depth interviews with 15 HIV-positive migrants, supplemented by 13 in-depth interviews with experts and caregivers providing HIV prevention and treatment services to migrants in Russia.
Results: Undocumented HIV+ migrants describe being doubly stigmatized for their migration status and their HIV status, both in Russia and in their home countries. This is especially exacerbating for migrants from key populations who endure the most serious stigma. They also describe facing double sets of barriers in Russia and their home countries. In Russia, migrants describe facing significant barriers to accessing prevention information and HIV testing and treatment services, as well as general medical services, contributing to high vulnerability.
On the other hand, migrants sometime fear to return home because of fear of stigma and uncertainty about availability of free HIV care back home. They also fear being placed on a ban list and being unable to return to Russia, where they have better economic opportunities than in their home countries. As a result, after learning their HIV status, many migrants prefer to remain in Russia undocumented, trying to obtain treatment using grassroots transnational networks or remain without treatment.
Conclusions: Twin fears of deportation and discrimination leave undocumented HIV+ migrants in Russia without any good choices. Consequently, many of them reside in limbo for years with little chance of obtaining ART.
Our principal recommendations are decriminalizing migrants with HIV in Russia and creating transborder agreements between migrants' sending countries and Russia to aid migrants in receiving treatment.

EPD371

Sexual health of migrant women attending French Red Cross Health Prevention Centers in French Guiana, in 2021

L. Alcouffe[1], A. Gonzalez[2], M. Volpellier[3], L. Bitan[4], B. Panfili[2], G. Jean[5], A. Zephirin[6], P.M. Creton[3], F. Huber[3], N. Vignier[1]
[1]Centre Hospitalier de Cayenne, CIC Inserm 1424, Cayenne, French Guiana, [2]French Red Cross of French Guiana, Saint Laurent du Maroni, French Guiana, [3]French Red Cross of French Guiana, Cayenne, French Guiana, [4]Université des Antilles, Cayenne, French Guiana, [5]Réseau Kikiwi, Cayenne, French Guiana, [6]Réseau Kikiwi, Saint Laurent du Maroni, French Guiana

Background: French Guiana is experiencing significant demographic and migration challenges (38% of the current population is foreign born). It's the French region with the highest HIV prevalence (1.18 - 1.35% in 2016). In this context, women's health must be considered.
The main objective of the study is to describe situations of sexual vulnerability among migrant women in French Guiana.
Methods: A cross-sectional survey with a mixed methodology was conducted from April to August 2021 and includes :
- a descriptive cross-sectional epidemiological study, using questionnaires administered in French, Haitian Creole, Spanish or Portuguese, to a random sample of foreign-born women over 18 years old attending the Red Cross Health Prevention Centers in the two main cities.
- a qualitative exploratory study, through semi-directive interviews conducted with caregivers working in these centers.
Results: A total of 382 women were included, mainly from Haiti (80.4%), Suriname (8.9%) and the Dominican Republic (5.7%). Median age was 31 years and 71.2% were in an irregular situation. Twelve semi-directive interviews were performed among health workers of these prevention centers.
A significant exposure to sexual violence and transactional sex was reported. Among the 382 women interviewed, 19.9% reported rape at least once in their lifetime, 27.7%



had traded sex for money and 27.6% had been physically abused. Health care teams reported mental health effects in women: anxiety and depressive disorders were frequently found in the epidemiological section: 24,3% had severe psychological distress (PHQ4 score).
An important vulnerability was reported: 76.7% of the respondents described a difficult financial situation and 55.5% were exposed to severe hunger. Social isolation was also a major finding, as 72.5% of women said they had noone to shelter them in case of need.
Menstrual precariousness was also significant, as 73.7% of the women reported a lack of sanitary protections in the last few weeks.
Conclusions: Sexual vulnerability of migrant women in French Guiana is a cause of concern and appears to be linked to poverty. Emergency measures (food aid, free sanitary protection, etc.) and medium-term measures (social and community interventions to reduce sexual risks, psychological care) need to be reinforced.

EPD372
Sexual and reproductive health knowledge, attitudes and behaviors of migrant workers in concentrated latex factories and rubber plantations in Surat Thani Province, Thailand

S. Rosamontri[1], S. Sukkhum[1], S. Satalalai[1]
[1]The Planned Parenthood Association of Thailand under the Patronage of Her Royal Highness the Princess Mother (PPAT), Research and Development Projects Division, Bangkok, Thailand

Background: Sexual reproductive health and rights (SRHR) problems remain a major health challenge among Thai and Myanmar workers. Those workers lack understanding of SRHR as well as access to sexual health and reproductive healthcare services due to illegal migration and language barriers.
The objectives of this study were to enable Thai and Myanmar workers in concentrated latex factories, rubber plantations and rubber plantation cooperatives to have accurate knowledge of SRHR including family planning, birth control and condom use to prevent STIs/HIV/AIDS and to increase their access to sexual and reproductive health services.
Methods: The project started from June 2020 to February 2021. The samples include 187 workers from 2 concentrated latex factories and 5 rubber plantations in Surat Thani Province selected by random through Probability Sampling method. The research instruments were consisted of questionnaires. The quantitative analysis referred to descriptive statistics to present individual data that compares the changes of knowledge, attitudes, and behaviors before and after trainings.
In addition, the qualitative data were collected through In-depth Interview, Participant Observation, Filed Note analyzed by Content analysis and Grounded Theory analysis.
Results: The sample group consists of 51.3% Thai and 48.7% Myanmar workers; 65.2% were females and 70.1% married. Mostly 40.6% of them had sexual intercourse for 1-2 times a month and 54% used natural methods of contraception. After SRHR trainings by PPAT, it was found that there were positively changes in knowledge, attitude and behavior levels from a low level to a high level.
Before the trainings, the mean of knowledge level (K) was 2.21 ± 1.23, the mean of attitude level (A) was 2.53 ± 1.15, and the mean of behavior level (B) was 2.14 ± 1.10.
After the trainings, the mean of knowledge level (K) was 3.22 ± 0.99, the mean of attitude level (A) was 3.22 ± 1.22 and the mean of behavior level (B) was 3.11 ± 0.70.
In addition, 12 models which were key success factors showing significant levels of positive changes in knowledge, attitudes, and behaviors.
Conclusions: The project was successful. It further strengthened volunteer mechanisms and expanded Drop-in centers to disseminate the knowledge and provide consultation on SRHR in factories and communities.

EPD373
Mobility is associated with ART interruptions among men in Malawi: a mixed-methods study

M. Thorp[1], M. Bellos[2], T. Temelkovska[3], M. Mphande[2], I. Robson[2], A. Choko[4], R. Hoffman[1], K. Dovel[1]
[1]UCLA David Geffen School of Medicine, Division of Infectious Diseases, Los Angeles, United States, [2]Partners in Hope, Lilongwe, Malawi, [3]UCLA David Geffen School of Medicine, Los Angeles, United States, [4]Malawi Liverpool Wellcome Trust Clinical Research Programme, Lilongwe, Malawi

Background: Frequent trips away from home, or "mobility," is common across sub-Saharan Africa. Mobile men in antiretroviral treatment (ART) programs may face unique challenges to accessing care. We sought to understand how mobility impacts HIV care for men living with HIV in Malawi.
Methods: This mixed methods study was embedded within two trials conducted with men from 20 health facilities in Malawi. Eligibility criteria were: ≥15 years; HIV+; and not currently on ART (never initiated or stopped treatment). Survey questions on mobility were conducted with all men at trial enrollment. In-depth interviews (n=32) were performed with a subset of 'highly mobile' men (defined as spending >14 nights away from home in last year). Interviews focused on reasons for travel and relationship between travel and ART interruption. Interviews were translated, transcribed, coded, and analyzed using grounded theory in Atlas.ti.
Results: Between August-December 2021, 651 men with treatment interruptions were enrolled in the trials. Median age was 38 years (IQR 31-45) with median 3.7 years since HIV diagnosis (IQR 1.1-10.5); 69% were married and 28% attended secondary school.

Of these men, 34% were highly mobile (median 60 nights away from home in past year [IQR 30-90]). Among them, 77% took long trips (≥14 consecutive days), of which 32% were international and 68% were for income generation. In-depth interviews revealed that men had limited control over travel dates and durations.

Most men experienced unplanned, "urgent" trips due to employer demands or familial deaths (24/32). While the majority brought ART during travel (28/32), most ran out of medication while away (23/28). Men understood the importance of adherence and made extensive efforts to adhere during travel, including having caregivers collect ART refills (11/32), accessing refills at alternate clinics (8/32), and returning home solely to collect ART (8/32), though efforts were often unsuccessful to prevent treatment interruption. Participants desired multi-month dispensing, rapid/flexible access to refills pre-travel, and the ability to refill at any facility in Malawi.

Conclusions: Mobile men were highly vulnerable to ART interruptions despite efforts to prioritize treatment. Mobile men may require multi-month dispensing and flexible ART refill locations and days of operation to achieve sustained retention.

EPD374

The role of residential mobility in recent methamphetamine use: a survey of young Black gay, bisexual and other men who have sex with men in Atlanta, Georgia, USA

A. Newman Jr.[1]

[1]Emory University, Rollins School of Public Health, Atlanta, United States

Background: Methamphetamine use, long recognized as a risk factor for HIV transmission as well as disengagement from HIV care, is increasing among young Black gay, bisexual and other men who have sex with men in Atlanta, Georgia, USA. We hypothesized that geographic mobility, including housing instability, incarceration, and migration from other cities, would be associated with increased risk for recent methamphetamine use.

Methods: We conducted a cross-sectional survey with N=100 YB-GBMSM recruited from clinical and community sites in Atlanta. Participants self-reported migration history, housing status, incarceration history, socioeconomic status, mental health indicators, and substance use behaviors using validated measures.

Recent methamphetamine use was defined as self-reported use within the past three months. Using SAS v.9.4 statistical software, we conducted bivariate and multivariable logistic regression to determine associations with recent methamphetamine use.

Results: Participants ranged in age from 18 to 35 years. The majority (82%) were living with HIV. Thirty-four percent (34%) reported ever using methamphetamines, and 27% reported recent use. In our multivariable analysis, factors significantly associated with recent methamphetamine use included homelessness in the past 12 months (aOR: 7.645, CI: 1.250-46.748), worry about housing stability in next 2 months (aOR: 6.642, CI: 1.260-35.030). Perceived difficulty in methamphetamine access was also associated with higher odds of recent use of methamphetamines (aOR: 0.058, CI: 0.004-0.756).

Other forms of mobility (migration, incarceration history) and mental health indicators (depression, trauma history) were not significantly associated with recent methamphetamine use.

Conclusions: Our findings highlight important associations of structural factors, and particularly housing concerns, with recent methamphetamine use among YB-GBMSM in Atlanta. Longitudinal studies are warranted to help determine the directionality of this association.

Additionally, programs for prevention and treatment of methamphetamine use and associated HIV-related sequelae may benefit from partnering with agencies that provide housing assistance.

EPD375

Knowledge of HIV pre-exposure prophylaxis and antiretrovirals preventive potential of among migrant women in French Guiana

N. Vignier[1,2], L. Alcouffe[1], A. Gonzalez[3], M. Volpellier[3], C. Marty[3], A. Lucarelli[4], G. Jean[4], A. Zephirin[4], P.M. Creton[3], F. Huber[3]

[1]Centre hospitalier de Cayenne, Centre d'Investigation Clinique Antilles Guyane, Cayenne, French Guiana, [2]Université Sorbonne Paris Nord, Infectious Diseases Department, Bobigny, France, [3]Croix Rouge Française, Centre Prévention Santé, Cayenne, French Guiana, [4]Réseau Kikiwi, Cayenne, French Guiana

Background: The use of antiretroviral drugs for prevention is a major progress in HIV prevention. French Guiana combines active immigration, precariousness and the highest HIV prevalence in France. We aimed to better understand the sexual health and knowledge of migrant women in French Guiana.

Methods: A cross sectional study was conducted with a random sample of women attending the French Red Cross centers. Multilingual mediators conducted the interviews. The descriptive statistics and the multivariate stepwise logistic regression were performed using Stata 15.0.

Results: Among the 429 women included, 69.6% were under 35 years of age, 71.6% were from Haiti and 56.3% did not know French well. Only 28.7% had ever heard of antiretroviral therapies, less often women from Haiti (19.9% vs 50.9%, p<0.001). Only 20.9% had ever heard of an emergency treatment that allows them to avoid catching HIV after unprotected sex (Post Exposure Treatment - PEP -), 13.6% among Haitian's women vs 39.2% among others (p<0.001). Only 15.4% knew what Pre-Exposure Prophylaxis for HIV - PrEP - was. Again, Haitian women had a lower level of information (9.3% vs 30.8%, p<0.001).

Oral abstracts

Poster exhibition

E-posters

Late-breaker abstracts

Author Index

Although few in number (n=22), the level of knowledge was significantly higher among women from the Dominican Republic, who were sex workers at 63.6%. Women (n=37) who self-identified as being at high risk for STIs were more aware of PrEP (52.8% vs. 11.9%, p<0.001). In the multivariate model, knowledge of prep was associated with sex work and high perceived risk of STIs, and was negatively associated with Haitian origin.

Only 4 women reported ever taking PrEP, and all discontinued due to adverse events or personal constraints. Once informed about PrEP, 18.3% said they were interested.

In addition, 13 women reported have ever used PEP. Finally, 54.4% were interested in receiving a sexual health consultation (or had already received), both Haitian and non Haitian women (54.4% and 48.7%, p=0,30)

Conclusions: The level of knowledge about the preventive effects of HIV antiretroviral therapies and PrEP is extremely low among migrant women in French Guiana. Haitian women are largely unaware of biomedical prevention tools despite reported sexual health needs and deserves targeted interventions.

EPD376

HIV- and homosexuality-related stigmas as barriers to accessing HIV-related services among gay and bisexual male migrants in Australia

S.P. Philpot[1], L. Mao[2], C. Power[3], S. Robinson[4,5], R. Varma[1,6], D.J. Templeton[1,7,8], G. Stackpool[9], A. Grulich[1], B.R. Bavinton[1]
[1]*UNSW Sydney, Kirby Institute, Kensington, Australia,* [2]*UNSW Sydney, Centre for Social Research in Health, Kensington, Australia,* [3]*NSW Ministry of Health, Sydney, Australia,* [4]*St George Hospital, Department of Infectious Diseases, Immunology and Sexual Health, Sydney, Australia,* [5]*UNSW Sydney, St George and Sutherland Clinical School, Sydney, Australia,* [6]*South Eastern Sydney Local Health District, Sydney Sexual Health Centre, Population and Community Health, Sydney, Australia,* [7]*Sydney Local Health District, Department of Sexual Health Medicine and Sexual Assault Medical Service, Sydney, Australia,* [8]*University of Sydney, Discipline of Medicine, Central Clinical School, Faculty of Medicine and Health, Sydney, Australia,* [9]*Sydney Local Health District, Multicultural HIV and Hepatitis Service, Diversity Programs and Strategy Hub, Population Health, Sydney, Australia*

Background: In some high-income countries, including Australia, migrant gay and bisexual men (GBM) from low- and middle- income countries are disproportionately at risk of acquiring HIV. Stigma is a significant driving force behind these disparities, but its effects can manifest in complex ways.

Little research has explored the effects stigma has on how migrant GBM in Australia access HIV-related services, understand sexual identity, and practice HIV prevention, both pre- and post-migration.

Methods: We conducted qualitative interviews between October 2018 and December 2019 with 24 migrant GBM who were diagnosed with HIV in Australia HIV from 2017 onwards. Interviews were offered in English, Thai, Mandarin, Spanish, and Brazilian-Portuguese.

Results: Nine participants were born in Southeast Asia, eight in Latin America, five in Northeast Asia, and one each in South Asia and Eastern Europe. Stigma relating to HIV and homosexuality was deeply embedded into social, cultural, and institutional settings in participants' countries of origin. This stigma led to poor HIV knowledge and sexual health literacy, reluctance to access HIV-related services, and fears of being publicly exposed as gay/bisexual in countries of origin.

Some viewed migrating to Australia as an opportunity to explore sexual identity and connect to HIV-related services. However, underpinned by internalised stigma, many others remained reluctant to access services and had ongoing concern about being exposed as gay/bisexual after migration.

Barriers to accessing HIV-related services in Australia included: fears of HIV testing, particularly when apprehensive about a potential HIV-positive result and the consequent possibility of visa cancellation; concerns about confidentiality in HIV-related services; lack of confidence and support in navigating the Australian healthcare system, including how to access pre-exposure prophylaxis (PrEP); and not perceiving oneself as having engaged in enough HIV-risk to warrant accessing services.

Conclusions: Addressing these multifaceted but interconnected barriers to HIV testing and prevention among migrant GBM requires policies, systems and interventions that: increase health literacy about HIV testing, prevention, and treatment; build trust, confidence, and supportive networks when navigating Australian health services; and reduce HIV and sexual identity stigmas in migrants' countries of origin and how those stigmas influence their experiences in Australia.

EPD377

The perpetuation of HIV risk in Latinx Immigrants: a cross-national perspective

J. Aleman[1], J. Lechuga[1], O. Esparza[2], A. Varela[3], M.E. Ramos[4], R. Ramos[4]
[1]*The University of Texas at El Paso, Public Health Sciences, El Paso, United States,* [2]*Autonomous University of Ciudad Juarez, Ciudad Juarez, Mexico,* [3]*The University of Texas at El Paso, Psychology, El Paso, United States,* [4]*Programa Companeros, Ciudad Juarez, Mexico*

Background: Past research has extensively documented the factors that exacerbate HIV risk among immigrants (Caballero-Hoyos et al., 2013; Magis-Rodriguez et al., 1999). However, past research has focused mostly on understanding the conditions that exacerbate risk once immigrants are settled in the final destination country.

There is agreement in the field that to develop a comprehensive theory of immigrant health, there is a need to apply a cross-national perspective and to document the experiences of immigrants temporarily residing in high-risk while in transit to their final destination, such as the US-Mexico border. Since 2019, approximately 6,000 immigrants from Cuba and Latin America have settled in Ciudad Juarez (CJ), a US-Mexico border city.

The purpose of the study is to understand the lived experience of immigrants who were temporarily residing in CJ awaiting the resolution of immigration petitions. We applied a cross-national perspective.

Methods: A snowball sampling approach was employed to recruit 30 immigrants to participate in in-depth interviews. Eligibility criteria included residing in CJ for at least 12 months, had used illegal drugs and engaged in sexual risk behavior. Participants were interviewed about their living situation while in their country of origin, their immigration journey experiences, and the context of engagement in HIV risk behaviors in CJ. Data was content coded using a grounded theory approach.

Results: Engagement in HIV risk behaviors occurred in a continuum. Trauma from violence and economic hardship precipitated substance use and sporadic engagement in sex for money exchanges in the sending country. Discrimination, severe economic hardship, hopelessness, and factors characteristic of a border setting such as high accessibility to illegal drugs exacerbated substance use and a highly active commercial sex industry facilitated entry into the sex work trade. Women and sexual minorities were more likely to experience severe violence and human rights abuses by law enforcement entities during the migration journey.

Conclusions: A cross-national perspective elucidated the dynamics of HIV risk in sending and receiving countries. Findings have implications for informing policy advocacy efforts for the provision of appropriate services to immigrants in countries facing an increase in the mobility of populations across the world.

EPD378

The prevalence HIV infection among regular migrants in France: data from STRADA study (2017-2020)

M. Duracinsky[1,2,3], I. Yaya[1], L. Yombo-Kokule[1], P. Bessonneau[1], O. Rousset-Torrente[1], F. Roudot-Thoraval[4], F. Lert[5], D. Zucman[6,7], A. Sobel[8], P. Sogni[9], O. Chassany[1,2]

[1]URC ECO - Hôpital Hôtel-Dieu, Paris, France, [2]Patient-Reported Outcomes Research (PROQOL), UM 1123, University de Paris, Inserm, Paris, France, [3]Bicetre Hospital, AP-HP, Internal Medicine & Clinical Immunology Department, Le Kremlin-Bicetre, France, [4]Hôpital Henri Mondor, Université Paris-Est, Department of Public Health, Créteil, France, [5]Vers Paris Sans Sida, Paris, France, [6]Hôpital Foch, Suresnes, France, [7]Xavier-Bichat Paris VII University, Paris, France, [8]Clinical Immunology, Hôpital Hotel Dieu, Paris, France, [9]Cochin Hospital, Paris, France

Background: HIV infection disproportionately affects regions of the world, as well as mobile populations in high-income countries. This study aimed to initiate HIV screening and assess the prevalence of HIV infection among regular migrants who present for their medical examination in territorial directorates of the French Office for Immigration and Integration (OFII).

Methods: STRADA was a multicenter observational study, conducted between January 2017 and March 2020 in 21 OFII centers. This study included regular migrants admitted for medical examination as part of their administrative process to obtain their residence permit.

Migrants who consented to participate completed a validated self-administered risk assessment questionnaire followed by a HIV rapid screening test. Multivariable logistic regression model was fitted to identify factors associated with HIV infection.

Results: Among 21133 regular migrants seen in OFII centers, 15,118 (71.5%) were included in the study. The mean age of the participants was 35.6 years (SD± 11.1), 62.8% of them were women, and 17.9% originated from a medium or high endemic country. History of dental care (70.4%), surgery (32.1%), piercing and tattoo (30.9%), blood transfusion (3.7%), and psychoactive substance consumption (3.0%) were reported.

Regarding the sexual behaviors, 10.3% of migrants reported having had two or more sexual partners during the previous 12 months. 2.2% of the participants reported male-to-male sex (MSM).The overall prevalence of HIV was estimated at 0.33% (95% confidence interval (95%CI): 0.25-0.44).

In multivariable analysis, reporting MSM (Odds-ratio (OR): 4.88; 95%CI: 0.98-88.65), being from HIV medium endemic areas (OR: 7.03; 95%CI: 3.71-14.05), and history of blood transfusion (OR: 3.52; 95%CI: 1.42-7.47) were significant factors associated with a HIV positive result.

Conclusions: The STRADA study introduced HIV screening during medical visits at OFII and the showed HIV prevalence results among regular migrants in France. HIV prev-

alence was reflective of the fact that regular migrants generally have a higher socio-economic status such as when a spouse joins their husband, qualified workers, or students. The systematic screening proposal should be introduced also to more vulnerable groups with low socio-economic status such as asylum seekers.

Political and structural factors

EPD379

Where everybody knows your name: correlation between a stable and familiar professional structure and sustained HIV viral suppression in clients: a New Jersey, USA, community health center experience

L. Kudryashova Hernandez[1], H. Tripathi, MD[1]
[1]*Neighborhood Health Services Corporation, Ancillary/HIV, Plainfield, United States*

Background: NHSC, a private, non-profit urban community-based health center in Plainfield NJ, USA, provides HIV care/treatment to 364 patients under the umbrella of Early Intervention Services (EIS). Based on internal data and confirmed by independent clinical audits, in 2021 NHSC's viral suppression (VS) rate was 98% and sustained VS rate (over the period 2019-2021) was 95%. NHSC's VS rates are consistently in the top 5% of all NJ HIV providers. EIS is NHSC's most stable professional program from the standpoint of staff retention/employment longevity; staff tenure being 6-28 years of service.

Therefore, it is our hypothesis that there is correlation between stable professional team and sustained VS among its HIV patients.

Methods: EIS program designed/implemented a study to assess correlation between stable staff structure and sustained VS:

1. A ten-year look-back time period (2010-2020) was established to compare annual staff retention rates and VS rates.
2. *Staff Retention Self-Assessment* tool was designed/administered to all program staff to ascertain rationale/reasons/value for staying with the company and perceived benefit to HIV care.
3. Self-assessment responses were collected/analyzed and presented to EIS staff and leadership.
4. Assisted by Human Resources Department, individualized annual employee longevity rates were established for each clinical and support provider.
5. Patient VS rates were established, assessed/analyzed for each study year.
6. Annual employee longevity rates and VS rates were stratified, compared and analyzed.
7. Study data was compiled into a chart/graph format for presentation to EIS staff, leadership and patients.

Results: Based on the study findings review/analysis: In 2010 (first year of the look-back period) NHSC's baseline VS rate was 81% and employee retention index was 10.5. We observed steady annual increases in VS rates over the entire look—back period, directly correlated with employee retention rates, culminating in 2020 with 98% VS rate and 15.2 EIS employee retention rate.

Conclusions: There is direct correlation between stable professional structure and sustained VS. Patients tend to be more engaged in care, have a deeper vested interest in health outcomes with sustained VS when they are supported by a familiar, stable team of clinicians/support staff in a patient-centered medical home.

Sexual- and/or gender-based violence and exploitation (including in conflict settings)

EPD380

COVID-19 impacts on post-GBV care utilization at EGPAF-supported Health Facilities across nine African Countries

C. Lenz[1], G. Munisi[2,3], J. Kose[4], M. Ethridge[1]
[1]*Elizabeth Glaser Pediatric AIDS Foundation, Technical Strategy and Innovation, Washington DC, United States,* [2]*EngenderHealth, Dar es Salaam, Tanzania, The United Republic of,* [3]*Elizabeth Glaser Pediatric AIDS Foundation, Dar es Salaam, Tanzania, The United Republic of,* [4]*Elizabeth Glaser Pediatric AIDS Foundation, Nairobi, Kenya*

Background: COVID-19 exacerbated the risks of gender-based violence (GBV). EGPAF provides post-GBV clinical care integrated within HIV, FP/SRH and TB platforms. In light of COVID-19, GBV-care was adapted including integrating virtual solutions for referrals, service delivery monitoring, capacity and training for HCWs and implementing community-based activities. We analyzed program data on utilization of post-GBV services comparing pre- and COVID-19 periods.

Methods: Routinely-reported PEPFAR-program data were analyzed across nine EGPAF-supported countries (Cameroon, CDI, DRC, Eswatini, Kenya, Lesotho, Malawi, Mozambique, Tanzania). GBV indicators included the number of individuals receiving post-GBV clinical care based on the minimum package, type of violence (physical/emotional and sexual), and post-exposure prophylaxis (PEP) uptake and completion.

Data were evaluated across timeframes; October2019-September2020 as the pre-COVID-19 period and October2020-September2021 as the COVID-19 timeframe. Data were disaggregated by country, sex, and age.

Results: A 47% increase in individuals utilizing post-GBV care comparing pre- and COVID-19 timeframes occurred; n=27,843 individuals sought care pre-COVID-19 compared

to n=40,858 individuals during COVID-19. A 20% increase in care sought for physical/emotional violence occurred between timeframes. A 15% increase in use of post-violence care (PVC) services resulting from sexual violence occurred with 6,943 individuals seeking care pre-COVID-19 and 7,989 individuals during COVID-19.

The proportion of women seeking PVC increased from 88% (n=6,117) pre-COVID to 93% (n=7,423) during COVID-19. The proportion of girls 15-19 years seeking PVC increased from 35% (n=2,453) to 39% (n=3,131) between periods. 10-24-year-olds consistently made up the majority of those seeking PVC with 65% (n=4,540) pre-COVID-19 and 67% (n=5,362) during COVID-19.

The proportion of young males (10-24) seeking post-GBV care between time periods decreased for sexual violence from 5% (n=362) to 3% (n=258) and for emotional/physical violence from 9% (n=1941) to 8% (n=2,475). Tanzania had the highest PVC utilization with over 4,000 receiving PVC during both pre-COVID-19 and COVID-19 periods.

Among survivors of sexual violence, PEP uptake decreased with 45% (n=3,114) completing PEP during pre-COVID-19 compared to 40% (n=3,201) during COVID-19.

Conclusions: The number of individuals receiving post-GBV clinical care increased comparing pre- and COVID-19 periods. The increase in utilization of post-GBV care particularly among women between pre and COVID-19 periods warrants additional review and response.

EPD381

Violence victimization among women by gender identity and HIV status in three multisite HIV cohorts in the United States

A. Rich[1], H. Jiang[1], A. Wirtz[2], A. Adimora[1], G. Wingood[3], C. Cannon[4], A. Wawrzyniak[5], A. D'Souza[2], K. Mayer[6], P. Tien[7], D. Konkle-Parker[8], S. Reisner[9], S.J. Haw[10], J. Schnieder[10], E. Cooney[2], M. Malik[1], K. Althoff[2], S. Kassaye[11], T. Poteat[1]

[1]University of North Carolina at Chapel Hill, Chapel Hill, United States, [2]Johns Hopkins University, Baltimore, United States, [3]Columbia University, New York, United States, [4]Whitman Walker Health System, Washington, D.C., United States, [5]University of Miami, Miami, United States, [6]The Fenway Institute, Boston, United States, [7]University of California San Francisco, San Francisco, United States, [8]University of Mississippi Medical Center, Jackson, United States, [9]Harvard University, Boston, United States, [10]Emory University, Atlanta, United States, [11]Georgetown University, Washington, D.C., United States

Background: Women living with HIV and transgender women (TW) experience elevated prevalence of violence. Few studies of violence include diverse cohorts of women to allow for comparisons across race, gender identity, and HIV status.

Methods: 2019-2020 data from 3 cohorts of women ≥18 years old were combined for this study: LITE (mixed HIV serostatus TW), LITE Plus (Black and Latina TW living with HIV (TWLH)) and WIHS (mixed HIV serostatus cisgender women (CW)). Violence victimization was captured by self-report of experiencing ≥ 1 act of physical or sexual violence within the past 6 months. Multivariable logistic regression models estimated crude (OR) and adjusted (aOR) odds ratios and 95% confidence intervals (95%CI) associated with correlates of past 6-month physical and sexual violence victimization.

Results: The study sample included 113 TWLH, 1470 cisgender women living with HIV (CWLH), 819 HIV seronegative TW, and 621 HIV seronegative CW. TW were younger, more likely to rate their health as excellent and had the highest prevalence of exogenous hormone use. TWLH had lower prevalence of viral suppression (<200 copies/mL) than CWLH, but similar mean CD4 count. TWLH reported highest prevalence of physical violence (15%; CWLH: 1%; TW: 12%; CW: 1%); whereas TW had the highest prevalence (12%) of sexual violence followed by TWLH (5%), CWLH and CW (both 1%). Similarly, TW had highest prevalence (85%) of depression, followed by CWLH and CW (both 72%) and TWLH the lowest (60%).

In bivariate analyses, gender identity, race, hormone use, substance use, and depression were associated with both physical and sexual violence. In multivariable analyses, gender identity (reference=cisgender; aOR: 12.2;95%CI: 5.5-26.9) and substance use (aOR: 2.7;95%CI: 1.4-5.2) were associated with greater odds of physical violence victimization.

Likewise, gender identity (aOR: 5.8 95%CI: 2.2-15.4) and substance use (aOR: 7.0 95%CI: 2.3-20.2) were associated with higher odds of sexual violence victimization. Neither race nor HIV status remained significant.

Conclusions: Gender identity and substance use are key factors in violence victimization. Policies that reduce anti-transgender stigma may be important for reducing violence against TW. Interventions to reduce substance use may be important for women at risk for and impacted by violence.

EPD382

Women empowerment to enhance access SRMNCAH service in the in humanitarian setting. Lessons learnt by International Community of Women Living with HIV Eastern Africa (ICWEA) from Northern Uganda

D. Namutamba[1], R. Mwesigwa[2]

[1]International Community of Women Living with HIV Eastern Africa, Programmes and Advocacy, Kampala, Uganda, [2]International Community of Women Living with HIV Eastern Africa, Kampala, Uganda

Background: Uganda is one of the countries with the highest number of refugees who are underserved with SRMNCAH services. ICWEA with support from UN Women implemented POWER project whose overall goal was to contribute to the impact that every woman, every child, every adolescent girl, everywhere demands her rights to

quality sexual, reproductive, maternal, new-born, child and adolescent health (SRMNCAH) services in the refugee camps and host communities in Ugandan.

Description: The 2 year project (2019 -2021) was implemented in the 4 refugee settlements in West Nile region targeting women and young women. ICWEA built capacity of 60 women leaders on SRMNCAH as transformational leaders.

Set up POWER and CARE clubs in each settlement for women to meet, learn and for economic empowerment activities. Held community literacy campaigns with religious, cultural and women leaders to challenge the unequal gender norms, and practices that perpetuated negative outcomes for women.

ICWEA identified male role models and nurtured positive attitudes, behaviors and practices towards women access to the SRMNCAH services Enhanced the knowledge of health care to integrate human rights and gender equality into their work to improve health outcomes for women, children and adolescents.

Lessons learned: Through the POWER and Care Clubs women discussed and sought solutions against negative gender norms and community myths related to access and utilization of SRH services. Multi-stakeholder coordination and engagement involving cultural, religious, women leaders, men, health workers, and women human rights defender led to a reduction of GBV and increased access to SRH services for women and girl. Empowered networks of women leaders s unconditionally supported other women across the settlements to access SRMNCAH services through active referrals and linked them to other services that were provided by other partners.

Conclusions/Next steps: Women empowerment is a critical component and is part of the strategies to achieve the development pillars of the comprehensive refugee response framework. There is need for continuous empowerment of the women and girls and engagement of all stake holders to challenge community level cultural norms and beliefs that deter women from accessing to SRMNCAH services. Need to introduce skilling of women and girls to diversify on their resources.

EPD383

Homoprejudiced violence experience, depression, and condomless sex among MSM in Zhuhai City, China: a mediation analysis

X. Yan[1,2], Y. Ni[1,2], Y. Lu[1,2], Q. Wang[1,2], R.K.J. Tan[1,2], G. Marley[1,2], Y. Zhou[3], W. Tang[4,2,5], D. Wu[2,6]

[1]University of North Carolina at Chapel Hill Project-China, Guangzhou, China, [2]Social Entrepreneurship for Sexual Health (SESH) Global, Guangzhou, China, [3]Zhuhai Center for Disease Control and Prevention, Department of HIV/AIDS Prevention and Control, Zhuhai, China, [4]University of North Carolina at Chapel Hill, Institute for Global Health and Infectious Diseases, Chapel Hill, United States, [5]Dermatology Hospital of Southern Medical University, Guangzhou, China, [6]London School of Hygiene and Tropical Medicine, International Diagnostics Centre, London, United Kingdom

Background: Homoprejudiced violence is a type of aggression against an individual or a group based on their actual or perceived sexual orientation. The minority stress theory argues that prejudice events (including homoprejudiced violence) may impact HIV risk via negatively impacting mental health outcomes. Few studies have attempted to validate this theory among Chinese men who have sex with men (MSM).

This study explores the association between homoprejudiced violence experience and condomless sex, and the potential mental health mediators.

Methods: Data were collected using a cross-sectional online survey among MSM through BlueD, a popular gay social networking platform, in January 2021, China. Standard instruments were used to collect data on depression severity (PHQ-9), ever experiencing homoprejudiced violence (12-item scale), and condomless sex with males in the last three months. These three measurements were all recoded to dichotomous variables. Mediation analysis was then conducted to explore associations between these variables using probit regression models.

Results: Among 1828 MSM enrolled in the survey, 73% (1327) identified as gay, 46% (847) ever experienced homoprejudiced violence (i.e., experienced any one of the 12 items). Nearly a quarter (427, 23%) reached a score that suggested moderate or more severe depression, 693 (48%) had condomless sex with male partners in the last three months. Over one-fifth (398, 22%) reported no sex with any male in the last three months and were excluded from mediation analysis.

We found that depression was a significant mediator: homoprejudiced violence experience would increase the predicted probability of depression by 0.15 (95%CI: 0.11~0.19), and depression would increase the predicted probability of condomless sex by 0.26 (95%CI: 0.12~0.40). The total effect of homoprejudiced violence experience on condomless sex with males was -0.09 (95%CI: -0.21~0.04), while the mediation effect through depression was 0.04 (95%CI: 0.02~0.07).

Conclusions: Experiencing homoprejudiced violence was not directly associated with condomless sex overall, but depression appeared to be an important mediator that added to the probability of condomless sex among MSM in China. The results indicated the importance of addressing homoprejudiced violence towards MSM and related mental health problems for reducing high-risk behaviors. Further longitudinal and qualitative studies are needed to understand psychological mechanisms.

EPD384

Changes in intimate partner violence among WLHIV in Tanzania before and during COVID-19

R. Hémono[1], S. Winters[1], E. Katabaro[2], A. Mnyippembe[2], P. Njau[3], A. Sabasaba[2], S.I. McCoy[1]

[1]*University of California, Berkeley, United States,* [2]*Health for a Prosperous Nation, Dar es Salaam, Tanzania, The United Republic of,* [3]*Ministry of Health, Community Development, Gender Elderly and Children (MOHCDGEC) - National Aids Control Program, Dodoma, The United Republic of Tanzania*

Background: There is mounting evidence that intimate partner violence (IPV) has increased globally during the COVID-19 pandemic due to a myriad of socio-economic stressors. Women living with HIV (WLHIV) are disproportionately affected by IPV and violence has been shown to impede engagement and retention in HIV care.

We investigated the prevalence of IPV before and during COVID-19 among partnered WLHIV initiating antiretroviral therapy (ART).

Methods: We analyzed baseline data from two randomized controlled trials conducted with adults initiating ART in Shinyanga, Tanzania between April-December 2018 (pre-COVID-19 period, n=530) and May 2021-January 2022 (COVID-19 period, n=539), respectively. Past 6-month IPV was defined as physical, sexual, or emotional violence, and categorized as a binary variable. Generalized linear models with a binomial distribution and identity link were used to estimate prevalence differences (PD) comparing IPV across time periods. Adjusted estimates were generated using inverse probability of treatment weighting (IPTW) and 1:1 propensity score matching (PSM) with replacement to account for temporal differences.

Propensity scores were constructed with logistic regression, controlling for age, marital status, primary language, education, occupation, and work status.

Results: A subset of 332 partnered WLHIV were included in the analysis (n=182 pre-COVID-19; n=146 COVID-19). The prevalence of past 6-month IPV decreased from 34.6% in 2018 (pre-COVID-19) to 19.2% (COVID-19) (unadjusted PD: -0.15, 95% CI: -0.25, -0.06).

IPV remained higher during the pre-COVID period after matching and weighting, with both IPTW and PSM yielding similar results to the unadjusted and to each other (PSM adjusted PD: -0.14, 95% CI: -0.27, -0.01; IPTW adjusted PD: -0.14, 95% CI -0.21, -0.07).

Conclusions: We found a lower prevalence of IPV during COVID-19 compared to the pre-COVID-19 period among WLHIV initiating care in Shinyanga, Tanzania, contrary to existing evidence. There are several possible explanations for the decline in violence, including bias, however, these findings may also indicate that WLHIV most at risk of IPV have not initiated ART during COVID-19.

Further research is warranted to examine trends in IPV and barriers to care for women diagnosed with HIV during COVID-19.

EPD385

Predictors of gender-based violence among adolescent girls aged 15-17 years; an assessment of baseline data of girls enrolled in the DREAMS Afya Pwani project in Mombasa, Kenya

I. Makena[1], J. Sunguti[2], C. Otwori[1], S. Omariba[3], S. Konah[4]

[1]*Pathfinder International, Business Development Unit, Nairobi, Kenya,* [2]*Pathfinder International, Programs, Nairobi, Kenya,* [3]*Pathfinder International, Country Directorate, Nairobi, Kenya,* [4]*Pathfinder International, Monitoring Evaluation and Learning, Nairobi, Kenya*

Background: Gender-based violence (GBV) is a risk factor for HIV among vulnerable adolescent femalesThe lifetime risk of some form of GBV among women is 1 in 3. The 2019 Kenya Violence against Children (VAC) study revealed that 15.6% of females aged 18-24 years experienced sexual violence before 18.

Methods: With support from USAID, Pathfinder International (PI) implemented the Determined, Resilient, Empowered, AIDS-free, Mentored, and Safe (DREAMS) program in Mombasa, Kenya, from 2018 to 2021. During the project's life, the DREAMS program offered HIV prevention services to 28,047 Adolescent Girls and Young Women (AGYW) aged 9-24 years in Mombasa.

We used program monitoring data and included all girls (6354) aged 15-17 years enrolled in the project between May 2018 and March 2021 based on completeness in key sociodemographic variables and self-reported GBV vulnerability.

Analysis of social demographic data and self-reported GBV vulnerability data from the intake forms provided insight into the predictors of GBV among vulnerable adolescents in Mombasa, Kenya. In addition, the Chi-square test evaluated the association between sociodemographic variables and GBV experience.

Results: Sub-county of residence (X^2=58.72, p<0.001), not being in school ((X^2=39.2, p<0.001),) and ever having had sex ((X^2=75.22, p<0.001),) were strong predictors for experiencing GBV.

Food insecurity, condom promotion and having more than one sex partner were not associated with GBV experiences.

Predictors	GBV Case					
	Yes		No		Significance Test	COR (95% CI)
Sub County Name	*n=552*	*%*	*n=5802*	*%*		
Jomvu Kisauni Likoni Mvita Nyali	127 73 223 27 102	23% 13% 40% 5% 18%	997 1297 1830 629 1049	17% 22% 32% 11% 18%	χ² (4)=58.72, p=0.00	2.26 (1.68-3.05)** 1.05 (0.83-1.32) 2.97 (1.94-4.55)** 1.31 (1.00-1.72)*
Currently in School	*Yes (n=550)*	*%*	*No (n=5746)*	*%*		
Yes	459	83%	5259	92%	χ² (1)=39.21, p=0.00	
No	91	17%	487	8%		0.47 (0.37-0.60)**
Ever had sex	*Yes (n=547)*	*%*	*No (n=5660)*	*%*		
Yes	77	14%	283	5%	χ² (1)=75.22, p=0.00	
No	470	86%	5377	95%		3.11 (2.38-4.07)**

Conclusions: Inclusion of programs to delay sexual debut and keep girls in school are key considerations to address the drivers of GBV among vulnerable adolescent girls. We recommend a more comprehensive study on GBV among adolescent girls at county levels to inform future programming.

Societal stigma towards people living with HIV and key populations

EPD386
Intersectional stigma and the stigma identity management framework: a metasynthesis of qualitative reports from people living with HIV in sub-Saharan Africa

A. Bergman[1], K.C. McNabb[1], A. Akumbom[2], K. Mlandu[1], D.D. Flores[3]
[1]Johns Hopkins School of Nursing, Center for Infectious Disease and Nursing Innovation, Baltimore, United States, [2]Johns Hopkins School of Nursing, Baltimore, United States, [3]University of Pennsylvania School of Nursing, Philadelphia, United States

Background: While stigma experienced by people living with HIV (PLWH) is well documented, intersectional stigma and additional stigmatized identities have not received similar attention. The purpose of this metasynthesis is to identify salient stigmatized intersections and their impact on health outcomes in PLWH in sub-Saharan Africa.

Methods: Using Sandelowski and Barroso's metasynthesis method, we searched four databases for peer-reviewed qualitative literature. Included studies

1. Explored personal experiences with intersecting stigmas,
2. Included ≥1 element of infectious disease stigma, and;
3. Were conducted in sub-Saharan Africa.

Our multinational team extracted, aggregated, interpreted, and synthesized the findings.

Results: From 455 screened abstracts, the 34 studies included in this metasynthesis reported perspectives of at least 1228 participants (282 men, 557 women, and 109 unspecified gender) and key informants. From these studies, gender and HIV was the most salient stigmatized intersection, with HIV testing avoidance and HIV-status denial seemingly more common among men to preserve traditional masculine identity. HIV did not threaten female identity in the same way with women more willing to test for HIV, but at the risk of abandonment and withdrawal of financial support. To guard against status loss, men and women used performative behaviors to highlight positive qualities or minimize perceived negative attributes. These identity management practices ultimately shaped health behaviors and outcomes. From this metasynthesis, the Stigma Identity Framework was devised for framing identity and stigma management, focusing on role expectation and fulfillment (Figure1).

This framework illustrates how PLWH create, minimize, or emphasize identity traits to safeguard against status loss and discrimination.

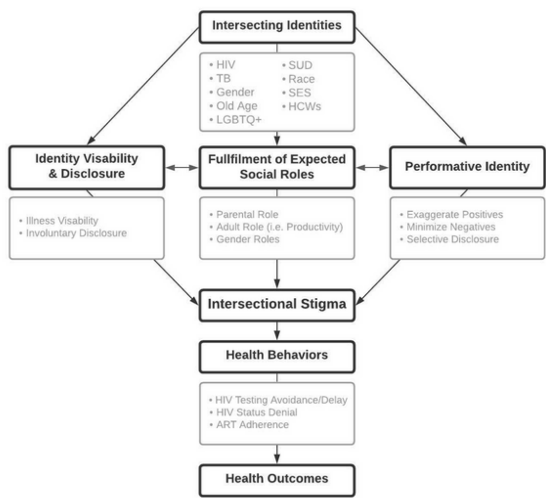


Figure 1. Stigma identity framework.
*Sub-themes are shown in gray

Conclusions: Providers must acknowledge how stigmatization disrupts PLWH's ability to fit into social schemas and tailor care to individuals' unique intersecting identities. Economic security and safety should be considered in women's HIV care, while highlighting antiretrovirals' role in preserving strength and virility may improve care engagement among men.

EPD387

Associations between HIV-related stigma and health-related quality of life among people living with HIV in Zambia and South Africa: cross-sectional analysis of data from the HPTN071 (PopART) study

E. Hall[1], K. Davis[1], J. Ohrnberger[1], M. Pickles[1], S. Gregson[1,2], R. Thomas[3], J. Hargreaves[4], T. Pliakas[4], J. Bwalya[5], R. Dunbar[6], K. Shanaube[5], G. Hoddinott[6], V. Bond[5,7], P. Bock[6], H. Ayles[8], A. Stangl[9], D. Donnell[10], R. Hayes[11], S. Fidler[12], K. Hauck[1]

[1]*Imperial College London, MRC Centre for Global Infectious Disease Analysis and the Abdul Latif Jameel Institute for Disease and Emergency Analytics, School of Public Health, London, United Kingdom,* [2]*Biomedical Research and Training Institute, Harare, Zimbabwe,* [3]*London School of Economics, Department of Health Policy, London, United Kingdom,* [4]*London School of Hygiene and Tropical Medicine, Department of Public Health, Environments and Society, Faculty of Public Health and Policy, London, United Kingdom,* [5]*University of Zambia, Zambart, School of Medicine, Lusaka, Zambia,* [6]*University of Stellenbosch, Desmond Tutu TB Centre, Department of Paediatrics and Child Health, Faculty of Medicine and Health, Cape Town, South Africa,* [7]*London School of Hygiene and Tropical Medicine, Department of Global Health and Development, Faculty of Public Health and Policy, London, United Kingdom,* [8]*London School of Hygiene and Tropical Medicine, Department of Clinical Research, Faculty of Infectious and Tropical Diseases, London, United Kingdom,* [9]*Hera Solutions, Baltimore, United States,* [10]*Fred Hutchinson Cancer Research Center, Vaccine and Infectious Disease Division, Seattle, United Kingdom,* [11]*London School of Hygiene and Tropical Medicine, Department of Infectious Disease Epidemiology, Faculty of Epidemiology and Population Health, London, United Kingdom,* [12]*Imperial College London, Department of Infectious Disease, Faculty of Medicine, London, United Kingdom*

Background: While the life expectancy of people living with HIV (PLHIV) has increased considerably due to treatment access, PLHIV often report lower health-related quality of life (HRQoL) than people who are not living with HIV. Stigma related to HIV status may impede HRQoL, but little is known about the relationship between the two. We explored associations between four HIV stigma outcomes and HRQoL among PLHIV and examined which HRQoL domains were most affected.

Methods: We analysed data from HPTN 071 (PopART), a cluster randomised controlled trial in 21 urban and peri-urban communities in Zambia and South Africa. An open cohort of randomly selected adults (18-44 years) in randomly selected households was recruited and surveyed at baseline and 36-months. We used data from PLHIV in the cohort at 36-months (09/2017-07/2018) who self-reported living with HIV and had laboratory-confirmed status. HRQoL was measured using the EuroQol-5-dimensions-5-levels (EQ-5D-5L) questionnaire. PLHIV responded to 11 questions capturing four composite stigma outcomes: internalized stigma (three questions), stigma experienced in the community (five questions), stigma experienced in healthcare settings (three questions) and any stigma experienced (11 questions).

Binary variables captured whether PLHIV agreed with any statements in each composite stigma measure. Associations between HRQoL and stigma were examined using logistic regressions, adjusted for socio-economic confounders and with fixed effects for communities.

Results: Data from 3,991 PLHIV (88% women; 12% men) were examined. PLHIV who experienced stigma in the community (n=693), and those who reported internalised stigma (n=552), had higher odds of reporting problems in at least one HRQoL domain than those who had not (adjusted odds ratio:1.46, 95% confidence interval:1.12-1.89 and 1.84, 1.42-2.39, respectively). Experiencing stigma in a healthcare setting (n=158) was not associated with HRQoL (0.94, 0.57-1.50). Individuals who had experienced any stigma (n=1,034) had higher odds of reporting problems in the domains of mobility (1.97, 1.23-3.14), self-care (1.92, 1.06-3.44), performing daily activities (1.98, 1.29-3.00), pain/discomfort (1.85, 1.43-2.39), and anxiety/depression (2.73, 1.94-3.83) than those who had not.

Conclusions: Internalised stigma and stigma experienced in the community were associated with lower HRQoL. Improving HRQoL among PLHIV requires more than expanding service access, addressing stigma and similar structural drivers is also important.

EPD388

Longitudinal impacts of internalized, anticipated and enacted stigma on health-related quality of life among PLWH in Southeast China: a prospective cohort study

C. Zeng[1], X. Li[2], S. Qiao[2], S. Liu[3], Y. Zhou[3], Z. Shen[3]

[1]*Harvard Medical School, Department of Global Health and Social Medicine, Boston, United States,* [2]*University of South Carolina, Columbia, United States,* [3]*Guangxi Centers for Disease Control and Prevention, Guangxi, China*

Background: As we are approaching the accomplishment of "90-90-90" goal, improving health-related quality of life (HRQoL) becomes a critical component of HIV treatment and care continuum. Empirical studies showed the detrimental impact of HIV-related stigma on HRQoL. Recently, theoretical studies proposed that HIV-related stigma could be classified as internalized, anticipated, and enacted stigma, which may have differential impacts on health outcomes. Yet studies in this regard are scarce. Leveraging data derived from a prospective observational cohort, we aimed to uncover the associations of three HIV-related stigma with HRQoL.

Methods: A prospective observational cohort study was conducted in Guangxi, China among 1,198 people living with HIV (PLWH). Data at baseline, 6-, 12-, and 18-month

follow-ups were used for analysis. Hierarchical linear mixed effect model was used to examine the impacts of internalized, anticipated, and enacted stigma on HRQoL adjusting for psycho-behavioral variables (e.g., antiretroviral therapy [ART] self-efficacy, HIV symptom management self-efficacy, depression, anxiety, and ART adherence) and other covariates (e.g., age, socioeconomic status, transmission modes, and CD4 counts).

Results: The HRQoL of PLWH decreased significantly over time. Hierarchical regression revealed that the three HIV-related stigma could explain the variance in HRQoL beyond psycho-behavioral variables and covariates. Internalized (adjusted β= -0.78 [-1.07 ~ -0.49]), anticipated (adjusted β= -0.84 [-1.12 ~ -0.55]), and enacted stigma (adjusted β= -0.83 [-1.10 ~ -0.56]) could significantly reduce HRQoL.

Conclusions: Despite different manifestations, all three types of HIV-related stigma have similar impacts on HRQoL over time. Future studies are called for investigating the mechanisms of each HIV-related stigma on HRQoL. To improve HRQoL among PLWH effectively, interventions are warranted to not only reduce HIV-related stigma but also to promote resilience that could mitigate the negative effects of different types of stigma on HRQoL among PLWH.

May stigma ba? (Is there stigma?) A qualitative investigation into HIV stigma in the Philippine context 2021

G.L. Bendicion[1], A.M. Robles[1], A.P.V. Villasanta[1], J. Fontilla[2], I.F. Alquiros[1], T. Balensoy III[1], M.L. Farinas[1], B.I. Mendoza[1], M. Muyargas[3], A.H. Pamoso[1], J.L. Panaligan[1], V. Reyes[1], K.A. Sarmiento[1], J.E. Violago[1], R. Pagtakhan[4], J.O. Corciega[5]

[1]Culture and Arts Managers of the Philippines (CAMP) Pag-Ayo, Inc., Research Department, Mandaluyong, Philippines, the, [2]Australian Federation of AIDS Organizations, Sustainability of HIV Services for Key Populations in Asia Program, Bangkok, Thailand, [3]University of the Philippines Visayas, Gender and Development Program, Miagao, Philippines, the, [4]LoveYourself, Inc., Taguig City, Philippines, the, [5]LoveYourself, Inc., Sustainability of HIV Services for Key Populations in Asia Program, Taguig City, Philippines, the

Background: HIV stigma is a barrier to HIV awareness and testing for men who have sex with men and trans women. Stigma as a research construct, however, can be limited to understanding the intra-psychological states of individuals and ignore interpersonal processes.

This study explores HIV stigma using an interpersonal lens and its impact on talking about and getting tested for HIV.

Methods: The study conducted in-depth, semi-structured interviews of key populations and their parents between August and October 2021. Interviews lasted between 1 and 2 hours. Key population participants consisted of 19 men who have sex with men and 16 trans women. Of these, 19 were ages 18-29, and 16 were 40 years or older; 19 have tested and 16 have never been tested for HIV. Parent participants consisted of 8 fathers and 8 mothers who had at least one child that met key population criteria. Participants represented all macro-geographic regions of the Philippines. Interviews were audio-recorded, transcribed, translated, subjected to thematic analysis, and coded. An analytic model was produced through an iterative collaborative process and validated using coded data.

Results: Data suggest that the burden of HIV stigma in the Philippines should be understood in relation to its intersection with the stigma on LGBT identities. To counteract stigma on their identities, Philippine LGBT persons employ a range of behavioral strategies to enhance their social standing. Under normal circumstances, talking about and getting tested for HIV occur when doing so enhances or does not threaten social standing.

Conversely, talking about and getting tested for HIV appear not to occur under normal circumstances when doing so threatens social standing. An exception to this model is emergency situations when social standing as a concern becomes less salient.

Conclusions: This model can be useful for making sense of the effectiveness of current and future strategies for increasing HIV awareness and uptake of HIV testing in the Philippines.

It also points to the value of interventions for counteracting LGBT stigma as a way to alleviate the burden of HIV stigma on men who have sex with men and trans women in the Philippines.

EPD390

The role of internalized HIV stigma in disclosure of maternal HIV serostatus to perinatally HIV-exposed but uninfected children enrolled in a US Cohort study

M. Davtyan[1], D. Kacanek[2], J. Lee[2], C. Berman[3], E.G. Chadwick[4], R. Smith[5], L. Salomon[3], T. Frederick[1], for the Pediatrics HIV/AIDS Cohort Study

[1]University of Southern California, Keck School of Medicine, Pediatrics, Los Angeles, United States, [2]Harvard T.H. Chan School of Public Health, Center for Biostatistics in AIDS Research, Boston, United States, [3]Harvard T.H. Chan School of Public Health, Epidemiology, Boston, United States, [4]Northwestern University, Feinberg School of Medicine, Pediatrics, Chicago, United States, [5]University of Illinois at Chicago, College of Medicine, Pediatrics, Chicago, United States

Background: Decisions to disclose HIV serostatus may be complicated by internalized HIV stigma, defined as incorporation of negative views of HIV into the self-concept. We evaluated the association of internalized HIV stigma in biological mothers living with HIV with disclosure of their serostatus to their perinatally exposed but uninfected (PHEU) children.

Methods: Mothers and their PHEU children were enrolled in the US-based Surveillance Monitoring for Antiretroviral Therapy (ART) Toxicities (SMARTT) study of the Pediatric HIV/AIDS Cohort Study (PHACS), a longitudinal study of outcomes among PHEU children exposed to HIV and ART.

Mothers who completed at least one stigma and disclosure assessment at the child's 11-, 13-, 15-, and/or 17-year study visits were eligible. Stigma was measured with the 28-item Internalized HIV Stigma Scale. Mean stigma scores were linearly transformed to a range of 0-100, with higher scores indicating greater levels of stigma.

Disclosure of maternal serostatus was defined as responding "yes" to "Is [child's name] aware of your HIV diagnosis?" Mothers were asked at what age the child became aware. The Kaplan-Meier estimator appraised the cumulative probability of disclosure at each child age.

Logistic regression models with generalized estimating equations to account for repeated measures were fit to examine the association between stigma and disclosure, controlling for relevant sociodemographic variables.

Results: Included were 576 children of 438 mothers (mean age 41.5, 60% US-born, 60% Black/African American, and 37% household income ≤$10,000). The prevalence of disclosure across all visits was 28.1%.

Mothers who had disclosed vs. not disclosed reported lower mean stigma scores (38.2 vs. 45.6 respectively).

The cumulative proportion of disclosure by age 11 was 0.184 (95% CI: 0.155, 0.218) and 0.410 by age 17 (95% CI: 0.352, 0.474). At all child ages, disclosure was higher among children of US-born vs. non-US-born mothers.

After adjusting for age, marital status, and years since HIV diagnosis, higher stigma scores were associated with lower odds of disclosure (OR=0.985, 95% CI: 0.975, 0.995).

Conclusions: Providing support to women as they make decisions about disclosure of their HIV serostatus to their children may entail addressing internalized HIV stigma and consideration of cultural factors, particularly for non-US-born mothers.

EPD391

Advancing community engaged research methods: experiences of MSM community in a novel HIV stigma study in China

W. Zhang[1], D. Luo[1], S. Meng[1], K. Smith[2]

[1]UNC Project China, Guangzhou, China, [2]University of Minnesota Twin Cities, Twin Cities, United States

Background: Community engagement in sexual health among men who have sex with men (MSM) may reduce stigma about HIV/STIs, which could elevate the wellbeing of this community.

We have launched an assessment to measure the impact of HIV stigma, homophobia, and their intersection on healthcare setting in Guangzhou, China. Trained local MSM who play standardized patients (SP)present as incognito patients in real clinical settings with a standardized case.

In this qualitative research, we attempt to understand their experience of being SPs and how this project impact their community engagement and healthcare seeking.

Methods: From February to August 2021, MSM who have taken part in SP project were purposively recruited for two interviews: one is before clinic visit and the other is after clinic visit. Semi-structured interviews were designed to explore participants' sexual identity, SP experiences, community engagement and healthcare quality reflection.

A complementary focus group took place to spark discussions after the whole clinic visit. Both interviews and focus group discussion were audio-recorded, transcribed, and analyzed in Dedoose through a framework analysis.

Results: We conducted 25 interviews and one focus group with 12 SPs. The average age was 29, and all have high school and above education. 6 of these SPs had never participated any community activities or research projects. Three themes emerged from the data.

First, although SPs experienced stigma from healthcare providers, especially when their character was MSM or people who live with HIV (PLWH), they were not discouraged and expressed enthusiasm in the project.

Second, participants expressed high willingness to engage in community activities in the future.

Finally, some participants showed that through this project their sexual health awareness have been improved, including attitudes towards HIV/STI testing and facility-based healthcare seeking.

Conclusions: Our findings demonstrate that research project could potentially increase MSM community participation under high stigma social environment. MSM community can benefit from this approach which could be extended to other sexual minority related study.

We conclude with a call for efforts to expand community engagement in research projects towards MSM and PLWH.

EPD392

Social (re)production of spatial stigma and barriers to care in HIV-related healthcare settings: A qualitative study of people living with HIV in Singapore

R.K.J. Tan[1,2], J. Dewaele[3], S. Hyder[3], C.S. Wong[4,5], B.C. Ng[3], E. Cambria[3], R. Chan[6], S. Banerjee[6], R. Jain[3]

[1]University of North Carolina Project-China, Guangzhou, China, [2]National University of Singapore, Saw Swee Hock School of Public Health, Singapore, Singapore, [3]Nanyang Technological University, Singapore, Singapore, [4]National Centre for Infectious Diseases, Singapore, Singapore, [5]National University of Singapore, Yong Loo Lin School of Medicine, Singapore, Singapore, [6]Action for AIDS Singapore, Singapore, Singapore

Background: Past literature on stigma have emphasized the role of institutions or groups of individuals in perpetuating stereotypes, prejudice, or discrimination towards people living with HIV. However, less attention has been

placed on how stigma is (re)produced in HIV-related healthcare settings, which consequently impact spatial practices and health-seeking behaviours among people living with HIV (PLHIV).

Methods: Semi-structured qualitative interviews were conducted with a total of 73 participants. These included 56 PLHIV (30 men who have sex with men, 23 heterosexual men, 3 women) and 17 stakeholders including healthcare workers, contact tracers, religious leaders, social workers, and volunteers. Interviews focused on both PLHIV and stakeholders' perspectives or experiences of HIV diagnosis, navigating healthcare, attitudes towards HIV, and impact of HIV on relationships. Data were analysed through inductive thematic analysis.

Results: Participants discussed how they negotiated stigma in a variety of healthcare settings, including HIV-related support groups and other healthcare institutions. Our analysis revealed that the (re)production of stigma across these settings was a dynamic process that drew on interactions between space-specific symbols or elements, and participants' own values or interpretations.

Examples of such interpretations included sociocultural factors such as perceptions of 'homonormativity' in support groups that provided safety for MSM but excluded heterosexual individuals; fear of disclosure around one's HIV status or sexual orientation in community-based and healthcare settings where greater visibility exists due to more 'open' spatial configurations or patient segregation; and perceptions of surveillance and state authority in local healthcare systems that have driven participants towards delaying their access to care out of fear of identification, or seeking care overseas instead.

As individual values and interpretations varied across participants, spaces were not intrinsically stigmatizing or comforting, but were constructed or socially produced as such.

Conclusions: Our findings nuance the idea of 'safe spaces' in the context of HIV, and further our understanding of the factors that exist beyond spaces themselves that (re) produce stigma and serves as barriers to access for HIV-related healthcare spaces.

Differentiated models of service delivery that address anticipated stigma that manifests through the social production of spaces are required to bridge gaps in access to care for all PLHIV.

Risk factors and impacts of HIV stigma among adults living with HIV on Antiretroviral Therapy in the Asia-Pacific Region

H.M.S. Lwin[1], W.M. Han[2], M.P. Lee[3], R. Ditangco[4], J.Y. Choi[5], R. Rajasuriar[6], J. Ross[7], I. Chan[3], M.I. Echanis Melgar[4,8], J.H. Kim[5], M.L. Chong[6], A.H. Sohn[7], A. Avihingsanon[9,10]

[1]HIV-NAT, The Thai Red Cross AIDS Research Centre, MD Department, Bangkok, Thailand, [2]The Kirby Institute, UNSW, Sydney, Australia, [3]Queen Elizabeth Hospital, Hong Kong SAR, Hong Kong, SAR of China, [4]Research Institute for Tropical Medicine, Muntinlupa City, Philippines, the, [5]Division of Infectious Diseases, Yonsei University College of Medicine, Department of Internal Medicine, Seoul, Korea, The Republic of, [6]University of Malaya, Kuala Lumpur, Malaysia, [7]TREAT Asia/amfAR – The Foundation for AIDS Research, Bangkok, Thailand, [8]Ateneo de Manila University, Quezon City, Philippines, the, [9]HIV-NAT, The Thai Red Cross AIDS Research Centre, Bangkok, Thailand, [10]Tuberculosis Research Unit, Faculty of Medicine, Chulalongkorn University, Bangkok, Thailand

Background: People living with HIV (PLHIV) continue experiencing stigma in community, social and health care settings. They are at increased risk of depression and mental health-related disorders, manifesting in self-isolation and reduced uptake of healthcare services, compared to HIV-negative. Studies in the context of Asian HIV epidemics are limited. We aimed to investigate factors associated with HIV stigma among adult PLHIV in Asia-Pacific.

Methods: This cross-sectional study at five HIV clinical sites in Hong Kong SAR, Malaysia, the Philippines, South Korea, and Thailand, assessing stigma, substance use, depression and daily functioning among adult PLHIV was performed between July 2019 and June 2020. Stigma perceived by study participants was assessed using the 40-item HIV Stigma Scale (HSS) which has been validated across diverse populations, including Asian PLHIV.

The HSS questionnaire also measures the stigma subscale scores: personalized stigma, disclosure, negative self-image, and public attitudes. CD4 count and viral loads were available from medical records within 6 months prior to study entry. Multivariate linear regression was performed to evaluate factors associated with total HIV-related stigma and each subscale group.

Results: Among 864 PLHIV, 88% were male and their median age was 39 years. Of the 97% on ART; 6% had HIV viral load >1000 copies/mL. Mean total HSS score was 96.7±20.1 (97.5±19.9 for males and 90.7±20.8 for females).

Overall mean scores for each subscale were 40.5±11.0 for personalized stigma, 27.9±4.9 for disclosure, 29.9±6 for negative self-image and 48.9±11.6 for public attitudes.

In a multivariate model, older age (difference=5.3, 95% CI 1.9, 8.7, p=0.002 for 40-50 years; 3.1, 95%CI 3.1, 10.1, p=0.003 for >50 years vs. ≤30 years), female (-4.6, 95%CI -8.4, -0.8, p=0.018 vs. male), moderate to severe depression (14.3, 95%CI 10.9, 17.6, p<0.001 vs. no depression), disability (6.8,

95%CI 4.2, 9.4, p<0.001 vs. no disability) and HIV non-disclosure (21.2, 95%CI 14.9, 27.5, p<0.001 vs. full disclosure) were associated with higher total HSS scores.

Conclusions: This study highlights the need to expand stigma assessments within HIV clinical settings in Asia-Pacific region, and address associated factors such as concurrent mental health disorders.

EPD394

The wellbeing of Priority Populations in Mauritius: the roles of stigma, discrimination, and social exclusion and the impact on the quality of life

T. Palmyre[1], G. Bernard[1], S. Issur[1], F. Grant[2]
[1]Collectif Urgence Toxida (CUT), Quatre-Bornes, Mauritius, [2]University of Mauritius, Faculty of Social Sciences and Humanities, Reduit, Mauritius

Background: The purpose of this community-based study is to investigate the perceived well-being of priority populations (PPs - People Living With HIV/Aids, People Who Inject Drugs, sex workers, the LGBT community and Men Who Have Sex with Men) in Mauritius and the relationship to specific social factors: stigma, discrimination, and social exclusion.

More specifically, the objectives were to assess the quality of life of PPs, the nature of perceived discrimination and stigma, and understand determinants of psychological wellbeing amongst the target population.

Methods: Using a mixed-method approach, data were collected through an online questionnaire and face-to-face interviews among PPs in Mauritius for a period of 6 months. The scales measured life satisfaction, perceived well-being, group identification, preparation for bias, everyday discrimination and ostracism, social exclusion, and demographic information. This study was correlational in nature.

Variable	1	2	3	4	5	6	7	8	9	10	11
1. Satisfaction	—										
2. Identification		—									
3. Secrecy			—								
4. Preparation			.216	—							
5. Ostracism			.193	.435	—						
6. Discrimination	−.181			.327	.642	—					
7. Exclusion				.200	.412	.312	—				
8. Psychological	.258			−.177	−.308	−.293	−.217	—			
9. Emotional	.187			−.223	−.445	−.430	−.319	.469	—		
10. Social	.213				−.312	−.260	−.201	.275	.289	—	
11. Physical	.248				−.310	−.276	−.267	.159	.242	.271	—

Table. Correlations for study variables.
Please note that only significant correlations are reported, p<.05

Results: Participants (N = 166; 90 males and 71 females; Mean age of 34.22 years and SD = 11.28) were representative of each PP group. The average scores for well-being were relatively high across the four dimensions of well-being; psychological, emotional, social, and physical. However, in contrast, the reported satisfaction with life (M = 3.36, SD = 1.92) was relatively low. PPs reported feeling excluded from Mauritian society, a sense of not being fully considered as a member of social and professional life. Correlational analysis revealed a domino effect between the measures of preparation for bias increasing ostracism, discrimination and social exclusion therein negatively impacting the levels of well-being among PPs.

Conclusions: This study is the first that examines determinants of wellbeing among PPs in Mauritius in contrast to documented barriers faced by such groups. This new perspective will enable the development of strategies for holistic health promotion of PPs, considering both physical and mental health for adequate treatment and care.

EPD395

A systematic review of biomarkers of stigma in people with HIV and HIV key populations

I. Gupta[1], N. Vyas[2], M. Zhao[2], M. Vetrova[3], K. Lunze[2]
[1]Dubai Health Authority, Dubai, United Arab Emirates, the, [2]Boston University, Boston, United States, [3]First Pavlov State Medical University, St. Petersburg, Russian Federation

Background: The biological processes associated with stigma manifested in people with or at risk for HIV are largely unknown. We conducted a systematic review of stigma biomarkers, i.e., quantifiable indicators related to stigma that influence or predict disease outcomes, in people with HIV (PWH) and HIV key populations.

Methods: This review (registered as PROSPERO CRD42021224383) included all study designs except case reports. PubMed, EMBASE, and PsychInfo were searched from August 2020 until November 2021.

We screened search results by title and abstract, performed a full-text review, searched for additional citations, and extracted data. The risk of bias was assessed using the U.S. National Institutes of Health tool for case-control and cohort studies.

Results: Out of the 978 studies screened by title and abstract and 96 by full-text review, 29 met the inclusion criteria. Published from 1996-2019, studies were conducted in North America (86%), Africa (3%), Asia (3%), and Europe (7%).

Studies recruited an average of 66% male and 34% female participants. Studies were cross-sectional (90%) and cohort (10%).

We assessed the quality of methods and found 52% of studies to be of good quality, 38% to be of fair quality, and 10% to be of poor quality.

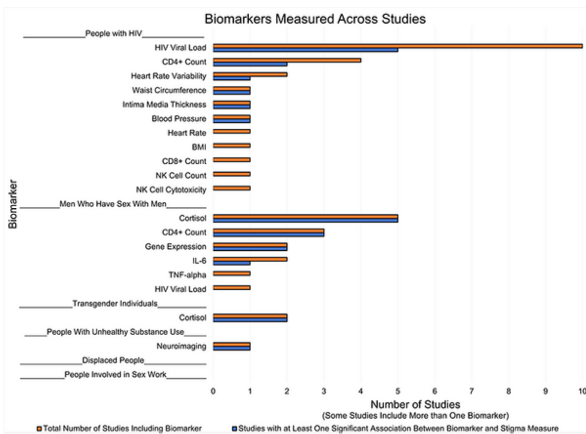

Figure. Biomarkers measured across studies.

Conclusions: Evidence on the biomarkers for the various stigmas manifesting in PWH and HIV key populations is circumscribed and based on limited cross-sectional and cohort designs. Better understanding the physiological mechanisms associated with stigma in these populations could inform mitigation strategies. Future stigma biomarker studies should include displaced people and people involved in sex work.

EPD396

"It's better to die than take medication". A qualitative study exploring the drivers of HIV-stigma at a community-level and the outcomes for people living with HIV in Zimbabwe

S. James[1], S. Gumede-Moyo[2,3], S. Sharma[2], C. Gwanzura[4], R. A. Ferrand[1,5]

[1]*London School of Hygiene and Tropical Medicine, Infectious Disease, London, United Kingdom,* [2]*Ipsos Healthcare, London, United Kingdom,* [3]*Faculty of Epidemiology and Population Health, London School of Hygiene and Tropical Medicine, Department of Population Health, London, United Kingdom,* [4]*Ministry of Health and Child Care, Department of AIDS & TB, Harare, Zimbabwe,* [5]*Biomedical Training and Research Institute, Harare, Zimbabwe*

Background: Despite investment in HIV control, HIV-stigma is documented to be a large barrier to programmatic success in Zimbabwe. Little research has conceptualised the development, and impact, of community-level HIV-stigma on people living with HIV (PLHIV). Frameworks have attempted to define and conceptualise HIV-stigma, and although consensus is lacking, the STRIVE framework provides a concise tool for its study.

Thus, this project utilises this framework to understand the manifestation of HIV-stigma at a community-level and its impact for PLHIV in Zimbabwe, gaining insights for informing future control programmes.

Methods: As part of a larger study investigating young-persons motivations to adhere to ART, PLHIV aged 18-35 were interviewed (n=12). From these interviews, members of the community considered influential to PLHIV were identified through a snowballing strategy and interviewed from the 7th-21st of December 2020. This cross-sectional study analyses drivers, and outcomes, of HIV-stigma at a community-level from in-depth, semi-structured interviews with influential individuals in the community (n=12 health care providers (HCPs)) (n=12 'other' influencers), across four regions of Zimbabwe.

This exploratory qualitative assessment utilised thematic analysis, adopting deductive methods (using the STRIVE framework as the analysis framework) and inductive methods, to allow new or emerging themes to develop.

Results: Influencers were geographically balanced across the four regions sampled but were not gender-balanced as 66.6% were women and 20.8% were men. Under the analysis framework of drivers and outcomes for PLHIV, social judgement, fear of transmission and responsibilisation were identified as key themes of actionable drivers of HIV-stigma at a community-level. These drivers were identified to facilitate the manifestation of perceived, anticipated, experienced, and internalised stigma, with intersecting stigmas playing an important role in mediating HIV-stigma at the community-level. This led to four primary outcomes for PLHIV: non-disclosure, psychological distress, defaulting and reluctance to test.

Conclusions: Findings identify misconceptions around HIV still persist. To date, Zimbabwe has taken a top-down approach, funnelling resources into improving ART acceptability and accessibility, however the value of local resources, i.e., community networks should be capitalised in programmes tackling actionable drivers of HIV-stigma, particularly focussing on reframing the narrative of an HIV infection to a chronic, but manageable infection.

EPD397

The force of HIV stigma: loops of negative feedback of social inequalities for women's access to HIV care in Chiapas, Mexico

A. Evangelista[1], A. Amuchástegui[2], A. Martin-Onraet[3], A. Rivera[4], A. Piñeirúa[5], F. Belaunzarán-Zamudio[6], M. Ferrara[7]

[1]*El Colegio de la Frontera Sur, Sociedad y Cultura, San Cristóbal de Las Casas, Mexico,* [2]*Universidad Autónoma Metropolitana Xochimilco, Ciudad de México, Mexico,* [3]*Instituto Nacional de Cancerología, Ciudad de México, Mexico,* [4]*Secretaria de Salud, Coordinación Estatal de VIH, ITS y Hepatitis C, Tuxtla Gutiérrez, Mexico,* [5]*Instituto Nacional de Salud Pública, Cuernavaca, Mexico,* [6]*N/A, Bethesda, MD, United States,* [7]*Centro de Investigaciones y Estudios Superiores en Antropología, Ciudad de México, Mexico*

Background: Due to the low HIV prevalence in cis-gender women in Mexico (0.2%), they have not been considered a "key group" for public policy. However, the epidemic in women is rapidly advancing: the masculinity ratio has dropped from 12:1 men per woman in 1987, to 4:1 in 2019. Studies show that nearly 90% of woman living with HIV got it through unprotected sex with their male stable

partners. Since many of them declare unilateral monogamy, their infection could be more related to their partner's sex practices than theirs. As gender unequal relations thus interact with other social conditions of vulnerabilities and inequalities, women's situation regarding the HIV epidemic in Mexico takes a more complex dimension.

Methods: We conducted 32 in-depth interviews (Nov-Dec 2020) with woman living with HIV from a random sample of 216 participants aged 18-44 receiving care in any of 13 HIV care centers coordinated by the state HIV program.

The aim of the interviews was to explore the dynamics of women's positions within inequalities regarding care work, geographic mobility and gender violence, and their effect on their access to HIV care and to adherence to antiretroviral therapy.

Results: Narrative analysis of the interviews showed the force of HIV stigma in what we called "paradigmatic cases" where the diagnosis detonates violence, further load of care work and food insecurity with greater impact on women with breastfeeding children.

We identified *negative feedback loops* in as much as HIV acquired in circumstances of poverty and gender inequality itself intensified the social, subjective and economic precarity that participants faced before the diagnosis.

In one of the narratives, contrastingly, similar situations of inequality did not prevent the interviewee to produce a voice of her own and transform her HIV diagnosis into a force for activism.

Conclusions: HIV stigma for women who live in disadvantaged positions within unequal structures of class, gender, racialization and sexuality drives further poverty, violence, discrimination and exclusion. Integrated HIV healthcare demands non assistential programs that should include attention to inequalities through interinstitutional strategies to foster women's rights activism for a life free of violence, stigma and discrimination.

EPD398

Structural violence and trajectories of stigma and discrimination among women living with HIV in Vancouver, Canada

C. Logie[1], K. Shannon[2], M. Braschel[2], A. Krusi[2], M. Lee[3], C. Norris[2], K. Deering[2]
[1]*University of Toronto, Social Work, Toronto, Canada,* [2]*Centre for Gender & Sexual Health Equity, Vancouver, Canada,* [3]*University of British Columbia, Vancouver, Canada*

Background: Women living with HIV and AIDS (WLWH) experience stigma and discrimination rooted in interlocking social-structural processes of oppression. Yet knowledge gaps remain regarding how and why HIV-related stigma and other forms of discrimination shift over time. We examined associations between social-structural factors (food/housing insecurity, violence, sexual minority identity) and HIV-related stigma and discrimination trajectories among WLWH.

Methods: We conducted a community-based open longitudinal cohort 'Sexual Health and HIV/AIDS: Longitudinal Women's Needs Assessment' (SHAWNA) with WLWH living in and/or accessing HIV care in Metro Vancouver, Canada. Using data from 2015-2019, semiannual averages in recent (past 6-month):

a. HIV-related stigma and

b. Everyday discrimination were plotted.

Latent Class Growth Analysis (LCGA) was then used to identify distinct trajectories of HIV-related stigma and discrimination, and baseline correlates of each trajectory were examined using multinomial logistic regression. Adjusted odds ratios (AORs) and 95% confidence intervals (95%CIs) are reported.

Results: The sample included 197 participants (trans women: 8.1%; Indigenous women: 62.4%; White women: 31.5%; African, Caribbean and/or Black women: 2.5%; other racialized women: 3.6%) with 985 observations over 4 years of follow-up.

Semiannual time trend plots showed little variation over time for stigma/discrimination. LCGA identified three distinct trajectories of HIV-related stigma and discrimination: sustained low, medium and high.

In multivariable analysis, recent (past 6-month) concurrent food and housing insecurity (CFHS) and physical/sexual violence were associated with higher odds of being in the sustained medium (CFHS: AOR=1.99, 95%CI=1.03-3.83; violence: AOR=1.96, 95%CI=0.88-4.39) and high (CFHS: AOR=6.93, 95%CI=2.00-24.04; violence: AOR=2.61, 95%CI=0.76-8.98) HIV-related stigma trajectories (vs. sustained low trajectory). Identifying as a sexual minority (AOR=2.18, 95%CI=1.10-4.31) and recent CFHS (AOR=2.15, 95%CI=1.05-4.40) were associated with higher odds of being in the sustained medium discrimination trajectory.

Recent physical/sexual violence (AOR=2.90, 95%CI=1.07-7.85), sexual minority identity (AOR=2.43, 95%CI=1.06-5.55), and recent CFHS (AOR=2.24, 95%CI=0.95-5.28) were associated with the sustained high discrimination trajectory.

Conclusions: Findings signal the role of social inequities (e.g., food/housing insecurity, violence) in sustaining, and the chronicity of, stigma and discrimination toward WLWH.

Multi-level strategies are required to address the structural violence embedded in socio-economic systems that elevate poverty and violence exposure and exacerbate stigma/discrimination in order to optimize health and rights among WLWH.

Stigma and HIV care engagement in the context of Treat All in Rwanda: a qualitative study

C. Ingabire[1,2], D. Watnick[3], J. Gasana[1,2], F. Umwiza[1,2], A. Munyaneza[1,2], G. Kubwimana[1,2], G. Murenzi[1,2], K. Anastos[4], A. Adedimeji[5], J. Ross[4]
[1]Research for Development (RD Rwanda), Einstein-Rwanda Research and Capacity Building Program, Kigali, Rwanda, [2]Rwanda Military Hospital, Einstein-Rwanda Research and Capacity Building Program, Kigali, Rwanda, [3]Albert Einstein College of Medicine, Department of Pediatrics, Bronx, United States, [4]Albert Einstein College of Medicine, Department of Medicine, Bronx, United States, [5]Albert Einstein College of Medicine, Department of Epidemiology and Population Health, Bronx, United States

Background: 'Treat All' policies recommending immediate antiretroviral therapy (ART) soon after HIV diagnosis for all people living with HIV (PLHIV) are now ubiquitous in sub-Saharan Africa. While early initiation of and retention on ART can reduce disease progression and onward transmission, evidence suggests that stigma remains a barrier to engagement in care.
This study aimed to understand the relationship between HIV stigma and engagement in care for PLHIV in Rwanda in the context of Treat All.
Methods: Between September 2018 and March 2019, we conducted semi-structured, qualitative interviews with adult PLHIV receiving care at two health centers in Kigali, Rwanda. After transcription and translation of interviews from Kinyarwanda to English, we simultaneously developed case-based and analytic memos alongside a codebook, which was iteratively applied to all transcripts.
We used a grounded theory approach for analysis, identifying emergent themes and higher order concepts related to HIV stigma and care engagement.
Results: Among 37 participants, 27 (73%) were women; median age was 31 years. Participants described how care engagement under Treat All, including taking medications and attending appointments, increased their visibility as PLHIV. This served to normalize HIV and use of ART but also led to anticipated stigma in the health center and community at early stages of treatment. Enacted stigma from family and community members and resultant internalized stigma acted as additional barriers to care engagement.
However, participants described how psychosocial support from care providers and family members helped them cope with stigma and promoted continued engagement in care.
Conclusions: Even though study participants faced multiple stigmas that negatively affected their engagement in care, personal and community support helped them utilize health services, particularly early in their treatment course. Developing interventions that leverage personal and community support can potentially reduce the negative impact of stigma and support Treat All goals.

EPD400
Assessing PLHIV quality of care with HIV response outcomes

M. Adeleke[1], O.O. Fisher[1], T. Adeshina[1], H.O. Olowofeso[2], I. Sidibe[2], S. Ravishankar[3], J.M. Zuniga[2,3]
[1]Lagos State AIDS Control Agency, Lagos, Nigeria, [2]International Association of Providers of AIDS Care, Washington, DC, United States, [3]Fast Track Cities Institute, Washington, DC, United States

Background: Alongside improvement ofPLHIV life expectancy noted over the last decade, health systems now focus on medicalandother determinants to improve PLHIVs quality of life.
Gaining insights into the PLHIV perspective on quality of care (QoC) will guide in developing strategies to improve engagement and retention in care and attainment of the 95-95-95 goals.
Methods: An observational, cross-sectional study, designed to assess the impact of QoC in PLHIV was conducted in Lagos, the sample population included 578 PLHIVon antiretroviral therapy (ART).
The levels of QoC were assessed against nine separate multi-item indices out of which four are included in this analysis: viral load suppression, age, key population, and gender. Chi-square tests were used to compare the QoC domains between different PLHIV subgroups.
Results: Chi-square analysis showed that higher QoC was associated with higher viral load suppression($p<0.00$). Higher QoC levels were also associated with age, [QoC decreased with increasing age], ($p<0.036$), key populations [higher QoC for KPs compared to general populations] ($p<0.00$), and gender [females had higher QoC compared to males]($p>0.036$).
QoC was also associated with higher retention in care among key populations($p<0.019$). Viral load suppression showed the same sub-population association trends as QoC.

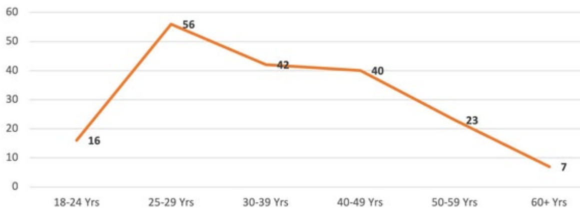

Figure. Perceived experience of good QoC

Conclusions: Decrease in QoC with increased age points to a need for improving quality of care for older populations. Higher levels of QoC in key populations compared to general population could be attributed to the scale up of the "One Stop Shop" service delivery system in Lagos. To attain the 95-95-95 targets, gaps in QoC across age, gender and population need to be addressed.

EPD401

"People thought I had HIV": PrEP stigma among Latina immigrant transgender women in the Washington DC metropolitan area

A.M. del Río-González[1], G. Came Fadul[1], F. González[1], N. Reyes[1], S. Poveda Lozada[2], M.C. Zea[1]

[1]The George Washington University, Department of Psychological and Brain Sciences, Washington, United States, [2]The George Washington University, Milken Institute School of Public Health, Washington, United States

Background: PrEP uptake among Latina transgender women has been slow, and PrEP stigma has been identified as an important barrier for uptake. This longitudinal mixed-methods research study investigated perceptions, expectations, and experiences of PrEP stigma among HIV-negative Latina immigrant transgender women. We also explored the relationship between PrEP stigma and PrEP-related intentions and behavior.

Methods: Participants were 37 HIV-negative Latina immigrant transgender women living in the DC metropolitan area. We conducted up to three in-depth, semi-structured mixed-methods interviews per participant. All interviews were conducted in Spanish. For qualitative data, we used a Rapid and Rigorous analysis (RADaR) technique to identify key themes. We analyzed quantitative data using descriptive and non-parametric statistics (e.g., Spearman correlations).

Results: Among PrEP-experienced participants, 60% (n=9) reported that they worried that others would think they were living with HIV by virtue of taking PrEP. This worry was associated with lower intentions to continue or re-uptake PrEP (r=-.59; p=.03). Participants reported two main reactions when an interlocutor thought they were living with HIV: Some used this as an opportunity to educate others about PrEP, whereas other participants concealed their PrEP use.

Many PrEP-naive participants anticipated that others would think they were living with HIV if they were to take PrEP.

However, few talked about this as a potential barrier for PrEP use, and this worry was unrelated to their intentions to initiate PrEP (r=-.26; p=.25).

Stigma related to risk compensation (i.e., increased number of sexual partners, condomless sex) was also evident in both the quantitative and qualitative data. Some participants also talked about intersectional stigma, where the stigma faced for being transgender was compounded with their experiences or expectations of PrEP-related stigma.

	Total (N = 37)	Ever used PrEP (n = 15)	Never used PrEP (n = 22)
Age Mean (SD)	34.5 (8.4)	32.6 (4.2)	35.6 (10.3)
Time in US Mean (SD)	10.5 (8.7)	8.8 (5.2)	11.6 (10.4)
Region of origin	Caribbean: 1; Central America: 28; North America (Mexico): 4; South America: 4	Central America: 14; North America (Mexico): 1;	Caribbean: 1; Central America: 14; North America (Mexico): 3; South America: 4
Worry that other people would think participant was living with HIV due to PrEP use - *"Not at all" or "A little"*	24 (64.9%)	9 (60%)	15 (68.2%)
"People who use PrEP have a lot of sexual partners" - *"Agree" or "Completely agree"*	16 (43.2%)	7 (46.7%)	9 (40.9%)
"People who use PrEP use it as an excuse to have sex without condoms" - *"Agree" or "Completely agree"*	16 (43.2%)	8 (53.3%)	8 (36.4%)

Table.

Conclusions: PrEP-related stigma is common among Latina transgender women and it can impact their PrEP use. Thus, interventions to reduce PrEP stigma are sorely needed. These interventions should not only target Latina transgender women, but must include the communities within which they live.

EPD402

Intersectional stigma among women who exchange sex and use drugs (WESUD) in Kazakhstan

V. Frye[1], T. McCrimmon[2], M. Darisheva[3], B. West[4], S. Primbetova[3], A. Terlikbayeva[3], L. Gilbert[4], O. Cordingley[4], L. Starbird[5], N. El-Bassel[4]

[1]City College of New York (CUNY), School of Medicine, New York City, United States, [2]Columbia University Mailman School of Public Health, Sociomedical Sciences, New York City, United States, [3]Global Health Research Center of Central Asia (GHRCCA), Almaty, Kazakhstan, [4]Columbia University School of Social Work, New York City, United States, [5]University of Pennsylvania School of Nursing, Family and Community Health, Philadelphia, United States

Background: Intersectional stigma is a major barrier to HIV prevention and treatment, including testing, PEP/PrEP uptake and treatment/care engagement in various global contexts. Various systems of oppression and stigmatized conditions overlap, potentiating their negative impact on HIV-related outcomes. In Kazakhstan, women who both exchange sex and use drugs (WESUD) experi-

ence dual and possibly intersecting stigmas, which reduce access to HIV prevention and care and thus are important to measure, characterize and address.

Methods: We administered a brief screening survey (N=48) and conducted in-depth interviews (N=30) with WESUD (March-July 2021).

The survey included an intersectional stigma scale where the respondent reported if they "might" (anticipated stigma subscale) or "did" (experienced stigma subscale) experience stigma or discrimination "based on who you are", which could include drug user or sex worker or another stigmatized status.

We examined bivariate associations between the measure and drug use and sex work status (full time sex work or for supplemental income).

Results: Participants who reported using drugs (injection or not) in the past 3 months had a significantly higher score on the experienced stigma subscale than those who did not report using drugs (19.95 vs 9.17; p<.05). Neither experienced nor anticipated stigma subscales differed significantly by sex work status. Qualitative in-depth interviews provided further insight into experiences of intersecting stigmas.

Participants reported stigmatization in health service settings based on both sex work and drug use ("The attitude is generally extremely bad, and if you inject drugs or provide some types of services, you are rubbish"), from community members ("People will be afraid of me and stop communicating") and self-imposed isolation/exclusion due to anticipation of stigma ("I left home, so as not to bother my relatives with my presence. Because I have such a way of life").

Conclusions: Social stigma is a major problem among WESUD in Kazakhstan, with deleterious consequences for self-esteem, social support, and service access. The association between recent substance use and experienced stigma suggests that women engaged in both sex work and substance use may be particularly stigmatized.

Our results suggest an urgent need for multilevel stigma-reduction interventions among this population.

EPD403

PLHIV and key populations avoid HIV-related services in India due to stigma

A.M. McFall[1], J. Bell[2], V. Arumugam[3], A.K. Enugu[2], D. Ashok[2], M. Datta[3], S.C. Ghosh[3], R. Pollard[2], A. Singh[2], S.H. Mehta[1], S.S. Solomon[2]

[1]The Johns Hopkins Bloomberg School of Public Health, Baltimore, United States, [2]The Johns Hopkins University School of Medicine, Baltimore, United States, [3]YR Gaitonde Center for AIDS Research and Education, Chennai, India

Background: Stigma and discrimination can impede utilization of HIV services and lead to sub-optimal health outcomes. We characterize stigma among people living with HIV and key populations (KP) (female sex workers [FSW], men who have sex with me [MSM], people who inject drugs [PWID], and transgender people [TG]) across 7 districts in 2 Indian states.

Methods: We conducted interviewer-administered surveys Oct-Nov 2021 with a random sample of clients receiving ART at treatment centres and people registered with local KP-specific NGOs. Questions included enacted, anticipated, and self-stigma relative to HIV status (PLHIV) and KP identity. For enacted and anticipated stigma, participants were asked about stigma from healthcare workers at treatment centres (PLHIV) and HIV/STI testing centres (KP). Each domain was summarized by calculating an item average (range 0-3, 3=highest). For PLHIV and KP separately, we assessed the association of stigma with avoiding care (likely or very likely) using logistic regression.

Results: 189 PLHIV and 195 KP (61 FSW, 36 MSM, 50 PWID, and 48 TG) were interviewed. Across all populations, self-stigma was highest [Figure]. For PLHIV, MSM, and TG, anticipated stigma was higher than enacted stigma but equal for FSW and PWID. TG experienced the highest enacted and anticipated stigma (median=0.3 and 1.5, respectively); PWID had the highest self-stigma (median=2.2). KP more commonly reported avoiding health centres because they expected to be treated poorly (26%) compared to PLHIV (9%). All stigma domains were significantly associated with avoiding care. KPs with higher enacted stigma were nearly 20 times more likely to avoid care and PLHIV with higher anticipated stigma were nearly 20 times more likely to avoid care.

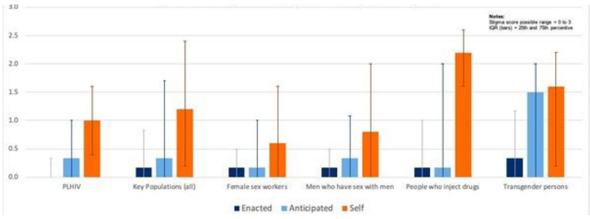

Figure. Median stigma scores, by domain and population group.

Conclusions: PLHIV and KP in India experience high levels of stigma which impact HIV care engagement, particularly among TG who report substantial anticipated and experienced stigma. Interventions to sensitize providers and KP-friendly clinics are needed.

EPD404
Differences in burden of Internalized HIV Stigma (IHS) by race/ethnicity among People with HIV (PWH) Living in the US

L.N. Drumright[1], D. Short[2], B.M. Whitney[1], S.A. Ruderman[1], J. Ma[1], L. Haidar[3], R.M. Nance[1], A. Hahn[1], E. Moffatt[2], K.H. Mayer[4], K. Christopoulos[5], M.O. Johnson[5], M.S. Saag[6], M.M. Kitahata[1], W.B. Lober[1], R.D. Moore[7], J.C. Keruly[7], A. Willig[6], E. Cachay[8], J.J. Eron[9], S. Napravnik[9], G. Chander[1], H.M. Crane[1], J.A.C. Delaney[3], P.K. Crane[1], R.J. Fredericksen[1]
[1]University of Washington, Seattle, United States, [2]ViiV Healthcare, London, United Kingdom, [3]University of Manitoba, Winnipeg, Canada, [4]Harvard University, Cambridge, United States, [5]University of California, San Francisco, San Francisco, United States, [6]University of Alabama, Birmingham, Birmingham, United States, [7]Johns Hopkins University, Baltimore, United States, [8]University of California, San Diego, United States, [9]University of North Carolina, Chapel Hill, United States

Background: Previous US-based studies suggest that HIV stigma may negatively impact clinical outcomes among people with HIV (PWH). Fewer studies have examined which subgroups of PWH carry the greatest burden of HIV stigma, which may be important in targeting/tailoring interventions.

Methods: CFAR Network of Integrated Clinics System (CNICS) is a longitudinal, US-based, multisite, clinical care cohort of PWH. During routine healthcare visits, PWH completed tablet-based assessments including a 4-item, Likert scale (low 1-5 high) internalized HIV stigma (IHS) instrument. Initial responses to IHS questions were transformed into a score, theta, using Item Response Theory models. Differences in theta across PWH who responded to questions on IHS were examined by sociodemographic characteristics using multiple linear regression stratified by race/ethnicity.

Results: 10,825 PWH responded,with a mean age of 47 years, 79.8% cis-men, 18% cis-women, 39% Black and 14.6% Hispanic.High IHS scores (≥3 on every question) were reported by ~25% of PWH. The mean theta IHS score was 0.066 (median: 0.221; range: low -0.947 to 2.40 high).

While high IHS scores were reported in all subgroups, in regression models adjusted for age, gender, years in care, geographic location, and sexual orientation, greater IHS was reported by all heterosexual PWH, but only White and Black bisexual-identifying PWH, not Hispanic.

Both Hispanic and Black PWH reported less IHS in each older age group, however for White PWH, a lower IHS score was only observed for ≥60 years.

Among Hispanic and White PWH, IHS scores were lower for most groups in care longer, but for Black PWH lower IHS scores were only reported for those in care ≥7 years.

Among Black PWH, but not other racial/ethnic groups, cisgender women reported more IHS than cisgender men, as did those from the Western US compared to the North-east.

Conclusions: We found that IHS is prevalent among PWH, with some subgroups reporting greater IHS including differences by race/ethnicity. These findings highlight the benefits of routine screening for IHS and suggest the need for interventions to reduce IHS among PWH, which could be maximized by targeting/tailoring to subgroups reporting higher mean stigma and individuals with high IHS scores.

EPD405
The prevalence of physical and sexual violence in Nigeria: Gateway to HIV infection among MSM and transwomen

M. Chinenye[1]
[1]Federal Ministry of Health, Public Health, Abuja, Nigeria

Background: Sexual and gender-based violence (SGBV) against minority populations is a global public health problem with consequential effects on human health and development. It has been reported among gay men and transgender women in forms of verbal abuse, physical and sexual violence. Sexual violence often predisposes the victim to HIV infection and other psychological traumas. This study was carried out to assess the burden of SGBV and identify factors associated with its occurrence among MSM and TGF in Nigeria.

Methods: This is a cross-sectional study among MSM and transwomen residing in Nigeria. The snowballing method was used to recruit participants. A total of 382 eligible responses were received through an online questionnaire. Descriptive statistics and binary logistic regression were used to analyze the data with a significance set at 5%.

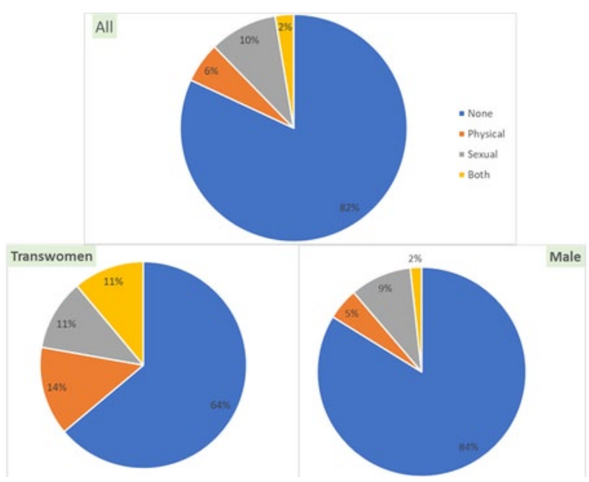

Figure.

Results: The mean (SD) age of respondents was 27(0.3) years. About 35 % (95%CI: 30.2-39.8) of all respondents had ever experienced sexual violence and 42.1 % (95%CI: 37.3-47.2) had ever experienced physical violence. The prevalence of sexual violence within one year preceding the study was 13.8% (95%CI: 10.8-17.5) while physical violence was 16.3% (95%CI: 13.0-20.2). Transwomen were about thrice (unadjusted odds ratio: 2.92, p<0.01). and 5.6

Oral abstracts

Poster exhibition

E-posters

Late-breaker abstracts

Author Index

times (unadjusted odds ratio: 5.60, p<0.001) more likely to experience sexual and physical violence respectively than MSM self-identified as males. One fifth (18.1%) of all respondents had ever experienced IPV and for transwomen, it was 1 in 3. Transwomen were also about 3 times more likely to experience IPV than MSM self-identified as males (unadjusted odds ratio: 2.92, p<0.01).

Conclusions: The prevalence of physical and sexual violence is high among MSM and transwomen in Nigeria. Implementing public health programmes that target modifying the background characteristics of MSM and transwomen which influence SGBV exposures may help reduce the prevalence of violence among MSM and the transwomen community.

EPD406

Health facility stigma: experiences of adolescent boys living with HIV in the Eastern Cape Province of South Africa

L. Gittings[1,2], M. Pantelic[3]

[1]University of Toronto, Factor-Inwentash Faculty of Social Work, Toronto, Canada, [2]University of Cape Town, Centre for Social Science Research, Cape Town, South Africa, [3]Brighton and Sussex Medical School, Brighton, United Kingdom

Background: Adolescents and men are two populations that perform poorly within the HIV cascade of care and have poor AIDS-related outcomes. HIV-related stigma is a documented barrier to retention in HIV care and adherence globally. However, scant research has explored the stigma-related experiences and challenges of adolescent boys and young men living with HIV.

We explore the stigma experiences of adolescent boys living with perinatally-acquired HIV accessing public health services in the Eastern Cape Province of South Africa.

Methods: Life history narrative interviews, in-depth semi-structured interviews and analysis of health facility files of adolescent boys and young men living with vertically acquired HIV (n=35, ages 13-22) in the Eastern Cape Province of South Africa 2017 and 2018. In-depth semi structured interviews with biomedical and traditional health practitioners (n=14).

Results: Adolescent boys reported two stigma-related deterrents to retention in the HIV cascade of care:

1. Anticipated stigma from attending health facilities, where they feared being visibilised as living with HIV; and
2. Experiences and fears of enacted stigma by biomedical health workers in the form of yelling, mistreatment and gossip.

Findings suggest that as adolescent boys with perinatally acquired HIV become older, their experiences begin to reflect the stigma-related challenges reported by adult men living with HIV. This may become more pronounced when caregivers stop accompanying boys to the clinic, and within certain types of facilities and transitions. Intersectional stigma theory is applied to consider the multiple intersecting vulnerabilities of this group, and the ways that masculinity articulates to shape experiences of stigma across the life course of adolescents with perinatally-acquired HIV.

Conclusions: This study found considerable stigma-related challenges faced by adolescent boys and young men living with HIV that affect their retention in care. Further research to quantify relationships between stigma and health practices of adolescent boys and young men living with HIV, and the pathways through which such practices are shaped is needed.

EPD407

Stigma, Syndemics, and HIV risk among Transgender Women (TGW) in Mumbai, India: a qualitative investigation

D. Baruah[1], A. Bhatter[1], R.V. Tikate[1], N.M. Shaikh[1], H. Kambli[1], S. Rawat[1], M. Shunmugam[2], R. Nelson[2,1], V.R. Anand[1], A. Sebastian[2,1], V. Chakrapani[2,1], P.A. Newman[3]

[1]The Humsafar Trust, Research, Mumbai, India, [2]Centre for Sexuality and Health Research and Policy (C-SHaRP), Research, Chennai, India, [3]University of Toronto, Toronto, Canada, Factor-Inwentash Faculty of Social Work, Toronto, Canada

Background: Syndemics of psychosocial problems such as depression, problematic alcohol use and violence victimization have been shown to synergistically increase HIV risk among TGW in developed countries. However, scant research is available on Syndemics among Transgender Women (TGW) in India.

This qualitative study aimed to explore how stigma, psychosocial problems and HIV risk are connected among TGW in Mumbai, India.

Methods: In March–August 2019, we conducted four focus group discussions (FGDs, n=25) and six in-depth interviews (IDIs) with TGW, and four key informant interviews with health care providers and trans community leaders. Purposive sampling was used. Thematic analysis was conducted on the translated data from FGDs and interviews.

Results: TGW participants were younger (mean age - 23.8 in FGDs; mean age - 35 years in IDIs), about half (48%) reported inconsistent condom use in the past month, and about two-fifths reported part-time sex-work. Narratives indicated that TGW experienced depression, anxiety, and suicidal ideation primarily from lack of social acceptance. Substance and alcohol abuse, as a maladaptive coping mechanism, heightened HIV vulnerability especially for those in sex work.

Depression secondary to loss of family support and rejection by partners and harassment from police and general public seems to lead to fatalistic attitude among some TGW, in turn contributing to condom less sex.

Participants described incidents of discrimination within healthcare settings, although they reported that understanding about trans people in general is increasing. Fear

of discrimination in health care settings, based on their gender minority status or sex work status, posed a barrier to accessing and using health care services. TGW living with HIV faced discrimination from other trans community members, with consequent loss of emotional support and loss of livelihood, especially among those in sex work.

Conclusions: Stigmas related to gender minority status, sex work status and HIV status contribute to psychosocial problems and HIV risk. HIV interventions for TGW need to incorporate strategies to reduce multiple stigmas faced by TGW, promote acceptance of TGW living with HIV and offer integrated services to screen for and manage psychosocial problems, all of which can strengthen HIV prevention efforts.

EPD408

Association of stigma and adherence to treatment among People Living with HIV in Kilimanjaro region, Tanzania: *repeated cross-sectional studies*

G. Stoopman[1], K. Ngowi[2], B. Mtesha[2]

[1]University of Amsterdam, Medicine, Amsterdam, Netherlands, the, [2]Kilimanjaro Clinical Research Institute, Moshi, Tanzania, The United Republic of

Background: Non-adherence to antiretroviral therapy is a common cause for treatment failure for People Living with HIV (PLHIV). As the Sub-Saharan African (SSA) region bears the biggest HIV burden, further research into adherence-enhancing interventions can be beneficial.

The lack of knowledge on the role of stigma on adherence in Tanzania, has brought us to the primary aim of this study: to assess whether an association of stigma and adherence among PLHIV in the Kilimanjaro region, Tanzania, exists. We hypothesize that stigma negatively influences adherence among PLHIV.

Methods: Cross-sectional assessments of stigma and adherence among 249 participants were conducted during a 48-week study period, at week 0 (visit 1), week 24 (visit 4), and week 48 (visit 7). Internalized and personalized stigma were measured with a 10-item abbreviated Berger HIV stigma questionnaire. Adherence was measured through Self-Report in the last week (SRweek) and last month (SRmonth), and Pharmacy refill counts (PR). Repeated cross-sectional bivariate logistic regression analyses were performed with continuous stigma scores and dichotomized adherence scores with levels below 95% being nonadherent. Sociodemographic factors were included in the final stepwise multivariate analysis if p-values <0.20 were reached in prior bivariate regression analysis on nonadherence.

Results: The annual mean internalized stigma score was 5.47 (±2.31) (min:4, max:16), and 10.10 (±4.76) for personalized stigma (min:6, max: 24). Annual mean adherence rates were 96.5% (SRweek), 97.9% (SRmonth), and 93.7% (PR). A significant association between internalized stigma and non-adherence was measured at visit 7 (OR: 1.29, CI 1.11-1.50, P <.001). Age (OR: 0.95, CI 0.92-0.99, P .005) and 'attending a Health Centre' as opposed to a referral hospital were significant covariates for non-adherence (OR:2.56, CI 1.12-5.85, P .026).

Conclusions: There was no dominantassociation between stigma and adherence measured.

Stigma scores were remarkably low and adherence levels fairly optimal. We must question the sensitivity of the Berger HIV stigma questionnaire to the Tanzanian context. Revalidation of the questionnaire in the local context together with qualitative research on stigma, is highly recommended for future studies.

Furthermore, more emphasis can be placed on improving the quality of HIV care among younger age groups and governmental health centres.

EPD409

An analysis of self-accounts of women living with HIV/AIDS in Indian Kashmir concerning their experiences of stigma and discrimination in local health care settings

S. Jan[1], S. Manzoor[1], J. Rashid[1]

[1]University of Kashmir, Social Work, Srinagar, India

Background: A huge proportion of women in India confront adverse socio-economic situations, gender inequalities and inequities in accessing healthcare services. In Indian Kashmir the stigmatizing attitudes and regressive actions towards Women Living with HIV (WLHA) greatly hinder identification of undiagnosed WLHA or connecting them to quality health care services, and thus increasing the number of WLHA. The local government and other agencies often under-report the number of PLHA in the region. Significant estimations of independent practitioners argue that stigma and discrimination attached to HIV is primarily responsible for this under-reporting.

Disclosing HIV status is challenging and has many repercussions for an individual in family, neighborhood and other social or institutional settings. WLHA in the region tend not to disclose their status due to fear of stigma, victimization and isolation.

Methods: The study is located in Indian Kashmir, a South Asian Territory witnessing an armed conflict. Twenty one (21) WLHA, who have experienced immense suffering and stigma after being detected with HIV participated in the study in 2017-18. An Interpretative Phenomenological Analysis was used to study and interpret their narratives. The self-accounts of participants are not seen as revealing any generic 'truth', rather they are treated as stories whose meanings are situationally located and require to be discovered.

Results: The WLHA internalize stigma before experiencing it directly. They experience shock, guilt, anger, numbness while receiving their diagnosis and confront enormous levels of stigma and discrimination at diverse levels . Much of it is socially constructed having little medical or logical basis. These experiences in health institutions have

Oral abstracts

Poster exhibition

E-posters

Late-breaker abstracts

Author Index

been greatly dis-empowering. Verbal abuse, gossiping, expressing shock and disbelief upon receiving diagnosis, discriminatory attitudes like wearing multiple surgical gloves denial of care and treatment, disclosing their HIV positive status without their consent to their families and others have been learnt.

Conclusions: Gender stereotyping and prevailing inequalities in the region within local health care settings and discriminatory approach of health practitioners towards WLHA is a main barrier in accessing the services for HIV prevention, treatment and support services. WLHA not only experience physical deterioration of health but also mental health issues that greatly alter their everyday well-being.

Investigating the development of perceptions and behavioural intentions towards people living with HIV (PLHIV) among pre-clinical medical students in the University of Malaya

C.C. Fernandez[1], F. Chan Choong[2], H. Wei-Han[3]

[1]University of Malaya, Medical Research and Development Unit, Kuala Lumpur, Malaysia, [2]University of Malaya, Medical Research and Development Unit, Faculty of Medicine, Kuala Lumpur, Malaysia, [3]University of Malaya, Medical Research and Development Unit, Faculty of Medicine, Kuala Lumpur, Malaysia

Background: People living with HIV (PLHIV) continue to face stigma and discrimination in various contexts including in the healthcare setting. Stigmatizing attitudes and behaviours by healthcare professionals towards PLHIV have resulted in poorer health outcomes for PLHIV, where they continue to face increasing mental health burden and end up practicing damaging health behaviours including HIV testing and treatment avoidance.

This study was conducted to explore the different stigmatizing perceptions and behavioural intentions of future medical doctors towards PLHIV, and how they develop over time.

Methods: Adopting a qualitative, case study design, six pre-clinical medical students were recruited using maximum variation sampling and underwent semi-structured, one to one online interviews on Zoom between March 2021 to April 2021. Their responses were transcribed verbatim and using inductive reasoning, were thematically-analysed.

Results: Two main themes emerged:

1. The manifestation of different perceptions and behavioural intentions towards PLHIV before and while in medical school;

2) The factors that influence them.

Early life perceptions of PLHIV were inherently negative due to misinformation, imposition of traditional religious and cultural beliefs and the criminalization of at-risk groups including drug users. These perceptions shifted in a positive direction as they enrolled in medical school, where they developed self-awareness and the initiative to re-educate themselves through the medical curriculum, HIV awareness campaigns, sex-positive conversations with friends and real-life encounters with PLHIV.

Conclusions: The ability to interact with non-discriminatory education materials and individuals who were either supportive of PLHIV or living with HIV themselves increased the level of cognitive and affective empathy among these students towards PLHIV. This in turn changed their perceptions and behavioural intentions towards PLHIV.

These results indicate that as a part of ensuring zero discrimination towards PLHIV in the medical fraternity in the future, necessary exposure should be provided beyond the classroom to medical students, where actual interactions with PLHIV can take place. Learning their stories beyond their medical condition can transform the way these future doctors treat and behave around their patients who live with HIV in the future.

Ultimately, this could increase confidence among PLHIV in getting testing and treatment, and staying on the latter throughout their lives.

EPD411

Forms and facilitators of HIV- and healthcare-related stigma in Kenya: an age-old persistent problem

P. Macharia[1], P. Bhattacharjee[2,3], R. Lorway[3], M. Thomann[4], T. Oraro-Lawrence[5], K. Kasoka[5], L. Stackpool-Moore[5], L. Gelmon[2,3,6]

[1]Health Options for Young Men on HIV/AIDS/STIs, MEARI, Nairobi, Kenya, [2]Partners for Health and Development in Africa, Nairobi, Kenya, [3]University of Manitoba, Winnipeg, Canada, [4]University of Maryland, Maryland, United States, [5]International AIDS Society, Geneva, Switzerland, [6]University of Nairobi, Nairobi, Kenya

Background: Despite interventions to reduce HIV stigma in Kenya, people living with HIV and other persons affected by HIV still face internalized, anticipated, healthcare-related and structural stigma which are facilitated by a myriad of factors.

This abstract is part of the "*Getting to the Heart of Stigma"* multi-country study commissioned by the International AIDS Society aiming to connect evidence with action and better understand stigma reduction efforts at the individual, healthcare and legal/policy levels that may facilitate improvements at scale. In this abstract, we explore a) what are the different forms and facilitators of stigma that persons seeking HIV and SRHR services face.

Methods: 27 key informants (KI) were interviewed in March and April, 2021: 14 representatives from key populations (KP) and people living with HIV (PLHIV) organizations, 7 healthcare workers, and 6 policymakers. The interviews were semi-structured questionnaire, audio recorded, and analyzed thematically.

Results: While stigma is largely perceived to have reduced in Kenya, it persists amongst members of key populations. This stigma in the healthcare setting comes from several sources, including:

- *Internalized/Self-stigma:* challenges around disclosure of HIV status and/or social or sexual identity as a member of a KP (i.e. LGBTI, sex workers, person who injects drugs)
- *Violations in the health care setting (Enacted Stigma):* breaches of privacy/confidentiality, blatant discriminatory remarks, denial of service or appropriate referrals, or poor quality of service provided. Such stigma/ discrimination in the clinic setting is compounded by KP identities.
- *Anticipated stigma:* related to the anxieties people have in while coming out to families/children/ community, violence, housing challenges, stigma promoted by religious institutions.
- *Stigma perpetrated by laws / policies:* while well-articulated anti-discrimination laws and policies are in place in Kenya, they must be put into action through in-depth sensitization work with health care providers, and on-going information-sharing with government/donors to emphasize the value of financing stigma reduction programs.

Conclusions: The age-old perspectivethat HIV only affects "the immoral" in society (especially members of KP) persists, cascading into the culture of Kenyan institution, including the healthcare setting. Stigma in the provision of health services inhibit KPs and PLHIV from seeking health care services, thereby increasing their vulnerability to health risks.

EPD412

The mediating role of anxiety between perceived HIV stigma and depression among people living with HIV in Nigeria

F. Shi[1], B. Olatosi[1], O. Adeagbo[2], O. Azurunwa[3], F. Ogirima[3], O. Yusuf[3], B. Oyeledun[3], X. Li[1]

[1]*University of South Carolina, Health Promotion, Education, and Behavior, Columbia, United States,* [2]*University of South Carolina, Columbia, United States,* [3]*Centre for Integrated Health Programs, Abuja, Nigeria*

Background: Mental health disorders are concerning among people living with HIV (PLWH) and perceived HIV stigma has long been viewed as an inducement of anxiety and depression, two major mental health problems among PLWH. However, there is a lack of studies investigating the potential mediating role of anxiety in the relationship between perceived stigma and depression, especially in countries with significant HIV burdens, such as Nigeria. To address this knowledge gap, we examined the mediation model among perceived HIV stigma, anxiety, and depression using data from PLWH in Nigeria.

Methods: A total of 3770 PLWH aged 18 years and older in Nigeria was recruited into this study in 2021. Data were collected via an anonymous survey using a structured questionnaire including basic demographic characteristics, perceived HIV stigma (a 10-item adapted HIV stigma scale), anxiety (GAD-7 scale), and depression (PHQ-9 scale). Confirmatory factor analysis (CFA) was conducted to assess the goodness of fit of the measurement model for both exogenous and endogenous factors. Path analysis was performed to assess the hypothesized mediation model. All analyses were performed using "Psych", "Lavaan", and "semTools" package in R 4.0.3 software.

Results: The final path analyses model yielded a satisfactory model fit ($\chi2$ = 1758.17, $p < 0.001$, CFI = 0.960, TLI = 0.957, RMSEA = 0.037, SRMR = 0.038). According to the standardized regression coefficient, perceived stigma was positively associated with anxiety (b= 0.08, $p < 0.001$) and depression (b= 0.001, $p = 0.936$). The path from anxiety to depression was also positive (b= 0.91, $p < 0.001$).

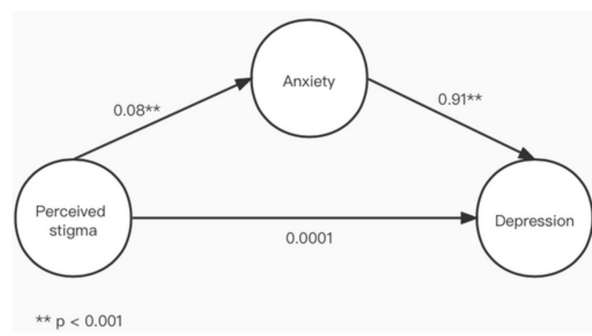

Figure. The final path model among perceived stigma, anxiety and depression.

Conclusions: Anxiety completely mediated the relationship between perceived HIV stigma and depression in this model. The interventions aim to decrease depression symptoms among PLWH in Nigeria may benefit more by incorporating strategies that address issues related to HIV-related anxiety.

Socioeconomic differences: Poverty, wealth and income inequalities

EPD413

Incorporating social determinants of health into the mathematical modeling of HIV/AIDS

R. Oliveira[1], F.A. Rubio[1], R.V. Anderle[1], M.N. Sanchez[2], I. Dourado[1], L.E.d. Souza[1], J. Macinko[3], D. Rasella[1]

[1]*Federal University of Bahia, Institute of Collective Health, Salvador, Brazil,* [2]*University of Brasilia, Brasilia, Brazil,* [3]*University of California, Los Angeles, United States*

Background: HIV/AIDS is among the 10 leading causes of death, mostly among low- and lower-middle-income countries. Despite the effective intervention in the prevention and treatment, this reduction did not occur equally among populations. This difference in the occurrence of the disease is associated with the social determinants of health (SDH), which could affect the transmission and

maintenance of HIV. The development of mathematical models that incorporate these determinants could increase the accuracy and robustness of the modeling. This article proposes a theoretical and conceptual way of including SDH in the mathematical modeling of HIV/AIDS.

Methods: For the selection of SDH that were incorporated into the model, a narrative literature review was conducted. A total of 31 SDH were obtained in the review, divided into 4 groups: Individual Factors, Socioeconomic Factors, Social Participation, and Health Services. In the end, 4 determinants were selected for incorporation into the model: Education, Poverty, Use of Drugs and Alcohol abuse, and Condoms Use.

Results: For this study, we propose an extended model in which the population (N) is divided into Susceptible (S), HIV-positive (I), Individual with AIDS (A) and individual under treatment (T). Each social determinant of health had an approach to be included in the final model. Thus, the model with the inclusion of the social determinants mentioned here has the following form:

$$\frac{dS}{dt} = \kappa - \mu S - q(1-c)\beta(x_1, x_2)\,\frac{I}{N}S - \theta_1 S + \theta_2 R$$

$$\frac{dI}{dt} = q(1-c)\beta(x_1, x_2)\,\frac{I}{N}S + \alpha_1 T - \rho I - \gamma_1 I - \mu I$$

$$\frac{dA}{dt} = \rho I + \alpha_2 T - \gamma_2 A - \delta_1 A - \mu A$$

$$\frac{dT}{dt} = \gamma_1 I + \gamma_2 A - \delta_2 T - \alpha_1 T - \alpha_2 T - \mu T$$

$$\frac{dR}{dt} = \theta_1 S - \theta_2 R - \mu R$$

Conclusions: The equations presented with the chosen SDH exemplify some approaches that we can adopt when thinking about modeling social effects on the occurrence of HIV. The recognition of the importance of including the SDH in the modeling and studies on HIV/AIDS is evident, due to its complexity and multicausality.

Models that do not take into account in their structure, will probably miss a great part of the real trends, especially in periods, as the current on, of economic crisis and strong socioeconomic changes.

EPD414

The role of material security in the interruption of HIV treatment and prevention services among key populations during the COVID-19 pandemic in Malaysia

N.A. Mohd Salleh[1,2], A. Ahmad[3,4], V. Balasingam[5], A. Yahya[2], A. Kamarulzaman[4,6]

[1]University of Malaya, Centre of Excellence for Research in AIDS, Kuala Lumpur, Malaysia, [2]University of Malaya, Department of Social and Preventive Medicine, Kuala Lumpur, Malaysia, [3]Yale School of Medicine, New Haven, United States, [4]University of Malaya, Centre of Excellence for Research in AIDS, Malaysia, [5]Universiti Sains Malaysia, Centre for Drug Research, Penang, Malaysia, [6]University of Malaya, Department of Medicine, Kuala Lumpur, Malaysia

Background: For key populations, continuous engagement in HIV services prevents HIV transmission and disease progression. The COVID-19 pandemic exacerbates pre-existing inequities and challenges including poverty among people at-risk of HIV/AIDS. Additionally, material security (e.g. housing, food and financial stability) may be disrupted by the pandemic and further limits access to health services.

This study sought to examine the validity and reliability of a material security scale, as a measurement of poverty, and examine the relation between material security and HIV service interruption among key populations during the pandemic.

Methods: Between August and November 2020, data were collected from people who use drugs, transgenders, sex workers and men who have sex with men registered with HIV service organizations across Malaysia.

Exploratory factor analysis (EFA) and confirmatory factor analysis (CFA) were performed. In a sub-analysis, the outcome of interest was interruption of any HIV-related services during the pandemic, including needle and syringe exchange program, methadone treatment, condom provision and antiretroviral therapy.

The relationship between material security and the odds of HIV service interruption was analysed using multivariable generalized logistic regression.

Results: Two-hundred sixty-two individuals were included in the analyses, of whom 58 (22%) reported any service interruption. Of these individuals, 127 (48%) were males, 69 (26%) were females and 66 (25%) were transgenders. We identified a 9-item, three-factor structure from the EFA analysis that demonstrated excellent fit in CFA.

The material security score displayed good reliability measures, with Cronbach's alpha of 0.843, 0.826 and 0.818 for housing, economic resources and basic needs factors, respectively. In the adjusted model, housing and economic resources were not significantly associated with HIV service interruption.

Basic needs were the single factor that was significantly associated with HIV service interruption (Adjusted Odds Ratio= 0.89, 95% Confidence Interval: 0.82 – 0.97,*p*-value = 0.006).

Conclusions: There was an 11% decrease in the odds of HIV service interruption during the pandemic for each one point increase in the basic needs factor score. Findings from our study call for innovative social support strategies in protecting the basic needs of key populations, especially during a pandemic.

EPD415

Examining the association of financial vulnerability on injection and sexual HIV transmission risk among people who inject drugs in Kyrgyzstan: implications for intervention and policy

A. Algarin[1], D. Werb[1,2,3], J. Cepeda[4], T. Patterson[5], A. Kurmanalieva[6], N. Shumskaya[6], A. Blyum[7], L. Smith[1]
[1]*University of California, San Diego, Division of Infectious Diseases and Global Public Health, La Jolla, United States,* [2]*c/o Li Ka Shing Knowledge Institute of St. Michael's Hospital, Centre On Drug Policy Evaluation, Toronto, Canada,* [3]*University of Toronto, Institute of Health Policy, Toronto, Canada,* [4]*Johns Hopkins University, Epidemiology, Baltimore, United States,* [5]*University of California, San Diego, Psychiatry, La Jolla, United States,* [6]*AFEW Kyrgyzstan, Research Department, Bishkek, Kyrgyzstan,* [7]*San Diego State University, San Diego, United States*

Background: The world's most rapidly expanding HIV epidemic is in Eastern Europe and Central Asia, predominately concentrated among people who inject drugs (PWID). Financial vulnerability may contribute to HIV disparities among PWID in this region.
We aim to examine the contributions of financial vulnerability on injection and sexual HIV transmission risk among PWID in Kyrgyzstan to inform future interventions and policies.
Methods: We analyzed cross-sectional data from n=279 PWID living in Kyrgyzstan between April-October 2021. The predictor of interest is recent (i.e., past 6-month) financial vulnerability; operationalized as a single, cumulative score of items related to not having enough money to maintain housing stability, essential needs (i.e. food for at least 2 meals a day), and non-essential needs (i.e. money for entertainment).
Our binary outcomes of interest are recent injection risks (e.g., public injection), and sexual risks (e.g., condomless sex). Bivariate and multivariate logistic regression models estimated the impact of financial stability on injection and sexual HIV transmission risk outcomes controlling for age, gender, ethnicity, educational attainment, HIV status, and recruitment method.
Results: On average participants were 40.2 years old, the majority were men (75.3%), ethnically Russian (53.8%), with a high school degree or less (73.5%), and HIV negative (76.3%). In multivariate analyses, greater recent financial vulnerability was significantly associated with increased likelihood of recent injection risk behaviors, including public injection (aOR[CI]: 1.05[1.02,1.07]; p<0.001), preparation of drugs in unsafe water sources (aOR[CI]: 1.07[1.03, 1.10]; p<0.001), sharing of injection equipment (aOR[CI]: 1.05[1.02, 1.08]; p=0.002), and reuse of a cooker/filter (aOR[CI]: 1.03[1.00, 1.05]; p=0.037).
However, greater recent financial vulnerability was also significantly associated with decreased likelihood of recent sexual risk behaviors, including anal or vaginal sex (aOR[CI]: 0.95[0.92, 0.98]; p<0.001) and condomless sex (aOR[CI]: 0.97[0.95, 0.99]; p=0.012).
Conclusions: Results suggests that financial vulnerability may exacerbate injection HIV transmission risk, though sexual transmission risk remains a concern even in the presence of decreased financial vulnerability.
Results suggest efforts to bolster financial stability integrated into extant harm reduction services may enhance HIV prevention efforts in the region. Prioritizing sexual risk reduction among PWID remains a priority to prevent expanded transmission to the general population.

EPD416

Material-need insecurities and physical and mental health outcomes among women living with or at risk for HIV in the United States

A. Norcini-Pala[1], S. Maya[2], H.J. Whittle[2], A. Adedimeji[3], T. Wilson[4], D. Merenstein[5], P. Tien[6], M. Cohen[7], E. Wentz[8], A. Adimora[9], I. Ofotokun[10], L. Metsch[11], M.-C. Kempf[12], J. Turan[13], E.A. Frongillo[14], B. Turan[15], S. Weiser[2]
[1]*Columbia University, School of Social Work, New York, United States,* [2]*University of California, Division of HIV, Infectious Diseases and Global Medicine, San Francisco, United States,* [3]*Albert Einstein College of Medicine, New York, United States,* [4]*SUNY Downstate, Department of Community Health Sciences, New York, United States,* [5]*UNC, Infectious Disease, Chapel Hill, United States,* [6]*University of California, Division of Infectious Diseases, San Francisco, United States,* [7]*Rush University, Department of Internal Medicine, Chicago, United States,* [8]*Bloomberg School of Public Health Johns Hopkins University, Center for AIDS Research (CFAR), Baltimore, United States,* [9]*UNC, Department of Epidemiology, Chapel Hill, United States,* [10]*Emory University, School of Medicine, Atlanta, United States,* [11]*Columbia University, Sociomedical Sciences, New York, United States,* [12]*University of Alabama at Birmingham, Nursing, Birmingham, United States,* [13]*University of Alabama at Birmingham, Department of Health Care Organization and Policy, Birmingham, United States,* [14]*University of South Carolina, School of Public Health, Columbia, United States,* [15]*Koç Üniversitesi, Psychology, Istanbul, Turkey*

Background: Difficulty meeting basic material needs including financial, food, housing, and healthcare needs may exacerbate poor health among people living with or at risk for HIV. The associations between these material-need insecurities (MNI) and health remain unclear.
Methods: We used data from a 2015 sub-study of the Women's Interagency HIV Study, a multi-site prospective cohort study of women living with and at risk for HIV in

the US. We built an exploratory structural equation model (SEM) to examine associations between MNI and latent factors for mental and physical health derived from a latent factor analysis. We also tested the association between experiencing multiple MNI and the latent factors, using a count of MNI experienced by each participant. Both models were adjusted for HIV status, marital status, age, race/ethnicity, and education.

Results: Two factors were retained based on factor loading patterns and factors' interpretation. Physical function, role function, and pain indicators of the quality of life scale uniquely contributed to the first factor (defined as physical health), while depressive symptoms, emotional wellbeing, and anxiety showed highest loadings on the second factor (defined as mental health). The factors were strongly correlated (r=0.559, p<0.001).

In adjusted SEM analyses, physical health was poorer among women who reported food insecurity (B=-0.606, p<0.001), had annual income <$12,000 (B=-0.231, p<0.001), had public health insurance (versus private, B=-0.226, p<0.001), and experienced housing insecurity (B=-0.127, p=0.029).

Similarly, mental health was poorer among women who experienced food insecurity (B=-0.756, p<0.001), had annual income <$12,000 (B=-0.231, p<0.001), had public health insurance (B=-0.127, p=0.026), and experienced housing insecurity (B=-0.299, p<0.001). Greater number of MNI was associated with both lower physical and mental health (B=-0.265, p<0.001, and B=-0.286, p<0.001, respectively).

Conclusions: Food, financial, and housing insecurity were all independently associated with poorer mental and physical health among women living with and at risk for HIV in the US. Poorer health outcomes were more common among those with public (versus private) insurance. Understanding individuals' structural needs to connect them with appropriate resources while striving for a more robust public health system should be a key component to improve the health of women affected by HIV.

EPD417

Perceived social status and retention in care after antiretroviral therapy initiation in Tanzania

P. Chitle[1], S. Winters[1], C. Fahey[1], E. Kataboro[2], A. Sabasaba[2], L. Packel[1], S. McCoy[1]

[1]University of California, Berkeley, Berkeley, United States, [2]Health for a Prosperous Nation, Shinyanga, Tanzania, The United Republic of

Background: Perceived social status (PSS) is an individual's perception of their socioeconomic position among their community (i.e., how an individual internalizes their socioeconomic position). We investigated the association between PSS and retention in HIV care shortly after antiretroviral therapy (ART) initiation.

Methods: We conducted a secondary analysis of control arm participants in an ongoing cluster randomized controlled trial in Tanzania of adult ART initiates (<=30 days). PSS was measured in an in-person baseline survey from May-November 2021 using the MacArthur Scale of Subjective Social Status, which utilizes a ladder image with social status represented as 10 increasing "steps" of PSS on the ladder. Participants were categorized into quartiles of low, low-moderate, moderate, and high PSS, with the "low" group serving as a reference group for analysis. Medical record review indicated whether participants attended their first follow-up appointment after ART initiation. We used logistic regression to evaluate the relationship between PSS and attendance at the first follow-up visit, controlling for age, sex, education, occupation, and mental wellbeing.

Results: The analysis included 677 participants in the control arm of the study (304 male, 373 female). Mean PSS score was 4.16, with no differences by sex.

Overall, 77.7% of participants attended their first follow-up visit after ART initiation, with 23.5%, 24.8%, 28.5%, and 23.2% of participants returning in the low, low-moderate, moderate, and high PSS groups, respectively.

Low-moderate PSS was associated with 1.75 times the odds of attending the first follow-up compared to those with low PSS [95% CI: 1.02, 3.02], moderate PSS was associated with 1.32 times the odds of attending the first follow-up visit [95% CI: 0.80, 2.17], and high PSS was associated with 1.23 times the odds of attending the first follow-up visit compared to those with low PSS [95% CI: 0.72, 2.11].

Conclusions: People with the lowest PSS may be at higher risk of disengaging from care, especially in the early phases of treatment. These findings could potentially be used to identify and intervene on those most at risk for HIV care disengagement.

Violence and conflict: Political, social, structural, interpersonal and family-based

EPD418

Depression as a mediator between Intimate Partner Violence (IPV) and CD4 cell count among men who have sex with men (MSM) living with HIV in China

L. Wang[1], C. Hong[2], J. Simoni[3], N. He[4], C. Xavier Hall[5,6], F. Wong[4,7,8,9]

[1]*University of Washington, Psychology, Seattle, United States,* [2]*University of California, Los Angeles, Department of Social Welfare, Los Angeles, United States,* [3]*University of Washington, Department of Psychology, Seattle, United States,* [4]*Fudan University, School of Public Health, Shanghai, China,* [5]*Northwestern University, Institute for Sexual and Gender Minority Health and Wellbeing (ISGMH), Evanston, United States,* [6]*Northwestern University, Medical Social Sciences, Feinberg School of Medicine, Evanston, United States,* [7]*Florida State University, Center for Population Sciences and Health Equity, Tallahassee, United States,* [8]*University of Hawaiʻi at Mānoa, Department of Psychology, Honolulu, United States,* [9]*University Mississippi Medical Center, Department of Population Health Science, Jackson, United States*

Background: Intimate partner violence (IPV) is associated with adverse mental and physical outcomes among men who have sex with men (MSM) living with HIV. Few studies examined IPV as a multifaceted phenomenon, specifically psychological IPV. This study examined the strength of the associations between different forms of IPV and depression and CD4+ cell count, and whether depression mediates the association.

Methods: Data for these analyses were derived from a larger cross-sectional study (2014-2016) on HIV-HCV co-infection among MSM in Shanghai, China (N = 2628). The final sample size for analyses was 1623, excluding HIV-negative MSM and incomplete cases. Using multivariate analyses, we investigated the association between different forms of IPV and CD4+ cell count and depression. We used R package *mediation* to estimate the average causal mediation effects (ACME) and average direct effects (ADE) through three steps (see Table).

Steps	Models	Formulas
1	Mediator model	med.fit <- lm (depression ~ IPV + age + residential status + education + income + ethnicity, data)
2	Outcome model	out.fit <- glm (CD4+ cell count ~ depression + IPV + age + residential status + education + income + ethnicity, data, family = "binomial")
3	Mediation model	med.out <- mediate (med.fit, out.fit, treat = "IPV", mediator = "depression", boot = TRUE)

Results: About 16% of the participants reported some form of IPV experience, with the three most common form of IPV being forced sex (7%), verbal threat of harm (4.6%), and having things thrown at them (4.4%). Among all forms of IPV, verbal threat of harm had the strongest association with more depressive symptoms (β = 3.22, 95%CI [1.13,5.31]) and a CD4+ cell count < 350 (*OR*1.93, 95%CI [1.07, 3.54]). Depression fully mediated the association between verbal threat of harm and a CD4+ cell count < 350 (ACME = .02, 95%CI [.01, .04]; ADE = 0.11, 95%CI [-.01, .23]; Prop.Mediated = .19, 95%CI [0.05, 0.95]).

Conclusions: Verbal threat of harm as a form of psychological IPV appears to have the largest negative effect on depression and CD4+ cell counts among all forms of IPV. More research on psychological IPV is warranted to examine its health impacts.

Our finding suggested depression as a potential pathway between psychological IPV and worse HIV-related health outcomes. Mental health could be a potential focus of intervention to enhance HIV-related health outcomes among MSM with IPV experience.

EPD419

Police abuse, stigma and HIV care utilization in people with HIV who inject drugs in St. Petersburg, Russia

T. Buckingham[1], Y. Sereda[2], S. Rossi[3], K. Hook[1], M. Tofighi[4], M. Vetrova[5], O. Toussova[5], S. Lodi[6], E. Blokhina[5], K. Lunze[3,1]

[1]*Boston University School of Medicine, Boston, United States,* [2]*Ukrainian Institute on Public Health Policy, Kyiv, Ukraine,* [3]*Boston Medical Center, Department of Medicine, Boston, United States,* [4]*Charite Berlin, Berlin, Germany,* [5]*Pavlov University, St. Petersburg, Russian Federation,* [6]*Boston University School of Public Health, Department of Biostatistics, Boston, United States*

Background: Various barriers limit care utilization of people with HIV who inject drugs in the Russian Federation (Russia). Police abuse's link with healthcare, stigma and health is not well understood.

This study examined police abuse reported by people with HIV who inject drugs, and assessed its association with HIV care utilization, stigma and mental health.

Methods: In a cross-sectional sample of 111 HIV-positive PWID recruited from October 2019 to September 2020 in Saint Petersburg, Russia, we examined the following outcomes: recent HIV care utilization (past 6 months), Berger HIV stigma Scale, Self-Stigma in Substance Abuse Scale, anxiety (GAD-7), and depressive symptoms (PHQ-9). We used logistic and linear regression to assess the association between each of these outcomes and recent police abuse (unjustified arrests, physical and verbal violence or sexual abuse in past six months). All models were adjusted for age, gender, HIV stigma (where not outcome), past incarceration, and willingness to begin ART (utilization model).

Results: Among 111 participants, 12(10.8%) reported experiencing any recent police abuse in the past 6 months, 4(4%) unjustified arrests, 9(8%) physical and verbal violence, and 1(1%) sexual abuse. Recent police abuse was not associated with recent HIV care utilization (adjusted

ART Willingness Not willing Willing	35 (32%) 76 (68%)	31 (89%) 68 (89%)	4 (11%) 8 (11%)	>0.999
HIV Stigma Mean (SD)	24 (4)	24 (4)	25 (4)	0.574
Substance Use Stigma Mean (SD)	32 (7)	31 (7)	35 (7)	0.125
PHQ9 Minimal/Mild Moderate/Severe	70 (63%) 41 (37%)	66 (94%) 33 (80%)	4 (6%) 8 (20%)	0.031
GAD7 Minimal / Mild Moderate / Severe	94 (85%) 17 (15%)	87 (93%) 12 (71%)	7 (7%) 5 (29%)	0.019

Table. Demographics and Clinical Characteristics

Conclusions: People with HIV who inject drugs and report recent police abuse in Russia are likely to manifest higher substance use stigma and impaired mental health.
These findings call for stigma and mental health interventions, and for policy and practice changes regarding the oppressive policing of this HIV key population.

EPD420

Exploring differences in violence and abuse-related healthcare utilization and mortality among people living with and without HIV in British Columbia, Canada

K. Closson[1,2], C. Mudhikwa[3], J. Chia[1], T. McLinden[1], S. Emerson[1], C. Marshall[1], K. Salters[1,3], R.S. Hogg[1,3]
[1]*British Columbia Centre for Excellence in HIV/AIDS, Vancouver, Canada,* [2]*University of British Columbia, School of Population and Public Health, Vancouver, Canada,* [3]*Simon Fraser University, Faculty of Health Sciences, Burnaby, Canada*

Background: The syndemic of HIV and violence is well documented, however the impact of violence/abuse among people with HIV (PWH) on healthcare utilization (e.g., hospitalization) and survival is unclear. Limited research has explored how experiences of violence/abuse appear in administrative health data and how this differs by HIV status.
This study seeks to characterize violence/abuse-related administrative health records and mortality among people with and without HIV in British Columbia (BC), Canada.

Methods: The Comparative Outcomes and Services Utilization Trends (COAST) study is a population-based longitudinal cohort examining health outcomes and healthcare utilization of all PWH in BC and a randomly selected 10% general population comparison sample.
We examined violence/abuse-related administrative health records (documented in practitioner [e.g., physicians, nurses] claims and hospitalization records, using abuse and assault-related ICD-9/ICD-9-CM [all practitioner claims; hospital data up until 2001]and ICD-10-CA [hospital data 2001-onward] codes) among people with (n=12,057) and without HIV (n=514,952) from April 1, 1996 to March 31,2013.
We examined differences in the prevalence of violence/abuse (with, without HIV) in administrative health records and, for those who with violence/abuse-related records, differences in all-cause and cause-specific mortality.

Results: Between 1996-2013, 5,668 (1.0%) participants in COAST had ≥1 occurrence of violence/abuse-related health record(s) (3.5% among PWH, and 1.0% among those without HIV). A quarter (124/493) of PWH with ≥1 violence/abuse-related record were female. Over the study period, 810 of the5,668 participantswho had a violence/abuse record died, including 33.9% and 12.4% of people with and without HIV, respectively.
Among 167 PWH who died, the most common cause of death was HIV-related (38.3%), whereas 12.6% died from assault, homicide, or injury-related causes (compared to 28.8%, among people without HIV).

Conclusions: Findings revealed higher violence/abuse-related healthcare utilization among PWH (vs. without HIV), and although the proportion of deaths among patients who had violence/abuse health records was higher among PWH, less PWH died of homicides, assault, or injury-related causes. High levels of mortality and violence/abuse-related healthcare utilization among PWH highlightsthe physical and social risk envrionments PWH are in, andthe need to integrate monitoring and holistic violence prevention and support services within HIV/AIDS care.

Prevalence of potentially traumatic events and symptoms of post-traumatic stress disorder, depression, and anxiety among people with HIV initiating HIV care in Cameroon

L.M. Filiatreau[1], P.V. Ebasone[2], A. Dzudie[2], R. Ajeh[2], D. Nash[3], M. Yotebieng[4], B.W. Pence[5], M. Wainberg[6], K. Anastos[7], A.M. Parcesepe[8]

[1]Washington University in St. Louis, Department of Psychiatry and International Center for Child Health and Development, St. Louis, United States, [2]Clinical Research Education and Networking Consultancy, Yaounde, Cameroon, [3]City University of New York, Institute of Implementation Science in Population Health, Graduate School of Public Health and Health Policy, New York, United States, [4]Albert Einstein College of Medicine, Department of Medicine, New York, United States, [5]University of North Carolina at Chapel Hill, Department of Epidemiology, Chapel Hill, United States, [6]Columbia University and New York State Psychiatric Institute, Department of Psychiatry, New York, United States, [7]Albert Einstein College of Medicine, Departments of Medicine and Epidemiology & Population Health, New York, United States, [8]University of North Carolina at Chapel Hill, Department of Maternal and Child Health, Chapel Hill, United States

Background: Exposure to potentially traumatic events (PTEs) is common among people with HIV (PWH) and can increase risk of mental health disorders. PTEs and mental health disorders can subsequently contribute to poor HIV treatment outcomes. However, evidence regarding the relationship between specific types of PTEs and symptoms of mental health disorders among PWH in sub-Saharan Africa remains limited.

Methods: We conducted structured interviews with 426 individuals aged ≥21 who were initiating HIV care at three clinics in Cameroon from June 2019-March 2020. Collected data included demographics, mental health symptoms, and lifetime exposure to PTEs. Multivariable log-binomial regression was used to estimate the association between exposure (yes/no) to six distinct PTE types (Table) and symptoms of depression (Patient Health Questionnaire-9 scores>9), anxiety (Generalized Anxiety Disorder-7 scale scores>9), and PTSD (PTSD Checklist for DSM-5 scores>30), separately.

Results: Approximately 20% (n=87) of study participants reported moderate to severe depressive symptoms, 13% (n=54) reported moderate to severe anxiety symptoms, and 16% (n=67) reported symptoms of probable PTSD.

Most participants (96%) reported exposure to at least one PTE with a median PTE exposure count of 4 (IQR: 2-5). The most commonly reported PTEs were seeing family members hitting/harming one another as a child (43%), physical assault/abuse from an intimate partner (42%), and witnessing physical assault/abuse (41%).

In multivariable analyses, the prevalence of PTSD symptoms was significantly higher among those who reported experiencing PTEs during childhood, violent PTEs during adulthood, and the death of a child (Table). No positive associations were observed between the PTEs explored and moderate to severe depressive or anxiety symptoms after adjustment (Table).

	PTSD uPR (95% CI)	aPR (95%CI)[b]	Depression uPR (95% CI)	aPR (95% CI)[b]	Anxiety[a] uPR (95% CI)	aPR (95% CI)[b]
PTE during childhood	**2.69 (1.59, 4.56)**	**1.96 (1.15, 3.33)**	**2.35 (1.52, 3.63)**	1.45 (0.95, 2.19)	**2.00 (1.15, 3.48)**	1.40 (0.81, 2.44)
Violent PTE (adulthood)	**2.05 (1.22, 3.43)**	**1.66 (1.01, 2.73)**	**1.73 (1.13, 2.64)**	1.34 (0.90, 1.98)	1.51 (0.88, 2.60)	1.24 (0.73, 2.10)
Witnessing violent PTE (adulthood)	**1.68 (1.02, 2.75)**	1.17 (0.71, 1.91)	1.33 (0.89, 1.98)	0.91 (0.62, 1.33)	1.57 (0.91, 2.73)	1.15 (0.66, 2.02)
Accident related PTE	1.06 (0.67, 1.67)	1.15 (0.75, 1.77)	1.32 (0.91, 1.92)	1.38 (0.99, 1.93)	1.23 (0.74, 2.04)	1.37 (0.84, 2.23)

War	**1.86 (1.20, 2.88)**	0.89 (0.54, 1.49)	1.35 (0.93, 1.97)	**0.67 (0.45, 0.99)**	1.52 (0.93, 2.51)	-

[a]missing anxiety n=2;[b]adjusted for gender and clinic
Abbreviations: PTE- potentially traumatic event; PTSD- post-traumatic stress disorder; uPR- unadjusted prevalence ratio; aPR- adjusted prevalence ratio; CI- confidence interval

Table. Associations between lifetime potentially traumatic events (PTEs) and mental health symptoms among 426 adults entering HIV care in Cameroon

Conclusions: PTEs were common among this sample of PWH initiating HIV care in Cameroon and associated with PTSD symptoms. Research is needed to foster the primary prevention of PTEs throughout the life course in PWH and to address the mental health sequelae of PTEs among PWH.

Risk compensation: Conceptualization, assessment and mitigation

EPD422

Moderating effect of pre-exposure prophylaxis use on the association between sexual behavior and HIV risk perception among Brazilian men who have sex with men

K. Blair[1,2], T. Torres[3], B. Hoagland[3], D. Bezerra[3], V. Veloso[3], B. Grinsztejn[3], J. Clark[1], P. Luz[3]

[1]University of California Los Angeles (UCLA), South American Program in HIV Prevention Research (SAPHIR), Division of Infectious Diseases, Dept. of Medicine, Los Angeles, United States, [2]University of California Los Angeles (UCLA), Dept. of Surgery, Los Angeles, United States, [3]Fundação Oswaldo Cruz (Fiocruz), Instituto Nacional de Infectologia Evandro Chagas, Rio de Janeiro, Brazil

Background: Pre-exposure prophylaxis (PrEP) is effective at preventing HIV infection in men who have sex with men (MSM). Few studies have explored the moderating effect of PrEP use on HIV risk perception, with risk perception typically measured via a single question. We utilized the Perceived Risk of HIV Scale (PRHS) to estimate the moderating effect of PrEP use on the relationship between sexual behavior and risk perception among Brazilian MSM.

Methods: A cross-sectional, online survey was completed by Brazilian *Hornet* application users ≥18 years old between February-March 2020. This analysis includes data from cis-men who reported sex with men in the previous six months. We evaluated the moderating effect of current PrEP use on the relationship between sexual behavior, measured by the HIV Incidence Risk Index for MSM (HIRI-MSM), and risk perception, measured by the PRHS. Higher HIRI-MSM (range 0-45) and PRHS scores (range 10-40) indicate greater behavioral risk and perceived risk of HIV infection, respectively. Both were standardized to z-scores for multivariable linear regression models.

Results: Among 4,344 sexually active, cis-gender MSM, 448 (10.3%) were currently taking PrEP. Mean HIRI-MSM and PRHS scores were 14.0 (standard deviation (SD) 8.5) and 25.8 (SD 4.9), respectively. Current PrEP users had a higher mean HIRI score (21.0 vs. 13.2, p<0.001) and a lower mean PRHS score (24.6 vs. 25.9, p<0.001) compared to those not taking PrEP. Greater HIRI-MSM scores significantly predicted increased PRHS scores in bivariate linear regression (β=0.19 [95% confidence interval 0.16 to 0.22], p<0.001). In the multivariable model, PrEP use moderated the association between HIRI-MSM and RPHS scores (p<0.001); among current PrEP users, higher HIRI-MSM scores did not predict increased PRHS scores (Figure).

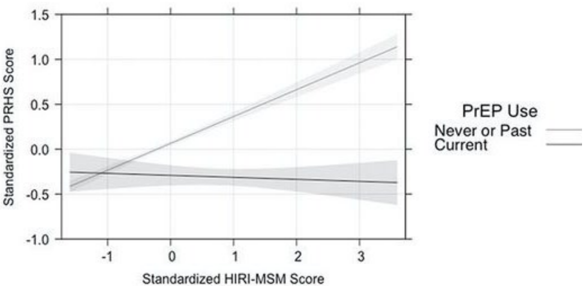

Figure. Graphical representation of the joint effect of sexual behavior (measured by HIRI-MSM) and current PrEP use on HIV risk perception (measured by PRHS). Models were adjusted for age, race, education, sexual orientation, HIV knowledge, steady partner, chemsex, transactional sex and timing of most recent HIV test.

Conclusions: Our results suggest current PrEP users have confidence in its effectiveness as an HIV prevention strategy. Frequent contact with health services required of PrEP users may influence their risk perception.

EPD423

Risk compensation in monogamy and testing: illusions of safety in 'ABCD'-premised HIV prevention communication strategies

R. Jain[1], R.K.J. Tan[2,3], S. Hyder[4], J. Dewaele[1], B.C. Ng[5], E. Cambria[6], S. Banerjee[7], R. Chan[7], C.S. Wong[8]
[1]*Nanyang Technological University, Language and Communication Centre, Singapore, Singapore,* [2]*University of North Carolina Project-China, Guangzhou, China,* [3]*National University of Singapore, Saw Swee Hock School of Public Health, Singapore, Singapore,* [4]*Nanyang Technological University, English, Singapore, Singapore,* [5]*Nanyang Technological University, Linguistics and Multilingual Studies, Singapore, Singapore,* [6]*Nanyang Technological University, Computer Science and Engineering, Singapore, Singapore,* [7]*Action for Aids, Singapore, Singapore,* [8]*National Centre for Infectious Diseases, Singapore, Singapore*

Background: 'Abstinence, Being faithful, Condom usage, and Detection' or ABCD have been considered pillars of behavioural intervention for self-protection and prevention of HIV transmission in Singapore. However, the approach has been rolled out uncritically and lacks sufficient attention to the interpretation and practice of each of these tenets among vulnerable populations.

This study examines the continued relevance and impact of these principles in empowering individuals in HIV prevention.

Methods: Semi-structured qualitative interviews were conducted with a total of 73 participants. These included 56 people living with HIV (PLHIV) of whom 30 were men who have sex with men and 26 were heterosexual men. The remaining 17 comprised healthcare professionals and allied workers. Interviews focused on participants' knowledge of HIV, HIV prevention practices, and sexual behaviour pre-diagnosis. Using an inductive approach data were thematically analysed.

Results: While adherence to ABCD either collectively or in combination is the theoretical gold standard for the prevention of HIV, in practice, singular individual tenets (B, monogamy alone; or D, only frequent testing) are often misinterpreted and conflated with HIV prevention.

Specifically, interview data reveal two forms of risk compensation behaviour: testing treated as a panacea and monogamy as a prophylactic against HIV.

Among participants, frequent testing was equated with safety and in fact, emboldened a continuation of sexual risk behaviours.

Critical for controlling transmission and accessing treatment, testing remains insufficient for (self) protection from infection.

Similarly, participants maintained a misconception that one's practice of monogamy is adequate to protect from infection. Interviewees often presumed condom use was unnecessary for self-protection in stable relationships and felt no need to ascertain their partners' HIV status.

Conclusions: Both practices of monogamy and frequent testing are necessary to reduce the risk of HIV transmission. However, poor communications around prevention messaging may lead to risk compensation in the context of ABCD-premised prevention communication strategies.
Policymakers and sexual healthcare providers should focus on clarifying such messaging and emphasise empowering individuals with a combination of prevention methods.
This is especially important given that novel HIV prevention modalities such as pre-exposure prophylaxis have yet to scale up in many settings, including Singapore.

Adolescents, sexuality and relationships

HIV knowledge and risk behaviours among early adolescents aged 10-14 years in Nigeria

O. Alo[1], A.E.-I. Ibrahim[1], G. Antonza[1], B. Ibrahim[1], L. Taylor[2], A. Oluwasanmi[1], I. Dalhatu[3], A. Matthias[3], S. Greby[4], A. Ikpeazu[5], A. Bashorun[5], G. Aliyu[6], A. Sylvia[1], M. Bronson[4], M. Charurat[2], K. Stafford[2]
[1]Maryland Global Initiatives Corporation (an affiliate of the University of Maryland, Baltimore), Abuja, Nigeria, [2]Center for International Health, Education and Biosecurity, Institute of Human Virology, University of Maryland, Baltimore, United States, [3]Centers for Disease Control and Prevention Nigeria, Abuja, Nigeria, [4]Centers for Disease Control and Prevention, Atlanta, United States, [5]National AIDS and STI's Control Programme Federal Ministry of Health, Abuja, Nigeria, [6]National Agency for the Control of AIDS, Abuja, Nigeria

Background: Adolescents remain at risk of HIV due to low risk-perception, poor HIV awareness and the socio-cultural environment. Yet, little is known about HIV knowledge and related risk behaviours among early adolescents in Nigeria. This study examined HIV knowledge and related risk behaviours among adolescents aged 10-14 years in Nigeria.
Methods: We analysed cross-sectional data from the 2018 Nigeria HIV/AIDS Indicator and Impact Survey, a nationally representative population-based two-stage cluster survey. Data on sociodemographic characteristics, risk behaviours, awareness (ever heard of HIV) and knowledge of HIV/AIDS were extracted for respondents aged 10-14 years. HIV knowledge was assessed based on correct responses to all five questions related to common myths and HIV prevention practices among those who ever heard of HIV. We reported weighted percentages and unweighted frequencies. Also, we conducted multivariable analyses to examine associations between HIV knowledge, and other selected variables.
Results: Data was available for 10,301 early adolescents with an average age of 12 years (SD ±1.4); 51.8% were boys and 87.5% were currently enrolled in school. Only 40.6% (4,166/10,301) ever heard of HIV, with teachers being their main source of HIV information.
Only 3.7% (138/4,157) of those aware of HIV correctly answered all the questions regarding HIV; 3.7% (135/4,014) among those currently enrolled in school and 2.6% (3/143) among unenrolled.
Furthermore, 6.9%% (173/2,289) reported ever having sex, 12.1% (1,268/10,171) ever taking alcohol, and 0.7% (65/10,137) ever engaged in illegal drug use. The odds of HIV knowledge were higher among adolescents aged 13 years (aOR: 2.7, 95%CI:1.4-5.4) and 14 years (aOR: 3.5, 95%CI: 1.8-6.9) compared to those aged 10 years. Girls (aOR: 0.6, 95%CI: 0.4-0.9) were less likely to correctly answer all questions regarding HIV compared to boys.
Also, adolescents who reported taking part in any HIV prevention programs had higher odds (aOR: 1.9, 95%CI: 1.2 – 3.0) of HIV knowledge than those who were not exposed to such a program.
Conclusions: Results indicate low comprehensive knowledge of HIV among early adolescents in 2018 in Nigeria. There is need for adolescent-friendly programs to focus on HIV prevention, education, and promote healthy sexual behaviours among early adolescents in and out of school.

EPD425
Charting the journey: shifting young women's HIV risk perception with journaling

S. Hobbs[1]
[1]NACOSA - Networking HIV & AIDS Community of Southern Africa, Communications & Business Development, Cape Town, South Africa

Background: Young women in South Africa, while being significantly more at-risk of acquiring HIV, are not focused on HIV prevention as a meaningful priority (AVAC, Upstream, Final Mile 2019). A successful HIV prevention strategy therefore means supporting young women in their journey to navigate healthy sexual behaviours and relationship management overall.
The My Journey Programme, funded by the Global Fund, developed a Journal to engage young women, support goal setting and planning and shift HIV risk perception.
Description: The journal was designed to inspire and inform: with key health messaging, aspirational quotes, prompt pages to guide reflection and planning, trackers and blank pages for doodling.
It was divided into thematic areas: Me, My body, My mind, My heart, My work, My money, My world, My power.
A local services directory was included in a pocket at the back of the journal. It was distributed to 240,798 young women between 15 and 24 from June 2020 to January 2022.

The content and design of the journal was informed at every stage of its development by validation workshops and feedback surveys.

Lessons learned: A feedback survey (n=300) found that almost 90% rated the journal either good, great or brilliant. Respondents said they read the information pages (72%) and 56% used it for planning and goal-setting. Use of the trackers (36%), the blank pages (35%) and finding services (29%) was evenly spread.

Qualitatively, the journal proved valuable in providing information in a creative, youth-friendly way and incentivised programme engagement. Respondents said it made them feel special, motivated and helped with planning and goal setting. Engaging young women in the process from the beginning through an iterative process, lead to a richer and more effective product.

Conclusions/Next steps: Vulnerable adolescent girls and young women are in need of motivation, inspiration and advice to shift their perception of HIV risk. The My Journey Journal will be made more widely available by digitising some content, adapting it for relevance for all young people, and possible distribution in schools.

Learnings will be applied to other programming with young people, where it will be used to incentivise programme sign-up and PrEP adherence.

EPD426

Co-creating a digital solution to engage out-of-school, low literacy girls in life skills and sexual health during the COVID-19 pandemic

S. Moore[1], O. Dias[2], K. Sutcliffe[2], S. Hand[1]

[1]Avert, Brighton, United Kingdom, [2]VSO, Maputo, Mozambique

Background: The EAGLE (Empowering Adolescent Girls to Learn and Earn) project seeks to work with vulnerable, out-of-school, low literacy female adolescents in Mozambique to achieve greater economic and social independence. Activity includes enhancing their literacy and numeracy skills as well as increasing life skills knowledge.

To adapt to the new COVID-19 restrictions, and seeing an opportunity to try new approaches, the original project was significantly redesigned. The life skills component was redeveloped as a digital, individual, home-based learning solution, using low-cost tablets and bespoke, co-created apps.

Description: The EAGLE project is being implemented by VSO in partnership with Light for the World, with funding from Global Affairs Canada. The need to pivot the project due to COVID-19 led VSO to consider how they could make a digital solution relevant to low literacy communities in lower income contexts. VSO contracted Avert to develop a digital Life Skills app.

Continuous engagement of the adolescent girls through co-creation, testing and validation has been a consistent approach across content, branding, user interface, and user experience. This has ensured the app is relevant, culturally appropriate and meets users' needs. For example, the app uses only audio and visuals to ensure it is easy to navigate and intuitive for non-literate users and those with low digital literacy skills.

Lessons learned:

- Low literacy, digitally naive communities can be part of digital developments in health; but user-centred design, co-creation, and tailored infrastructure support will be vital to successful deployment
- Digital learning resources give greater scope for engaging learners and the wider household
- Pivoting to digital approaches could address issues of longer term sustainability and lasting change
- Large projects can pivot - and improve: using existing data, evidence and technical partners is essential
- Applications provided on low-cost tablets offer a significant opportunity to reach marginalised groups with key information that contributes to both empowerment and agency.

Conclusions/Next steps: Rapid adaptation to COVID-19 restrictions is possible by creating partnerships with organisations and communities with existing expertise and knowledge.

Technology can provide a COVID-safe learning environment and apps can be developed to reach non-literate populations using visual and oral narratives that are localised to the context.

EPD427

Sexual behaviour and HIV acquisition risk of female adolescents in high schools from Harare, Zimbabwe

Y. Mandivenga[1], T. Mudzviti[1,2], B. Dzingirai[1,3], C.C. Maponga[1,4], G.D. Morse[4]

[1]University of Zimbabwe, Department of Pharmacy and Pharmaceutical Sciences, Harare, Zimbabwe, [2]Newlands Clinic, Harare, Zimbabwe, [3]University of Groningen, Department of Health Sciences, Groningen, Netherlands, the, [4]SUNY, University at Buffalo, School of Pharmacy and Pharmaceutical Sciences, Buffalo, United States

Background: HIV prevention modalities will need to be packaged appropriately in order to make them appealing to at risk adolescent girls. This study was conducted to identify the HIV acquisition risk and sexual behaviour of adolescent girls in high school in Zimbabwe.

Methods: This was a cross sectional study which was conducted in June 2021 at two high schools from Harare, Zimbabwe. A validated, de-identified, self-administered, face-to-face questionnaire was initially piloted and then rolled out to adolescents aged 13 to 16 years. The tool assessed sexual behaviours which would place participants at risk of acquiring HIV.

Sexually active was defined as penetrative vaginal or anal intercourse. Descriptive statistics are used to present the results of the study. The study was approved by the Medi-

cal Research Council of Zimbabwe (MRCZ/B/2097). Participation in the study required written, informed parental consent and informed participant assent.

Results: A total of 150 adolescent girls participated in this study with a mean age of 15 years (range 13 – 16). Forty-four (29%) of the participants reported that they were sexually active. The sexual practice characteristics of the sexually active participants are shown in the table below:

Variable	Frequency, N = 44
Age of sexual debut in years, n(%)	
13	4 (9)
14	9 (20)
15	19 (43)
16	12 (27)
Nature of sexual debut, n(%)	
Planned	25 (57)
Unplanned	19 (43)
Condom use during sexual debut, n(%)	
Yes	28 (63)
No	16 (37)
Ever practiced unprotected sexual intercourse, n(%)	
Yes	39 (87)
No	5 (13)
Condom use in the Last 12 months, n(%)	
Some of the time	38 (86)
All of the time	6 (14)
Total number of sexual partners since debut, n(%)	
1	29 (66)
2	11 (25)
3	4 (9)
Knowledge of personal HIV status, n(%)	
Yes	16 (36)
No	28 (64)
Knowledge of partner's HIV status, n(%)	
Yes	13 (30)
No	31 (70)

Table.

Thirty-two (72.7%) of the sexually active adolescents had their sexual debut before the age of 16 years (legal age for females to provide sexual consent in Zimbabwe).

Conclusions: Sexually active adolescents indulged in practices exposing them to risk of HIV acquisition. The proportion of sexually active adolescents aware of their HIV status was low. HIV acquisition risk was high in the sexually active adolescents due to the low condom use, unknown HIV status of sexual partners and low age of sexual debut. HIV prevention programmes need to strengthen interventions that educate adolescents on HIV acquisition risk.

EPD428

Adolescent girls and young women's experiences with disclosing oral or vaginal PrEP use: a multi-country analysis

A. Young[1,2], M. Garcia[3], K. Ngure[4,5], S. Tenza[6], M. Chitukuta[7], L. Soto-Torres[8], D. Szydlo[9], D. Kemigisha[10], L. Nobula[11], A. van der Straten[12,13], S. Roberts[1], on behalf of the MTN-034/REACH Protocol Team

[1]Women's Global Health Imperative at RTI International, Durham, United States, [2]University of North Carolina, Department of Maternal and Child Health, Gillings School of Global Public Health, Chapel Hill, United States, [3]FHI360, Durham, United States, [4]Jomo Kenyatta University of Agriculture and Technology, Nairobi, Kenya, [5]University of Washington, Seattle, United States, [6]Wits Reproductive Health and HIV Institute, Johannesburg, South Africa, [7]University of Zimbabwe Clinical Trials Research Centre, Harare, Zimbabwe, [8]Division of AIDS, National Institute of Allergy and Infectious Diseases, Bethesda, United States, [9]Statistical Center for HIV/AIDS Research and Prevention, Fred Hutchinson Cancer Research Center, Seattle, United States, [10]Makerere University-Johns Hopkins University Research Collaboration, Kampala, Uganda, [11]Desmond Tutu HIV Centre, Cape Town, South Africa, [12]University of California, Center for AIDS Prevention Studies, Dept of Medicine, San Francisco, United States, [13]ASTRA Consulting, Kensington, United States

Background: Stigma and fear of disclosure are barriers to uptake and effective use of oral PrEP among adolescent girls and young women (AGYW) in sub-Saharan Africa. Little research has been conducted on AGYW's disclosure experiences with dapivirine vaginal ring use. Understanding their experiences with the ring compared to oral PrEP may inform strategies to motivate uptake and effective use of both products.

Methods: MTN-034/REACH, a randomized crossover trial, evaluated the safety of and adherence to the monthly ring and daily oral PrEP among AGYW (ages 16-21) in South Africa, Uganda, and Zimbabwe. In a nested qualitative component (N=119), trained social scientists facilitated 16 focus groups, 37 single in-depth interviews, and 3 serial IDIs with each of 24 participants.

All discussions used semi-structured interview guides addressing product use disclosure and subsequent reactions from key influencers.

Results: Participants most often disclosed their product use to family members, followed by sex partners and peers. In most cases, product disclosure resulted in support for study participation or product use, including reminders to take pills, encouragement to keep the ring inserted, or transportation for study visits.

Reasons for nondisclosure of both products included fear of being prohibited from study participation or product use by family and partners, overall discomfort discussing reproductive health matters with men, and fear of stigma and rumors, especially partners believing they are

being bewitched or that participants were being unfaithful. Ring use was disclosed less often than oral PrEP use, mainly because the ring could be used discreetly. Some participants also stated it was easier to disclose oral PrEP use because pills are common in their communities, while the ring was unfamiliar.

Importantly, many participants did not consider nondisclosure of ring use to be a barrier to adherence. However, despite the ring being more discreet, some participants indicated they had to disclose to partners in case partners felt it during sex.

Conclusions: Overall,disclosure of both products yielded positive support from key influencers and encouraged product adherence and study participation.

However, increased community awareness of the ring is essential before rollout to reduce perceived stigma and concerns about key influencer opposition.

EPD429

"It's a 50/50 thing you know": exploring the multileveled intersections of gender and power within the relationships of young South African men and women

K. Closson[1,2], C. Zharima[3,4], M. Kuchena[4], J.J. Dietrich[4], A. Gadermann[1], B. Zulu[5], G. Ogilvie[1], M. Beksinska[5], A. Kaida[6]

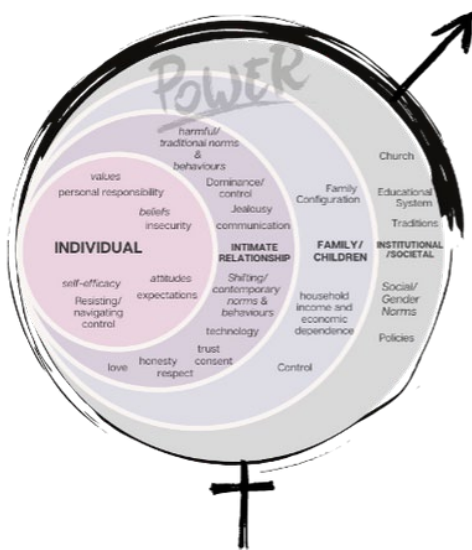
[1]University of British Columbia, School of Population and Public Health, Vancouver, Canada, [2]British Columbia Centre for Excellence in HIV/AIDS, Vancouver, Canada, [3]University of the Witwatersrand, Centre for Health Policy, Johannesburg, South Africa, [4]Perinatal HIV Research Unit, Soweto, South Africa, [5]MatCH Research Unit, Durban, South Africa, [6]Simon Fraser University, Faculty of Health Sciences, Burnaby, Canada

Background: In South Africa, greater understandings of youth intimate relationship dynamics are needed to improve and better measure gender transformative targets within behavioural interventions that have been largely unsuccessful at reducing high sustained HIV incidence among young women. This study explores how gender and power intersect to shape young South African women and men's relationship dynamics that impact HIV transmission in South Africa today.

Methods: Between October 2019 and March 2021, 38 (21 women and 17 men aged 21-30 from Durban and Soweto) previous participants of a longitudinal youth-engaged HIV prevention study (2014-2017) were recruited to participate in qualitative cognitive interviews. Reflecting on their primary intimate relationships, participants answered Strongly Agree to Strongly Disagree to a 4-point Likert-type 13-item sexual relationship power (SRP) scale, explained their answers, and discussed whether and how each item related to their relationship. Participants also discussed the influence of SRP on youth sexual decision-making. Data analysis was guided by Charmaz' constructivist grounded theory and constant comparative approaches. Results were organized using the socio-ecological model.

Results: Gender and power intersected at multiple levels to influence youth relationships (see Figure). This included individual-level gender attitudes, male partner expectations, and women's resistance to dominance; contemporary intimate relationship-level shifting power dynamics, consent, intimacy, and support; and family-level household configuration and parental monitoring of daughters.

Societal-level power inequities and traditional gender norms were resisted by some women through communication and rejection of inequitable relationships, however not by young mothers financially dependent on partners and/or parents. These gender norms were also resisted by some men, however most upheld inequitable power structures through institutional affiliation (e.g., church) and deep-rooted socialized beliefs and attitudes.



Conclusions: Findings provide guidance into how multi-leveled HIV prevention approaches should aim to address inequitable power dynamics at individual, intimate relationship, family, and societal-levels simultaneously.

EPD430

Harnessing the strength of the family to send young mothers back to school; the case for the re-entry policy in Zambia

I. Ntoka[1], Y. Ayami[1], Y.M. Ayami[1], M. Mumbi[2]

[1]Family Development Initiatives, Lusaka, Zambia, [2]UNESCO, Lusaka, Zambia

Background: Teenage pregnancy is one of the huge challenges facing teenage girls and has largely contributed to increased school drop-outs in Zambia. Recent studies suggest that over 120, 000 teenage pregnancies were reported between 2010 to 2017. This has contributed to the under development of women as many of them grow up not having the requisite education or skills to contribute to their own and national development.

To redress this problem, in 1997 the government introduced the school re-entry policy, targeting young mothers who had dropped out of school because of preg-

nancy. Since then, the government through the Ministry of General Education (MoGE), has allowed girls who fall pregnant to go on maternity leave and then continue with their education after delivery. However, Despite the re-entry policy, there is still a large number of girls who fall pregnant that shun to go back to school. A study by MoGE discovered that from the 15,497 girls that got pregnant in 2009 only 6,679 were readmitted to school.

Description: Family Development Initiatives working in partnership with UNESCO sought to uncover some of the factors contributing towards girls that fall pregnant not going back to school. A sample of 20 young mothers were purposefully sampled.

Lessons learned: Some parents/guardians still see their children as a means of livelihood and therefore prefer to marry them off in comparison to taking them back to school. Secondly, the inability for young mothers to go back to school cannot be entirely attributed to economic challenges. Even when the project was able to meet school requirements, some parents/guardians were still not willing to allow their young girls to go back to school. Finally, there is still a huge information gap regarding the re-entry policy, especially among parents/guardians.

Conclusions/Next steps: To conduct targeted sensitization outreaches on the re-entry policy being implemented targeting households with young mothers.

Additionally, there is a need to link programmes aimed at implementing the re-entry policy to livelihood/rural enterprise development programmes targeting parents/guardians of the affected young mothers. Lastly, create safe space programmes that address the stigma and discrimination targeted at young mothers when they return back to school.

EPD431

Reducing unintended pregnancies among in-school adolescents and young women through comprehensive sexuality education linked to accessible sexual and reproductive health services

A.M. Saili[1], M.T. Mbizvo[2], K. Kasonda[2], N.-C. Muntalima[2], S. Inambwae[2], J.G. Rosen[2], E. Namukonda[2], R. Mungoni[2], N. Okpara[2], C. Phiri[2], P. Machawira[1], R. Mukonka[1], M.L. Mumbi[1], G. Malunga[3]

[1]UNESCO, UN Annex, Lusaka, Zambia, [2]Population Council, Lusaka, Zambia, [3]UNFPA, UN House, Lusaka, Zambia

Background: Advancing the health of adolescents, in particular their sexual and reproductive health, including HIV prevention and care; and fully attaining their educational goals, are crucial to national development. However, adolescent girls and young women (AGYW) in much of sub-Saharan Africa, including Zambia, encounter challenges rooted in gender inequalities. Lack of empowerment, inaccurate knowledge on sexuality, and poor access to sexual and reproductive health (SRH) services, result in many AGYW failing to complete school due to early unintended pregnancy (EUP). Comprehensive sexuality education (CSE), integrated in the school curriculum, confers opportunities for imparting scientifically accurate information about SRH, and potential reduction in EUP and risk of HIV acquisition, but much less is known on accelerating reduction through health services linkages.

Description: We developed and tested a model that links provision of CSE to pre-sensitized, responsive SRH services in selected schools in Zambia. Schools where CSE was being routinely provided were randomized into a non-intervention arm (arm1), an intervention arm in which information on available SRH services was provided in schools by health workers to complement CSE, (arm 2), and arm 3 in which pupils receiving CSE were also supported to access pre-sensitized, receptive SRH services.

Lessons learned: Following 3 years of intervention exposure, findings showed a significant decline in in-school pregnancies amongst AGYW in both intervention arms, with arm two exhibiting a more significant decline ($p< 0.001$), having recorded only 0.74 percent pregnancies at endline ($p< 0.001$), as well as arm 3, which recorded 1.34 percent pregnancies ($p< 0.001$), with some schools achieving no pregnancies throughout an academic year. Trends in decline of pregnancies started to show by midline, and persisted in 2020, despite the increases noted in some none-intervention schools during the COVID-19 pandemic restrictions.

Conclusions/Next steps: A model linking CSE to SRH information and receptive health services is effective in reducing in-school pregnancies, and potentially risky sexual behaviors.

Gender issues and gendered relationships

EPD432

Sexual life of male migrant sex workers in Chiang Mai, Northern Thailand: a qualitative study

A. Tangmunkongvorakul[1], C. Banwell[2], M. Kelly[3], A. Jirattikorn[4], A. Ayuttacorn[4], K. Srithanaviboonchai[5]

[1]Chiang Mai University, Research institute for Health Sciences, Chiang Mai, Thailand, [2]Australian National University, National Centre for Epidemiology & Population Health, Research School of Population Health, Canberra, Australia, [3]Australian National University, Department of Global Health, Research School of Population Health, Canberra, Australia, [4]Chiang Mai University, Faculty of Social Science, Chiang Mai, Thailand, [5]Chiang Mai University, Faculty of Medicine, Chiang Mai, Thailand

Background: Recent studies indicate that increasing numbers of cross-border male migrants enter sex work in Northern Thailand. Limited research on the sexual life of this population restricts our understanding of their health risks and the effects of HIV prevention.

This study examines the sexual practices of this group.

Methods: This is a qualitative arm of a mixed methods study conducted among 198 male migrant sex workers in Chiang Mai, the capital city in Northern Thailand, between March-October 2019. A subgroup of 21 males were invited to participate in in-depth interviews. Recruitment was via NGO staff coordinating with owners/managers of 11 male sex work venues. Thematic analysis related to sexual practice during their work and private life.

Results: Participants were drawn to sex work by the income, a relatively comfortable job and flexible work, with the hope to seek a better life for themselves, and to support families back home. Many entered this work through friends, relatives and informal networks. Participants' clients were gay men, transgender women and heterosexual women. All participants perceived themselves as general men and preferred having vaginal sex with women. They performed assertive anal sex only with male-at-birth clients. Many used sex videos, alcohol and/or Viagra to boost sexual arousal when having sex with same-sex clients. Participants reported using condoms quite often with their clients, but rarely with regular female partners. The main reasons for the low condom use with regular partners were stigma and non-disclosure of sex work.

Quotes

Entering sex work

"I worked in the orange orchard in Fang [rural district] until I was 16 years old. Then, I moved to Chiang Mai and started a job at a super market. I was responsible to take care of fragile goods. I was very clumsy. So, I asked one of my friends if she knew where to find a new job. On the day we met, we looked for a job all day, but we couldn't find one. Then, she gave me a nice cloth and told me that maybe in the meantime I should try this job [in male karaoke bar]. She said I would still get paid for 300 Baht a day [basic rate per day for a laborer] even if I did not have any client." (IDI 06, 18 years old)

"For this job [sex work], I am doing it while I work in a construction site as a painter. I come here to do it [sex work] when I don't have a painting job. I have a friend working in a massage parlor. So, I joined him and have been here for 5-6 months already." (IDI 12, 22 years old)

Sexual practices

"I don't do receptive sex. I go out only with the clients I like. Some just ask me to do it externally [non-insertive sex]. Once, I had a try to have a receptive sex, but it didn't work as it was not my thing. I have sex with male clients because it's for work." (IDI 16, 20 years old)

"It is more fun to have sex with women because, when having sex with men, it's not lubricated as the way I do with women. When I have to have sex with gay or Katoey [transgendered women], I have no erection. I need to take the drug that I can buy at work. It's a small package of orange-flavored gel. If I don't take the drug, it will take very long for me to get erection." (IDI 11, 24 years old)

"People don't know what kind of job I am doing. They don't know how I feel about the clients. It's just my job. This is my work, but I am not gay. Other people may think that if I am not gay, why am I still working in this job? Many gay men don't do this job. But I am a man, and this is my work." (IDI 08, 24 years old)

Condom use

"For me, I protect myself when I have sex with anyone except my girlfriend, I will protect myself. I have confidence in my girlfriend because she has a normal life. She doesn't do the job like me." (IDI 14, 25 years old)

"I usually use condom with clients, but not with my girlfriend. I did not use condom because we both know each other. She is my girlfriend and I know that she does not have anyone else. (IDI 13, 23 years old)

"My girlfriend warns me to protect myself if I happen to have sex with other people. We don't use condom when we have sex. I try to protect myself every time I go out with the clients. So, I am confident that I am not getting any sexual transmitted diseases." (IDI 02, 20 years old)

Stigma and non-disclosure of sex work

"My girlfriend doesn't know I work in this bar. She only knows that I go out to drink with friends." (IDI 04, 20 years old)

"My girlfriend only knows that I work as a masseuse. She doesn't know other details. I think she may not be able to accept it. If she does know and not accept it, I have to let it be. It's her rights, right? I never use condom with her as she gets the pills." (IDI 21, 23 years old)

Conclusions: The study provides some insights into the attractions of sex work for male migrant sex workers and their risky sexual practices that reflected individual and cultural issues. Designing of effective policy implementation to prevent HIV transmission among this group needs to consider the gender issues and gendered relationships, along with the reality of their everyday lives.

EPD433

Mechanisms of a relationship-focused intervention to improve PrEP use among young women in western Kenya: a secondary analysis of the Tu'Washindi na PrEP pilot study

N.K. Kelly[1], M. Hartmann[2], K. Agot[3], A. Minnis[2], S. Otticha[3], S.T. Roberts[2]

[1]*University of North Carolina at Chapel Hill, Department of Epidemiology, Chapel Hill, United States,* [2]*RTI International, Women's Global Health Imperative, Berkeley, United States,* [3]*Impact Research and Development Organization, Kisumu, Kenya*

Background: Pre-exposure prophylaxis (PrEP) is a highly effective biomedical tool to prevent HIV acquisition; however, inequitable gender dynamics continue to impede PrEP uptake and adherence among adolescent girls and young women (AGYW) in sub-Saharan Africa. Tu'Washindi na PrEP was an AGYW co-designed, multilevel intervention that targeted relationship dynamics and successfully increased PrEP uptake and adherence during a pilot randomized trial. This analysis examines potential mechanisms, operating at the individual, partnership, and community levels, through which the intervention may have improved PrEP use.

Methods: From April-December 2019, 6 DREAMS Safe Spaces (n=103 AGYW) in Siaya County, Kenya were randomized in a 1:1 ratio to receive either the intervention plus DREAMS standard of care (SOC) services or SOC services only over a 6-month period. Multivariable regression models were used to estimate the intervention effect on 8 proposed mechanisms of change (PrEP readiness, hope for the future, partner knowledge of PrEP, disclosure of PrEP interest or use to a partner, relationship self-efficacy, sexual relationship power, social assets, and PrEP stigma).

We then estimated the association between each mechanism and PrEP uptake within 6 months and PrEP adherence in the previous month. A fixed effect term was used to account for clustering; all analyses used alpha=0.10 given the pilot nature of the study (i.e., small sample size and short duration of follow-up).

Results: Intervention arm participants had significantly higher disclosure of PrEP interest or use to a partner (risk ratio (RR): 1.26, 90% confidence interval (CI): 1.05,1.52) and partner knowledge of PrEP (RR: 1.13, 90% CI: 1.02,1.25); there were no effects on other mechanisms.

While not statistically significant, disclosure of PrEP use/interest to a partner was associated with higher PrEP uptake (RR: 1.25, 90% CI: 0.54,2.92) and adherence (incidence rate ratio (IRR): 2.47, 90% CI: 0.49,12.46).

Conclusions: Findings support the hypothesis that increasing partner knowledge of PrEP and facilitating disclosure can bolster AGYW PrEP use in sub-Saharan Africa. However, the intervention did not affect many of the proposed mechanisms of change which suggests that other, unmeasured pathways may have driven improvements in PrEP uptake and adherence and that AGYW may still face substantial gender-based barriers to PrEP.

EPD434

Piloting community drop-in centres to increase HIV Testing among men who have sex with men in Kampala amidst Covid-19 first and second lockdowns: insights from AIDS Information Centre-Uganda

D. Nabadda[1], P. Bukenya[1], S. Nakasi[1], T. Tumusiime[1]
[1]AIDS Information Centre-Uganda, Community Engagement, Kampala, Uganda

Background: Men who have sex with men (MSM) accounted for 13% of new HIV infections in Uganda. MSM experienced homophobic stigma, discrimination, physical violence and negative reaction from healthcare workers forcing them to hide their identity and sexual orientation due to the 2021 Anti-homosexuality Act. Because of the laws which criminalize same-sex orientation, MSM stop accessing HIV services leading them to risk-behaviors that drive transmission.

Description: AIC used its Ministry of Health Accredited community-based drop-in-centers (DiCs) to provide MSM with a comfortable place to relax, rest, get information, receive program services, and interact with each other and with HIV prevention, care and treatment program staff. MSM received information on Health and HIV Prevention, care, treatment; were mobilized to take up services; gathered for events and activities; received psychosocial services and support and referral to other services; received condoms and lubricants; received HIV self-testing kits, exchange needles and syringes. The DiCs provide safe spaces to discuss, plan and respond to drug adherence challenges, discrimination, stigma, and violence from the community.

Lessons learned: Through May 2021, a total of 120 MSM Peer Leaders were identified and trained to educate their peers on HIV prevention including providing prevention commodities such as condoms and lubricants, campaigning for better access to services. Over 1,345 hotspots were mapped 11,234(11.2%) MSM received MSM-Friendly HIV Testing services. 512 eligible MSM who tested negative received PrEP services. Identified 1,021 HIV-positive members of MSM society who were linked to treatment (25%). Of the 1,021 MSM on treatment 991(97%) accessed viral load testing services and 811(82%) of those tested are virally suppressed.

Conclusions/Next steps: MSM in Kampala are at substantially higher risk for HIV than the general adult male population. It is important to target MSM with HIV prevention campaigns using DiCs.

EPD435

Developing interventions to improve ART initiation and retention among men living with HIV in Malawi: a qualitative study across the treatment cascade

K. Coursey[1], K. Phiri[2], A.T. Choko[3], P. Kalande[2], J. Hubbard[2,4], T.J. Coates[5], K. Dovel[2,4]
[1]David Geffen School of Medicine at UCLA, Los Angeles, United States, [2]Partners in Hope, Lilongwe, Malawi, [3]Malawi-Liverpool-Wellcome Clinical Research Programme, Blantyre, Malawi, [4]David Geffen School of Medicine, Division of Infectious Diseases, Los Angeles, United States, [5]University of California Global Health Institute, San Francisco, United States

Background: Men in sub-Saharan Africa are underrepresented in both antiretroviral therapy (ART) initiation and retention, yet there are few interventions that reach men across the treatment cascade. Interventions across the cascade should be prioritized, as they may improve overall engagement and program scalability.

We examined similarities and differences in barriers and facilitators to men's engagement across ART initiation and retention in Malawi to identify which cross-continuum interventions may work for men.

Methods: In-depth interviews (IDIs) were conducted with HIV-positive men ≥18 years in 2016-2017. Medical chart reviews were used to identify potential participants from 10 health facilities in Central and Southern Malawi.

We interviewed two categories: men who have never initiated ART or who initiated ART late (≥14 days after testing HIV-positive); and men who initiated ART ≥ 6 months ago but were late for a recent ART appointment. Audio recordings were transcribed, translated to English, and coded using Atlas.ti v8.

We conducted a secondary analysis of data using constant comparison methods.

Results: Forty men living with HIV were interviewed—19 in the initiation category (never initiated or initiated late) and 21 in the retention category (on ART ≥6 months and late for an ART appointment). Mean age was 35 years, 87% were married, and 89% had children.

Long wait times, being required to attend multiple facility visits, lack of privacy at clinics, and fear of unwanted disclosure were major barriers to HIV care for both initiation and retention. Poor knowledge of ART was frequently discussed as a barrier to ART initiation, while unexpected or prolonged travel was primarily mentioned as a barrier to retention.

Key facilitators for both initiation and retention included previous positive experiences with health facilities and providers. Facilitators unique to initiation included having examples of men who successfully engaged in ART; unique facilitators for retention included having support from a spouse or male friends/relatives.

Conclusions: Men face similar barriers and facilitators for both ART initiation and retention. Holistic interventions that incorporate fast, convenient, and private service de-

livery strategies, as well as positive patient-provider interactions and peer support, may effectively improve men's engagement across the treatment cascade.

EPD436

HIV-related risk behaviors among mak nyah (transwomen) sex workers in Malaysia

T. Nemoto[1], M. Iwamoto[2], H. Xie[2], S. Tan[2], Y.K. Teh[3]
[1]Public Health Institute, San Francisco, United States, [2]Public Health Institute, Oakland, United States, [3]National Defense University of Malaysia, Kuala Lumpur, Malaysia

Background: The Malaysian government reported high HIV prevalence among mak nayh. Also, few studies reported HIV risk behaviors in relation to discrimination and violence against mak nyah, arrests and harassment by police and religious authority, and human rights abuses.
This study aims to quantitatively describe HIV risk behaviors among mak nayh in relation to psychosocial factors.
Methods: Based on purposive sampling, 150 mak nyah were recruited in Kuala Lumpur. A structured survey questionnaire was administered to describe sexual risk and substance use behaviors in relation to psychosocial factors. Correlates of psychological conditions and risky sexual behaviors were examined using bivariate and multiple regression analyses.
Results: The participants who had engaged in sex work had higher levels of depression (CES-D scale) (p = .03) and lower levels of self-esteem (p = .09) than those who had not engaged in sex work; there were no significant group differences on transphobia and identity with mak nyah communities. Almost all sex workers (82.7%) reported having always used condoms for anal sex with customers in the past 30 days, but 27.9% reported not always using condoms when customers offered extra money.
A regression analysis revealed that unprotected anal sex with customers was significantly and independently correlated with unstable housing situations and higher levels of mak nyah community identity.
Conclusions: Mak nayhs' mental health issues, such as depression and self-esteem, must be addressed in relation to sex work and ethnicity or religious background.
Future study must investigate positive and negative influences of involvement in and identifying with mak nyah community. Importantly, sex workers' unstable housing and willingness to engage in condom-less sex for extra money must be addressed through individual counseling and support groups.
Because of the COVID-19 pandemic, public health resources were shifted to testing and treatment of COVID19-infected patients at large; however, mak nyah sex workers are further exposed to riskier health and social conditions due to their gender identity and expression. CBOs and government agencies must address HIV prevention and treatment for mak nyah in relation to COVID-related health issues.

EPD437

Trans women, HIV and the carceral system: a profile of trans women in San Francisco

M. Leathers[1], I. Chiu[2], D. Cano[1], C. Turner[3,4], D. Trujillo[3], S. Sicro[3], W. McFarland[3,4], E.C. Wilson[3], S. Arayasirikul[3], K.D. Taylor[5]
[1]University of California, Berkeley, College of Letters and Sciences, Berkeley, United States, [2]University of California, Berkeley, Berkeley, United States, [3]Center for Public Health Research, San Francisco Department of Public Health, San Francisco, United States, [4]University of California, San Francisco, Epidemiology and Biostatistics, San Francisco, United States, [5]University of California, San Francisco, Institute for Global Health Sciences, San Francisco, United States

Background: Trans women are disproportionately represented in the carceral system, experiencing high rates of arrest and incarceration. Trans women also have among the highest prevalence of HIV of any population, estimated at 19.9% worldwide. Research has found that one fifth of trans women report ever being arrested and one in six trans women report being in prison, higher than the national average for cisgender women. Given these intersections, we examined the level of HIV services access among trans women while incarcerated.
Methods: Data are from the community-based, cross-sectional survey of trans women in the San Francisco site of the National HIV Behavioral Surveillance for Transgender Women (N=201). Trans women were recruited through respondent-driven sampling from July 2019 to February 2020. Eligibility criteria were self-identified women, trans women, or other gender and assigned male at birth; living in San Francisco; English or Spanish-speaking; and 18 years or older. Structured interviews collected demographics, history of arrest (12 months, ever), and HIV risk and status.
Results: Among 201 participants, over half identified as underrepresented minorities: Hispanic/Latina (37.3%), Black (20.9%). The average age was 44.5; 85% lived below the poverty limit, 79 (39.3%) reported being HIV-positive.
Overall, 135 (67.2%) participants reported being ever held or arrested, of whom 63 (46.7%) reported being HIV-positive. Ever being held or arrested was associated with being HIV-positive (p=0.002). Eighteen trans women (22.8% of those living with HIV) reported having their first HIV-positive test in jail or prison.
Of the 28 (13.9%) participants who reported being held or arrested in the past 12 months, 18 (64.3%) reported receiving an HIV test while being held or arrested, leaving more than one-third (35.7%) who had not received an HIV test while being held or arrested.
Conclusions: Trans women in this San Francisco-based study confirm the national profile of very high levels of incarceration and HIV. Given the high rates of trans women engaged in the carceral system, it is imperative for this system to address the unmet health needs of trans wom-

en. The carceral system may be a primary point of health care intervention for diagnosis and treatment initiation among trans women.

EPD438
Relationships between disclosure of sexual identity and PrEP-related sociobehavioral outcomes among youth in the United States: ATN protocol 142

H. Budhwani[1], I. Yiğit[2], K. Muessig[3], K. Claude[3], C. Ranier[3], L. Hightow-Weidman[3]
[1]University of Alabama at Birmingham (UAB), Department of Health Policy and Organization at the School of Public Health, Birmingham, United States, [2]TED Üniversitesi, Department of Psychology, Ankara, Turkey, [3]University of North Carolina at Chapel Hill (UNC), Gillings School of Public Health, Chapel Hill, United States

Background: Disclosing one's sexual and gender identities to family, friends, and clinical providers can be empowering for sexual and gender minority (SGM) youth and may facilitate access to preventative care, including HIV testing and pre-exposure prophylaxis (PrEP).
Simultaneously, psychosocial and structural processes including stigma and fear inhibit disclosure among SGM youth. Understanding demographic profiles and PrEP-related attitudes and beliefs of SGM toward disclosure could inform better tailoring of HIV prevention initiatives.
We conducted an exploratory analysis of three dimensions of disclosure to: parents, friends, and providers. Each dimension was evaluated to assess its relationship with PrEP indicators including but not limited to sociodemographics, stigma, confidence, and stereotypes.
Methods: The full-scale P3 (Prepared, Protected, emPowered) 3-arm randomized controlled trial was conducted under the NIH/NICHD-funded Adolescent Medicine Trials Network for HIV/AIDS Interventions (protocol 142). Data collection occurred across nine clinical sites in the United States from May 2019 to September 2021. Participants were young men who have sex with men and young transgender women who have sex with men, 16-24 years (N=264).
Results: Age was associated with disclosure (non-disclosure) of sexual identity to providers, potentially indicating a need for age stratified approaches in clinical settings to promote PrEP, as well as presence of age-related stigma in healthcare settings. PrEP confidence, PrEP stereotypes, and PrEP disapproval were associated with disclosure to family and peers, but not to providers. Anticipated HIV stigma was associated with disclosure to family, but not friends or providers. See Table 1 for statistical outcomes.
Conclusions: Many HIV-related social science studies focus on direct impacts of individual-level behaviors, such as disclosure, upon treatment and prevention continuums of care. However, evaluating the effects of disclosure as a mediator or potential precursor to care may offer important insights to improve service delivery and clinical care approaches, as well as identifying potential intervention targets and opportunities.

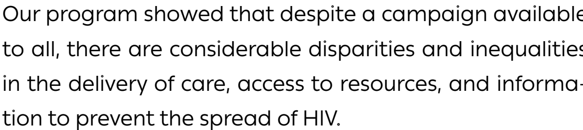
EPD439
A symbiotic relationship? Gender inequality in HIV prevention among key populations in Uganda

L. Akullu[1], R. Gumbie[2], J. Van Leeuwen[2], H. Nabimanya[1], J. Amanya[2], I. Nkonge[1], B. Muhindo[1], H Amutuhaire[2], R. Grundy[2]
[1]Reach a Hand Uganda, Kampala, Uganda, [2]Global Livingston Institute, Denver, United States

Background: HIV continues to afflict women and young girls disproportionately over the world, particularly in Sub-Saharan Africa. Women's ability to negotiate condom use and protect themselves from HIV is often hampered by financial inequities and intimate partner violence in relationships. Reduced access to sexual and reproductive health (SRH) services, including HIV testing and treatment, is closely linked to gender inequality in education and social autonomy among women.
Description: We launched the 'iKnow Kati' (meaning I know my status) HIV awareness and prevention edutainment campaign in five rural districts across Uganda. This method focused on tackling and eradicating the myriad disparities that continue to aid the spread of HIV.
The campaign activities included youth-friendly HIV awareness and prevention messages, community youth involvement drives and outreaches, door-to-door mobilization, and musical performances to mobilise people to receive integrated HIV and SRH information and services.
Lessons learned: While the campaign reached 47,600,000 people through online interaction for HIV awareness and prevention messaging, out of 707 people who received health outreach services, only 218 were female.
A total of 1869 health services were conducted, of which only 209 related to women's health services. The World AIDS Day event presented a nationwide advocacy opportunity for young people to campaign for access to SRHR information and HIV programming that is tailored to the needs of young people.



Our program showed that despite a campaign available to all, there are considerable disparities and inequalities in the delivery of care, access to resources, and information to prevent the spread of HIV.

Conclusions/Next steps: To eliminate AIDS as a public health issue by 2030, the battle against HIV must begin with individual responsibility to eliminate disparities. There are considerable disparities and inequalities in the delivery of care, access to resources, and information to prevent the spread of HIV. Increased service provision for adolescent girls and young women through tailored programming such as the evidence-based DREAMS (determined, resilient, empowered, AIDS-free, mentored and safe) intervention, aimed at reaching this key population will help to address inequalities.

Gender-transformative approaches

EPD440
Factors and priorities influencing satisfaction with care among women living with HIV in Canada: a Fuzzy Cognitive Mapping study

L. Skerritt[1,2], A. Kaida[3], É. Savoie[4], M. Sánchez[5,3], I. Sarmiento[1], N. O'Brien[6], A.N. Burchell[7], G. Bartlett[8], I. Boucoiran[9], M. Kestler[10], D. Rouleau[6], M. Loutfy[11], A. de Pokomandy[1,4,2]

[1]McGill University, Department of Family Medicine, Montreal, Canada, [2]Research Institute of the McGill University Health Centre, Montreal, Canada, [3]Simon Fraser University, Faculty of Health Sciences, Burnaby, Canada, [4]McGill University Health Centre, Chronic Viral Illness Service, Montreal, Canada, [5]Viva Women, Vancouver, Canada, [6]Centre de Recherche du Centre Hospitalier de l'Université de Montréal, Montreal, Canada, [7]University of Toronto, Department of Family and Community Medicine, Faculty of Medicine, Toronto, Canada, [8]University of Missouri, Department of Family and Community Medicine, Columbia, United States, [9]Université de Montréal, Centre Hospitalier Universitaire Sainte-Justine, Montreal, Canada, [10]Oak Tree Clinic, Vancouver, Canada, [11]University of Toronto, Women's College Hospital, Toronto, Canada

Background: Engagement along the HIV care cascade in Canada is lower among women compared to men. Women living with HIV describe a lack of healthcare services that address their comprehensive care needs and priorities.

This study aimed to identify factors influencing satisfaction with HIV care, their causal pathways and relative importance to satisfaction with care from the perspective of women living with HIV.

Methods: We used Fuzzy Cognitive Mapping (FCM), a participatory research method to integrate existing literature and the experiential expertise of women living with HIV. A map of factors influencing satisfaction with HIV care was derived from a mixed-studies literature review. Between December 2020 and March 2021, Peer Research Associates conducted individual FCM interviews virtually with 23 women living with HIV in Canada.

Participants adjusted the literature-based map, adding and removing factors, specifying causal relationships, and assigning weights between -5 and +5 to indicate the strength and direction of influence on satisfaction.

Using content analysis and transitive closure, we synthesized individual maps into an aggregate map categorizing the factors influencing satisfaction with HIV care. The aggregate map was analyzed using network analysis to determine the most central considerations in women's satisfaction with HIV care.

Results: Ten categories influencing satisfaction with HIV care were identified. The most central and influential category was 'feeling safe and supported by clinics and healthcare providers,' followed by 'accessible and coordinated services' and 'healthcare provider expertise.'

The latter two of the top three categories closely reflected themes from the literature-based map, with factors expanded and redefined by participants.

Additional categories captured gendered social and health considerations not previously specified in the literature. These categories included 'healthcare that considers women's unique care needs and social contexts,' 'gynecologic and pregnancy care,' and 'family and partners included in care.'

Conclusions: Women living with HIV emphasized the importance of care approaches that increase their feelings of safety and support. The maps enabled us to capture stakeholder perspectives not reflected in the literature.

The findings also contribute to our understanding of how gender shapes care needs and priorities among women living with HIV.

EPD441
There is no word for that in my language: investigating modern masculinities through the lens of young men living in urban contexts

C. Zharima[1,2], M. Kuchena[2], A. Gibbs[3], A. Kaida[4], M. Beksinska[5], J. Dietrich[2], K. Closson[6]

[1]University of the Witwatersrand, Centre for Health Policy, School of Public Health, Johannesburg, South Africa, [2]University of the Witwatersrand, Perinatal HIV Research Unit, Johannesburg, South Africa, [3]South African Medical Research Council, Gender and Health research unit, Durban, South Africa, [4]Simon Fraser University, Faculty of Health Sciences, British Columbia, Canada, [5]University of the Witwatersrand, MatCH Research Unit (MRU), Department of Obstetrics and Gynaecology, Durban, South Africa, [6]University of British Columbia, School of Population and Public Health, Vancouver, Canada

Background: Men's masculinities have an impact on HIV transmission, as understandings of what it means to be a man influence condom use, HIV-testing, and HIV

treatment adherence. This study aims to understand the different types of masculinities and their underpinning perceptions on notions of power, decision-making and authority in relationships of young men in two South African contexts disproportionately affected by HIV and violence.

Methods: Between October 2019 and March 2021, 17 men aged 21-30 from Durban and Soweto participated in qualitative cognitive interviews in which they reflected on their primary intimate relationships to answer a 13-item sexual relationship power (SRP) scale with a 4-point Likert-type scale (Strongly Agree to Strongly Disagree).
Subsequently, participants elaborated on their answers, and explained how each item related to their relationship. Participants also discussed the influence of SRP on youth sexual decision-making. We conducted a thematic analysis of this data to explore different types of masculine identities within young men's intimate relationships.

Results: We found three main masculine identities within young men's intimate relationships:
1. Traditional,
2. Modern, and;
3. Mixed.

Traditional masculinities drew upon ideas of patriarchal gendered expectations, leading to control over partner's whereabouts and attire, and sexual and reproductive health (SRH) decision-making (e.g., contraceptive use).
Modern masculinities drew upon 'liberal' gendered expectations of equitable decision-making in the relationships, including around SRH. Men with 'Mixed masculinities' drew on elements of both 'modern' and 'traditional' masculinities in their relationships. The multiplicity of masculinities provides a way to understand where change is possible in different contexts.

Conclusions: Findings highlight the integral and complex connection between masculinity, SRP dynamics in youth relationships, and HIV risk behaviour (e.g., condomless sex, multiple concurrent sexual partnerships, and controlling partner's reproductive health choices). As such, critical efforts are needed to advance gender transformative initiatives that are relevant and context specific.

EPD442
Investing in adolescent girls and young women's leadership and voice in the HIV response

N. Damji[1], E. Kudravtseva[1], A. Guhathakurta[1]
[1]*UN Women, Gender Equality, HIV and Health, New York, United States*

Background: New HIV infection rates among adolescent girls and young women (AGYW) are staggeringly high in sub-Saharan Africa. Due to persistent unequal gender norms and gender inequalities, including violence against women, stigma and discrimination, denial around AGYW sexuality, young women face significant barriers in accessing HIV services. UN Women's programme focused on empowering AGYW to demand non-discriminatory HIV services and engage with women leaders and decision-makers to advocate for policy change that includes their voices and perspectives.

Description: Conducted across fifteen countries in sub-Saharan Africa over twelve months, this programme invested in the feminist leadership of over 250 AGYW while mobilizing decision-makers to commit to addressing gender-related barriers for successful HIV prevention among AGYW. This was achieved through a mentorship programme linking AGYW with women of power; a youth-led advocacy campaign to amplify AGYW's voices; creating platforms for AGYW to share their experiences; and calling global leaders to address barriers to AGYW's access to services while increasing their engagement in the HIV response.

Lessons learned: This programme used collaborative and youth-centered approaches to break through stigma and denial around AGYW sexuality, AGYW seeking HIV and sexual health services and gender norms. It demonstrated the importance of gender-responsive and empowerment-focused programming to strengthen AGYW's leadership skills to engage with key decision-makers and exercise their rights to advocate for policy change.
Bringing together various networks of AGYW leaders resulted in peer-to-peer learning and engagement, translating to the creation of a collective of AGYW utilizing their power and voice towards more inclusive HIV policies and programming.

Conclusions/Next steps: Focusing on transforming gender norms and improving the understanding of power in relationships, especially how they influence HIV risks, is critical to consider in national programmes. Programmes supporting AGYW through mentorship and advocacy creates a cadre of empowered, young leaders who can improve their communities while also holding existing women leaders in this space accountable for change.
Scaling up or replicating strategies utilized in this initiative will work towards transforming gender inequalities in the HIV response and improve access to HIV prevention, treatment and care services for AGYW.

Sexual practices and sexually transmitted infections in heterosexual women and men who make sexualized use of drugs ("Chemsex")

D. Incera Fernandez[1], M. Gámez-Guadix[1], L. Ibarguchi[2], L.J. García-Fraile Fraile[2]
[1]Autonomous University of Madrid / Faculty of Psychology, Department of Personality, Assessment and Psychological Treatment, Madrid, Spain, [2]Apoyo Positivo, Madrid, Spain

Background: The sexualized use of drugs (SUD), also known as chemsex, has been associated in recent years with the intentional use of substances to facilitate, maintain and/or enhance the sexual experience in men who have sex with men (Bourne et al., 2015). This use of substances to enhance the sexual experience can lead to risky sexual behaviors (Palamar et al., 2018) and to a higher risk of contracting sexually transmitted infections (STIs) (Gertzen et al., 2021), including HIV (Achterbergh et al., 2020). The evidence and information available is very scarce among heterosexual people (Heinsbroek et al., 2018).
We aim to analyse the prevalence and gender differences in risky sexual practices and STIs among heterosexual people who do SUD.

Methods: Cross-sectional study by anonymous self-administered online survey from February to May 2021. Participants: heterosexual women, men and non-binary persons aged 18 years or older, engaged through social networks messages, personal messages, and promotional posters. Statistical analysis by SPSS™ v.26

Results: The sample consisted of 1181 heterosexual persons between 18 and 78 years old (mean age = 24.4, SD = 7.4). Approximately 12% of the participants had been involved in the SUD. No differences were found in the prevalence of SUD between men and women. SUD was related to having more sexual partners, having penetrative sex without a condom, practicing a fetish, and having been diagnosed with an STI. Men involved in SUD reported more sexual partners (30.8% vs 10.8%). Women on SUD referred a constant use of condoms in their sexual intercourse more frequently (37.7% vs 21.7%).

	Total respondents		Non SUD		SUD		Stats (X_2)

Other STIs	22	19	6	4.1	16	1.5	0.033

*Bondage, Discipline, Domination and Submission, and Sadism and Masochism

Table.

Conclusions: SUD has not been studied broadly enough among heterosexual people yet. SUD has been associated with health implications. It is necessary to design programs aimed at reducing the incidence of the health consequences of SUD, both in men and women, regardless of their sexual orientation.

Living with HIV

EPD444
HIV-related burdens among people living with HIV in mainland China: a mixed-methods study

X. Zhou[1], Y. Hu[1], H. Li[2], X. Wu[1], Y. Chen[1], Y. Deng[1], R. Bi[1], H. Zou[1,3]
[1]School of Public Health (Shenzhen), Sun Yat-sen University, Shenzhen, China, [2]Shizhong District Center for Disease Control and Prevention, Jinan, China, [3]Kirby Institute, University of New South Wales, Sydney, Australia

Background: HIV infection has become a manageable disease in the highly active antiretroviral therapy (HAART) era. In this context, we aimed to evaluate the HIV-related burdens among people living with HIV/AIDS (PLWHA) in mainland China.

Methods: A mixed-methods study was conducted among PLWHA in China April-December 2021. A telephone-based semi-structured interview of PLWHA was conducted to understand HIV-related burdens among PLWHA.
Thematic analysis was employed to qualitatively analyze potential themes and develop a questionnaire. An online survey among PLWHA was conducted to collect detailed information about HIV-related burdens.
We classified burdens into three categories: low (1-2 points), medium (3-5 points), and high burden (6-7 points) based on a 7-point Likert scale. Sociodemographic characteristics were compared using the Mann-Whitney U test and the Kruskal-Wallis test. Ordinal logistic regression was applied to examine the determinants of burden.

Results: We enrolled 30 PLWHA (gender: 83% male; age: median 34 years, IQR: 27-45) in the interviews and 904 PLWHA (gender: 91% male; age: 32 years, 27-38; time since HIV diagnosis: 3.2 years, 1.6-5.4; CD4 count: 47% were >500 per mm^3) in the online survey. 83% (n=25) of respondents reported HIV-related burdens at different aspects in the interviews. 91% (n=828) PLWHA reported living with a medium or high level of burdens in the online survey, and 93% (n=837) reported discrimination from society to be burdensome. T
he most prevalent emotional consequences were being worried about comorbidities (94%) and medication side effects (91%). PLWHA who scored higher on their health in terms of diet, sleep, and exercise were less affected by HIV burdens (odds ratio [OR], 0.29; 95% confidence interval [CI], 0.19-0.44). PLWHA who had no sex partner or had a HIV-negative partner were less burdensome (0.71; 0.51-0.97).

Burdens were higher among those with lower/unknown CD4 counts (1.53; 1.02-2.28). Participants with lower education had a lower disclosure burden (0.55; 0.40-0.75). The emotional burden was higher among those diagnosed with HIV within three years (2.35; 1.36-4.06) and those with low income (1.55; 1.04-2.30).

Conclusions: Our findings highlight high HIV-related burdens among PLWHA in China. Systematic measures that involve all stakeholders are urgently needed to reduce stigma and discrimination against PLWHA.

EPD445

Personality and adherence to ART in PLWHA: a clinical correlation study with outpatients in a specialized hospital in São Paulo, Brazil

G. Mueller-Roger Welter[1], A.C. Penalva de Oliveira[1]
[1]*Instituto de Infectologia Emilio Ribas, São Paulo, Brazil*

Background: Objective was to assess personality traits in patients living with HIV/AIDS (PLWHA), considering general patterns of behaviour and attitude, and to verify its association with the perceived social support, expectation of self-efficacy to follow antiretroviral treatment (ART) and the adherence by means of immunological markers.

Methods: Clinical, exploratory, descriptive, and cross-sectional study carried out in a specialized outpatient hospital in São Paulo, Brazil.

Results: Participants were PLWHA, approached randomly in the outpatient waiting room. Evaluation of socio-demographic variables, personality traits, perception of social support and self-efficacy expectations to follow ART; application of a structured questionnaire, HumanGuide Test, Scale of Perceived Social Support in HIV (PSS-HIV) and Scale of Self-efficacy Expectations of Adherence to Antiretroviral Treatment; review of medical records; descriptive and correlation data analysis.

Results: 66 PLWHA were included, 22 women and 44 men (65,8% HSM), mean age 50 years (*SD*=12.19). Differences in personality characteristics correlated significantly to positive perceived social support: sociability and optimism (*r*=0.393; *p*=0.001), ability to deal with changes (*r*=-0.284; *p*=0.024) and flexibility (*r*=-0.276; *p*=0.029).

Scores indicative of good prognosis on the PSS-HIV showed significant positive correlation with CD4+ T cell and viral load (X^2=9.721; *gl*=2; *p*=0.008). Low expectation of self-efficacy to follow ART correlated with dependence of social approval and recognition (*r*=-0.302; *p*=0.017), high expectations in the dimension Negative Emotional Experiences and Physical Conditions correlated with an increase in the CD4+ T cell count (*r*=0.286; *p*=0.023) and decrease of viral load (*r*=-0.305; *p*=0.015). High scores on sense of responsibility and care for life correlated with an increase in the CD4+ T cell count (*r*=0.297; *p*=0.019).

No correlations were found between sociodemographic variables (age, education, race, marital status) and self-report on adherence with perceived social support, expectation of self-efficacy and immunological markers. Anova Post Hoc showed no significant differences in the mean scores of personality traits between genders, except for the dimension Imagination, higher in MSM (*M*=2.93) compared to women (*M*=0.24) (*p*=0.006).

Conclusions: Personality may influence the adherence to ART by affecting psychosocial mediators such as perceived social support and self-efficacy expectations to follow ART, which affects the adherence to ART and, consequently, the individual's immune system.

Adaptation to living with HIV for individuals, families and communities

EPD446

Resilience of HIV-positive parents and their children within the family context in Bangladesh: A way of achieving 'self'

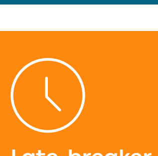
M.S. Islam[1]
[1]*University of New England, School of Health, Faculty of Medicine and Health, Armidale, Australia*

Background: Whilst HIV prevalence is low in Bangladesh, the number of HIV-positive parents and children is increasing. Despite this, HIV-affected families have, the focus of much research being 'risk' groups. This research examined the factors contributing to resilience of parents and children affected by HIV within the family context of Bangladesh.

Methods: A qualitative approach using grounded theory methodology was adopted for this research. Data was collected by in-depth interview with 19 HIV-positive parents and their 19 HIV-positive or -negative children as dyad, recruited with the support of two self-help groups of HIV positive people, in two settings, namely Khulna and Dhaka in Bangladesh.

Results: Finding worth, meaning and purpose in life enabled participants to make physical progress, as well as cope with thoughts of death. Thus, the opportunity of receiving support from self-help groups and extended family members helped them cope and adapt to living with HIV. The findings indicate that HIV-positive parents in Bangladesh were motivated to cope with their post-infection lives from an increased sense of familial responsibility especially for their children. They indicated that their children's presence increased their feelings of security and warmth for them. The findings of this research demonstrate that both the parental and child sense of obligation and sense of self and meaning increased after having diagnosed HIV within the family.

Conclusions: The findings of this study demonstrate that the provision of social support helped to minimize the magnitude of the participants' distress and enhanced their mental well-being to deal with their new sense of self in a more positive way.



EPD447
HIV-positive *Machos* in Colombia: silence, invisibility and vulnerability

H. Ruiz[1]
[1]*University of Connecticut, Anthropology, Storrs, United States*

Background: The Colombian HIV prevention and treatment policies, known for their inclusiveness of diverse gender dynamics, have systematically excluded heterosexual men from prevention and healthcare, most profoundly impacting men living in poverty. In this context, self-identified heterosexual HIV-positive men are often forced to bear the intensity of HIV in silence and without institutionalized care. The absence of support for these men and the political blindness towards the suffering often makes their chronic diseases fatal.

Methods: Between 2013 and 2018, I visited Cali, Colombia, three times, completing 18 months of fieldwork. I conducted many hours of participant observation at clinics, hospitals, people's homes, NGOs, and public events from which I have fieldnotes. I conducted individual interviews with 36 HIV-positive men, 30 HIV-positive women, 3 HIV-positive couples, and 30 NGO and health care professionals. Interviews were transcribed, codified, and analyzed in Maxqda.

Results: Heterosexual men in Colombia are not "at-risk" populations for HIV, and thus they are ignored by prevention measures, treatment protocols, budgets, and policies. Within this context, the appearance of an HIV-positive diagnosis in the life of heterosexual men strikes them without accurate information, support, and care, leaving them ruminating on their questions and anxieties about how to live with HIV on their own and often refusing to take ART until they reach AIDS phases.

However, men's mothers and female partners are the ones that counterbalance the impact of the HIV-positive diagnosis through practices of care and love, allowing men to resituate and signify their existence and cope with the virus.

Conclusions: Heterosexual men in Colombia typically find out about their diagnosis when their immunological systems collapse or when their partners become pregnant.

This phenomenon speaks of an invisible group in Colombia's HIV/AIDS panorama, which needs recognition and tailored support. Leaving these men without proper care negatively affects women's and families' health and well-being and leaves Colombian HIV care policies outdated.

The HIV epidemic in Colombia and the region is changing. Understanding heterosexual men and their role in these changing dynamics is a unique opportunity to update our knowledge of HIV in Latin America today.

EPD448
Barriers, facilitators and recommendations for HIV care in a rural, low-prevalence state: findings from a state-wide needs assessment

M. Javorka[1], P. Bean[1], E. Normand[1], K. Fertaly[1]
[1]*University of Montana, Rural Institute for Inclusive Communities, Missoula, United States*

Background: Montana is a low-prevalence state for HIV. However, while rates of diagnosis have remained relatively stable, a higher proportion of people newly diagnosed with HIV in Montana receive a late diagnosis in comparison with national data. These data may indicate gaps in the HIV care continuum are driving delayed testing and care.

As part of a statewide needs assessment, this study explores barriers and facilitators to HIV care among people living with HIV (PLWH) in Montana.

Methods: Using a semi-structured interview guide based on the HIV care continuum model, we conducted qualitative interviews with 17 PLWH in Montana. Participants from nine counties were recruited via the state's Ryan White Program. Participants were predominantly white (82%), male (88%), and identified as gay, queer, or bisexual/pansexual (82%). Interviews were analyzed using a general inductive approach to identify barriers, facilitators, and recommendations for HIV care across the care continuum.

Results: Participants described barriers to HIV treatment in the state, including difficulties accessing HIV medications, the lack of available and accessible HIV specialty care providers, and lack of general provider knowledge about HIV testing and treatment. Facilitators of HIV treatment included being part of a community or social network with strong HIV awareness, connecting to HIV care via community-based organizations, and having social support to seek and maintain treatment.

Recommendations for improvement focused on three key areas:

1. Improving prevention by increasing HIV awareness campaigns and implementing "opt-out" HIV testing practices;
2. Increasing access to HIV specialty providers and improving general provider knowledge and training around HIV; and,
3. Improving system and care coordination between providers and facilities across the state.

Conclusions: Montanans living with HIV are not benefiting equally from advances in HIV prevention and treatment due to unique barriers to care related to both the low prevalence of HIV in the state and the challenges of rural health care provision. However, connections with HIV-aware individuals, communities, and organizations can help facilitate initiation and maintenance of HIV treatment. Public health interventions, health system-level change, and increased healthcare provider knowledge are necessary to strengthen HIV care for this rural population.

EPD449

Ageing well with HIV: Factors associated with improved quality of life for people living with HIV aged 50 years and over in Australia

J. Dawe[1], D. Cassano[1], I. Elsum[1], R. Keane[2], S. Ruth[3], J. Gunn[1], H. Von Doussa[4], G. Brown[5], A. Wilkinson[1,6], M. West[5], J. Hoy[7], J. Power[4], M. Stoové[6,1]

[1]Burnet Institute, Disease Elimination, Melbourne, Australia, [2]Living Positive Victoria, Melbourne, Australia, [3]Thorne Harbour Health, Melbourne, Australia, [4]La Trobe University, Australian Research Centre in Sex, Health and Society, Melbourne, Australia, [5]Department of Health and Human Services, Melbourne, Australia, [6]Monash University, School of Public Health and Preventive Medicine, Melbourne, Australia, [7]The Alfred Hospital and Monash University, Department of Infectious Diseases, Melbourne, Australia

Background: In 2020, over half of the 26,457 people living with HIV (PLHIV) in Australia were estimated to be aged 50+. Despite this, there is limited data describing quality of life (QoL) in this population. Understanding the factors that influence QoL as PLHIV age is critical to ensuring that tailored health and support models are available and effectively targeted. We describe the QoL of a national sample of PLHIV aged 50+ years and identify health and social factors associated with QoL.

Methods: Data were collected between December 2018–May 2019 through the HIV Futures 9 survey, a national cross-sectional survey assessing the health and wellbeing of PLHIV. Surveys were self-completed through either an online or hard-copy form. QoL was measured using PozQoL, a validated QoL scale for PLHIV.

The primary outcome of quality of life was defined as a binary variable, with a PozQol score of three or higher indicating a "good" quality of life. Logistic regression estimated the association between selected factors and quality of life, adjusting for age, education level and gender.

Results: Among the 319 participants aged 50+ years, approximately two-thirds (64%) received a PozQoL score that indicated a good overall quality of life. The odds of a PozQoL score of three or more was higher among participants in a regular relationship (aOR:1.94;95%CI:1.13–1.37). The odds of a PozQoL score of three or more was lower among participants who often or sometimes ran out of food (aOR:0.40;95%CI:0.22–0.73), experienced financial stress in the previous 12 months (aOR:0.36;95%CI:0.22–0.61), were currently experiencing depression (aOR:0.37;95%CI:0.22–0.65), experienced stigma related to HIV in the previous 12 months (aOR:0.38;95%CI:0.23–0.63) and felt isolated from the HIV community (aOR:0.22;95%CI:0.12–0.39).

Conclusions: We found that lower QoL among older PLHIV is associated with reduced accessibility of social services, as well as personal stressors including poor social connectedness and financial precarity. Our findings provide novel data on QoL among the growing population of people ageing with HIV in Australia, and offer important insights for the development of policy and practice.

EPD450

The effects of aerobic exercise on flow-mediated vasodilation among older persons with HIV

C. Irwin[1], M. Higgins[1], D. Waldrop[1], R. Gary[1]

[1]Emory University, School of Nursing, Atlanta, United States

Background: Older persons with HIV (OPWH) are twice as likely to develop cardiovascular disease (CVD) approximately one decade younger than persons without HIV. Endothelial function measured with brachial artery flow-mediated vasodilation (FMD) is used to identify individuals at high risk for vascular dysfunction and CVD. Aerobic exercise has been shown to mitigate CVD risk by improving endothelial function in persons at high risk for developing CVD. The purpose of this study is to examine changes in FMD associated with exercise among PWH.

Methods: Intervention participants were randomized to an aerobic exercise intervention and walked at 60-70% of their maximal heart rate for 60 minutes per day, 4 days per week. Attention control participants performed stretching and flexing movements 5 days per week. Brachial artery FMD was performed at baseline and at 6-months. Reactive hyperemia was measured at 60-and 90-seconds post cuff deflation and maximum post-hyperemia diameter determined. Univariate analysis of covariance was performed to test differences between intervention and attention control groups for FMD measurements at 6-months adjusting for baseline.

Results: The majority (n=97) were male (n=55, 57%) and African American (n=84, 87%). Reactive hyperemia was improved in persons in the aerobic exercise intervention group compared to the attention control group at 60 ($F_{(1,94)}$=5.346, p=0.023) and 90 seconds ($F_{(1,94)}$=5.351, p=0.023).

Conclusions: This secondary analysis examining FMD changes with exercise showed that moderate intensity walking improved endothelial function in OPWH.

Aerobic exercise may be a cost-effective addition to usual care for OPWH that may improve vascular function and lower CVD risk in this population.

Improving access to ART& psychosocial support to reduce interruption of treatment among the Elderly with HIV in the highlands of South Western Uganda: lessons from Save and Heal Uganda (SAHU)

S. Ahakundiire[1], G. Jjuuko[2]

[1]Uganda College of Commerce Kabale, Kampala, Uganda, [2]Makerere University, Kampala, Uganda

Background: In Uganda, the HIV prevalence among the general population is at 6.2% (UPHIA 2017), whereas the prevalence among Elderly 55 yrs. and above is estimated to be increasing. Numerous factors impede the provision of HIV/AIDS care and prevention services among the Elderly in rural areas of Uganda, the major one being long distances from the care and treatment centers & lack of a clear policy on HIV programming among the Elderly. South west Uganda had the highest prevalence of HIV at 7.9% among adults 55yrs and above (UPHIA 2017).

Description: SAHU is a non-governmental organization working to improve the livelihoods of the rural based Elderly & their households. Our approach involves a close and friendly collaboration with the Elderly and their households through; provision of psychosocial support, health education, home visits, phone calls with help of our trained community volunteers. Partnering with HIV care and treatment centers in Kabale District, we establish appointment dates for ART pickups, Viral load bleeding, and other essential medicines such as anti-Hypertensive and anti-diabetic drugs.

We do pre appointment reminders through home visits and phone calls, we do home drug deliveries using motorbikes commonly referred to as "Boda Bodas", take vital parameters and viral load bleeding to our clients scattered in the Hilly parts of Kabale District. Clients who need medical attention are ferried to the Health facilities on our bodabodas, as well as providing transport in cash were necessary.

Lessons learned: Between March 2020 and December, 624 Elderly people were under our Livelihood program, 75/624 (12%) are HIV positive, 49 (65%) females & 26 (35%) males, 3/75 clients were virally non suppressed. The median age was 62 yrs.26/75 (34.6%) had other co infections,17/75 (11 females & 6 males) on anti-hypertensive drugs, 9/75 (4 Femalea & 5 Males) on anti-Diabetic drugs, whereas 16/26 (61%) were on both anti-hypertensive and anti diabetic drugs.187 drug refills were made, 24 home to hospital ferries were made, 210 psychosocial sessions conducted, 164 reminder calls made. None of the clients was hospitalized.

Conclusions/Next steps: Home care support and transport for people Aging with HIV in rural areas is key in improving treatment outcomes & psychosocial wellbeing.

Community input to develop an online platform for older adults aging with HIV: preliminary results from potential users in three U.S. cities

K.Y. Greene[1], J.T. Galea[1], A.L. Nguyen[2], E. Ruiz[3], A.N. Polonijo[4], M. Yoo-Jeong[5], J. Taylor[6], C. Christensen[6], B. Brown[7]

[1]University of South Florida, School of Social Work, Tampa, United States, [2]University of Southern California, Keck School of Medicine, Los Angeles, United States, [3]University of South Florida, College of Public Health, Tampa, United States, [4]University of California, Merced, Department of Sociology, Merced, United States, [5]Northeastern University, School of Nursing, Boston, United States, [6]HIV+Aging Research Project-Palm Springs, Palm Springs, United States, [7]University of California, Riverside, School of Medicine, Riverside, United States

Background: Older people living with HIV (PLWH) face unique health challenges and social isolation exacerbated by the COVID-19 pandemic. Our study aims to create an online platform to connect older (aged 50+ years) PLWH with community resources, service providers, and social support.

To obtain a broad understanding of older PLWH's experiences during the COVID-19 pandemic and potential for the online platform, we surveyed potential users from three U.S. cities. Here, we report our preliminary findings.

Methods: During July-November 2021, we conducted online focus groups (n=9) and individual interviews (n=26) with PLWH age 50+ from three cities (Los Angeles, CA, Palm Springs, CA, and Tampa, FL) on the topic of creating an online platform. Participants completed a survey that gathered data on demographic characteristics, depressive symptoms (PHQ-2), and mental health experiences during the COVID-19 pandemic. Descriptive analyses of the data were performed.

Results: 84 PLWH aged 50-82 years (mean=60.8 years) participated. Most (n=67) identified as male. 47.6% (n=40) of participants identified as White; 33.3% (n=28) Black/African American; 15.5% (n=13) Hispanic/Latino/a/x. Nearly all (n=75) reported daily email/internet use and 66.7% (n=56) had ≥1 social media account or dating app. 22.6% (n=19) of PHQ-2 respondents screened positive for potential major depressive disorder. Participants in focus groups and interviews reported increased social isolation during the COVID-19 pandemic that negatively affected their mental health. When answering questions about what to include in the development of an online platform, one focus group participant said, "I think one of the major challenges for me during this whole pandemic has just been the isolation and trying to find something to do to even get through the day".

Conclusions: Social isolation and depressive symptoms were common among study participants. A high percentage of daily internet use suggests that an online platform holds promise as an intervention to improve social connection and depressive symptoms among older PLWH.

EPD453

Childhood sexual trauma and opioid use among older adults living with HIV

M. Brown[1], D. Amoatika[1], A. Kaur[1], P.N.O. Addo[1]

[1]*University of South Carolina, Department of Epidemiology and Biostatistics, Columbia, United States*

Background: The prevalence of trauma, including childhood sexual trauma, is higher among populations living with HIV compared to the general population. Research estimates have shown the prevalence of trauma to range from 10 to 90% among PLWH. The opioid epidemic is currently affecting many areas in the US, and data has shown an increase in opioid use in the Southern US since the start of the COVID-19 pandemic.

Childhood sexual trauma has been linked to substance use, but research focusing on specific substances are lacking. In addition, studies examining this association among older adults living with HIV are scant.

Therefore, the aim of this study was to examine the relationship between childhood sexual abuse and opioid use among older adults living with HIV.

Methods: Data were obtained from 91 older adults living with HIV (age range: 50 – 80 years; mean (SD): 58.1 (6.7) years) from an HIV clinic population in South Carolina during the COVID-19 pandemic (April to June, 2021). Descriptive statistics were used to obtain prevalence estimates of childhood sexual abuse and opioid use.

Crude and multivariable logistic regression models, adjusting for age, gender, race, and education, were used to determine the association between childhood sexual abuse and opioid use.

Results: Approximately 32% of the study population reported childhood sexual abuse while 10% of the study population reported opioid use (once per month, two to four times per week, four or more times per week vs. never). The crude model showed that older adults living with HIV who reported childhood sexual abuse had eight times higher odds (OR: 8.05; 95% CI: 1.49 – 43.4) of reporting opioid use.

However, after adjusting for age, gender, race, and education, older adults living with HIV who reported childhood sexual abuse had 13 times higher odds (OR: 13.8; 95% CI: 1.33 – 144.3) of reporting opioid use.

Conclusions: Childhood sexual trauma was linked to opioid use among older adults living with HIV. Trauma-informed interventions addressing childhood sexual trauma may be warranted, which may help to attenuate opioid use among this population.

Future research should determine the relationship between childhood sexual abuse and other specific substances (e.g., alcohol and marijuana).

Confronting stigma: Lessons learned

EPD454

Experiences of intersecting stigma among young people living with HIV in Uganda

M. Simon[1], E. Small[2], B.B. Sharma[3], M. Okumu[4], M. Pate[2], B. Mukubba[5]

[1]*University of Illinois at Urbana-Champaign, Social Work, Urbana, United States,* [2]*University of Texas, School of Social Work, Arlington, United States,* [3]*University of Texas at San Antonio College for Health, Community, and Policy, School of Social Work, San Antonio, United States,* [4]*University of Illinois Urbana-Champaign, School of Social Work, Urbana, United States,* [5]*Most at Risk Population Initiative, Programming, Kampala, Uganda*

Background: HIV/AIDS-related stigma is invoked as a persistent and pernicious problem standing in the way of implementation science. Although remarkable scientific gains have been made in the last 20 years in HIV treatment with effective tools, including antiretroviral therapy, pre-exposure prophylaxis, and post-exposure prophylaxis (PEP), more than half the people living with HIV (PLWHIV) worldwide do not access care. Demographics such as the youth and women still bear the brunt of HIV. It is a geo-fenced epidemic and highly concentrated in SSA (70%), with approximately 1.4 million HIV-positive people in Uganda. In 2018, 33% of children living with HIV in Uganda were not in care.

The purpose of the study was to identify the structural and community barriers that prevent young people living with HIV (YPLHIV) from seeking HIV care services in Uganda.

The study sought to answer the following research question: How does stigma impact care-seeking services among YPLHIV in Uganda?

Methods: The study was conducted through qualitative grounded theory methods and used semi-structured interviews and focus group discussions involving 31 YPLHIV, ages 18 and 25, recruited through urban HIV clinics and counseling facilities in Kampala between December 2020 and May 2021 (see table 1).

The interviews were recorded in English, transcribed verbatim, and analyzed using Dedoose, a cross-platform App for analyzing qualitative and mixed methods research data.

Results: The findings highlight the following themes under each barrier.

Theme 1: Structural barriers to HIV services, including governmental policies, social isolation, and normalization of stigma.

Theme 2: Stigma practices to include discrimination and prejudice, intersectional stigma, including internalized, perceived, and interpersonal. See figure 2: A multi-level framework of understanding stigma.

Conclusions: The findings inform HIV implementation that scientific gains could be curtailed if community stigma remains unaddressed.

Author Index

Significantly, it is critical to address the social determinants of health, including HIV stigma and related intersecting individual factors. Intentionally engaging communities to involve a synergy of government, private, and community-level initiatives will address societal stigma. Policy advocacy in sharing information is a recommended HIV management strategy.

EPD455

Digital storytelling to address stigma and discrimination in Uganda

D.B. Ndagire[1]

[1]National Forum for People Living with HIV/AIDS Network Uganda, Programs, Kampala, Uganda

Background: The 2019 National People Living with HIV(PLHIV) stigma index study in Uganda indicated that HIV-related stigma and discrimination presents major barriers to HIV care and prevention programs. Largely stigma and discrimination hinders the uptake of HIV/AIDS testing, treatment and counseling services.

At community level, HIV-related stigma and discrimination is an obstacle to accessing and benefiting from effective prevention and treatment programs. Due to lack of disclosure therefore involving PLHIV in digital storytelling and engaging the community contributes to efforts directed at reducing HIV stigma.

Objectives: To increase awareness of the dangers of HIV/AIDs related stigma and impact on access to care and treatment at individual, household and community level.

Description: A total of 40 PLHIV champions were identified to shared their personal untold stories on stigma and discrimination the impact of stigma and made call to action to put to an end to stigma and discrimination through spreading love not hate towards people living with HIV.

The stories were popularised on NAFOPHANU whatsapp groups, Facebook, twitter, website and you tube on to create awareness at community.

A total of 30 key advocates including CSO leaders, artists, politicians, religious leaders and young people developed 2 minutes video clips with key messages on stigma reduction in different languages these were shared on social media (Facebook, twitter, you tube Tik Tok & whatsup) by 20 social media influencers and 10 tik tokers.

Lessons learned:

- Engagement of communities increased resilience to stigma & discrimination thus increased demand and utilization HIV/ SRHR services.
- Working artists, politicians, religious leaders and young people created awareness around stigma reduction thus commitment to challenge the vice were made.
- The short video clips prompted conversation HIV, stigma and discrimination thus giving smooth area for PLHIV either to disclosure or not.

Conclusions/Next steps: Digital storytelling to address stigma and discrimination in Uganda reached over 6,000,000 people through Facebook, twitter, you tube Tik Tok & whatsup.

This needs to be replicated in other countries for increased awareness on dangers of HIV/AIDs related stigma and impact on access of HIV prevention, treatment & support for individuals, household and community.

EPD456

Reducing self-stigma among HIV positive pregnant young women and adolescent girls living in slums of Kampala, Uganda: insights from Afrislum's expert clients' delivered cognitive behavioral therapy model in Uganda

S. Babirye[1], S. Kawooya[2], M. Achom[2], C. Oundo[3], C. N. Kihara[4]

[1]Afrislum Uganda, Research and Evaluations, Kampala, Uganda, [2]Afrislum Uganda, Programs, Kampala, Uganda, [3]Kampala City Council Authority, Directorate of Public Health and Environment, Kampala, Uganda, [4]VIIV Healthcare, Postive Action, London, United Kingdom

Background: Self-stigma is linked to HIV positive living; yet there is a gap in interventions addressing self-stigma especially in resource limited settings like Uganda where expert psychologists are few, and psycho-social interventions are barely present.

With support from VIIV Healthcare Postive Action, Afrislum Uganda is implementing an innovative psychosocial therapy model whereby HIV Expert Clients were trained to offer Cognitive-Behavioral Therapy (CBT) group sessions to HIV positive, pregnant Young Women and Adolescents Girls (YWAG) to facilitate change in their conception of HIV, sense of self-worth and to empower them with techniques to deal with Self-stigma.

Description: In Q4 October 2021, Afrislum rolled-out the Experts' client delivered CBT model at three public health facilities serving the urban-poor in Kampala-Uganda.

A total of 141 HIV positive pregnant YWAG were identified and enrolled into the monthly CBT group sessions. At each health facility, four HIV expert clients were identified, trained to deliver CBT group sessions. Each expert client was allocated a cohort of 8-12 participants to engage 10 times throughout their EMTCT journey.

This model has10 different but interrelated sessions delivered with-in 10 months. By Dec 2020, 124 beneficiaries had been engaged in the CBT group sessions. Through the one-hour monthly CBT sessions, beneficiaries are taught cognitive, coping and assertive skills in order to empower them to deal with negative thoughts, interpersonal problems and stigmatizing reactions.

CBT sessions are delivered in presence of expert psychologists who offer continuous support supervision and assessment of the expert clients as part of capacity development.

Lessons learned: Afrislum's CBT Model has created an opportunity for participants to freely share their HIV-related experiences with their peers. This has motivated participants not to miss their clinic days.

Through the CBT sessions, HIV pregnant YWAG have been empowered to control their thought processes-especially the negative thoughts. Some changes in norms and practices have also been noted i.e., openness and engaging with others, lessening in worrying about the future, and increased self-care, and self-confidence.

Conclusions/Next steps: Psycho-social interventions like Afrislum's CBT model that utilize lay-counselors, offer cost-effective alternatives to addressing stigma in resource limited settings where expert psychologists and psychological support services are scarce.

Experiences and impacts of antiretroviral therapy

EPD457

Relationship between Multi-Month ARVs Dispensing (MMD) and viral load suppression among PLHIVs accessing care in Nigeria: results from a retrospective study using 2000–2021 data

O. Airaoje[1], Z. Allen[2], E. Ondura[1], D.S. Dauda[1]

[1]*Data. FI, Palladium/Nigeria, Abuja, Nigeria,* [2]*Data. FI, Palladium/USA, Chapel Hill, United States*

Background: Multi-month dispensing (MMD), a differentiated service delivery model that provides PLHIV with 3 or 6 months of ART, aims to reduce barriers in accessing lifelong ART, improve retention in care, and improve viral load (VL) suppression among clinically stable clients.

We analyzed the relationship between various modes of MMD and VL suppression among clients on MMD in 16 USAID-supported states in Nigeria to inform continual implementation of differentiated model of care in HIV programming.

Methods: Data from USAID implementing partner electronic medical records in 16 states were analyzed cross-sectionally. Between September 2000 and September 2021, a total of 568,272 clients were on long-term ART. Clients who received 3–5 and 6 months plus of antiretroviral were classified as MMDs.

Only active clients were included in the analysis. Multivariate regression was used to examine the relationship between VL suppression and MMD status for all clients, controlling for age and sex.

Results: Of the total 568,272 active clients analyzed, 495,800 (87.2%) had a documented VL result; 4.5% (n=22,151) of clients with documented VL were on <3 months treatment (no MMD), 20.6% (n=102,059) were on 3–5 months MMD, and 74.9% (n=371,590) were on 6 months plus MMD. 95.6% (n=474,216) had viral suppression of <1000 c/ml as of September 30, 2021. 42.5.5% of clients on no MMD, 95% of clients on 3–5 months MMD and 99% of clients on 6 months plus MMD had suppressed VL. There were no sex differences in VL suppression across groups.

Clients on 3–5 months (AOR 25.7, 95% CI 24.7-26.7, P value 0.0002) and 6 months plus MMD (AOR 132, 95% CI 127-138, P value 0.0002) were more likely to be virally suppressed than clients on <3 months treatment.

Clients on 6 months plus MMD (AOR 4.82, 95% CI 4.62 - 5.04, P value 0.0002) were more likely to be virally suppressed than clients on 3–5 months MMD.

Conclusions: The study demonstrated high viral suppression among PLHIV on MMD compared to clients on no MMD. Clients on 6 months plus MMD showed better viral suppression than clients on 3–5months MMD.

Key words: PLHIV, MMD, Viral Suppression, Nigeria

EPD458

"Only if it was better": perspectives and preferences on long-acting injectable antiretroviral use among people living with HIV

H. Gonzalez Rodriguez[1], A. Volcan[2], B. J. Uhrig Castonguay[2], M. Peretti[3], A. Suarez[4], C. Barrington[1], D. Kerrigan[5], D. Wohl[2]

[1]*University of North Carolina at Chapel Hill, Department of Health Behavior, Gillings School of Global Public Health, Chapel Hill, United States,* [2]*University of North Carolina at Chapel Hill, School of Medicine, Chapel Hill, United States,* [3]*Fenway Community Health, The Fenway Institute, Boston, United States,* [4]*La Clinica del Pueblo, Washington, United States,* [5]*George Washington University, Department of Prevention and Community Health, Milken Institute School of Public Health, Washington, United States*

Background: In 2021, the Food and Drug Administration (FDA) approved long-acting injectable antiretroviral therapy (LAI-ART) for HIV treatment. LAI-ART will have two dose options for in-clinic administration: a four-week (FDA approved) and an eight-week dose (FDA approval pending). LAI-ART will provide people living with HIV (PLWH) more options in HIV treatment frequency and delivery, while also raising new questions and concerns.

The purpose of this study was to characterize LAI-ART perceptions and preferences among PLWH.

Methods: We conducted qualitative in-depth interviews with 71 PLWH receiving HIV care at three clinics in the eastern United States from December 2019 through April 2021 as part of the Shared Decisions when Choosing between Long-Acting Injecting or Oral Therapy (SELIGO) study. We purposively sampled participants by viral suppression, gender identity, ethnicity, and language preference. Per participant preference, we conducted interviews in English (n=40) and Spanish (n=31) using a semi-structured interview guide to elicit narratives of HIV care experiences, and LAI-ART perspectives and preferences. Interviews were transcribed verbatim and analyzed in their original language using narrative analysis, thematic coding in Dedoose, and matrices to compare findings across sites and participant characteristics.

Oral abstracts

Poster exhibition

E-posters

Late-breaker abstracts

Author Index

Results: Most participants were virally suppressed (n=52) and, on average, were aged 46 and traveled 44 minutes to their clinic. Most preferred the 8-week LAI-ART dose to reduce clinic visits. Compared to oral ART, potential LAI-ART benefits included reduced adherence burden and risk of unwanted HIV disclosure, and LAI-ART possibly being "better" or "stronger".

LAI-ART concerns included side-effects, effectiveness, safety, developing resistance due to missed doses, dislike of injections, cost, and inconveniences resulting from increased clinic visits. Desired support to facilitate LAI-ART use included transportation and financial assistance, appointment notifications, service bundling, fast injection visits, and more LAI-ART information.

Conclusions: Findings highlight the need to understand perceived LAI-ART benefits and concerns among PLWH to inform introduction and promote uptake of this treatment innovation.

Discussions about LAI-ART need to balance patient interest with concerns about safety, effectiveness, and logistics to help determine which HIV treatment will work best for their individual needs and circumstances. PLWH may also benefit from logistical support to facilitate access and optimize LAI-ART use.

EPD459

Poor HIV treatment adherence and barriers to medication management among adolescents in Western Kenya

L.L. Sabin[1], L.J. Messersmith[1], H. Chergui[2], N. Sarkisova[1], J. Oyombra[3], P. Akello[4], J. Otieno[5], D.O. Kwaro[6], M.A. Onyango[1]

[1]Boston University School of Public Health, Global Health, Boston, United States, [2]Last Mile Health, Monitoring and Evaluation, Boston, United States, [3]Jaramogi Oginga Odinga Teaching and Referral Hospital, Comprehensive Care Center, Kisumu, Kenya, [4]Uzima University, School of Nursing, Kisumu, Kenya, [5]Uzima University, Department of Pediatrics and Child Health, Kisumu, Kenya, [6]Kenya Medical Research Institute, Research, Kisumu, Kenya

Background: HIV incidence in Kenya is declining in all age groups except in persons 15-24 years of age. HIV-related morbidity remains the leading cause of death among adolescents. For many, maintaining consistently high adherence to antiretroviral therapy (ART) is a major challenge.

The overarching purpose of this study was to better understand the situation of adolescents living with HIV (ALWHIV) in western Kenya to inform potential interventions to improve their ART adherence. The specific objectives were to:

1. Measure adherence levels among ALWHIV using electronic adherence monitors (EAM) and
2. Investigate individual, interpersonal, community, and structural level barriers to ART adherence in this population.

Methods: We conducted a mixed methods study from August to November 2018 at the comprehensive care center of Jaramogo Oginga Odinga Teaching and Referral Hospital in Kisumu, Kenya. Study participants included ALWHIV aged 15-19 years and three groups of key informants (KIs): teachers, caregivers, and healthcare providers.

We first measured adolescents' ART adherence via EAM for three months, and categorized their adherence by optimal (≥95%) or sub-optimal (<95%).

We then conducted individual in-depth interviews (IDIs) and focus group discussions (FGDs) with adolescents and KIs. IDIs and FGDs were analyzed in NVivo using a thematic approach.

Results: A total of 24 ALWHIV completed adherence monitoring and participated in IDIs along with five participants in each KI group (15 total). Two FGDs were conducted with adolescents and one FGD with each group of KIs (five total). Only two ALWHIV achieved optimal adherence; nearly half (11, 46%) had <80% adherence.

Qualitative data revealed that school-based challenges posed the most substantial barriers to effective medication management, including an unsupportive school environment and culture, lack of confidentiality, difficulty keeping friends, and fear of verbal and physical abuse by teachers and peers.

Additional adherence barriers included the size and taste of medicines, and noisy medicine containers. Political violence and economic hardship hindered service access. HIV-related stigma was a cross cutting theme at all levels.

Conclusions: We identified formidable barriers to ART adherence among ALWHIV in western Kenya, particularly in the school environment. School-based interventions are urgently needed for this vulnerable population

Growing up with HIV: Specific needs and interventions for children and adolescents

EPD460

Understanding needs of South African adolescents living with perinatally-acquired HIV to inform a smartphone app to improve social support and treatment adherence

M.I. Mulawa[1,2], B. Mtukushe[3], A. Saslafsky[1], M. Matiwane[3], H. Wilkinson[4], J. Keenan[1], K.E. Muessig[5], L.B. Hightow-Weidman[6,5], J. Hoare[3]
[1]*Duke University, School of Nursing, Durham, United States,* [2]*Duke University, Duke Global Health Institute, Durham, United States,* [3]*University of Cape Town, Department of Psychiatry and Mental Health, Cape Town, South Africa,* [4]*Duke University, Durham, United States,* [5]*University of North Carolina at Chapel Hill, Gillings School of Global Public Health/Health Behavior, Chapel Hill, United States,* [6]*University of North Carolina at Chapel Hill, Medicine/Infectious Diseases, Chapel Hill, United States*

Background: Innovative interventions are needed to support adolescents living with perinatally-acquired HIV (APHIV). Our team is adapting an evidence-based smartphone app-delivered intervention co-created with youth in the United States to improve treatment adherence among APHIV in Cape Town, South Africa. The intervention is designed to foster social support, facilitate connection with peer mentors and health experts, offer tools for self-monitoring, and present users with engaging information.

We conducted this study to understand the health needs and preferences of APHIV in this setting to inform the adaptation process and the development of tailored content to meet their needs.

Methods: We conducted in-depth interviews with 15 APHIV (15-19 years) between January – March 2021. The interviews addressed APHIV's health-related challenges and unmet needs, including questions about the impact of the COVID-19 pandemic. Participants learned about potential app features and content topics and were asked to rank both according to their interests. Data were analyzed using applied thematic analysis using an interactive cycle of coding and consensus building.

Results: Most participants described the instrumental role of social support, though many reflected on the limitations of support provided by family, the limited opportunities for peer support given anticipated stigma and fear of disclosure, and the negative impact of COVID-19 on the frequency and quality of clinic-based support groups.

Consequently, participants were enthusiastic about the prospect of communicating with others in the app's forum, with many noting the benefits of doing so anonymously. Participants also discussed the importance of connection to health experts (both lay and professional) and rated the ask the expert features highly, reflecting their desire to receive individualized and timely feedback from health experts. Finally, participants reported informational gaps around prevention of mother-to-child transmission, PrEP, and treatment as prevention. Participants were enthusiastic about features of the app (e.g., activities and resources) that could address these unmet gaps.

Conclusions: Our findings highlight the needs of APHIV for additional social support and connection to health experts. The results support the inclusion of all existing app features and underscore the importance of customizing content to address informational gaps, tackle stigma, and support disclosure.

EPD461

Oral History of paediatric HIV in the UK: a participatory approach

A. Ely[1], W. Rickard[1], E. Fitzgerald[1]
[1]*CHIVA, Bristol, United Kingdom*

Background: The spoken history of HIV has been important in order to capture and preserve our past and to inform the present and the future. However, there are gaps in current historical records about HIV. Cutting edge, grassroots projects are still needed to capture the experiences of those most hidden from history. The voices of the young who grew up with HIV are currently missing from historical records.

Description: The on-going Positively Spoken Project gathers the life histories of 50 young people (now aged 16-30 years) who grew up with HIV in the UK (70% African).

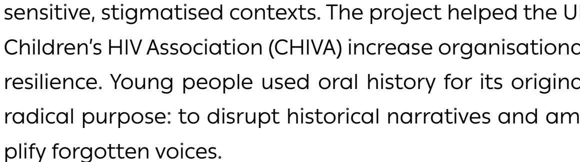
Young people had a leading paid role in planning, shaping and delivering this sensitive, peer-driven project in partnership with professional oral historians at the British Library and with psychological support. We archived the stories for the future.

We share our participative experiences of designing training, adapting methodology from trauma contexts and asserting youth agency over planning, procedures and archival products.

Lessons learned: By definition, the project posed privacy challenges by revealing mothers' HIV diagnoses. These paediatric stories were hence closed for 70 years under complex recording agreements. Young people helped devise protective procedures to use a limited amount of the data for current research outputs and to archive the remainder for systematic release at specified future times.

We developed new ethical practices, devised exciting supported batch peer interviewing techniques and challenged international oral history protocols for the future, working closely with specialist archivists.

Conclusions/Next steps: The outcomes are significant in making it possible to capture and preserve different experiences of perinatal HIV treatment and care through the eyes of a child. Peer interviewing gathered highly original insights and gave youth agency and ownership of the diverse life stories, often being shared for the first time in



sensitive, stigmatised contexts. The project helped the UK Children's HIV Association (CHIVA) increase organisational resilience. Young people used oral history for its original radical purpose: to disrupt historical narratives and amplify forgotten voices.

EPD462

Can an adolescent HIV psychosocial attrition risk assessment tool predict lost to follow up? Preliminary findings from Uganda

N. Medina-Jaudes[1], D. Adoa[2], N. Aziz[3], K.J. Bosco[3], A. Carmone[1], S. Dowling[1], J. Joseph[1], E. Magongo Namusoke[3], K. Mary[3], M. Mbabazi[3], V. Nabitaka[2], B. Namayanja[3], K. Suggu[1], A. Williams[1], A. Musoke[2], T. Nabwire Chimulwa[3]

[1]Clinton Health Access Initiative, Inc., Boston, United States, [2]Clinton Health Access Initiative, Inc., Kampala, Uganda, [3]Ministry of Health, Uganda, Kampala, Uganda

Background: Retention in HIV care impacts medication adherence and viral suppression, and factors influencing attrition from HIV care are multifactorial for adolescents. To help identify adolescents at risk for loss-to-follow-up (LTFU) and more effectively target interventions to improve retention and viral load (VL) suppression, we are developing and evaluating an adolescent psychosocial attrition risk assessment (APARA) tool for predicting attrition from HIV care among adolescents in Uganda.

Methods: The APARA tool will be implemented from November 2021 through July 2022. 20 facilities were randomly selected for implementation, stratifying by region and urban/rural designation.

Adolescents living with HIV, aged 15-19 years, who are currently on antiretroviral therapy (ART) and active in care at the facility are eligible for enrollment. Healthcare workers will administer the APARA tool at enrollment and each standard-of-care visit for 6 months.

Patient data such as ART visit dates and most recent viral load are extracted from study participants' medical records. While LTFU status can't yet be analyzed, a stepwise backwards multivariate model was used to determine preliminary predictors of unsuppressed VL.

Results: By December 2021, 461 adolescents had been enrolled. Participants were on ART for an average of nine years; about 10% were on ART for less than one year. Of the 424 participants with VL results, 92% were virally suppressed.

An adolescent was more likely to be unsuppressed if they were initiated on ART at an advanced stage of HIV (Odds Ratio (OR): 11.13), on second line treatment (OR: 6.04), had fair or poor adherence (OR: 7.39), or if they had missed any of their previous three appointments (OR: 4.65).

An adolescent was more likely to be suppressed if they received an ARV refill for 60 or more days (OR: 0.07).

Conclusions: Early results have shown what risk factors are associated with unsuppressed VL. The study's final analysis will assess whether scoring the APARA tool and finding a specific cut-off point can accurately predict participants' LTFU status. The tool is expected to assist the program in identifying adolescents at risk of attrition early-on so appropriate or extra support can be provided to minimize LTFU.

EPD463

Enhancing lives of children in HIV-positive widow-headed households: A peer-led program in southern India

G.N. Raju[1], A. Kant[2], F. Santhosh[1], C. Salian[3], G. D[3], F.T. Thomas[3], M. Raj[3], K. Laxmikanth[3], B. Seenappa[3], A. Shet[2]

[1]Sparsha Care Home, Sparsha Care Home, Kaudiyal(s), Nirugudi(P), Basavakalyan(tq), Bidar(d), Bidar, India, [2]Johns Hopkins University, Johns Hopkins Maternal and Child Health India Center, Baltimore, United States, [3]Sneha Charitable Trust, Snehagram, Banglore, India

Background: HIV-positive widows face the double burden of being husbandless and living with a stigmatizing illness. Karnataka state in southern India is home to 25,000 HIV-positive widow-headed households in 2018, likely an underestimate. Most reside in low-income communities with limited access to resources and poor HIV care access. Many face stigma, violence and discrimination, resulting in deep negative impact on their children's lives.

To reach these children and improve their quality of life, Sneha Charitable Trust (SCT)'s peer leader program worked closely to empower HIV-positive women-headed households. We present the preliminary outcomes after one year (January-December 2020) of this intervention.

Description: SCT peer leaders (HIV-positive youth with demonstrable leadership potential) identified 175 children and adolescents who resided in HIV positive widow-headed households.

The intervention had four components;

i. Family counseling on addressing stigma, HIV disclosure, ART adherence, continuing education of children, and sustainable livelihoods;

ii. Facilitating access to health services, including ART;

iii. Provision of essential nutrition supplies during the strict lockdown period; and,

iv. Establishing linkages with government schemes that can benefit the HIV positive widow-headed families.

The program promoted HIV-positive single mothers to be change agents in the community and helped them to reach out to other vulnerable women.

Lessons learned: The peer-led program enhanced the adherence to ART among HIV-positive single mothers to 94% and among children to 92%. 80%of HIV-positive single mothers expressed that they were able to disclose their HIV-positive status to their children.

Assistance with existing government schemes led to 55% women getting enrolled in the widow pension scheme and 60% women availed ration cards that would provide them access to basic household needs and nutritional supplies.

Prior to the program initiation, school drop-out rate was high among children of these women; however the peer leaders' engagement also encouraged the widowed mothers to pay attention to education, and over 90% of the children from HIV positive women-headed households got enrolled in school.

Conclusions/Next steps: The peer-led pilot program empowered HIV-positive single mothers by enhancing their self-confidence and self-efficacy that positively impacted their children's lives.

Further scale-up can have intergenerational effects which can contribute towards poverty alleviation measures.

	Female Peer Members				Response to "have experience with pregnancy" or "given birth at least once"			
	10 - 14	15 - 19	20 - 24	Total	10 - 14	15 - 19	20 - 24	Total
Makambako TC	60	74	167	301	4	69	73	146 (49%)
Njombe TC	48	58	51	157	0	13	15	28 (18%)
Njombe DC	33	43	43	119	3	1	4	8 (7%)
Ludewa DC	26	35	29	90	3	8	12	23 (26%)
Wanging'ombe DC	65	53	76	194	4	21	25	50 (26%)
Makete DC	52	50	28	130	1	10	11	22 (17%)
Subtotal	284	313	394		15 (5%)	122 (39%)	140 (36%)	
Total				991				277 (28%)

Table: Pregnancy and births data among female peer members in Njombe, Tanzania

Conclusions: This study demonstrates the large burden of pregnancy among adolescents and young women living with HIV and emphasizes the importance of including approaches to address adolescent pregnancy into general HIV programs. For programs in Tanzania, the study shows that there is a wealth of local resources to establish "Peer-to-Peer" programs, i.e., experienced adolescent mother mentors.

EPD464

Pregnancy and early motherhood among adolescent community ART networks in Tanzania

B. Kasambala[1], K. McKenzie[1,2,3], S. Ndunguru[1], R. Chakupewa[1], L. Mwita[1]

[1]Baylor College of Medicine Children's Foundation - Tanzania, Mbeya, Tanzania, The United Republic of, [2]Baylor College of Medicine, Houston, United States, [3]Baylor International Pediatric AIDS Initiative (BIPAI) at Texas Children's Hospital, Houston, United States

Background: Adolescent pregnancy remains a major challenge in both developed and developing countries. Early and unintended pregnancies among adolescents are associated with multiple adverse health, educational, social, and economic outcomes.

Methods: We used community antiretroviral therapy (CART) registers from 33 established CART networks in Njombe region, Tanzania, to examine response trends associated with adolescent pregnancy.

Field teams collected data from CART registers of 991 female members who responded to have been pregnant or given birth. The analysis focused on a subsample of adolescents aged 10 to 14 years.

Results: Adolescent pregnancy and early motherhood in peer members is common in the districts of Njombe region, ranging from 7% among adolescents in Njombe DC to 49% in Makambako TC, with a total of 277 (28%) in all six districts combined (see table).

Although all six districts experienced a low number of adolescent pregnancies in the 10 to 14-year-olds, the numbers were variable. More than 70% (196/277) of the 15 to 19-year-old adolescents who experienced pregnancy and/or births in these districts were from Makambako TC and Wanging'ombe DC.

The analysis showed that more than half (140/277) of the adolescent and young mothers were in the 20 to 24-year-old age category but when looking at proportion of total peers members, the 15 to 19-year-old group had the highest amount at 39% (122/306).

EPD465

"Our children are coming to us with trauma and loss. Healthcare providers need to know that.": perspectives on accessing healthcare among parents of Internationally Adopted Children Living with HIV

C. Fair[1], F. Glover[1], C. Crowell[2], R. Olivero[3]

[1]Elon University, Public Health Studies, Elon, United States, [2]von Haunerscher Children's Hospital, Pediatrics, Munich, Germany, [3]Helen DeVos Children's Hospital, Pediatric Infectious Disease, Grand Rapids, United States

Background: The number of internationally adopted children living with HIV (IACH) in the U.S. has increased over the past decade. IACH are more likely to have neurocognitive deficits and behavioral/emotional challenges than non-IACH youth.

This qualitative project aims to understand parents' perspectives on their child's medical care.

Methods: Twenty-three parents of IACH from 14 U.S. states completed hour-long audio-recorded semi-structured phone interviews focused on parents' perspectives on their child(ren)'s experiences with health care during summer 2021. The purposive sample was recruited from two pediatric infectious disease clinics (n=5) and a private Facebook group (n=18). Drawing on analytic principles of constant comparison, transcripts were analyzed for emergent themes.

Results: Most parents identified as white (n=22/23), female (n=22/23), and Christian (n=22/23), (mean age = 42.7 years). All were married with private insurance. Some parents cared for several IACH. Of the 29 IACH (16 male, 13 female), all were virally suppressed. Sixteen were adopted from African countries (mean age at adoption = 5.5 years

Oral abstracts

Late-breaker abstracts

Author Index

(range 0.5-15), current mean age= 12.7 years (range 1-24).
Results indicated parents had close connections with their pediatric infectious disease (PID) team: "they've been through every stage of her life." Several shared experiences of discrimination from providers outside the PID clinic environment. Families emphasized that healthcare providers needed to prioritize the developing parent-child relationship during all encounters.
For example, parents suggested that providers offer the opportunity for parents to privately share concerns that may be due to "trauma, attachment, and trust." Parents appreciated trauma-based care when available.
Accessing mental health clinicians with expertise in adoption-related trauma was noted as a significant challenge particularly since all IACH had histories of abandonment and loss. Further, parents underscored the importance of diversity within their healthcare providers as few Black IACH had providers of color.
Finally, most parents expressed apprehension about transitioning from pediatric to adult infectious disease care.
Conclusions: Medical management of HIV was not a high burden. Providers should recognize the important role the parent-child relationship plays in the overall wellbeing of the child particularly as they mature into adolescence. Access to trauma-informed medical and mental health care is essential to supporting this unique population.

HIV and the workplace: Policies, responding to stigma and/or discrimination, unemployment, return to work and rehabilitation

EPD466

Because she cares: Using spoken word films as a performance-educational tool to catalyze discussion around Canadian AASO employment as (un)caring work for African, Caribbean and Black women living with HIV

L.A. Chambers[1,2], E. Gzuha[2], G. Kwaramba[2], C. Mukandoli[2], V. Pierre-Pierre[2], J. Snagg[2], M. Sumner-Williams[2], P. Tshuma[2], M. Muchenje[1,2], P. Maseko[2], W. Murombedzi[2], F. Ongoiba[3,2], L. Soje[2], A. Bassolé[4,2], C. Idibouo[3,2], H. Inoua[4,2], M. Aden[5,2], K. Arnold[2], T. Bennett[2]
[1]University of Toronto, Factor Inwentash School of Social Work, Toronto, Canada, [2]The Because She Cares Collaborative, Toronto, Canada, [3]Africans in Partnership Against AIDS (APAA), Toronto, Canada, [4]AIDS Committee of Ottawa, Ottawa, Canada, [5]Women's Health in Women's Hands Community Health Centre, Toronto, Canada

Background: Employment in Canadian AIDS service and allied organizations (AASOs) can benefit African, Caribbean and Black women living with HIV (ACBWH) and realize their rights of greater involvement and meaningful engagement in HIV responses. Yet, concerns exist on how HIV disclosure, employment precarity, risks of burnout and the work's emotional labour can be harmful. Care concerns stemming from HIV service employment demands critical reflection to assure the health and well-being of ACBWH-employees.
Description: *Because She Cares* is a participatory performance narrative art project (poetry and spoken word performance) that uses educational-entertainment methods to translate and mobilize research findings into educational tools on AASO employment. Qualitative findings on the experiences of ACBWH-employees were translated into 12 short spoken word films, which were screened online, followed by post-performance dialogues (i.e., "kitchen table talks") amongst AASO employees in Ontario, Canada.
Lessons learned: In November 2021, we hosted three (3) screenings followed by six (6) facilitated kitchen table talks amongst 20 participants: immigrant ACBWH AASO employees and AASO allied employees. Participants welcomed the use of spoken word film to translate the lived experiences of immigrant ACBWH who work in AASOs. ACBWH-employees felt the film sufficiently captured their experiences of AASO employment.
The screenings, followed by kitchen table talks, aided AASO allied participants to develop a more empathetic understanding of intersecting forms of discrimination and institutional oppression that ACBWH-employees navigate within AASO workplaces including anti-Black racism and gendered, racialized and ethnocultural normative of caring work.
Uncaring work practices discussed included tokenism in AASO employment, credentialism and devaluation of experiential knowledge, inadvertent HIV disclosure through one's work, and balancing the "multiple hats" of caring as AASO workers, community leaders, mothers, partners, and transnational caregivers.
Conclusions/Next steps: Because She Cares offers an innovative way to translate and mobilize research findings as a performance-educational intervention. The piloted educational tool shows promise in catalyzing discussion around developing informal and formal support strategies that could better assure the care and well-being of ACBWH-employees in AASOs.
The next phase will develop a series of modules on ACBWH AASO employment for implementation in Canadian AASOs.

EPD467

Ending discrimination in the workplace

V. Sainz Ballesteros[1], E. Massa[2], S. Stolfo[3]

[1]*Fundación Huésped, Buenos Aires, Argentina,* [2]*SAP, Buenos Aires, Argentina,* [3]*IBM, San Pablo, Brazil*

Background: Workingpositively is an international program designed to fight discrimination related to HIV/AIDS in the workplace.

Description: Workingpositively was officially launched in June 2019 in Germany in cooperation with IBM, SAP, and the German Aidshilfe. From there it spread throughout the world and is now active in the USA, Latin America, Germany, Austria, Switzerland, Czech Republic, Australia, and New Zealand with over 250 signing organizations. Local NGOs design a pledge for companies to sign to become visible role models internally and externally in the fight against discrimination of employees with HIV in the workplace.

This project has shown us that people with HIV still suffer stigmatization and that knowledge about this infection has not improved significantly over the past years. Fundación Huésped is the lead organization for Latin America.

"Last year, Fundación Huésped received 20.000 inquiries, 25% of which referred to discrimination in the working place. The cases were related to pre-employment testing, violation of confidentiality, access to health insurance, and discrimination after diagnosis" emphasizes Leandro Cahn, Executive Director of Fundación Huésped.

Lessons learned: Our reach and awareness of this global initiative has proven that our mission deeply moves the community and that the societal need for projects like this is apparent. Together with HR and D&I partners of signatories, #workingpositively enhances the mental well-being of employees, raises awareness for HIV, and provides support structures for open and inclusive communication. Concretely, Fundación Huésped has introduced a virtual e-learning course for HIV in the workplace that is exemplary for how destigmatization and knowledge building are driven.

Furthermore, during the course of World AIDS Day 2021, an external event was held to reach maximum awareness for our fight against discrimination in the workplace, where over 76 Latin American companies were present.

Conclusions/Next steps: The aim is to launch this project in every country worldwide thus, significantly reducing the stigma and discrimination of employees living with HIV in the workplace.

We can conclude that over 250 supporting companies worldwide contribute, and we seek to enlarge this number to 300 by the end of 2022.

EPD468

Trade Unions contribute to the development of non-discriminatory workplace policies for workers living with HIV

E. Nuriana[1], M. Trisiswati[2], D. Schaaf[3], S. Sudjatmiko[4], L.M. Usman[5], T. Pangaribuan[6]

[1]*International Labour Organization, HIV/AIDS, Jakarta, Indonesia,* [2]*University of Yarsi, HIV/AIDS Care, Jakarta, Indonesia,* [3]*International Labour Organization, Gender, Equality, Diversity and Inclusion Branch, Geneva, Switzerland,* [4]*Confederation of Indonesia Moslem Labour Union (K-Sarbumusi), Jakarta, Indonesia,* [5]*Confederation of National Trade Union (KSPN), Jakarta, Indonesia,* [6]*All Indonesia Trade Union Confederation (KSPSI – AITUC), Jakarta, Indonesia*

Background: HIV-related related discrimination continues to persist, including in the workplaces. 63% respondents in an ILO Gallup survey 2021, in Indonesia reported that people who have HIV should not be allowed to work with those who don't have HIV.

Trade unions took up the challenge of developing non-discriminatory HIV workplace policies working in close collaboration with employers.

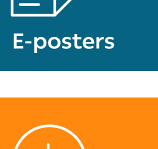
Description: During 2020 and 2021, ILO supported three union confederations in Indonesia (KSPN, KSPSI-AITUC and K-Sarbumusi) to advocate for the development of non-discriminatory policy for workers living with HIV. The PLHIV community, District Aids Commission and District Health Office were engaged in this process.

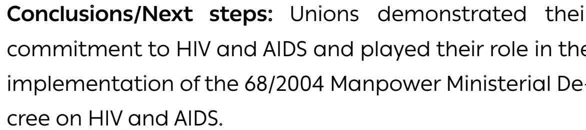
Three non-discriminatory policies were developed at national confederation level, district level and company level in prioritized sectors (land transport, sea farers and garment). 45 peer educators who were trained reached out to over 3,600 workers, IEC/campaign materials were developed and disseminated. HIV testing reached 267 male and 106 female workers.

KSPN has successfully negotiated a clause in the renewed collective bargaining agreement that covers the right of workers living with HIV to continue working and the regular implementation of a training on harassment, violence, and HIV awareness.

Lessons learned:

1. Strong leadership, a good relationship with top management and buyer representatives created a mutual collaboration between union organization and the company management on developing a non-discriminatory policy for PLHIV at the workplace.
2. Strong trade union leadership in certain sectors can play an important role in prioritizing those workplaces with workers who are more vulnerable for HIV infection, for example the transport, informal, seafarers and seaport crew sectors.
3. The trained HIV peer educator among union member, tailor-made campaign tools and IEC material that were sector specific increased more interest among union members to join the HIV prevention session both inside and outside the companies.





Conclusions/Next steps: Unions demonstrated their commitment to HIV and AIDS and played their role in the implementation of the 68/2004 Manpower Ministerial Decree on HIV and AIDS.
This strategic intervention was communicated to Ministry of Health and Ministry of Home Affairs as a model for replication and scaling up. K-Sarbumusi scheduled the replication to other companies in different district.

Living with HIV and co-infections and/or co-morbidities

EPD469
Old driver, new insight: the perspective of Spanish-speaking drug users on HIV and overdose prevention

R. Melendez[1], S. Zepeda[2], A. Martinez[1]
[1]*San Francisco State University, Sociology and Sexuality Studies, San Francisco, United States,* [2]*San Francisco AIDS Foundation, Latino Programs, San Francisco, United States*

Background: Providing HIV services to Spanish-speaking immigrants is challenging especially when drug use is involved. Previous research marks low levels of engagement with harm reduction services among Spanish-speakers. Low engagement may be due to stigma, lack of services available in Spanish, lack of structural access, misconception of individual needs, and social determinants like economic instability and fear of interaction wit government agencies.
Methods: We conducted two qualitative studies exploring issues of access to HIV and overdose prevention services for Spanish-speaking drug users and homeless immigrant populations in the San Francisco Bay Area from 2019 to 2021. Both studies sought to increase and assess needs and provide HIV prevention and treatment among Spanish-speaking immigrants.
Recruitment was a multi-part, labor intensive process and resulted in new findings for both research recruitment and engagement with services. Bi-cultural recruiters, knowledgeable of both Spanish-speaking immigrant cultures and languages as well as with issues relating to homelessness and drug use approached individuals in diverse locations. Informational interviews were conducted with individuals to assess knowledge of services, interest in services, and needs specific to Spanish-speakers.
Analysis of interviews were conducted by a multi-disciplinary team to find common themes and information useful for identification and recruitment for services.
Results: We found that many participants would not refer or use terms in Spanish that describe themselves as a drug user. Furthermore, participants often thought they were taking medicine to treat fatigue or restlessness without understanding that family or friends had given them illicit drugs.
Overwhelmingly participants had little knowledge of how to treat an overdose but had some experience with overdoses and wanted to learn what they could do to help.
Conclusions: Building trust and rapport with participants required multiple points of contact and enticement through incentives and services, which highlights how easy it is for Spanish-speaking immigrants to fall through gaps of both recruitment and identification and not access harm reduction services. Basic knowledge of drug use, HIV prevention and use of naloxone were lacking among Spanish-speaking immigrants in San Francisco.
Service providers need to be Spanish-Latino-Centered, with specific drug users, and immigrant cultural foundations beyond just having the language skills.

EPD470
Self-care in the time of reduced in person consultations: experiences of patients' self-management of HIV, hypertension and diabetes

A. Nyatela[1], S. Nqakala[1], T. Johnson[1], S. Gumede[1]
[1]*University of Witswatersrand, Ezintsha - Wits Health Consortium, Johannesburg, South Africa*

Background: Globally Covid-19 has imposed constraints for in-person healthcare service delivery and utilization. This has placed self-care in the spotlight as being central to improving and/or maintaining good clinical outcomes, particularly from health policymakers and healthcare service providers.
Albeit not new, patient experiences of self-management as part of clinical care are not extensively documented in South Africa. Thus, initiatives to understand acceptability and practice of self-management from the patient perspective are required.
Methods: Semi-structured interviews were conducted with 46 patients living with HIV and hypertension and/or diabetes, during January to March 2021. Individuals were purposively recruited from four primary health clinics in Johannesburg, South Africa. Participants answered questions about their self-management practices and motivations, ability, and willingness to use monitoring devices, and the presence of support networks. Interviews were transcribed, translated, and thematically analyzed post quality assurance processes.
Results: Most of the participants were female, aged 35-70 years, from 11 ethnicities, and across three nationalities (majority South African, and the rest, Zimbabwean and Malawian). Patients reported their self-management practices as diet modification, stress management and medication adherence.
While patients did not mention self-monitoring devices as part of self-management, when prompted, the majority responded positively to the use of self-monitoring devices, provided they bear no personal cost. Of those who responded positively, all agreed they needed support for device use, which included, demonstration, device main-

tenance, interpretation of results, and knowing when to approach a healthcare service provider. Although, for several participants, family and work life cause stress and potentially negatively affect their conditions, participants also noted these structures as their main source of support in the management of diet and adherence to medication.

Conclusions: Self-care could play a significant role in healthcare systems because of patient acceptability of their current practices. Additional to the possible clinical successes, self-care can contribute to decreased service disruption, reduced waiting times, financial burden, and overall improvement in the utilization of healthcare resources.

Assessment of pandemic preparedness has heightened the value of self-care and its role for strengthening healthcare systems, highlighting the urgency for healthcare decision makers to fast-track self-monitoring and management programmes.

EPD471

The mental health of people living with HIV: prevalence and associations of depression, anxiety and stress

S. Opoku Agyemang[1], J. Ninonni[1], L. Bennin[1], E. Agyare[2], L. Gyimah[3], K. Senya[4], E. Birikorang[5], E. Nii-Boye Quarshie[6], A. Nyonuku Badoo[7], D. Obiri-Yeboah[8,2]

[1]University of Cape Coast, Department of Mental Health, Cape Coast, Ghana, [2]Cape Coast Teaching Hospital, Public Health Unit, Cape Coast, Ghana, [3]World Health Organization Country Office, Mental Health Desk, Accra, Ghana, [4]World Health Organization Country Office, Communicable and Noncommunicable Diseases Cluster, Accra, Ghana, [5]University of Cape Coast, Department of Laboratory Technology, Cape Coast, Ghana, [6]University of Ghana, Department of Psychology, Accra, Ghana, [7]National AIDS/STIs Control Programme, Clinical Care Division, Accra, Ghana, [8]University of Cape Coast, Department of Microbiology and Immunology, School of Medical Sciences, Cape Coast, Ghana

Background: An important but less researched burden of HIV in sub-Saharan Africa includes the associated psychosocial and mental health outcomes of living with the virus.

This study aimed to estimate the prevalence of depression, anxiety, and stress and describe some of the socio-demographic associations among people living with HIV (PLHIV) presenting to a teaching hospital in Ghana.

Methods: Analytical cross-sectional research study was conducted at the Cape Coast Teaching Hospital, Ghana. Simple random sampling was used to recruit 395 PLHIV who access HIV related services from the antiretroviral therapy clinic. The Depression, Anxiety and Stress Scale - 21 (DASS-21) was used to assess prevalence of depression, anxiety and stress over the previous one week. Frequencies and percentages were used to estimate the prevalence and multivariable logistic regression was used to evaluate socio-demographic factors associated with depression, anxiety, and stress.

Results: The prevalence estimates of depression, anxiety and stress among PLHIV were 28.6% (95%CI 24.4-33.3), 40.8% (95%CI 36.0-45.8) and 10.6% (95%CI 7.9-14.1), respectively. Females experienced higher prevalence of depression 32.2% (95% CI 27.2-37.7), anxiety 44.0% (95% CI 38.4-49.6) and stress 12.6% (95% CI 9.4-17.0) compared to depression 17.5% (95% CI 11.1-26.4), anxiety 30.9% (95% CI 22.5-40.7) and stress 4.1% (95% CI 1.2-10.4) among males.

PLHIV without a regular partner were about 0.63 increased odds of experiencing anxiety compared to those with a regular partner (AOR= 0.63, 95% CI 0.40-1.00: p= 0.049). PLHIV without formal education were about 0.49 and 0.44 increased odds to experience anxiety and stress, respectively compared to those with tertiary education.

Among females, factors such as age, marital status, employment status, and educational level were not significantly associated with depression, anxiety, and stress. However, in males, educational level was associated with depression (AOR, 0.11, 95% CI 0.02-0.73:p= 0.02) and anxiety (AOR=0.18, 95% CI 0.04-0.86: p= 0.031).

Conclusions: The levels of stress, anxiety and depression are high, and females are disproportionately affected. Mental health assessment and management should be included in the HIV care guidelines.

Also, there should be capacity building for health care workers to offer differentiated service delivery based on mental health care needs of PLHIV.

EPD472

Prevalence and co-occurrence of symptoms of mental disorders and substance use among people with HIV aged ≥40 years in low- and middle-income countries in the Sentinel Research Network of IeDEA

M. Stockton[1], K. Lancaster[2], C. Bernard[3], T. Kanguya[4], E. Kwobah[5], B. Crabtree-Ramírez[6], G. Murenzi[7], J. Ross[8], A. Minga[9], M. Tlali[10], S. Goodrich[11], F. Maruri[12], C. Ingabire[7], S. Nimkar[13], M. Wainberg[1], A. Parcesepe[14], IeDEA Consortium

[1]Columbia University, Department of Psychiatry, New York, United States, [2]The Ohio State University, Department of Epidemiology, Columbus, United States, [3]University of Bordeaux, National Institute for Health and Medical Research, Research Institute for Sustainable Development, Bordeaux Population Health Research Centre, Bordeaux, France, [4]Centre for Infectious Disease Research in Zambia, Lusaka, Zambia, [5]Moi Teaching and Referral Hospital, Department of Mental Health, Eldoret, Kenya, [6]Instituto Nacional de Ciencias Médicas y Nutrición, Departamento de Infectología, Mexico City, Mexico, [7]Rwanda Military Hospital and Research for Development (RD Rwanda), Kigali, Rwanda, [8]TREAT Asia/amfAR, The Foundation for AIDS Research, Bangkok, Thailand, [9]Centre Medical de Suivi de Donneurs de Sang/CNTS/PRIMO-CI, Abidjan, Cote D'Ivoire, [10]University of Cape Town, Centre for Infectious Disease Epidemiology & Research (CIDER), School of Public Health & Family Medicine, Cape Town, South Africa, [11]Indiana University School of Medicine, Division of Infectious Diseases, Indianapolis, United States, [12]Vanderbilt University, Division of Infectious Diseases, Nashville, United States, [13]Byramjee Jeejeebhoy Government Medical College - Johns Hopkins University Clinical Research Site, Pune, India, [14]University of North Carolina at Chapel Hill, Department of Maternal and Child Health, Chapel Hill, United States

Background: Mental and substance use disorders (MSD) are commonly reported among people living with HIV (PLWH). Little is known about the prevalence and co-occurrence of MSD among older PLWH in low- and middle-income countries.

Methods: We analyzed cross-sectional baseline data from the International epidemiology Database to Evaluate AIDS (IeDEA) Sentinel Research Network (SRN) cohort of PLWH aged ≥40 years on antiretroviral therapy from six sentinel HIV clinics within the Asia-Pacific, the Caribbean, Central and South America, Central Africa, East Africa, Southern Africa, and West Africa IeDEA regions.

We documented the prevalence of symptoms of moderate to severe depression (PHQ-9 ≥10), anxiety (GAD-7 ≥10), or post-traumatic stress disorder (PTSD) (PCL-5 ≥33), hazardous or recent alcohol use (positive uEtG or AUDIT ≥7 for males, ≥8 for females), drug use (positive urine screen for amphetamines, benzodiazepines, cocaine, marijuana, or opioids or ASSIST >3 for cannabis, cocaine, amphetamines, inhalants, sedatives, hallucinogens, or opiates) and the co-occurrence of symptoms.

Results: Among 1,271 participants, the mean age was 50 (range: 40-84) and 59.6% were female. The prevalence of mental health symptoms or substance use ranged from 19.9% for unhealthy or recent alcohol use to 5.3% for PTSD and varied by region and sex (Table).

Among participants with mental health symptoms or substance use, 25.8% had symptoms of 2 or more disorders. The prevalence of symptoms of depression, anxiety, and PTSD was higher among females than males while the prevalence of hazardous or recent alcohol use and drug use was higher among males than females.

	Total	Sex		Region					
	n (%)	Male (N=514) n (%)	Female (N=757) n (%)	Asia-Pacific (N=200) n (%)	Central Africa (N=350) n (%)	Caribbean, Central and South America (N=30) n (%)	East Africa (N=200) n (%)	Southern Africa (N=191) n (%)	West Africa (N=300) n (%)
Depression	129 (10.2)	29 (5.7)	100 (13.2)	9 (4.5)	57 (16.3)	3 (10.0)	8 (4)	4 (2.1)	48 (16)
Anxiety	112 (8.8)	35 (6.8)	77 (10.2)	7 (3.5)	33 (9.4)	5 (16.7)	2 (1)	15 (7.9)	50 (16.7)
PTSD	67 (5.3)	20 (3.9)	47 (6.2)	1 (0.5)	21 (6.0)	3 (10.0)	3 (1.5)	17 (8.9)	22 (7.3)
Unhealthy or Recent Alcohol Use	253 (19.9)	163 (31.7)	90 (11.9)	5 (2.5)	106 (30.3)	2 (6.7)	19 (9.5)	69 (36.1)	52 (17.3)
Drug Use	74 (5.8)	40 (7.8)	34 (4.5)	3 (1.5)	12 (3.4)	10 (33.3)	22 (11.0)	11 (5.8)	16 (5.3)
2+ MSD	118 (9.3)	51 (9.9)	67 (8.9)	4 (2.0)	44 (12.6)	5 (16.7)	6 (3.0)	18 (9.4)	41 (13.7)
2+ MSD among ≥1 MSD	118 (25.8)	51 (23.6)	67 (27.8)	4 (20)	44 (28.2)	5 (35.7)	6 (12.8)	18 (19.1)	41 (32.5)

Table: Prevalence of Metal Health Symptoms and Substance Use

Conclusions: Mental health symptoms and substance use were commonly reported among PLWH aged ≥40 years in the IeDEA SRN. Integration of MSD screening and treatment into HIV care should be prioritized and may benefit older PLWH. Transdiagnostic interventions designed to address multiple MSD may be particularly relevant for this population.

EPD473

Household decision-making power and symptoms of depression, anxiety and PTSD among people with HIV in Cameroon

A. Gomez[1], P.V. Ebasone[2], A. Dzudie[2], D. Nash[3], M. Yotebieng[4], B. Pence[5], M. Wainberg[6], K. Anastos[7], A. Parcesepe[1,8]
[1]Gillings School of Global Public Health, University of North Carolina at Chapel Hill, Department of Maternal and Child Health, Chapel Hill, United States, [2]Clinical Research Education and Networking Consultancy, Yaoundé, Cameroon, [3]City University of New York, Institute of Implementation Science in Population Health, Graduate School of Public Health and Health Policy, New York, United States, [4]Albert Einstein College of Medicine, Department of Medicine, Bronx, United States, [5]Gillings School of Global Public Health, University of North Carolina at Chapel Hill, Department of Epidemiology, Chapel Hill, United States, [6]Columbia University and New York State Psychiatric Institute, Department of Psychiatry, New York, United States, [7]Albert Einstein College of Medicine, Departments of Medicine and Epidemiology & Population Health, Bronx, United States, [8]University of North Carolina at Chapel Hill, Carolina Population Center, Chapel Hill, United States

Background: Household decision-making power (DMP), one measure of gender equity, may be an important driver of mental health among people with HIV (PWH), who are at higher risk for mental disorders. Little is known about the relationship between DMP and mental health among PWH.

Methods: Wesurveyed 426 PWH initiating HIV care in Cameroon between 2019-2020. DMP was assessed with the Household Decision-Making Scale consisting of questions about participation in decisions in three scenarios: major household purchases, daily household purchases, and visits to family.

For each scenario, individuals were categorized as having sole DMP (makes decision alone), shared DMP (makes decisions with partner), or no DMP (no participation in decision-making). Symptoms of moderate to severe depression (PHQ-9 >9), anxiety (GAD-7 >9), and PTSD (PCL-5 >30) were assessed.

Results: Most participants were female (59%) andreported the same type of DMP (sole, shared, none) across all scenarios (73%).

Overall, 46%, 8% and 19% consistently reported sole, shared, and no DMP across all scenarios, respectively, while 27% reported different types of DMP across scenarios.

Across all scenarios, compared to those with no or sole DMP, those with shared DMP were less likely to report symptoms of depression, anxiety, and PTSD. When stratified by gender, the association between DMP and mental health was particularly evident for men. Among men, across all scenarios, the prevalence of depression, anxiety, and PTSD was lowest among men who reported shared DMP. Among women, the prevalence of depression, anxiety, and PTSD was not meaningfully different across types of DMP.

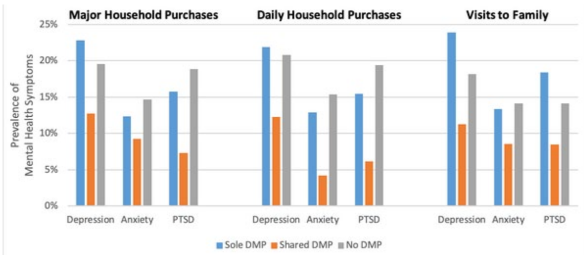


Table.

Conclusions: Shared DMP was associated with lower prevalence of depression, anxiety, and PTSD and appeared to be particularly beneficial for men. Research to examine mediators and moderators of the relationship between DMP and mental health among PWH is warranted. Gender-specific pathways between DMP and mental health should be explored.

EPD474

High risk behaviour and syphilis co-infection among people living with HIV in Mumbai, India – Need for comprehensive interventions

A. Palkar[1], S. Acharya[1], L. Shivkar[1], M.S. Setia[2], R. Mayekar[1]
[1]Mumbai Districts AIDS Control Society, Mumbai, India, [2]Consultant Dermatologist & Epidemiologist, Mumbai, India

Background: Risk-reduction strategies have been a part of targeted interventions in key population in India. Though there are isolated programs, focused risk-reduction interventions for sexual risk behaviours in HIV infected individuals are not a part of these programs.

The present study was designed to assess the sexual behaviours among People Living with HIV (PLHIV) diagnosed with syphilis co-infection.

Methods: Demographic information and data on sexual behaviours were collected from 425 HIV-Syphilis co-infected individuals registered for care at Antiretroviral Treatment (ART) centers in the city. We compared information on the type of partner, sexual behaviours, condom use, and other risk behaviours in the past three months.

Results: The mean (SD) age of this population was 38.5 (11.3) years; 339 (80%) were male, 67 (16%) were females, and 19 (4%) were TGH. Of these, 30 (7%) were migrants in Mumbai. Most of them had commercial (28%) and casual (25%) partners; 7% had regular partners. Anal sex and vaginal sex were the most common sexual practices with casual (60% and 39%) and commercial (32% and 68%) partners respectively.

Condom use was low with causal and commercial partners – 41% and 37% had rarely or never used condoms with them respectively. 31% had sex in exchange for money; the proportion was significantly higher in TGH (89%) com-

Oral abstracts

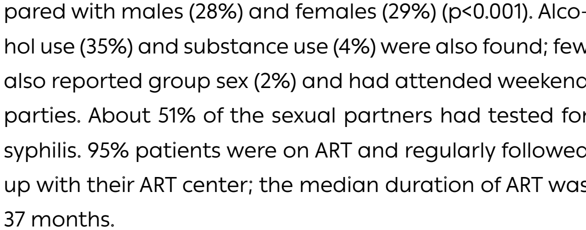
Author Index



pared with males (28%) and females (29%) (p<0.001). Alcohol use (35%) and substance use (4%) were also found; few also reported group sex (2%) and had attended weekend parties. About 51% of the sexual partners had tested for syphilis. 95% patients were on ART and regularly followed up with their ART center; the median duration of ART was 37 months.

Conclusions: Unprotected sexual acts with casual and commercial partners were common in HIV infected individuals, even in individuals who are aware of their status and are on ART. Thus, regular risk-assessment and specific risk reduction programs for HIV Infected individuals is a priority for the AIDS program in India.

EPD475

Associations of mental health disorders and substance use with detectable viral load by sex among older adults with HIV from low- and middle-income countries, the Sentinel Research Network of IeDEA

M. Stockton[1], A. Parcesepe[2], C. Bernard[3], B. Chihota[4], S. Goodrich[5], A. Haas[6], C. Ingabire[7], E.K. Kwobah[8], I. Marbaniang[9], F. Maruri[10], A. Minga[11], G. Murenzi[7], B. Crabtree Ramírez[12], J. Ross[13], M. Wainberg[1], K. Lancaster[14], IeDEA Consortium

[1]Columbia University, New York, United States, [2]University of North Carolina at Chapel Hill, Chapel Hill, United States, [3]University of Bordeaux, Bordeaux, France, [4]Centre for Infectious Disease Research in Zambia (CIDRZ), Lusaka, Zambia, [5]Indiana University, Indianapolis, United States, [6]University of Bern, Bern, Switzerland, [7]Rwanda Military Hospital, Kigali, Rwanda, [8]Moi Teaching and Referral Hospital, Eldoret, Kenya, [9]Johns Hopkins University, Baltimore, United States, [10]Vanderbilt University Medical Center, Nashville, United States, [11]Centre Médical de Suivi de Donneurs de Sang (CMSDS), Abidjan, Cote D'Ivoire, [12]Instituto Nacional de Ciencias Médicas y Nutrición, Mexico City, Mexico, [13]TREAT Asia/amfAR – The Foundation for AIDS Research, Bangkok, Thailand, [14]Ohio State University, Columbus, United States

Background: Mental health disorders and substance use are among the most common comorbidities among people with HIV (PWH) and are associated with sub-optimal HIV treatment and transmission-risk outcomes. However, mental health disorders and substance use are rarely screened for within HIV care settings.

Methods: We analyzed cross-sectional data from the International Epidemiology Database to Evaluate AIDS (IeDEA) Sentinel Research Network (SRN) cohort of PWH aged ≥40 years from HIV clinics within the Asia-Pacific, Latin America, and Africa regions.

We report associations between symptoms of common mental disorders (CMD), including moderate to severe depressive symptoms, anxiety symptoms, probable post-traumatic stress disorder (PTSD); hazardous or recent alcohol use; and drug use (cannabis, cocaine, amphetamines, inhalants, sedatives, hallucinogens, or opiates) with HIV viral loads (VLs) measured within 90 days of screening; detectable VLs were defined as ≥60 copies/mL. Log binomial regression was used to estimate prevalence ratios for each CMD and substance use stratified by sex.

Results: Of 1,271 participants, 943 (74%) had available VLs. The mean age was 51 years (range: 40-84); 56% were female; and 43% had a detectable VLs. The prevalence of depressive symptoms, PTSD, any CMD, and hazardous or recent alcohol use was higher among those with detectable VLs than those with undetectable VLs.

Females with depressive symptoms (PR: 1.53; 95%CI: 1.26-1.85), PTSD (PR: 1.45; 95%CI: 1.13-1.86), and any CMD (PR: 1.35; 95%CI: 1.12-1.64) were more likely to have detectable VLs compared to those without the respective disorder.

Males with hazardous or recent alcohol use were more likely to have detectable VLs (PR: 1.48; 95%CI: 1.16-1.88).

Disorder	Total	Females	Males
Moderate to severe depression (PHQ-9 ≥ 10)	1.49 (1.25-1.78)	1.53 (1.26-1.85)	1.09 (0.65-1.83)
Anxiety (GAD-7 ≥ 10)	1.02 (0.79-1.31)	1.12 (0.86-1.46)	0.67 (0.35-1.29)
PTSD (PCL-5 ≥ 33)	1.44 (1.14-1.81)	1.45 (1.13-1.86)	1.26 (0.75-2.12)
Any common mental disorder	1.28 (1.08-1.52)	1.35 (1.12-1.64)	0.99 (0.67-1.46)
Hazardous or recent alcohol use*	1.21 (1.03-1.42)	1.13 (0.89-1.44)	1.48 (1.16-1.88)
Drug use**	0.79 (0.52-1.18)	0.91 (0.49-1.68)	0.79 (0.46-1.35)
>1 disorder	1.29 (1.05-1.58)	1.37 (1.08-1.74)	1.19 (0.83-1.71)

Table 1. Prevalence ratios (95% CI) of each mental health and substance use disorder on detectable viral oads by sex.

**positive uEtG or Alcohol Use Disorders Identification Test (AUDIT) ≥7 for females and ≥8 for males; **positive urine screen or Alcohol, Smoking and Substance Involvement Screening Test (ASSIST) >3 for cannabis, cocaine, amphetamines, inhalants, sedatives, hallucinogens or opiates.*

Conclusions: Without routine screening, CMD and substance use among PWH aged ≥40 would remain undiagnosed and untreated, which could end in virological failure for both females and males. Implementation strategies for integrating routine screening and treatment must be explored to prevent an ongoing implementation gap.

Peer support: Lessons learned, access to services and health outcomes

EPD476

Jamaican Network of Seropositives (JN+) Community Facilitators' Deployment Programme (CFDP)

A.A. Williams[1,2,3], R.M. Plummer[4,2], J.-A.R. Nugent[4,2,5], K. Dillon[4], A. Davis[4], JN+ Programme Team

[1]University of West Indies, Mona, Caribbean School of Media and Communication, Kingston, Jamaica, [2]University of Washington, Seattle, Washington, United States, [3]University of Technology, Jamaica, College of Health Sciences, Kingston, Jamaica, [4]University of the West Indies, Mona, Kingston, Jamaica, [5]University of Technology, Jamaica, Institute of Management, Kingston, Jamaica

Background: The Stigma Index 2.0 showed that (53%) of PLHIV reported that their HIV status made them feel guilty, embarrassed, useless, and/or unclean, and 44% of PLHIV delayed treatment, while 27% missed at least one ART dose because of S&D fears. Improvement was needed to reduce social vulnerability, battle S&D, improve quality of life, and reduce HIV/AIDS morbidity and mortality.

The whole-care and empowerment of PLHIV to receive and advocate for their own health rights, building their capacity and self-efficacy while enabling and providing opportunities for HIV-related discrimination, reporting and redress that holds everyone accountable was also crucial for a Community-led Response (CLR) and greater involvement of PLHIV through the CFDP.

Description: The CFDP began in 2018 and now covers 44% (20) of clinics in Jamaica. The programme uses Community Facilitators (CFs) who are PLHIV, virally suppressed and empowered to work with clinics to support other PLHIV directly through peer-to-peer support activities such as support groups, mentorship, capacity building sessions, linkage and referrals, care, and support services.

This type of support focuses on PLHIV dignity, treatment and care, and other positive health-related areas. The CFDP works closely with the Ministry of Health and Wellness, which supports increased retention and treatment outcomes.

Lessons learned: Despite the pandemic, the programme has managed to support and engage PLHIV for better health outcomes. See table below re the engagement.

Year	Number of CF In Programme	Peers Assigned	AGE RANGE					Gender Identity		Number of Peers Virally Suppressed
			10-19	20-29	30-39	40-49	50+	Man	Woman	
2018	8	87	2	15	21	25	24	36	51	38
2019	20	182	8	38	48	43	45	64	118	67
2020	32	338	29	67	70	96	76	122	216	89
2021	38	421	35	86	91	111	98	167	254	186

Table.

The CFDP utilizes as best practice, CFs paired with other PLHIV who share comparable experiences, age, gender, sexual orientation, and/or gender identity. The programme's impact saw a 44% viral suppression rate by the end of 2021; 7 peers were promoted to CFs and 3 CFs promoted to the post of Adherence Counsellor.

Conclusions/Next steps: The CFDP enhanced adherence and viral suppression among PLHIV assigned to CFs. JN+ aims to deploy at least one CF to HIV Treatment facilities in Jamaica by 2025 to increase reach and support for the national HIV response as we continue with the Greater Involvement of PLHIV.

EPD477

Acceptability and feasibility of a peer-support program for HIV-positive women in Gaza, Mozambique: a qualitative analysis

S. Ndima[1], L. Katirayi[2], A. Mabote[1], I. Meque[1], I. Chiposse[3], A. Muteerwa[4], J. Greenberg Cowan[4], N. Bhatt[1]

[1]Elizabeth Glaser Pediatric AIDS Foundation, Maputo, Mozambique, [2]Elizabeth Glaser Pediatric AIDS Foundation, Washington DC, United States, [3]Núcleo Provincial de Pesquisa de Gaza, Direcção Provincial de Saúde, Gaza, Mozambique, [4]Centers for Disease Control and Prevention, Maputo, Mozambique

Background: In 2016, the Elizabeth Glaser Pediatric AIDS Foundation launched the Mentor Mother Program (MMP) in Mozambique. Mentor Mothers (MMs) are HIV-positive women who successfully adhered to antiretroviral treatment (ART) throughout their pregnancy and provide mentoring and home visits to HIV-positive pregnant and breastfeeding women.

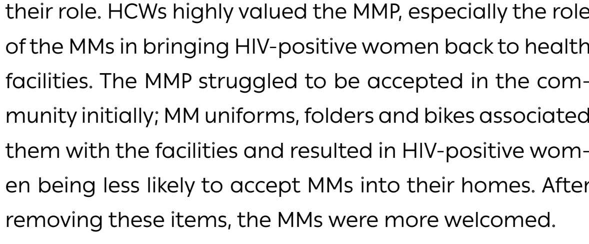
This study explored the acceptability and feasibility of the MMP among those providing and receiving services.

Methods: This qualitative study included in-depth interviews with 45 HIV-positive women enrolled in the MMP to receive mentor mothers (MMs), nine HIV-positive women who refused to enroll in the MMP, nine MM supervisors, 15 health care workers (HCWs) and 12 key informants.

Eight focus group discussions (FGDs) were conducted with MMs. MMs, MM supervisors, HCWs and key informants had been in their current positions for at least six months.

HIV-positive women included were pregnant or postpartum. Interviews and FGDs were held at nine study health facilities and audio recorded. Data were analyzed using thematic analysis, exploring perspectives by participant group. Transcripts were coded using MAXQDA software.

Results: The MMs reported that HIV-positive mothers who accepted the MMP asked basic questions to the MMs about ART scheduling and adherence that clearly indicated they had not received enough counseling and had remaining questions. MMs felt satisfaction in their job and felt 'less alone' regarding their own HIV status, but many limitations made their job more challenging. Challenges included insufficient travel stipend and cell phone credit, far travel distances, lack of communication regarding



their role. HCWs highly valued the MMP, especially the role of the MMs in bringing HIV-positive women back to health facilities. The MMP struggled to be accepted in the community initially; MM uniforms, folders and bikes associated them with the facilities and resulted in HIV-positive women being less likely to accept MMs into their homes. After removing these items, the MMs were more welcomed.

Conclusions: The MMP was highly valued by those who received services and those who provided services, however additional resources and training could help to strengthen the program and ensure sustainability.

EPD478

Exploring the feasibility of peer-delivered mental health support for young mothers living with HIV in four sub-Saharan African countries: evidence from peer supporters and their mentors

C.A. Laurenzi[1], W. Saal[2], A. Ronan[3], L. Hatane[3], C. Busakhwe[2], C. Mutambo[3], D. Operario[4], E. Toska[2]

[1]Institute for Life Course Health Research, Stellenbosch University, Tygerberg, South Africa, [2]Centre for Social Science Research, University of Cape Town, Rondebosch, South Africa, [3]Paediatric-Adolescent Treatment Africa, Mowbray, South Africa, [4]Brown University, Providence, United States

Background: Young women aged 15-24 in sub-Saharan Africa are at high risk of HIV, unintended pregnancy and early motherhood. Experiencing HIV and pregnancy at a young age may lead to stigma and isolation, which can discourage care-seeking and adversely affect mental health and HIV outcomes during a pivotal life-stage. Peers may be a promising way to deliver non-stigmatizing support to young mothers living with HIV (YMHIV).

In 2018, Paediatric-Adolescent Treatment Africa co-developed the evidence-based Ask-Boost-Connect-Discuss (ABCD) model to holistically address YMHIV's mental health needs in a clinic-embedded group format.

However, evidence is needed to understand this approach's feasibility. Implementers themselves are well-placed to contribute to model refinement.

Methods: Multi-method programmatic data was collected from peer supporters (n=18) and their mentors (n=10) over two waves of programme implementation (April-September 2019, April-November 2021) in Malawi, Tanzania, Uganda, and Zambia. Data sources included focus group discussions, debriefing notes, individual telephonic interviews, and email correspondence. Data were transcribed and synthesized, systematically reviewed, and thematically coded in ATLAS.ti software.

Results: Respondents, as implementers and supervisors of ABCD across all four countries, identified ABCD as overall feasible to implement; however, they also identified gaps in its successful implementation.

Peer supporters described ABCD modules, which used cognitive-behavioural therapeutic approaches, as an effective way to communicate psychoeducation and practical coping strategies to YMHIV groups. Respondents also reflected on ABCD's appropriateness to age and life-stage, with content and delivery adaptations that resonated with YMHIV.

A number of implementation facilitators were noted. Consistent attendance was a challenge, as participating YMHIV often lacked funds for transportation or childcare arrangements during sessions. As ABCD was facility-linked and integrated with YMHIV's routine HIV visits, ensuring space for group sessions and maintaining adequate cross-referrals relied on strong relationships with facility staff, which varied by site.

Strong supervision and facility relationships supported smooth implementation, and ABCD's adaptability by context meant that peer supporter-mentor teams were able to exercise agency in fitting the programme to their facility's needs.

Conclusions: Peer-delivered programmes present promising and overall feasible vehicles for supporting YMHIV, but should be well-integrated into health facilities and cognisant of structural barriers facing participants.

EPD479

Importance of peer support in the lives of people living with HIV (PLHIV)

M.R.C. Menezes[1], A. Gupta[2]

[1]Human Touch Foundation, Goa, India, [2]Global Alliance for Human Rights, Goa, India

Background: Post Covid19 lockdown in India where commuting became problem, many PLHIV had to vacate rented homes, lost jobs/income source, no ART pills, food nor work. It affected PLHIV Mental Health and ART Adherence

Objectives: To reach out to PLHIV in need through peer support & self help thereby create a sense of belongingness and improve quality of life through ART adherence and referrals.

Description: Peer intervention from March 2020 to January 2022 in Goa, India.

Post Covid lockdown where commuting became problem, Mobile phones kept us together. Through whatsapp group for PLHIV from different parts of India. We made contacts through facebook, NGOs, ART Centers, peers, and telephone calls. Helpless and lonely were added to our group with informed consent. Video calls were made for those in need through whatsapp and Zoom.

PLHIV who had their own bikes helped their peers get their ART pills from ART centers,provided food for those quarantined and at containment zones, lent money for needy. peer assistance also extended to those stranded from other states/Countries. Peers attended to phone call, provided peer counseling and referral services.

Lessons learned: Group members: 122, (65 female, 57 males) age 14 to 64 years. 34 were provided ART home deliveries, 71 (42 female, 29 male) peer counseling and guidance regularly, 11 found jobs, 12 found life partners, 22 referrals for other health emergencies, 34 received dry

ration. 15 (9 women, 6 male) lent money in need, 5 women received money as gift. 13 females started their own business. All are adhering to ART.
Through Peer support PLHIV overcome stigma & discrimination, make informed decisions, cope better with illnesses, overcome loneliness. Peers found jobs, life partners, accompany the sick to hospitals, lend money in need, give hope to live and increase self esteem.
Conclusions/Next steps: Our experiences proves that peer support plays very important role in PLHIV lives as it gives sense of belongingness, hope, increase self esteem, improves quality of life also prevent HIV treanmission.
Peers are always there like their own family as they empathize with each other with many similarities as to treatment adherence, side effects management, concerns, emotions and feelings.Peer led programs should be encouraged at all HIV programs.

EPD480

Task-shifting for viral suppression: piloting a provider-peer case management approach to support unsuppressed people living with HIV (PLHIV) at Wantanshi Health Center (CS) in the Democratic Republic of Congo (DRC)

C. Tendo[1], M. Malele[1], S. Kimbangu[1], P. Kibwa[1], J.-C. Kiluba[1], D. Canagasabey[2], I. Thior[2]
[1]PATH, Lubumbashi, Congo, Democratic Republic of the, [2]PATH, Washington, DC, United States

Background: DRC's estimated viral suppression rate is 87.4% (2020), highlighting the need to focus on viral suppression. However, limited facility personnel and weak monitoring mechanisms hamper delivery of comprehensive support for PLHIV to achieve viral suppression.
The USAID/PATH Integrated HIV/AIDS Project in Haut-Katanga (IHAP-HK) supported Wantanshi CS to introduce a collaborative case management system to better support PLHIV achieve suppression (<1000 copies/mL).
Description: IHAP-HK co-created a collaborative case management system with Wantanshi CS, PLHIV, and peer educators by:
1. Conducting empathy mapping to understand PLHIV pathways to viral suppression;
2. Defining a minimum service package with quality standards;
3. Advocating for task-shifting to peer educators; and,
4. Training providers on the service package and monitoring tools (unsuppressed PLHIV register; service monitoring dashboard).
A clinical provider-peer educator pair would contact PLHIV with unsuppressed viral load (VL) within seven days to develop and implement a customized plan, with enhanced adherence counseling tailored to self-identified barriers, close monitoring, and use of reminder systems.
We report viral suppression outcomes of 51 PLHIV who received detectable VL results between September 2019 and September 2021.
Lessons learned: Median age of these PLHIV was 37 years (IQR: 28–44), and 53% were female. Most common reasons cited for treatment nonadherence were forgetfulness (49%), competing priorities (24%), and travel (18%).
Among the 51 PLHIV, 44 (86%) received undetectable VL counts after four months of customized case management, and seven (14%) after 12 months. A defined service package and task-shifting to peers enabled consistent delivery of high-quality services, and led to earlier enrollment in the system (four days on average versus 1-3 months at their next clinical appointment).
Use of service monitoring dashboards also helped provider-peer educator pairs track service provision against established quality standards. By September 2021, 98% of PLHIV were on a dolutegravir-based regimen from 80% at initial VL sampling.
Conclusions/Next steps: Our results highlight the feasibility of using this collaborative case management system to improve viral suppression outcomes for unsuppressed PLHIV at Wantanshi CS. Scaling up collaborative approaches to support PLHIV is critical to maximizing use of existing resources to help people achieve optimal health outcomes and reach viral suppression targets.

Positive health, dignity, psychological well-being and mental health

EPD481

HIV Quality of Life Framework: conceptualisation and application of a tool that describes links between formal and informal service delivery and the needs of people living with HIV

K. Moody[1], F. Anam[2], A. Babirye[3], M. Cassolato[4], M. Chatterjee[5], G. Caswell[6]
[1]Amsterdam University Medical Centres, Department of Infectious Diseases, Amsterdam, Netherlands, the, [2]Global Network of People Living with HIV (GNP+), Kisumu, Kenya, [3]STOPAIDS, London, United Kingdom, [4]Frontline AIDS, London, United Kingdom, [5]NCD Alliance, London, United Kingdom, [6]Global Network of People Living with HIV (GNP+), Cape Town, South Africa

Background: Suppressed viral load is achievable in people living with HIV and life expectancy is similar to that of people without HIV. The 95-95 95 HIV targets aim to ensure that people living with HIV can be diagnosed, access, and be retained on HIV treatment but that is not enough. Those who do achieve viral suppression still face chronic multimorbidities; stigma and discrimination; and violence, all of which prevent basic foundational needs to be met.
Description: GNP+ convened the HIV Quality of Life Partnership (GNP+, STOPAIDS, NCD Alliance, Frontline AIDS, UNAIDS and WHO) in 2019 to link the needs of people living with HIV to the services that are provided in the formal and informal health sectors. They reviewed and updated

Positive Health Dignity and Prevention and developed the HIV Quality of Life Framework to illustrate how services contribute to quality of life. This prepared members of the Partnership to participate in consultation processes in 2021, including the Global AIDS Strategy 2021-2026, the UN High Level Meeting on HIV/AIDS and the WHO Global Health Sector Strategies, which resulted in the incorporation of quality of life issues for people living with HIV, including emphasis on integrated services, NCD services and people-centred approaches.

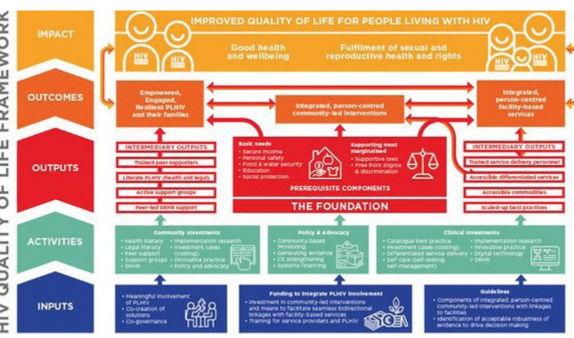

Figure. HIV Quality of Life Framework.

Lessons learned: The development of the Framework required an investment from all partners at a time when other issues, including the COVID-19 pandemic, took precedence. The Framework's ability to facilitate focussed discussions related to consultation processes and synergise beyond the HIV community ultimately provided a return on these initial investments.

Conclusions/Next steps: Members of the HIV Quality of Life Partnership created synergies and enhanced their own work related to quality of life. Co-creation of the Framework primed partners to collaborate on time-bound consultation processes that achieved success in promoting quality of life issues for people living with HIV.

EPD482

Prevalence of depression and its association to stigma and other psychosocial factors among women living with HIV in Tanzania

D. Kisamo[1], S. Kuganda[1], M. Relf[2], R. Mtei[3], M. Kilonzo[3], L. Nyblade[4]

[1]*Muhimbili University of Health and Allied Sciences, Psychiatry and Mental Health, Dar es Salaam, Tanzania, The United Republic of,* [2]*Duke University, School of Nursing, Durham, United States,* [3]*Muhimbili University of Health and Allied Sciences, Psychiatry and Mental Health, Dar-es-salaam, Tanzania, The United Republic of,* [4]*RTI International, Global Health Division, Washington, United States*

Background: The study aim was to determine prevalence of depression and its association to HIV stigma and other psychosocial factors among women living with HIV (WLWH) in Tanzania. Despite documented prevalence of depression and HIV stigma among WLWH, there is limited data on the association between stigma and depression among WLWH in Tanzania.

Methods: A cross-sectional survey (n=211) with WLWH aged 18+ attending HIV care and treatment clinics in Dar-es-salaam (two) and Tanga (one) region, Tanzania. Systematic, non-proportionate stratified sampling ensured half the sample was aged 18-24, half 25+, with urban, peri-urban and rural representation.

Depression was measured with the PHQ-9 and analyzed as a bivariate variable; no depression (score of 0-4) versus at least some depression (5+). Psychosocial factors were assessed with the Rosenberg Self-Esteem, Coping Self-Efficacy and 28-item Sayles stigma scales.

A final 23-item, five factor stigma scale (experienced, anticipated, internalized, perceived, health-provider); alpha 0.93, ranged from 0-115, and was dichotomized into low (below the median of 53) and high stigma (53+).

Multiple logistic regression was applied to identify independently associated risk factors for depression, adjusted for age, marital status, education, and income. Variables with p-values of <0.05 were considered statistically significant.

Results: Among this sample, 37.9% of the women had depression and 50.7% had high stigma. WLWH who had high stigma compared to those who had low stigma were three times more likely to have depression. (AOR=3.11, CI =1.69-5.73; P=0.000)

Variable	Adjusted odds ratio AOR (95% CI)	P-value
Self-esteem (Reference category=High)		
Low	1.83 (0.59-5.76)	0.289
stigma (reference category =low)		
High[1]	3.11 (1.69- 5.73)	**0.000**
Coping self-efficacy (reference category =high)		
Low	0.60 (0.33-1.12)	0.109
Model adjusted for age, marital status, education, income (all statistically non-significant) P[1]=<0.05 significance		

Table 1: Multivariate results: Associations between depression and stigma, self-esteem, and coping self-efficacy

Conclusions: Depression is a critical health issue among WLWH. In this sample, HIV stigma is high and associated with depression. Addressing depression effectively among WLWH requires understanding and addressing the factors that influence depression, including HIV stigma.

Screening for depression at the CTC and early interventions for HIV stigma and depression at CTC clinics could improve WLWH's mental and physical health.

EPD483

From homeless to whole - creating a safe space to heal from societal hurts and support retention in care

D. Lewis[1], A. Allen[1]

[1]*Larry Chang Centre, Kingston, Jamaica*

Background:
Established in April 2017, Larry Chang Centre's goal is to reduce the structural vulnerability of MSM and persons of Trans Experience through housing and other psychosocial support for improved treatment outcomes and equipping them with skills to be able to transition back into society as fully independent persons. Key programme activities are grounded on 4 key pillars:

- Safe Shelter; (group housing or semi- independent living)
- Improve Health Outcomes; individualised care plans; nutritious food to support diet plans; linkages with discrimination free healthcare, peer to peer support for retention and improved viral suppression.
- Psychosocial Support & Life Skills Training; counselling and empowerment sessions to reduce risky behaviours.
- Improve Employability; remedial educational programmes, employability workshops and readiness seminars & documentation such national identification

Description: The programme uses a client centered approach to address their individual needs. Other interventions carried out are:

- Case management as part of treatment monitoring to support increasing adherence not only through monitoring of Viral Load readings but case conferencing with treatment teams
- Ensure new clients are retained in care (attends clinic regularly) within first 4 months of programme
- Access to training around PHDP curriculum increasing dignity and positive prevention models
- Access to remedial educational programmes
- Provide access to education and skills training to capacitate individuals with needed skills to become employable
- Engage agencies for placement of skilled clients

Lessons learned: Lessons learned between 2020 & 2021 are:

- Providing a safe space and nutritional support has enabled persons to move to an undetectable status within 6 to 8 months.
- Peer to peer support significantly improved adherence in a shorter time.
- Reintegration requires more than providing persons with a skill to become employable.
- Many participants have deep trauma because of the many layers of discrimination experienced.

Conclusions/Next steps: A care farming component will be added to promote mental and physical health utilising hydroponics as a model which takes less land space. As well, the programme intends to expand this into an income generating project so that persons can earn from the project based on their input to reap the rewards of their labour and the skills are transferable when they transition.

EPD484

Exploring factors that drive mental health service utilization among young Black, gay, bisexual and other MSM living with HIV

A. Pather[1], M. Jones[1], E. Lawal[1], C. Chaudhury[1], Q. Allen[1], A. Newman[1], D. Camp[1], R. Wade[2], G. Harper[3], S. Hussen[1]

[1]*Emory Rollins School of Public Health, Hubert Department of Global Health, Atlanta, United States,* [2]*School of Social Work. University of Illinois, Urbana, United States,* [3]*University of Michigan School of Public Health, Department of Health Behavioral and Health Education, Ann Arbor, United States*

Background: HIV and mental health challenges disproportionately impact young Black gay, bisexual and other men who have sex with men (YB-GBMSM), yet this population is less likely to engage in HIV care or seek mental health care (MHC). Optimizing MHC holds promise as a strategy for improving both mental health and HIV outcomes for YB-GBMSM.

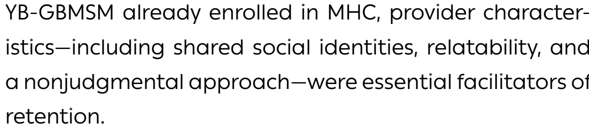
Methods: We conducted qualitative interviews (n=40) with YB-GBMSM living with HIV (ages 18-29) in Atlanta, USA. In collaboration with youth advisors, we developed a semi-structured guide informed by Andersen's Behavioral Model of Health Services Use (detailing the impact of predisposing factors, enabling factors, and psychiatric need on MHC utilization). We used thematic analysis to identify and describe barriers and facilitators to MHC utilization among participants.

Results: Participants discussed internal and external barriers to seeking MHC, as well as facilitators of MHC engagement.

Internal barriers: Participants described experiencing racism, homophobia, and HIV stigma. For many participants, these factors contributed to feelings of social isolation, hopelessness, fear, and consistent stress. In some cases, these stressors prevented YB-GBMSM from seeking MHC.

External barriers: Participants indicated that family and community ideals around resilience, masculinity, and strength promote managing mental health problems individually or with families and communities, instead of seeking MHC. Some participants described being perceived as weak for seeking MHC, worsening feelings of inadequacy, and rejection from their families and communities. Additionally, participants described logistical barriers to seeking MHC, including lack of awareness of resources, costs of care, and transportation challenges. These barriers exacerbated other internal and external barriers to seeking MHC.

Facilitators: Despite compounding barriers, HIV care engagement can facilitate linkage to MHC for YB-GBMSM. Several participants discussed positive experiences being connected to MHC through their HIV program. For



YB-GBMSM already enrolled in MHC, provider characteristics—including shared social identities, relatability, and a nonjudgmental approach—were essential facilitators of retention.

Conclusions: Our findings suggest that integrating MHC into HIV care enhances mental health service utilization among YB-GBMSM.

Additionally, non-traditional approaches, such as virtual platforms for MHC delivery and peer support groups, may address internal and external barriers by providing patients with social support, overcoming resource constraints, and enhancing MHC retention.

EPD485

Sexual orientation and health-related quality of life among people living with HIV/AIDS in Taiwan

D.-M. Chuang[1], C.-L. Chen[2], C.-C. Hung[3], N.-Y. Ko[4]

[1]National Taiwan Normal University, Graduate Institute of Social Work, Taipei City, Taiwan, Province of China, [2]Taiwan Lourdes Association, Taipei City, Taiwan, Province of China, [3]National Taiwan University Hospital, Taipei City, Taiwan, Province of China, [4]National Cheng Kung University, Tainan City, Taiwan, Province of China

Background: Health-related quality of life (QOL) is a critical factor for assessing the well-being of people living with HIV/AIDS (PHA). Studies have found that heterosexual PHA had a lower QOL than gay/bisexual PHA.

The present study aimed to examine the correlates of QOL and whether the association varied between gay/bisexual and heterosexual PHA in Taiwan.

Methods: From June to September 2021, a cross-sectional online survey was conducted among a convenience sample of PHA recruited from community-based organizations across Taiwan. Survey items included socio-demographic characteristics, HIV-related characteristics (ART, CD4 count, adherence, and ART side-effects), syndemic conditions (physical and mental health needs, substance use), endorsement of receiving support from and disclosing HIV status to, family and friends, and experiences of discrimination.

Two multivariable logistic regression models were conducted to examine the association between potential correlates and the WHOQOL-HIV Brief as a dependent variable (poor/good) for gay/bisexual and heterosexual PHA separately, adjusting for socio-demographic characteristics and ART.

Results: Of all participants (n = 708), 71.8% identified as gay/bisexual men, 56.5% had a college degree or more, 74.4% had a religion, 63.4% were single, and 81.1% lived with someone. Using the median QOL score as a cut-off, 50.1% of gay/bisexual and 53.0% heterosexual PHA reported having good QOL.

For gay/bisexual PHA, good quality of life was associated with having a college degree or more (AOR=2.54, 95% CI=1.35–4.77), being in a relationship (AOR=2.35, 95% CI=1.22–4.54), reporting few ART side-effects (AOR=0.86, 95% CI=0.81–0.91), reporting no mental health needs (AOR=0.43, 95% CI=0.26–0.70), disclosing HIV status to partners (AOR=2.40, 95% CI=1.28–4.48), and receiving support from non-PHA friends (AOR=1.80, 95% CI=1.01–3.22). For heterosexual PHA, good QOL was associated with reporting few ART side-effects (AOR=0.81, 95% CI=0.69–0.94), and reporting never experiencing social rejection from others (AOR=0.17, 95% CI=0.03–0.96).

Conclusions: Our study provides evidence indicating that good QOL was associated with not only better physical and mental health, but also better social acceptance, among PHA in Taiwan. QOL among MSM may be further improved by addressing mental health awareness.

Further intervention for improving QOL among heterosexual PHA may focus on reducing ART side-effects.

EPD486

Say yes to physical fitness! The impact of a structured physical activity program on health outcomes amongst children and adolescents living with HIV in South India

B. Seenappa[1], D. Srikanth[2], F.T. Thomas[1], V.K. Babu[1], S. Raju[1], S. Sanjukumar[1], F.M. Perumpil[1], M. Babu Raj[1], K. Mehta[3], K. Lakshmikanth[1], G.N. Raju[1], A. Shet[3]

[1]Sneha Charitable Trust, Snehagram, Bangalore, India, [2]Surana Collage, Department of Humanities (Arts) Course, BA Honors Psychology, Bangalore, India, [3]Johns Hopkins University, Johns Hopkins Maternal and Child Health India Center, Baltimore, United States

Background: Treatment-related increased life expectancy in HIV is accompanied by metabolic changes that have negative health outcomes. Regular physical activity is not only associated with improved immune function but also builds strength and promotes holistic development. These effects are not well studied among HIV-infected children and adolescents.

As part of children's routine care with nutrition, education, and medical support, Snehagram in India has integrated programs scientifically designed and guided by professional coaches and sports physiotherapists.

Description: From 2008-2019, 150 children from southern India who graduated from the Snehagram program participated in the structured physical fitness and sports program. Highlights included: an hour every morning for aerobic exercises to build strength and flexibility; running between 5-10kms twice a week to build endurance and speed; and evenings of field sports such as football, basketball, volleyball, and cricket:We conducted a survey to understand the impact of this program among graduates of this program.

Lessons learned: Average age of participants was 20.5yrs (range 16-23yrs), and 40% were female.Eighty percent were employed, 10% were pursuing studies full-time, and 10% were in transition. All were introduced to sports at an early age (8-10yrs). Barriers included self-perceptions of

weakness and ill-health due to underlying HIV (reported by 20%). A beneficial effect on physical and mental health was perceived by 82% and 65%, respectively.
Overall, 80% opined that participation in the sports program made them feel healthier in body and mind, reduced fatigue, decreased anxiety, improved sleep, and boosted self-confidence.
However, 82% felt that additional nutritional support and education on the biological effects of exercise on health would have enhanced their participation. After 1-2 years of graduation from Snehagram, 30% are involved in regular physical activity, while 90% recommended running should be included as a daily activity to their peers.
Conclusions/Next steps: Our results from examining the effect of ten years of the structured physical activity program at Snehagram indicate a perceived physical and psychological benefit for children living with HIV.
A greater emphasis on nutrition and education related to physical fitness, and incorporation of structured exercise into daily life would be important for sustainability and long-term benefits.

EPD487

HIV associated neurocognitive disorder screening and diagnosis pathways in Australia: a scoping review

A. Mullens[1], R.A. Wagstaff[1], K. Daken[1], L. Cysique[2,3], D. Le Clercq[1], C. Howard[4], S. Gilling[4], A. Piovesana[1], C.L. Thompson[5]
[1]University of Southern Queensland, Ipswich, Australia, [2]St Michael's Hospital, MAP Centre for Urban health Solutions, Li Ka Shing Knowledge Institute, Toronto, Canada, [3]The University of New South Wales, School of Psychology, Faculty of Science, Sydney, Australia, [4]Queensland Positive People, Brisbane, Australia, [5]Central Queensland University, Rockhampton, Australia

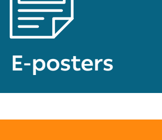
Background: HIV associated neurocognitive disorder (HAND) is complication of HIV characterised by cognitive decline. If detected early, interventions can slow further decline and help develop coping skills. However, there is uncertainty surrounding screening and diagnosis information in Australia. Therefore, the objective was to map screening and diagnosis information in Australia.
Methods: A scoping review examined academic literature, government policies, and non-government organisational information on HAND screening and diagnosis. The Joanna Briggs Institute guideline for scoping reviews was used.
The literature search includes EBSCOhost Megafile Ultimate and Medline (dates limited to 2015 to 2021), the .gov.au (all Australian government) and the .org.au (non-government organisation) domains, Google, and unpublished academic works. Items written by Australian authors or organisations about HAND screening, diagnosis and/or referral were included.
Results: Seventeen items met the inclusion criteria. The review located no specific government guidelines and several different diagnostic guidelines proposed by various HIV-related organisations. Most HAND research originated from Sydney, Australia. The most accessible information was from Dementia Australia, however some of it is inaccurate.
Conclusions: There is a concerning paucity of research or consumer information readily available to Australian clinicians or people living with HIV (PLHIV) regarding screening and diagnosis of HAND.
There is an urgent need to develop an accessible set of HAND screening and diagnosis standards for health professionals, PLHIV, and the general community. Without such resources, PLHIV are at risk of missed diagnosis, inadequate treatment, and consequent unnecessary cognitive decline.

EPD488

The relationship between depressed, minority stress and sexualized drug use men who have sex with men in Chengdu, China

X. Chen[1], J. Li[1]
[1]Sun Yat-sen University, School of Public Health, Guangzhou, China

Background: Previous literatures have shown that sexualized drug use (SDU) was commonly found among men who have sex with men both world wide and in China, which impacted greatly on HIV related sexual behaviors and become an emerging public health concern.
The current study was to examined the SDU prevalence and depressed, minority stress - SDU pathways among Chinese MSM.
Methods: An anonymous, cross-sectional survey was conducted through a HIV Voluntary Counseling & Testing (VCT) service organization between December 2021 and January 2022 in Chengdu, China. Participants completed sociodemographic measures, Minority Stress Measure (including four dimensions, stigma towards homosexuality, identity concealment, rejection anticipation and internalized stigma), the Patient Health Questionnaire 9 (PHQ-9) and SDU experience during last six months. Multivariable logistic regression using SPSS 26.0 was used to compare MSM who engaged in SDU recently with those who did not.
Results: Of the 436 eligible participants included, 38.5% (168/436) reported SDU engagement., Higher PHQ-9 scores (aOR=1.05, 95%CI 1.01 to 1.09) and stigma towards homosexuality (aOR=1.07, 95%CI 1.01 to 1.14) were found associated with SDU after adjusted for monthly income, STI diagnosis and HIV status whereas identity concealment, rejection anticipation and internalized stigma were not found associated.
Conclusions: The results showed high prevalence of SDU among Chinese MSM in Chengdu, which was positively associated with depress and stigma towards homosexuality. Targeted psychological interventions and services



should be considered immediately to reduce the harm cause by minority stress and depressed to prevent SDU engagement.

EPD489

Understanding Self-care practices to live well with HIV: a phenomenological study to inform supportive technology design

S.C. Sidat[1], C. Claisse[2], B. Kasadha[3], D. Laycock[1], L. Coventry[4], A.C. Durrant[2]

[1]Terrence Higgins Trust, London, United Kingdom, [2]Newcastle University, Open Lab, School of Computing, Newcastle-upon-Tyne, United Kingdom, [3]University of Oxford, Nuffield Department of Primary Care Health Sciences, Oxford, United Kingdom, [4]Northumbria University, Psychology and Communication Technology (PaCT) Lab, Newcastle-upon-Tyne, United Kingdom

Background: This empirical study utilised a bespoke paper-based Self-care diary as a design prompt to facilitate discussions with four UK adults (from a sample of seven) living with the Human Immunodeficiency Virus (HIV). The aim was to understand Self-care practices through deployment of the diary in each participant's daily life for up to six months.

Supported by three semi-structured interviews with each participant, we investigated individual routines, experiences, needs and concerns for self-managing HIV, plus experiences of consultations with Healthcare Professionals (HCPs) to inform Self-care Information Communication Technology (ICT) design for living well with HIV, from a user-centred perspective.

Methods: Participants were recruited via HIV charitable organisations in England. A purposive sample of four participants were selected. Two identified as cis male, one as Trans man, and one as female. All identified as Caucasian and were aged between 20 and 68. Two male participants identified as Gay, one as Queer, and the female participant as heterosexual. Audio data were collected on three occasions: at study commencement; at interim stage; and at study deployment end. Data was transcribed verbatim producing transcripts which were analysed using Interpretative Phenomenological Analysis.

Results: The analysis generated three superordinate themes. The first, *Value in Diary Engagement,*provided participants with opportunities to self- reflect, self-record and to generate personal data which could be utilised in routine medical appointments. The second, *Trusted Communications*, highlighted patient-centred, collaborative engagement with HIV physicians in which participants felt acknowledged and listened to whilst receiving optimum care. The final theme, *Lack of Understanding,*highlighted experienceswith other HCPs in participants' network of care, including General Practitioners (GPs), in which stigma was prevalent along with feelings of being rushed and not being listened to.

Conclusions: Participant experiences highlight the personal value of using patient-generated data in the context of consultations with different HCPs in a multidisciplinary network of care.

Also illuminated is the need for effective communication in these consultations, providing the patient the time to convey their experiences in a non-judgmental environment whilst feeling listened to. This study evidences unmet communication needs in consultations with HCPs other than HIV physicians for supporting patient-centred health care consultations.

EPD490

Mental health and well-being of men who have sex with men within the context of HIV: a key role for social support in Ghana

M. Stockton[1], R. Richmond[2], K. Saalim[2], D. Dada[3], G.M. Abubakari[4], E. Mankattah[5], R. Vormawor[5], P. Appiah[6], F. Boakye[7], R. Akrong[5], A. Apreku[8], A. Manu[8], E. Gyamerah[5], D. Turner[9], C. Logie[10], K. Torpey[8], L.E. Nelson[3,4,11], L. Nyblade[2]

[1]Columbia University Irving Medical Center, Department of Psychiatry, New York, United States, [2]RTI International, Research Triangle Park, United States, [3]Yale University, School of Nursing, New Haven, United States, [4]Yale University, Center for Interdisciplinary Research on AIDS, School of Public Health, New Haven, United States, [5]Educational Assessment & Research Center, Accra, Ghana, [6]Youth Alliance for Health & Rights, Kumasi, Ghana, [7]Priorities on Rights & Sexual Health, Accra, Ghana, [8]University of Ghana, Department of Population, Family & Reproductive Health, School of Public Health, Legon-Accra, Ghana, [9]University of South Florida, College of Nursing, Tampa, United States, [10]University of Toronto, Factor-Inwentash Faculty of Social Work, Toronto, Canada, [11]Yale University, Yale Institute or Global Health, School of Public Health, New Haven, United States

Background: Men who have sex with men (MSM) in Ghana have a high prevalence of HIV and experience stressors, such as stigma, that adversely impact their mental health and create barriers to HIV prevention and treatment. However, knowledge of protective factors that support mental health in the face of intersectional HIV, same-sex and gender non-conformity stigma in Ghana is limited, hence this study sought to explore these factors and their inter-relations.

Methods: Mixed-methods: In-depth interviews (n=8), focus group discussions (n=11), and baseline survey data (N=256) among MSM in a multi-level intersectional stigma-reduction intervention. in the Ashanti and Greater Accra Regions between October 2020 and August 2021. Surveys assessed depressive symptoms with the Patient Health Questionnaire-2 and self-reported HIV testing history and access to HIV testing, counseling, and treatment services. Narrative analyses were conducted on qualitative data, and frequency analyses were conducted on survey data. Findings were triangulated by examining the

associations between mental health, stigma, social support, and HIV care themes in qualitative and qualitative data.

Results: Qualitative findings suggested that accepting being gay/MSM was a difficult process with adverse implications for mental health and well-being.

Further, intersectional stigma – due to HIV, same-sex behavior and/or gender nonconformity – took its toll on mental and social well-being. Figure 1 depicts integration of the qualitative data about mental health, stigma, and social support and social support-related quantitative data.

Quantitative findings also suggest MSM may avoid necessary healthcare: only 52.4% of the sample reported receiving an HIV test in the previous 6 months, and 92.1% reported avoiding or delaying sexual health services they felt they needed.

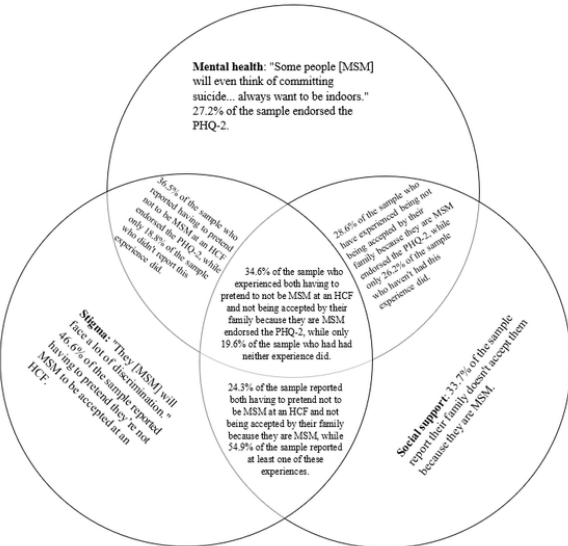


Figure 1. Interactions between mental health, stigma and social support.

Conclusions: Interventions to improve HIV prevention and treatment among key populations such as MSM and gender nonconforming men need to meet their mental health needs, address intersectional stigma and build protective factors that nurture social support.

Prevention interventions and their effects on the lives and relationships of people living with HIV

EPD491

To disclose or not? Experiences of HIV infected pregnant women in disclosing HIV status to their male sexual partners in Blantyre, Malawi

A. Mkandawire[1,2], V. Jumbe[2], A.L. Nyondo-Mipando[2]

[1]Malawi College of Health Sciences, Nursing and Midwifery, Blantyre, Malawi, [2]Kamuzu University of Health Sciences, Department of Health Systems and Policy, Blantyre, Malawi

Background: HIV status disclosure is one of the elements that enhance the success of the Prevention of Mother to Child Transmission of HIV (PMTCT) program. However, there are challenges that limit full disclosure. Literature shows that for pregnant women who have been diagnosed with HIV, only 16% to 86% in the developing countries disclose their status to their sexual partners.

This study explored the experiences of newly diagnosed HIV-infected pregnant women in disclosing HIV status to their male sexual partners in Blantyre, Malawi.

Methods: This was a qualitative explanatory multiple case study that was conducted from August 2018 to December 2019 using in-depth interviews and diaries as data collection tools. We recruited seven newly diagnosed HIV pregnant women who had not disclosed their status to their male sexual partners and were initiated on Option B+ strategy of the PMTCT of HIV at Limbe Health Centre (Malawi). The investigator had three contacts with each participant where in-depth interviews were conducted. The first contact was on the day of HIV testing, and the other two contacts were 6 weeks apart on the days the women came for their Antiretroviral (ARV) drugs refill. This study employed content analysis and used a within-case and across-case analysis.

Results: Women either used facilitated mutual disclosure or direct disclosure when disclosing HIV status to their male sexual partners. Women were motivated to disclose in order to have an HIV-free baby, to know the partners' status, and also to resolve the gap on how they got infected with HIV. Women were reluctant to disclose because they feared relationship dissolution. Privacy and soberness of the partner were important considerations during the process of disclosure.

Conclusions: Women accessing PMTCT services need guidance from health workers on how to yield positive feedback from their sexual partners so that there can be male support, an important element in the uptake of PMTCT services.

If health workers in developing countries know the motivation and discouragement factors of disclosure, it will enable them to counsel women to disclose, and how best they can do it in order to receive a positive feedback from their male sexual partner.

Effectiveness of couple-based interventions vs. individualized interventions in promoting HIV preventive behaviors in couples: a systematic review and meta-analysis of 11 randomized controlled trials

R. Fu[1], J. Hou[1], Y. Gu[2], X.N. Yu[1]
[1]City University of Hong Kong, Department of Social and Behavioural Sciences, Kowloon, Hong Kong, SAR of China, [2]Guangzhou Center for Disease Control and Prevention, Guangzhou, China

Background: Despite existing evidence indicating that couple-based HIV interventions are more effective in promoting HIV preventive behaviors of couples than individual-level interventions, no study to date has exclusively synthesized the findings from randomized controlled trials (RCTs) and examined the quality of the original studies in terms of implementation and evaluation through rigorous quantitative criteria.
This systematic review and meta-analysis compared couple-based prevention interventions to individual-level interventions from RCTs and examined moderators of the intervention effect.

Methods: This systematic review and meta-analysis was registered in the PROSPERO database (CRD42020222819, https://www.crd.york.ac.uk/PROSPERO/). We searched five electronic databases (Web of Science, PubMed/Medline, PsycInfo, CINAHL, and clinicaltrials.gov) and other sources. Random-effects models were used to quantitatively synthesize the existing evidence.

Results: Eleven RCTs were included, comprising 3,555 couples in the intervention group and 7,125 individuals in the individual control group, mostly in heterosexual couples from the USA and Africa. Three studies were poorly designed and implemented.
The overall estimates of random-effects models showed that compared to individual-level interventions, couple-based interventions had a significant effect in promoting condom use (OR = 1.431, 95% CI 1.133-1.808, p = 0.003) and HIV testing (OR = 1.308, 95% CI 1.061-1.612, p = 0.012).

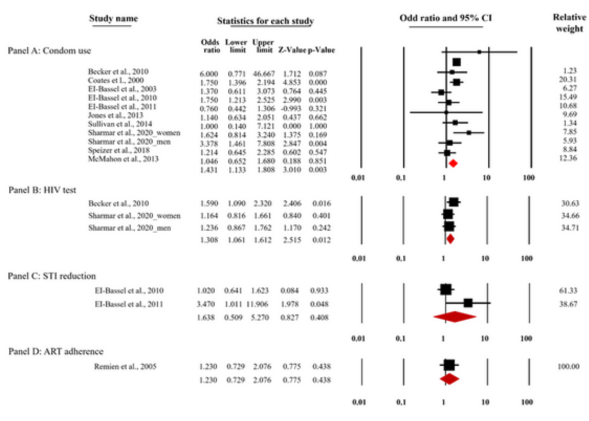

Figure.

The education level of high school or above was associated with a higher odds of condom use (Q(1) = 4.401, p = 0.036). Compared to skills-building, the intervention component incorporating HIV testing and counseling was marginally more effective in improving condom use (Q(1)= 3.275,p= 0.070).

Conclusions: Future research needs to standardize the trial design and implementation, strengthening the dyad-level theoretical underpinnings for intervention development, tailoring intervention contents according to participants' education level, adopting a combined intervention module with effective biobehavioral components, and assessing the long-term intervention effect.

EPD493

Managing HIV among male prison inmates in Nigeria: implication for spread

R. Ekwunife[1,2]
[1]Prison Special School Abakaliki Nigeria, Welfare, Abakaliki, Nigeria, [2]Enugu State University of Science and Technology, Mass Communication, Enugu, Nigeria

Background: Managing HIV among male prison inmates in Nigeria is challenging.Using a census study, the project reviewed the access of male inmates of the Prison Special School Abakaliki (PSS Ai) in Ebonyi State of Nigeria to medical attention, psychotherapy, intervention programmes, sex orientation, as well as meaningful post incarceration life through the existing inclusive education.
The objectives were to find out the extent of HIV spread among male prison inmates at PSS Ai, to discover the possible mode of transmission and spread of HIV among the male prison inmates at PSS Ai, to determine the influence of penal principles on HIV management among male prison inmates at PSS Ai and to identify the possible reasons for the ineffective management of HIV among them.

Description: The long term project employed a triangulation approach which included the survey, interview and ethnography. The setting was a special school for prison inmates located inside the Ebonyi State Prisons Command, Abakaliki.

Lessons learned: The findings showed that the level of HIV spread among the male students was relatively high. The mode of transmission emanated from the sharing of sharp objects, drug abuse and the practice of men who have unprotected sex with men- a phenomenon which the study is struggling to establish its level of practice. The greatest challenge to HIV management within incarceration were the penal principles.
In view of global best practices, tolerance should be brought into the management of persons with HIV, particularly in relation to culture/sex orientation. The penal principles should be de-emphasized for rehabilitation principles to accord the incarcerated the opportunity to access intervention programmes.
The major significance is that these treatments promote stigmatization and the spread of HIV in the prison and outside world during post incarceration.

Conclusions/Next steps: The study concluded that the management of male prison inmates with HIV has not been effective in forestalling the spread of the virus within the prison and the larger society where these carriers spill into on release. Medical attention for HIV is also inadequate.
Again, these penal principles have not enabled the school to effectively practice inclusive education where counseling sessions are professionally utilized.

EPD494

Triple R project support for HIV Exposed Infants adherence to HIV interval testing until end of exposure

M. Hadebe[1]
[1]*Pact Eswatini, Programs, Mbabane, Eswatini*

Background: The Eswatini Ready, Resourceful, Risk Aware (Triple R) project, for orphaned and vulnerable children (OVC), Adolescent Girls, and Young Women (AGYW), aims to prevent new HIV infections and to reduce vulnerability among this target group in Eswatini. HIV Exposed Infants (HEIs) are part of the OVCs receiving follow-up and interval HIV testing per ministry of health guidelines at birth,6 weeks, 9,12,18 months until end of exposure.
Description: Caregivers provide consent for OVC enrollment and follow-up of these children. An electronic appointment tracker for HEIs due for interval testing, is maintained. Home Visitors (HVs) support caregivers by reviewing HEIs' health cards for appointment dates and adherence to interval testing. HEIs who missed clinic appointments are issued with referrals within 3 days, and new appointment dates are given.
HVs continues to call caregivers until appointments are honored and calls are documented on the follow-up log and tracker. HVs liaise with health facility Linkages Assistant (LAs) to confirm clinical appointments' adherence and further verify from child's card. The Department of Social Welfare is engaged to intervene where HEIs caregivers' miss appointments after five calls, as this is considered as an infringement of the right of the child to health care.
Lessons learned: Results: 100% of enrolled HEIs were reached between October 2020 - September 2021, 99% tested HIV negative and are on track with interval HIV testing and the 1% HIV+ are on ART. Active tracking of the HEIs ensured their scheduled clinic visit dates are honored by caregivers.

Figure. CI_HEI: # with documented HIV status-Reach VS Enrol-FY21 100% (1749/1749)

Conclusions/Next steps: Implementation of this integrated patient centered community model was effective in ensuring that HEIs adhered to interval HIV testing, throughout their exposure period. This effective model will be employed also for FY22.

EPD495

"You can get that person on ART but you can't give them back their social system". Qualitative insights of HIV voluntary assisted partner notification in marginalized populations

K. Bärnighausen[1,2], M. McGowan[1], A. Berner-Rodoreda[1], C. Mtaita[3], F. Neuhann[1]
[1]*Heidelberg University, Heidelberg Institute of Global Health, Heidelberg, Germany,* [2]*University of the Witwatersrand, School of Public Health, Johannesburg, South Africa,* [3]*Lewy Mwanawasa Medical University, School of Medicine and Clinical Sciences, Lusaka, Zambia*

Background: Voluntary Assisted Partner Notification (VAPN) is an important method for identifying HIV infections, sero-discordant couples, and to link partners of persons diagnosed with HIV to testing and care services. While the VAPN approach is seen as appropriate in many settings, little is known about VAPN in groups that experience marginalization and whether its use is suitable for referral to HIV care pathways.
Methods: From December 2019 to October 2020, we conducted a qualitative study using semi-structured in-depth interviews with purposively selected VAPN stakeholders at global (n=4), national (n=6) and community (n=4) levels regarding their perspectives and experiences with VAPN policy and implementation. Data were analyzed following a Reflexive Grounded Theory approach and managed using NVIVO Pro 12.
Results: Respondents highlighted flexibility in VAPN policy implementation and spoke extensively about patient centred approaches to support VAPN. However, respondents felt the scope of policy was not broad or nuanced enough for marginalized groups, especially women, Female Sex Workers (FSW), men who have sex with men (MSM) and children. Women were seen as vulnerable to violence following partner notification, and lacked access to adequate support. Age appropriate VAPN assistance was considered unavailable for sexually active children. Upon HIV status notification, FSW and MSM could face exclusion from important social networks leading to further marginalization, particularly - for MSM - in places where same-sex relationships are illegal. Strict funder driven VAPN targets were considered to reduce the quality of care and functioning of VAPN as health workers forego certain guidelines in order to reach adequate numbers of patients.
Conclusions: VAPN can be a useful tool for HIV testing and prevention but marginalized communities have complex care needs which current policy does not support. Embedding understandings of identity, belonging and safety

Oral abstracts

into VAPN could address individual priorities and needs. Community support networks, tailored care for children and family orientated approaches to HIV notification may overcome issues relating to vulnerability and marginalization.

Sexual and reproductive health, fertility, family planning, pregnancy and abortion

EPD496

Amplifying the voices and experiences of parents living with HIV around breast/chestfeeding

C. Covin[1], A. Agwu[2], J. Conley[1], O. Ford[1], K. Martel[1]
[1]The Well Project, Brooklyn, United States, [2]Johns Hopkins, Baltimore, United States

Background: Breast/chestfeeding is considered both the healthiest option for infant feeding for the general population and the standard of care for women and other birthing parentsliving with HIV in resource-limited settings. Limited research on breastfeeding and HIV in high-resource settings has resulted in a lack of education/clinical standards for providers in these areas to support informed decision-making among women living with HIV.

Description: The Well Project, a nonprofit whose mission is to change the course of the HIV pandemic through a unique and comprehensive focus on women and girls, advances efforts *to increase knowledge and expand access to information around breast/chestfeeding and HIV. The core of this programming elevates the experiences of women living with HIV to improve knowledge among healthcare providers and policy makers and build leadership capacity.*

Specific programming about breast/chestfeeding includes webinars, live-streaming events/videos, and fact sheets. To assess interest in breast/chestfeeding and HIV, we measured views of the resources.

Lessons learned: To date, two live-streamed events presenting these perspectives reached >14,000 (in 5 months). Fact sheets on infant-feeding choices (developed with women living with HIV) in English and Spanish reached 34,000 and 22,000, respectively (in 3 years). A webinar featuring two women living with HIV who breastfed reached 27,000 (in 3 years).

Conclusions/Next steps: There is a significant appetite for content about breast/chestfeeding and HIV that centers the experiences of women and other birthing parents living with HIV. Endeavors in this field are strengthened when providers/other stakeholders are responsive to the infant-feeding experiences of parents living with HIV, recognize their autonomy, and trust that they will make well-informed decisions. Including women and other birthing parents living with HIV in the development and execution of this programming will ensure that they can experience their fundamental right to make informed, uncoerced infant-feeding decisions, while also centering their voices and fostering leadership development.

EPD497

Homens trans gestantes atendidos em uma clínica pré-natal de um centro de referência em HIV/AIDS do estado de São Paulo - Brasil

V. Cruz[1], M. Silva[1], D. Barros[1], A. Coelho[1], L. Nichiata[2]
[1]Secretaria de Estado da Saúde de São Paulo/ Centro de Referência e Treinamento DST/AIDS-SP, São Paulo, Brazil, [2]Universidade de São Paulo/Escola de Enfermagem, Enfermagem em Saúde Coletiva, São Paulo, Brazil

Background: Brazil has instituted the National Policy of Integral Health of Lesbians, Gays, Bisexuals, Transvestites and Transsexuals, since 2010, in the context of the country's health system, being universal and public.

The study presents the barriers identified in the experience of monitoring pregnant transgender men and describes the action plan developed for the improvement of care for this group.

Description: São Paulo, the 4th largest city in the world in terms of population, in 2009, implemented the 1st outpatient clinic for the health of the transgender population in the country and has been attending transgender men in pregnancy, starting to perform prenatal care. It is located in the headquarters of the State Program of STD/AIDS where there is an obstetrician, nurse, infectious disease specialist, psychologist, social worker and volunteer doula.

The barriers to accessing health services in general were identified as: difficulty in health services to accept them, where historically they attend cis women, fear of bodily changes, prejudice and discrimination, hormonal changes as a result of not using the male hormone, difficulty and acceptance of interaction with social environment (work, transportation, friends and families), fears and insecurity regarding delivery and baby care, and prejudice in health services in general.

The care plan foresaw: meetings with the health professional team and transversal areas to the service, preparation of standard operating procedures, articulation with the humanization team, agreements with the prenatal care and attention network, with reference maternity hospitals for delivery, puerperium, and care of the newborn, partnership with the public defender's office for legal guarantees, conversation circle with pregnant men, and workshops on care of the newborn.

Lessons learned: Importance of embracement as a way to guarantee reproductive rights; need for protagonism and improvements in the autonomy of pregnant trans men; teamwork guaranteed access for this population to the network of assistance for childbirth, newborn care, and paternity.

Conclusions/Next steps: It is essential to have a continuous learning process between health services and the population of trans men in order to overcome barriers to access. The action plan calls for changes in health services, facilitating institutional acceptance from the perspective of the reproductive rights.

EPD498

Barriers and facilitators to seeking sexual health services for LGBTQIA+ older adults: a global scoping review and qualitative evidence synthesis

H. Conyers[1], J. Tucker[1], D. Wu[1], E. Kpokiri[1], Q. Zhang[1], S. Hinchliff[2], T. Shakespeare[1]
[1]The London School of Hygiene and Tropical Medicine, Reproductive and Sexual Health, London, United Kingdom, [2]University of Sheffield, Sheffield, United Kingdom

Background: The number of older adults identifying as lesbian, gay, bisexual, transgender and other sexual and gender diverse identities (LGBTQIA+) continues to grow as populations age and social environments becomes more accepting. This study uses a global evidence synthesis to understand perceived barriers and facilitators to sexual healthcare service access globally for older LGBTQIA+ adults.

Methods: We used a scoping review and qualitative evidence synthesis. Embase, PubMed and PsycInfo were searched with terms related to LGBTQIA+ populations, older adults, and sexual healthcare. We used the Cochrane Handbook and the review protocol was registered.

Primary and secondary textual data were coded and grouped into themes using PRISMA-SCR and the Minority Stress Model. The certainty of review findings was assessed using the GRADE-CERQual approach.

Results: The scoping review identified 19 studies and 15 were included in the qualitative evidence synthesis. All studies were from high-income countries. Heterocentricity and male-centricity of sexual health care services contributed to feelings of exclusion for older LGBTQIA+ adults (13 studies, moderate certainty of evidence).

Both anticipated and enacted stigma by healthcare providers resulted in older LGBTQIA+ adults, especially those with chronic conditions, avoiding health services (seven studies each, low certainty). Older LGBTQIA+ adults have unique sexual health needs and may feel their age empowers them to access appropriate care (four studies, low certainty).

Conclusions: This review highlights the need for additional research and interventions to improve sexual health services for older LGBTQIA+ adults. Practical strategies to make sexual health less heterocentric (e.g., gender neutral signage) may increase uptake of essential sexual health services.

EPD499

Impact of antiretroviral treatment and treatment duration on incident pregnancy among HIV-positive women: evidence from population-based HIV impact assessments

S.R. Levano[1], S. Jonnalagadda[2], P. Stupp[2], A.C. Voetsch[2], J.W. Eaton[3], P.S. Sullivan[1]
[1]Emory University, Epidemiology, Atlanta, United States, [2]CDC, Division of Global HIV & Tuberculosis, Atlanta, United States, [3]Imperial College London, MRC Centre for Global Infectious Disease Analysis, London, United Kingdom

Background: Pregnancy incidence was estimated in women living with HIV (WLHIV) in the era of universal test and treat (UTT) in comparison with HIV-negative women (HNW) to inform fertility estimates and plan for prevention of mother to child transmission (PMTCT) services.

Methods: Population-based HIV Impact Assessments (PHIAs) in Zambia, Malawi, Tanzania, and Eswatini (2015 – 2017) were analyzed. Female participants, 15-49 years, with a valid HIV test result were included in the analysis. Time to pregnancy during the period 45 months prior to the survey, corresponding to births occurring a maximum of 36 months prior to the survey, was modeled retrospectively using Cox proportional hazards regression. Observations were censored at conception for women with a pregnancy and at the survey date for women without a pregnancy.

Each participant's exposure time and pregnancy events were stratified into time-varying categories by HIV status, self-reported antiretroviral therapy (ART) status, and duration on ART. Analyses using survey weights compared pregnancy incidence rates estimated forHNW, WLHIV not on ART, and WLHIV on ART for ≤1 year and >1 year.

		Zambia	Malawi	Eswatini	Tanzania
HIV Negative Women	Pregnancy events/ Person-years[1] Incidence Rate (95% CI[1])	1,279,702/ 9,804,283 130.5 (124.8, 136.3)	1,299,457/ 10,340,975 125.7 (120.1, 131.2)	54,108/ 783,691 69.0 (64.4, 73.7)	4,711,357/ 36,971,132 127.4 (122.2, 132.7)
	Hazard Ratio (95% CI)	1.0	1.0	1.0	1.0
WLHIV not on ART	Pregnancy events/ Person-years Incidence Rate (95% CI)	12,588/ 168,188 74.8 (48.4, 101.3)	7,458/ 111,343 67.0 (13.9, 120.1)	4,126/ 45,747 90.2 (65.4, 115.0)	23,075/ 210,810 109.5 (67.3, 151.6)

Late-breaker abstracts

Author Index

Results: Compared to HNW, hazard ratios for pregnancy in WLWH not on ART were 0.6, 0.4, 1.2 and 0.9 in Zambia, Malawi, Eswatini and Tanzania, respectively; 1.5, 1.1, 1.7, and 1.5, for WLHIV on ART for <1 year in Zambia, Malawi, Eswatini and Tanzania, respectively; 0.4, 0.5, 0.8, 0.6 in WLHIV on ART for >1 year in Zambia, Malawi, Eswatini and Tanzania, respectively (Table 1).

Conclusions: Pregnancy incidencediffers by duration on ART with greatest likelihood of pregnancy observed in WLWH who recently initiated ART. Further analysis will include age-adjusted models accounting for behavioral and biological factors which may impact pregnancy.

These updated estimates of pregnancy incidence will help to accurately estimate PMTCT rates and plan for adequate PMTCT service coverage and resource allocation.

EPD500

Reproductive decision-making autonomy is associated with contraceptive use among women living with HIV in Gaborone, Botswana

S.A. Gutin[1], G.W. Harper[2], N. Moshashane[3], K. Ramontshonyana[3], J. Harries[4], D. Ramogola-Masire[5], C. Morroni[3,4,6]

[1]UCSF Center for AIDS Prevention Studies, Division of Prevention Science, San Francisco, United States, [2]University of Michigan School of Public Health, Dept. of Health Behavior and Health Education, Ann Arbor, United States, [3]Botswana Harvard AIDS Institute Partnership, Princess Marina Hospital, Gaborone, Botswana, [4]School of Public Health and Family Medicine, Faculty of Health Sciences, University of Cape Town, Women's Health Research Unit, Cape Town, South Africa, [5]Faculty of Medicine, University of Botswana, Dept. of Obstetrics and Gynecology, Gaborone, Botswana, [6]University of Edinburgh, MRC Centre for Reproductive Health, Edinburgh, United Kingdom

Background: Unintended pregnancies may be related to low contraceptive use and raise concerns regarding potential HIV transmission risks from women living with HIV (WLHIV) to partners and infants. Unintended pregnancy is often related to a woman's lack of autonomy or power within her relationship. Relationship dynamics among WLHIV are understudied yet are important correlates of contraceptive use in sub-Saharan Africa.

Botswana has the fourth highest HIV prevalence in the world (18.2-22.1% among adults), and 43-50% of births are unintended. Using an adapted Reproductive Autonomy Scale, we sought to measure whether

a. Reproductive decision-making,

b. Freedom from coercion, and

c. Reproductive communication are associated with current contraceptive use among WLHIV in Botswana to assist in HIV and reproductive health program development.

Methods: We conducted a cross-sectional survey among 356 WLHIV in Gaborone, Botswana from June-December 2018 at six public sector clinics. Participants were 18-40 years, not currently pregnant, and desired future children or were unsure about their childbearing plans. Respondents reported current contraceptive usage including pill, injectable, implant, intrauterine device (IUD), male/female condoms, or sterilization. Separate multivariate logistic regression models examined the association of reproductive autonomy (full scale and sub-scales) with a dichotomous variable for contraceptive use adjusting for clinic and covariates.

Results: On average, WLHIV were 33.6 years and women reported a mean of 2.4 pregnancies. Current contraceptive use was reported by 95.5% (n=340) of WLHIV. The most commonly used methods were male/female condoms (88.2%) with just 21.6% reporting use of another method (6.2% pills, 12.4% injectable, 2.0% implants, 0.8% IUD, 0.3% sterilization).

In multivariable models, reproductive autonomy was associated with contraceptive use (aOR=1.12,95%CI: 1.01-1.24). In addition, higher reproductive decision-making autonomy was associated with contraceptive use (aOR=1.80,95%CI: 1.26-2.57) compared to those with lower decision-making autonomy. The reproductive autonomy freedom from coercion and communication sub-scales were not significantly associated with contraceptive use.

Conclusions: Reproductive autonomy, and specifically, decision-making autonomy, is associated with contraceptive use among WLHIV. Findings have implications for HIV programs and practice since reproductive autonomy is a modifiable factor that can be targeted in interventions to encourage gender-equitable relations and reduce unintended pregnancies and HIV transmission risks in Botswana.

EPD501

The impacts of COVID-19 social distancing measures on sexual and reproductive health services in Botswana, a high HIV prevalence setting

S. Ensor*[1,2], I. Mechie*[1,2], A. Mussa[1,2], R. Ryan[1,2], B. Bame[1,2], L. Tamuthiba[1,2], N. Moshashane[1,2], C. Morroni[1,2,3]

[1]Botswana Sexual and Reproductive Health Initiative, Gaborone, Botswana, [2]Botswana Harvard AIDS Institute Partnership, Gaborone, Botswana, [3]The Univeristy of Edinburgh, MRC Centre for Reproductive Health, Edinburgh, United Kingdom

Background: Universal access to effective contraception is a health and human right, and has a multitude of benefits, including reduced maternal mortality and vertical HIV transmission, by enabling safe pregnancy planning and spacing. In Botswana, 26.3% of women of reproductive age live with HIV; supporting them to access sexual and reproductive health (SRH) services to avoid unintended pregnancy and HIV transmission is essential.

We evaluated the effects of COVID-19 social distancing measures (SDMs) on SRH service access for people living with HIV (PLWH) in Botswana.

Methods: This observational, cross-sectional study was conducted in Botswana between 17th January and 22nd February 2021. Data were collected through a web-based questionnaire disseminated on social media as part of the International Sexual Health and REproductive Health (I-SHARE) Survey. Respondents answered questions on SRH and wellbeing, before and during Botswana's COVID-19 SDMs.

Results: Of the 409 survey respondents (female 82.2%, male 17.6%), 65 were PLWH (80% female, 20% male). Compared to the HIV-negative group, more PLWH used condoms as their primary contraceptive method (54.2% vs 48.0 %). Women living with HIV had lower use of long-acting reversible contraception (e.g. implant, intrauterine device, intrauterine system) (8.3% vs. 14.2%) and dual contraception (8.3% vs. 15.8%). PLWH were more likely to always use contraception (69.0% vs 50.6%) and less likely to never use contraception (17.2% vs 29.8%), than HIV-negative participants.

During SDMs, PLWH reported decreased condom use of 17.1% with steady and 19,0% with casual partners. Similar proportions in both groups encountered problems accessing condoms (23.8 % vs. 21.18%) and their regular form of contraception (16.67% vs. 15.08%). Those obtaining contraception from hospitals during SDMs increased by 66.7% in PLWH but decreased by 61.5% in people without HIV. 8.7% of PLWH obtained contraception from their HIV clinic, reducing to 0% during SDMs.

Conclusions: Our findings show COVID-19 SDMs disrupted access to contraception and SRH services for PLWH. Integrating SRH services with Botswana's well-developed HIV infrastructure, to deliver continuous access to highly-effective contraceptive methods, could improve health system capacity and resilience, and reduce unintended pregnancies and HIV transmission.

Opportunities to leverage fatherhood goals and ideals among South African men to promote HIV testing, treatment, and prevention

O.O. Isehunwa[1], X. Ntinga[2], L. Msimango[2,3], P.M. Smith[1], A.V. Heerden[2,4], L.T. Matthews[1]

[1]University of Alabama at Birmingham, Department of Medicine, Division of Infectious Diseases, Birmingham, United States, [2]Human Sciences Research Council, Pietermaritzburg, South Africa, [3]Centre for the AIDS Programme of Research in South Africa (CAPRISA), University of KwaZulu-Natal, Durban, South Africa, [4]University of the Witwatersrand, Department of Paediatrics, MRC/WITS Developmental Pathways for Health Research Unit, Johannesburg, South Africa

Background: Despite significant gains in HIV testing, treatment, and prevention in sub-Saharan Africa, low male engagement and retention in HIV care remain as challenges.

We aimed to understand how fatherhood goals and ideals of South African men could inform approaches to engage men and their partners in care and prevention.

Methods: We conducted in-depth interviews (n=25) between April and September 2021 with men with HIV (MWH) living in rural KwaZulu-Natal, South Africa. MWH ages 18 years and older were recruited from prior research participants who consented to be contacted for future projects. Interviews were audio-recorded, transcribed, translated, and analyzed thematically.

Results: Median age was 44 (range: 28 – 58) years. Majority were black South African men (96%), unemployed (60%), in a long-time relationship or with a legal spouse (84%), with at least some secondary school education (92%).

Men articulated the importance of having children and fulfilling fatherhood responsibilities at individual, couple, and community levels.

1. Men are motivated to remain healthy in order to father and support HIV-uninfected children. Promoting concepts around U=U and treatment as prevention may leverage individual-level motivations to promote testing, treatment, and retention in care.

2. Couple-level motivations to meet reproductive goals with partners, have HIV-uninfected children, and maintain a healthy partner to raise children may promote disclosure, and encourage men to support partners to access HIV prevention strategies such as PrEP.

3. Men want to be seen and respected as fathers who provide for their families in their communities. Aligned messages and peer support may promote engagement in care and viral suppression.

Conclusions: Men with HIV value and strive to achieve important reproductive and fatherhood goals. We describe opportunities to leverage these goals based on insights from MWH in order to promote HIV testing, treatment, and prevention. Clinic and community-based programs including peer support that address fatherhood goals and opportunities to achieve them may help MWH engage and remain in care and support their partners to access prevention.

Reproductive health and parenthood among women living with HIV in the Ontario HIV Treatment Network (OHTN) Cohort Study (OCS)

K. O'Brien[1], T. Bekele[1], A.J. Odhiambo[2], M. Bannerman[3], J. Brophy[4,5], S. Baidoobonso[6], M. Ndung'u[7], M. Muchenje[7], A.E. Kroch[1,2,8]

[1]*The Ontario HIV Treatment Network, Data and Applied Science Impact, Toronto, Canada,* [2]*University of Toronto, Dalla Lana School of Public Health, Toronto, Canada,* [3]*Women & HIV/AIDS Initiative, Toronto, Canada,* [4]*Children's Hospital of Eastern Ontario, Ottawa, Canada,* [5]*University of Ottawa, Ottawa, Canada,* [6]*Dalhousie University, Department of Community Health and Epidemiology, Halifax, Canada,* [7]*University of Toronto, Factor-Inwentash Faculty School of Social Work, Toronto, Canada,* [8]*Public Health Ontario, Toronto, Canada*

Background: In Ontario, Canada, almost half of women living with HIV (WLHIV) are of reproductive age and many intend to give birth in the future. The Birth Outcomes Registry Network reports 80-100 WLHIV give birth in Ontario every year. While on treatment and maintaining viral suppression, vertical transmission in utero or during birth is essentially eliminated. Ensuring reproductive health care and parental support services for WLHIV is critical. At the same time, WLHIV require social and financial supports to minimize parental stress.

Methods: The OCS is a longitudinal cohort of people receiving HIV care in Ontario, Canada. We analysed data from 398 women interviewed in 2021, including questions on reproductive health needs, parenthood, and parental stress.

Results: Respondents had a median age of 50 years, were 60% black, 28% white, 12% other races and tend to be low-income, (34% earned <20K CAD; 61% had difficulty paying for housing, and 54% were food insecure). 77% are mothers; 41% have children <18 years and 42% have children 18 years or older. 35% had children since their diagnosis and 12% considered, but have not had children.

37% reported that their provider did not support their decision/did not provide support/counseling on infant feeding. 86% report they have a provider with whom they can discuss reproductive needs. 17% are interested in becoming a parent, among whom 73% intending to become pregnant, 25% feel they will require fertility services, and 11% feel they will require adoption services.

WLHIV with children <18, enjoyed their children (97% strongly/somewhat agree), are satisfied with being a parent (93% strongly/somewhat agree), and find their children to be a source of affection (96% strongly/somewhat agree). However, children were a major source of stress (33% strongly/somewhat agree) and financial burden (16% strongly/somewhat agree), and some WLHIV are overwhelmed by parental responsibility (26% strongly/somewhat agree).

Conclusions: Optimal health for WLHIV includes reproductive health options and support in their role as a parent. Increasing support services for pregnancy planning should be considered by healthcare providers and policy makers. WLHIV require social, medical and financial supports in order to reduce parental stress and maintain optimal health.

EPD504

Desire for more children and postpartum contraceptive use patterns among women living with HIV in South Africa

A. Ajayi[1,1], O.V. Adeniyi[2]

[1]*African Population and Health Research Center, Population Dynamics and Sexual and Reproductive Health, Nairobi, Kenya,* [2]*Walter Sisulu University, East London, South Africa*

Background: Contraceptive use has numerous benefits, including preventing unintended pregnancy and vertical and horizontal transmission of HIV. Monitoring the desire for more children, which almost perfectly correlates with fertility, could create avenues to support women living with HIV to realize their fertility desire.

We examine the association between desire for more children and patterns of postpartum contraceptive use among women living with HIV in East Cape, South Africa.

Methods: We interviewed 485 postpartum women with HIV between January and May 2018 from the baseline database of the East London Prospective cohort study. This was a follow-up study of women previously recruited post-delivery into a PMTCT evaluation study between late 2015 and early 2016. All participants responded to questions on contraceptive use, methods type, and desire for more children. Adjusted and unadjusted logistic regression models were used to examine the association between the desire for more children and postpartum contraceptive use.

Results: The average age of women included in the study was 32.91 (SD 5.74) years. Contraceptive prevalence was 85.4% (n=485) at two years postpartum, a drop of 7.8 percentage points compared with immediate postpartum. Condoms and injectables were the commonly used contraceptives. The prevalence of dual contraceptives used was 35.3% (n=485). Only 5.2% (n=485) of women were using implant and IUCD. Most women were not using any contraceptive methods because they had no steady sexual partner (43.5, n=69) and suffered from contraceptive side effects (27.5%, n=69). Only 26.4% of study participants desire to have more children. After adjusting for the effect of age, education level, marital status, parity, employment status, HIV status disclosure to partner, and knowing partner's status, women who desired more children were 47% less likely to use any contraceptive methods than those who do not want more children. However, there was no significant association between desire for more children and long-acting contraceptive or dual contraceptive use.

Conclusions: Two-year postpartum contraceptive use was relatively high but slightly lower than the immediate postpartum period. Desire for more children is an important predictor of contraceptive use but long-acting or dual contraceptive use.

EPD505

Adverse pregnancy and infant outcomes in a trial of an intervention for PMTCT and family health in Southwestern Kenya

S. Ogola[1], Z. Kwena[1], E. Owengah[1], J. Adongo[1], K. Owuor[2,3], A. Helova[2,4], L. Darbes[5], A. Hatcher[6], E. Bukusi[1], L. Kimbo[2,4], D. Lajah[1], G. Wambi[1], M. Oyoo[1], L. Ouma[1], P. Odero[1], J. Turan[2,4]

[1]Kenya Medical Research Institute/Centre for Microbiology Research, Research, Care and Treatment Programme, Nairobi, Kenya, [2]University of Alabama at Birmingham/ School of Public Health, Sparkman Center for Global Health, Birmingham, United States, [3]University of Alabama at Birmingham/School of Public Health, Biostatistics, Birmingham, United States, [4]University of Alabama at Birmingham/School of Public Health, Health Policy and Organization, Birmingham, United States, [5]University of Michigan/School of Nursing, Center for Sexuality and Health Disparities, and Department of Health Behavior and Biological Sciences, Ann Arbor, United States, [6]University of North Carolina at Chapel Hill/Gillings School of Global Public Health, Department of Health Behavior, Chapel Hill, United States

Background: Adverse pregnancy/infant outcomes occur frequently in southwestern Kenya, even though antenatal care (ANC) and skilled maternity services are available in most health facilities. Many women face socio-cultural and financial barriers, which negatively impact their access to ANC and delivery with skilled birth attendants. This study examines serious adverse events (SAEs) by HIV status in a prevention of mother-to-child (PMTCT) trial in Kenya.

Methods: The Jamii Bora Study targets couples (HIV-positive and HIV-negative pregnant women and their male partners) accessing ANC at 24 health facilities in southwestern Kenya. Couples are randomized into one of three study arms, namely couple-based home visits, HIV self-test kits for couples, and standard care.

Results: As of December 1, 2021, 812 women (544 HIV-positive and 268 HIV-negative) were enrolled in the study and 660 couples had been randomized. We recorded 52 SAEs, including 7 miscarriages, 16 stillbirths, 13 neonatal deaths, 8 infant deaths, 2 child deaths, 1 maternal death and 5 participant deaths after 42 days postpartum. Differences by HIV status (HIV-positive vs. HIV-negative) were largest for neonatal death (12 vs. 1) and stillbirth (11 vs. 5). Although more HIV+ women experienced any SAE compared to HIV- women (39 vs. 13), the occurrence of any severe adverse outcome did not differ significantly by HIV status (7.2% vs. 4.9%, p=.20).

Conclusions: We identified a high burden of adverse pregnancy and infant outcomes in this population. Several patient-level factors may be related to these outcomes, including lack of regular ANC visits, non-adherence to recommendations of ANC providers, lack of funds for transportation, harmful traditional beliefs, and strenuous work during pregnancy. Facility-level factors contributing to this problem include understaffing, lack of systems for prompt referral of women/infants in emergency situations, inadequate tracing of women lost-to-follow up in ANC, and lack of psychosocial support services. Engagement of men in the process is crucial since much health-related decision-making is influenced by male partners.
We recommend strengthening MCH services and developing programs focused on awareness of healthy MCH practices in the community and clinic aimed at reducing adverse pregnancy/infant outcomes, with special attention to risks faced by HIV-positive pregnant women.

EPD506

Erectile dysfunction among men living with HIV: a cross-sectional prevalence study in a Turkish outpatient clinic setting

S. Atalay[1], H. Albayrak Ucak[2], D. Caglayan[3], E. Arkali[1], H. Abakay[1]

[1]University of Health Science Tepecik Education and Research Hospital, Infectious Diseases and Clinical Microbiology, Izmir, Turkey, [2]University of Health Science Ankara City Hospital, Infectious Diseases and Clinical Microbiology, Ankara, Turkey, [3]Dokuz Eylul University Faculty of Medicine, Infectious Diseases and Clinical Microbiology, Izmir, Turkey

Background: Understanding the sexual health-related issues of men living with HIV(MLWH) is one of the imperative factors in improving health outcomes across the continuum-of-HIV-care. Many MLWH express their concerns about unmet needs related to sexuality after being diagnosed. In contrast, sexual functioning is not adequately and systematically screened in clinic settings. Several studies revealed erectile dysfunction (ED) is the most frequent sexual problem and more significant in the MLWH.
Therefore, this study aimed to assess ED and associated factors in MLWH attending an outpatient-clinic in Turkey.

Methods: In the cross-sectional study settings, the participants answered an anonymous-self-responsive survey that consisted of sociodemographic-characteristics and the International-Index-of-Erectile-Function (IIEF) questionnaire to measure sexual-functioning. A blood-sample was taken to assess sexual-hormone-levels. Statistical-analysis was used to determine the prevalence and predictors of ED.

Results: A-total of 112MLWH were recruited.Eighty-five (75%) of the participants(mean age42.6±12.8 years, p:0.003) hadbeen diagnosed with ED (*Table.1*). The mean ED score of men aged 18-35 was 19.8±4.2, 17.9±4.3for those aged 36-54, and 13.1±5.6 for those aged 55-71 (p<0.001).

Oral abstracts

Poster exhibition

A moderate, negative correlation was found between age and ED score (r: -0.440,p<0.001). The median of HIV diagnosis interval and the duration of the antiretroviral therapy in ED compared to non-ED patients was 43 vs 26.5 months (p:0.15), and 16 vs 18 months (p:0.81), respectively. The majority of the participants' sexual hormone levels were normal (*Table. 2*).

In the ED score prediction analysis, the age variable's unstandardised coefficient was -0.165 95% CI;-0.231 to-0.098), and the-unstandardised-coefficient for the duration of HIV-diagnosis was -0.015 (95% CI;-0.028to-0.001).

International Index of Erectile Function Scores	Erectile Dysfunction Severity	Number (Percentage) 112 (100%)
22-25	None	28 (25%)
17-21	Mild	44 (39.3%
12-16	Mild-Moderate	29 (25.9%)
8-11	Moderate	5 (4.5%)
5-7	Severe	6 (5.4%)

Table 1. Erectile dysfunction severity of MLWH.

	MLWH with ED number (%)	MLWH without ED number (%)	P Value
Marital Status			
Married	31 (73.8)	11 (26.2)	0.78
Single	51 (76.1)	16 (23.9)

Impact of the COVID19 crisis on HIV treatment uptake among MSM from urban and non-urban areas: *preliminary analysis from the EPIC community-based research program in Peru*

M. Reyes Diaz[1], J.C. Enciso Durand[1], L. Riegel[2], O. Apffel Font[2,3], R. Diagne[4], V. Villes[2], N. Lorente[2,5,6], C. Sandoval Figueroa[1], D. Rojas Castro[2,7], C.F. Cáceres[1], EPIC study group

[1]Universidad Peruana Cayetano Heredia (UPCH), Centro de Investigación Interdisciplinaria en Sexualidad, SIDA y Sociedad, Lima, Peru, [2]Coalition PLUS, Community-Based Research Laboratory, Pantin, France, [3]Coalition des Organismes Communautaires Québécois de Lutte Contre le Sida (COCQ-SIDA), Montréal, Canada, [4]Coalition PLUS, Community-Based Research Laboratory, Dakar, Senegal, [5]Centre d'Estudis Epidemiològics sobre les Infeccions de Transmissió Sexual i Sida de Catalunya (CEEISCAT), Departament de Salut, Generalitat de Catalunya, Spain, [6]Centro de Investigación Biomédica en Red de Epidemiología y Salud Pública (CIBERESP), Madrid, Spain, [7]Aix Marseille Univ, Inserm, IRD, SESSTIM, Sciences Economiques & Sociales de la Santé & Traitement de l'Information Médicale, ISSPAM, Marseille, France

Background: Crucial to reach and maintain viral suppression, HIV treatment access was affected worldwide during the COVID19 crisis due to limitations on mobility and logistic operations that restricted access to antiretrovirals. We sought to explore whether living in rural areas increased those effects.

Here we present preliminary data from Peruvian men who have sex with men living with HIV (MSM-LWH), who participated in the EPIC program in 2021.

Methods: EPIC is a multi-country community-based research project, coordinated by Coalition PLUS, which aims to collect data regarding the impact of COVID19 on key populations for HIV infection. In Peru, the online EPIC survey targeted MSM from March-July 2021. We analyzed data among MSM-LWH respondents, and used the Fisher's exact test to compare antiretroviral treatment (ART)-related outcomes according to area of residence (urban vs semiurban/rural area).

Results: Among 302 respondents, 110 were MSM-LWH (36%). Among the latter, median age was 31 years old (range:18-61), college/technical higher education was attained by 76%, and 94% lived in the Lima/Callao region. Ninety-four respondents (85%) lived in the urban area, and 16 (15%) in a semiurban/rural area. Being ever on ART was reported by 103 respondents (95%). Among them, 9 (9%) interrupted ART during the COVID19 crisis. Compared to residents from urban areas, respondents from semi-urban/rural areas had a higher frequency of interrupted ART (27% vs 6%), had decided to reduce ART intake (47% vs.

12%), and had difficulties taking ART because they were confined with people unaware of their HIV status (36% vs 10%) (Table 1). Common reasons to interrupt ART in semi-urban/rural areas were: being confined with people unaware of respondent's HIV status, fear of COVID, and ART out of stock (2/4 respondents in each case).

HIV treatment-related characteristics		Total n (%)	Urban area n (%)	Semiurban/ rural area n (%)	p-value
Interrupted ART		9/103 (9%)	5/88 (6%)	4/15 (27%)	0.024
Reduced ART (less medication)					0.005
	Yes, self-decided	16 (17%)	9 (12%)	7 (47%)	
	Yes, with health personal assistance	13 (14%)	11 (14%)	2 (13%)	
	No	64 (69%)	58 (74%)	6 (40%)	
Difficulties taking ART because respondent was confined with people unaware of his HIV status		13/96 (14%)	8/72 (10%)	5/14 (36%)	0.023

Table 1. HIV treatment-related characteristics by area of residence

Conclusions: ART uptake among MSM-LWH from semiurban/rural areas was impacted by the COVID19 crisis. Perceived lack of medication availability and stigma-related (undisclosed HIV status) reasons were commonly reported and need attention to maintain the continuum of care gains among MSM-LWH.

EPD508

Access to HIV Pre-exposure Prophylaxis (PrEP) during early COVID-19 pandemic in the Republic of Ireland

F. Ongolly[1], S. Geiger[1]

[1]*University College Dublin, College of Business, Dublin, Ireland*

Background: Covid-19 disrupted a lot of services worldwide (including health services) especially in the early phase of the pandemic. Ireland implemented its PrEP national scale-up in November 2019, just before the pandemic, exposing its fledgling PrEP program to a lot of Covid-19 related challenges.

Methods: We conducted 14 in-depth qualitative interviews with 4 PrEP activists, 3 PrEP healthcare providers, 3 PrEP researchers, 2 policymakers and 2 HIV NGO staff within a larger study investigating the role of health advocates in access to medicines in the Republic of Ireland. All interviews were conducted virtually on Zoom.

A rapid analysis was manually conducted to identify arising themes in preparation for a more robust analysis on Dedoose.

Results: The pandemic brought a lot of challenges and opportunities to the Irish PrEP program. The shortage of healthcare providers to support Covid-19 services saw their redeployment to pandemic-related services hence affecting sexual health services including PrEP to the level of closure for close to 15 months.

Due to the closure, PrEP refills for those who had started PrEP before the pandemic and new PrEP initiations were disrupted for a long time and sexual health clinics were only provided on an emergency basis. To bridge PrEP and other sexual health services access gaps during the pandemic, PrEP services were moved online on phone, and via post.

Perhaps more importantly, we saw PrEP users becoming innovators themselves by switching from daily oral to event-based PrEP for their supplies to last longer. Some shared pills with their peers who were at risk of HIV infection and had no PrEP supply. Users also adopted other prevention strategies both behavioral and biomedical.

Conclusions: Despite sexual health services' disruption, lessons learnt from innovations adopted during the pandemic such as offering PrEP services online, on phone, and through postal services demonstrate the feasibility of creating wider PrEP access through virtual services especially to those who may not be able to attend Physical PrEP clinics due to several barriers.

The study also illustrates how proactive patients become when health services are lacking due to contextual circumstances.

EPD509

Mitigating COVID 19 impact on HIV service delivery to key populations through community interventions in Uganda

S. Atuhura[1], H. Muyonjo[1], I. Katundu[1], S. Kiiza Ganafa[1], M. Mulindwa[1], I. Rukundo[1], P. Katusabe[1], N. Kayongo[1], L. Saddic[1]

[1]*Spectrum Uganda Initiatives, Research and Advocacy, Kampala, Uganda*

Background: On 21st March 2020, Uganda reported its first COVID-19 case and the government responded by instituting a seven months total lock down and other measures to prevent virus spread in all districts inclusive of Soroti and Kabarole districts. This led to disruptions in HIV prevention service delivery and supply chains for key prevention commodities, including condoms, lubricants, antiretrovirals and other medicines. During the lockdown Uganda registered 41% decline in HIV testing and 37% (Uganda AIDS Commission 2021) decline in referrals for diagnosis treatment due to the pandemic. However, the Spectrum Uganda Initiatives (SUI)- MSM Drop-in Centers (DIC) ensured continuity of treatment and ART adherence support systems among MSMs and other KPs living with HIV such as door to door ART delivery and community drug distribution points.

Description: In both Soroti and Kabarole districts, SUI adopted a community drug distribution points model with 45 peer leaders who delivered condoms, lubricants, PREP and ART refills at household level. Community led viral load testing was also adopted where blood samples were picked up and delivered to health facilities for confirmatory testing. Social network strategy was used to identify new clients and also make referrals for covid 19 contacts. Soroti DIC tested 1226 Female Sex Workers (FSW), 226 MSM and 15 People who Inject drugs (PWIDs).

Oral abstracts

Poster exhibition

E-posters

Late-breaker abstracts

Author Index

Among those tested 25 FSW and 4 MSMs tested HIV positive. The Kabarole Spectrum DIC tested 531 MSM and 23 were HIV positive. All the 52 HIV positive clients have since registered viral load suppression.227 MSM were enrolled on PREP in Kabarole while 125 enrolled in Soroti.

Lessons learned: Community drug distribution points model is a feasible approach to be included among the options for decentralized drug distribution especially when access to health services is disrupted. Support efforts to build wider referral networks and longer-term treatment regimens that enable KPs to collect or refill their medication.

Conclusions/Next steps: COVID-19 restrictions had a greater impact on access to HCT services, HIV viral load testing services and ART access. Without the aforementioned interventions, it is possible that many of these at-risk populations would not have been able to access HIV services during the COVID-19 lockdown.

EPD510

A home dispensing of antiretroviral therapy program as an affordable way to maintain access to treatment during COVID-19 pandemic in Guatemala

S.M. Soberanis López[1], L. Aguirre[1], N. Medina[1], O. Bonilla[2], J.C. Pérez[2], E. Arathoon[2], J.L. Rodríguez-Tudela[3]
[1]*Asociación de Salud Integral, Guatemala, Guatemala,* [2]*Clínica Familiar Luis Ángel García, Guatemala, Guatemala,* [3]*Global Action for Fungal Infections, Geneva, Switzerland*

Background: COVID-19 pandemic has impacted on healthcare systems. Lockdowns and measures adopted for reducing SARS-Cov-2 transmission affected access to health care attention for people living with HIV (PLHIV).

Here, we evaluate the capacity of a home dispensing program to provide access to antiretroviral therapy (ART) during COVID-19 pandemic for PLHIV in Guatemala.

Methods: The delivery ART program was implemented from June 2020 to December 2021 for ART stable patients who met the following criteria:

i. Viral load <1000 copies/mL,

ii. Taking ART for more than 6 months straight,

iii. And those not requiring face-to-face medical attention.

Patients that did not met these criteria and had financial constraints, were evaluated by each of the HIV Healthcare Facilities (HCFs) to provided economical support. Eight HCF agreed to participate in this program.

The information was collected in a web-based system. Statistical analyses were performed in R (version 4.1.2) at a 95% CI.

Results: This program benefited 4,557 patients. Of whom, 3,730 patients were supported only with ART delivery, 570 with economical support, and 257 with both. Mean age was 38.5 ± 15.1 and 2,585 (57%) were male. Overall, 3,987 patients received ART without taking risks of exposing to COVID-19. The average cost for each shipment was $5. Of those who met the inclusion criteria (7,298), 55% (3,987) were covered by the program. A total of 8,328 shipments were delivered countrywide with a coverage of 79% (271/341 municipalities). Of those shipments, 75 delivered substitutes of breastmilk formulas. The average economical support provided for each patient was $10.

Conclusions: In the dire situation of the COVID-19 pandemic, the home dispensing program has proved to be an affordable way to maintain the access to ART while reducing the risk of acquiring SARS-CoV2 and the associated negative outcomes.

Indirectly, these actions could help patients living far-off, saving them money and time invested in transport, and problems at their jobs due to *"no show"* or absence permit.

EPD511

HIV testing and diagnosis at the apex tertiary referral hospital of India: impact of two years of COVID-19 pandemic

S.P. Maurya[1], B.K. Das[1], R. Singh[1], A. Sharma[1], H. Gautam[1]
[1]*All India Institute of Medical Sciences, New Delhi, India*

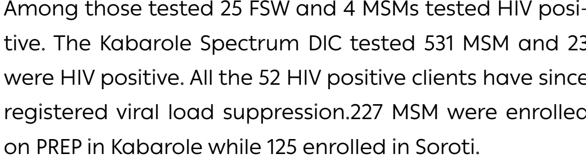
Background: Timely HIV testing and diagnosis is critically important to achieve an AIDS free world. Around 8.5% of global AIDS related deaths were estimated to be from India during 2019. Recognising the capability of COVID-19 pandemic related restrictions to impact HIV services, we collected and compared the data on HIV testing and diagnosis at the apex tertiary referral hospital of India in 2020 and 2021 with pre-COVID-19 years.

Methods: The documents/records on HIV testing and diagnosis from 01/01/2016 to 31/12/2021 was collected from integrated HIV counselling and testing centre attached to the apex tertiary referral hospital of India. It had individual identification number, age, gender, testing date, provider/client-initiated, risk behaviour,etc. Data was analyzed on Microsoft excel and GraphPad prism v5. Chi-square test was applied in analysis of all data sets (intra-group and inter-group) to calculate p values. P<0.05 was considered significant.

Results: During 2020, HIV testing declined by 56.9% [n=1182;2743] and hence new HIV cases declined by 54% [n=262;572] than average pre-COVID-19 years (2019-2016). During 2021, HIV testing saw just 3% [n=1217] improvement compared to 2020 [n=1182].

Although Client-initiated HIV testing saw considerable improvement [26.9%] in second year of COVID-19 pandemic compared to first year; provider-initiated HIV testing continued to be affected and got further reduced [by15.7%]. Provider-initiated testing used to constitute >2/3rdof total testing before pandemic [n=1922;2743].

New HIV cases and positivity rate increased in 2021 than 2020; but HIV diagnosis was still lower compared to pre-COVID-19 years by 43.7% due to low HIV testing. HIV testing in 15-34 years was significantly reduced than other



age groups. Transmission via infected syringe/needles and commercial partner significantly declined, however, transmissions via heterosexual regular partner/spouse and non-regular/casual/non-commercial partner significantly increased. There was 30.9% increase in HIV positive male despite <1% change in male HIV testing.

Conclusions: HIV testing and diagnosis was severely disrupted in two years of COVID-19 pandemic at our centre and the same could be true with other healthcare centres.

The world needs to adopt a modified strategy for HIV testing after assessing the existing one to compensate shortfalls during COVID-19 pandemic so that future rise in late-diagnosis/AIDS-related deaths could be prevented. This is particularly needed for provider-initiated testing.

EPD512
Access to HIV and sexual healthcare during COVID-19: gay and bisexual men's experiences during concurrent epidemics

C. Grey[1], S. Skakoon-Sparling[2], E. Daroya[1], D. Lessard[3], B. Klassen[4], M. Gaspar[1], J. Sinno[1], N.J. Lachowsky[5,6], D.M. Moore[6,7], G. Lambert[8,9], J. Jollimore[4], T.A. Hart[2,1], J. Cox[10,8], D. Grace[1]

[1]*University of Toronto, Dalla Lana School of Public Health, Toronto, Canada,* [2]*Ryerson University, Department of Psychology, Toronto, Canada,* [3]*McGill University, Montréal, Canada,* [4]*Community-Based Research Centre, Vancouver, Canada,* [5]*University of Victoria, School of Public Health and Social Policy, Victoria, Canada,* [6]*British Columbia Centre for Excellence in HIV/AIDS, Vancouver, Canada,* [7]*University of British Columbia, Vancouver, Canada,* [8]*Direction Régionale de Santé Publique, Montréal, Canada,* [9]*Institut National de Santé Publique du Québec, Montréal, Canada,* [10]*McGill University, Department of Epidemiology, Biostatistics & Occupational Health, Montréal, Canada*

Background: The implementation of COVID-19 public health measures resulted in disruptions to sexual health services for many Canadians. We examined how disruptions affected access to sexual and mental health services and impacts on the health of gay, bisexual, and other men who have sex with men (GBM) living with HIV.

Methods: Engage-COVID-19 is a mixed-methods study examining the impact of COVID-19 on GBM living in Vancouver, Toronto, and Montreal. Using purposive sampling, we conducted two rounds of in-depth qualitative interviews (11/2020-02/2021 and 06/2021-10/2021) with 93 GBM; 20 were living with HIV. GBM discussed the impact of COVID-19 on their lives. Interviews were coded in NVivo software using thematic analysis.

Results: HIV-negative GBM described challenges in accessing HIV/STI testing during various waves of the COVID-19 pandemic. Some participants indicated less/no need for sexual health services since they were having less sex during the pandemic. Most GBM living with HIV accessed health services for HIV without disruption (e.g., prescription refills, bloodwork). There were some changes to in-person healthcare visits during COVID-19 such as masking and social distancing requirements, and extended prescriptions for HIV medications.

Although online healthcare appointments posed a challenge for some participants, most GBM living with HIV generally reported high levels of satisfaction with the care received. In contrast, some GBM living with HIV reported interruptions in access to care for mental health and substance use.

These participants, most of whom lived alone, also described feelings of loneliness and depression while public health restrictions were in place, as they were unable to see family and friends.

Conclusions: For GBM living with HIV and already linked to care, there appears to be stability and adaptability of the HIV care system in these Canadian cities. Nonetheless, GBM living with HIV experienced interruptions to mental health and substance use services, posing challenges to their overall health.

Our findings signal the need to expand our understanding of essential HIV care to include mental health and substance use supports.

EPD513
Community based organizations providing support for PLHIV during the COVID lockdown in Vietnam

T. N.N. Nguyen[1], L. T. Nguyen[2], N. T. Truong[2], L. T.X. Hang[2], H. C. Nguyen[3], N. T.M. Vo[2], H. H. Mai[4], V. T. Nguyen[3]

[1]*Centre for Promotion of Quality of Life (LIFE Centre), Strategic Information, Ho Chi Minh, Viet Nam,* [2]*LIFE Centre, Technical, Ho Chi Minh, Viet Nam,* [3]*LIFE Centre, Monitoring and Evaluation, Ho Chi Minh, Viet Nam,* [4]*LIFE Centre, Communications, Ho Chi Minh, Viet Nam*

Background: The COVID response has been highly regarded for Vietnam's early intervention and control. However, from May – September 2021, the country had a significant wave of cases that led to restrictions on movement. People living with HIV (PLHIV) often have several social and economic barriers that impact their ability to access and maintain basic needs.

Recognizing this potential impact, community-based organizations (CBOs) were activated to mitigate the needs of clients during the lockdown period.

Description: Response to COVID was supported by CBOs but required advocacy to vaccinate its community health workers (CHWs). They were authorized to provide delivery of food packages and additional resources to help meet the needs of PLHIV unable to leave their homes.

In collaboration with CBOs and social influencers, LIFE helped organize virtual events to engage PLHIV who were alone or with limited engagement due to stay-at-home orders. This virtual community shared valuable information and discussion for people to feel connected.

Oral abstracts

Poster exhibition

E-posters

Late-breaker abstracts

Author Index

Lessons learned: During the lockdown period, just over a third of CHWs were fully vaccinated while the other nearly 2/3 received at least one dose. This step allowed CHWs some layer of protection, in addition to having personal protective equipment, as they delivered supplies and resources to clients and their families. CBOs identified 368 clients who were quarantined during the lockdown period in HCMC and Dong Nai provinces.
Utilizing the network of CBOs supporting these clients, CHWs delivered food aid to 2,000 people, beyond those immediate clients identified.
Additional support in the form of first aid kits (331), essential medicines (351), PPE (883) and other living expenses (1,919) were provided to 3,484 people. The virtual events conducted included topics on HIV, COVID-19, nutrition, stress management, and physical activities. Nearly 100 virtual events were conducted during the lockdown with thousands of views.
Conclusions/Next steps: The strict lockdown measures impacted many, particularly PLHIV. The activation of established CBOs and protecting their CHW, allowed aid and support to be promptly delivered. CBOs became an important resource to support and engage PLHIV, allowed for effective and efficient distribution of supplies/resources as well as maintaining supportive engagements.

EPD514
Differentiated barriers and preferences for receiving HIV care among Peruvian and Venezuelan men who have sex with men (MSM) in Peru

L. Menacho[1], G. Díaz[1], S. Villanueva[2], C. Pantoja[2], E. González[1], A. Duerr[3]
[1]Universidad Peruana Cayetano Heredia, Instituto de Medicina Tropical Alexander Von Humboldt, Lima, Peru, [2]Hospital Cayetano Heredia, PROCETSS, Lima, Peru, [3]University of Washington, Global Health and Epidemiology, Seattle, United States

Background: Retention in HIV care drops significantly during the second year and the COVID-19 pandemic has worsened this. This study explored barriers and facilitators for retention during COVID-19 curfew among HIV+ Peruvian and Venezuelan MSM. We also explored preferences for receiving care.
Methods: We performed an online survey in 2021 among 50 HIV+ MSM receiving treatment at a national hospital in Peru. We used closed and open-ended questions.
Results: Twenty-four percent of respondents were Venezuelan immigrants and 76% were Peruvians. The mean age was 32.7 years. 80% self-reported as homosexual and 20% as bisexual. 52% had college education or above, and 24% were unemployed. Regarding barriers to start treatment, Venezuelans reported lack of treatment in their country and lack of money to complete procedures; while Peruvians reported bureaucracy, poor health and denial. The main motivation to start treatment was to recover and maintain good health. In addition, Peruvians were motivated by their personal goals and families.
After starting treatment, participants set the goal of having healthier lifestyles and to reach viral suppression; also, Peruvians pursued emotional stability and advancement of education and work[BK1].
During the pandemic, the barriers to access care were lack of transportation, fear of going out and getting COVID-19, long waiting times, closure of the primary health system, and economic limitations; also, Peruvians complained about the lack of personnel and appointments, and lack of emotional support.
Regarding solutions to improve care, participants suggested enhancing telemonitoring including text messages as reminders; decreasing bureaucracy and decentralizing the delivery of treatment; providing treatment for longer periods.
Finally, topics of interest for receiving information were scientific news and monitoring of viral load/CD4. Peruvians were also interested in mental health, prevention of HIV and other sexually transmitted infections, and alcohol abuse; while Venezuelans, in nutrition and treatment literacy.
Conclusions: We could better retain Peruvian MSM and Venezuelan immigrants by addressing specific needs and preferences for receiving HIV care. Telemonitoring can help address this and barriers that have appeared during the pandemic. While mental health is a concern for Peruvians who are motivated by long-term goals, Venezuelans are focused on individual and short-term wellbeing.

EPD515
Pandemic impact and adaptations in delivering health care to people living with HIV without health insurance in Toronto, Ontario, Canada: the Blue Door Clinic experience

A. Li[1], A. Bisignano[2], J. Eden[3], E. Nam[4], R. Lopez[5], M. Vahabi[6], J.P.H. Wong[6]
[1]Committee for Accessible AIDS Treatment, Regent Park Community Health Centre, Toronto, Canada, [2]Casey House, Toronto, Canada, [3]Committee for Accessible AIDS Treatment, Toronto, Canada, [4]Gilead Science, Toronto, Canada, [5]Centre for Spanish Speaking Peoples, Toornto, Canada, [6]Ryerson University, Nursing, Toronto, Canada

Background: The Blue Door Clinic was established in 2019 as a partnership amongst ten HIV and health service organizations in Toronto, Canada. It provides short-term bridging health services and linkage to stable long-term treatment for people living with HIV (PLHIV) who do not have full health insurance coverage.
The clinic team consists of physicians, nurses, case managers and peer navigators. In-person drop-in services are provided asin-kind contribution by the partner agencies on a biweekly basis with phone support in between clinics.

Description: We used mixed methods to assess the effectiveness of clinic operation during the COVID-19 pandemic. Data collection included chart reviews of service use, focus groups, and individual interviews.

This presentation draws on the qualitative data from focus groups with internal and external service providers (N=32) who have engaged in the planning and delivery of services to Blue Door clinic.

Lessons learned: As a multisector partnered initiative, the Blue Door clinic faced compounded operational challenges during the pandemic due to a mixture of factors specific to the clients, service providers and institutions.

In addition to physical and mental distress that impact both service users and providers, precariously insured PLHIV experience additional challenges: increased barriers in accessing social, legal and government services; final hardship related to precarious work conditions; difficulties in accessing online care due to living condition and lack of privacy.

Provider were faced with increased workload, workplace re-deployment, and challenges in delivering virtual care. Institutional challenges included health and safety concerns and resource planning specific to PPE, physical distancing, staffing shortage and redeployment needs.

To address these challenges, Blue Door Clinic changed operation from drop-in to appointment based, increased clinic frequency to weekly, mobilized and trained new redeployed staff to take on provider roles, leveraged more community partner and peer navigator support, and increase virtual support by diversifying modes of communication with clients using text, email and what's app.

Conclusions/Next steps: COVID-19 presented unprecedented challenges to health care delivery and marginalized groups experienced disproportionate negative impact.

Proactive efforts in leveraging multisectoral collaboration and increased flexibility in service delivery are essential to address widening health inequities by vulnerable populations.

EPD516

Saving the ARV lifeline: continued outreach helped the PLHIV to continue with drug adherence during COVID lockdown: an experience from GFATM supported Ahana project in India

K. Biswas[1], R. Kb[1], S. Kanoujia[1], R. Rana[1]

[1]*Plan International (India Chapter), New Delhi, India*

Background: While country wide lockdown halted the spread of COVID spread, but it left a serious health impact on the general people, it was a double blow for the People living with HIV, for those ARV drug is the lifeline. It becomes even more critical considering pregnant women needsing continued ANC services along with ARV.

Ahana project supported by GFATM, puts up a fight to keep the lifeline of ARV continued for the HIV positive pregnant women and general PLHIV during COVID lockdown.

Description: Three staged approach has been adopted to keep the ARV life line going with:

A. Advocacy at the national, state and at the local level with Govt. so that passes can be issued for the outreach staff,

B. Desk based analysis of HIV positive pregnant women registered with the project to determine ARV requirement,

C. Coordination established with ART centres so that drugs can be issued against individual client in need of drugs,

D. Follow up with care and support for ART adherence as well as ANC related needs.

Lessons learned: Field workers carried ARV medicines from ART centres, as well Dry ration from the Govt. sources to deliver it in the homes of HIV positive pregnant women and general PLHIV. Combining both phases of outbreak a total of 36,700 general PLHIV, including 13,899 HIV positive pregnant women were delivered ARV medicines at home.

A total of 14,578 families were provided with dry ration through local NGO, Plan India sources or linked to Govt. rationing services. And 40,907 PLHIVs were provided with COVID related awareness messaging to remain safe from the infection being immunocompromised. Around 1,883 PLHIVs were supported to get vaccinated for dose-1 and 622 PLHIVs were supported to completing double dose during April- Sept 21.

Conclusions/Next steps: With curfews and lockdowns imposed and movement restrictions, meeting the requirement of ART adherence and other ANC needs became a great challenge. Ahana field workers put up an unputdownable effort to reach out to PPW and general PLHIVs with the ARV medicines to keep the lifeline continued and to ensure that the PMTCT needs are met appropriately and vertical transmission averted.

EPD517

Association between missing ART doses and economic hardships, difficulties to access healthcare and negative mental health outcomes among people living with HIV during the COVID-19 pandemic in Argentina

P.D. Radusky[1,2], I. Aristegui[1,3], G. Devisich[1], O. Sued[1], D.L. Jones[4], H.K. Ludvik[1]

[1]*Fundación Huésped, Research Department, Buenos Aires, Argentina,* [2]*Universidad de Buenos Aires, Faculty of Psychology, Buenos Aires, Argentina,* [3]*Universidad de Palermo, Department of Research in Psychology, Buenos Aires, Argentina,* [4]*University of Miami Miller School of Medicine, Department of Psychiatry and Behavioral Sciences, Miami, United States*

Background: Since the outbreak of the COVID-19 pandemic successive lockdown and social distancing measures were implemented. This context negatively affected income, access to healthcare and quality of life of specific groups, such as people living with HIV (PLHIV), possibly impacting antiretroviral treatment (ART) adherence.

This study analyzes correlates of missing daily ART doses among PLHIV after 15 months of initiation of the COVID-19 pandemic in Argentina.

Methods: Eighty PLHIV completed an online survey, including the CES-D Depression Screen-Short Form and the Perceived Stress Scale (PSS-4), from June to September/2021. Median age was 39.50 years (IQR: 34-47.75), 74.7% self-identified as males and 25.3%, as females.

Most participants self-identified as gay or bisexual (70%). A dichotomous variable was constructed: participants who reported having missed at least one daily ART dose in the last 30 days (31.3%), vs. those who reported no missing daily doses (68.8%). Associations with missing ART daily doses were explored with chi-square tests for categorical variables, and with t-tests, for continuous variables.

Results: Having missed daily ART doses was associated with having requested/received unemployment insurance (OR=4.02; CI95%=1.28-12.67) and with difficulties to afford basic needs (e.g., food, hygiene products) (OR=2.66; CI95%=0.96-7.37), to attend healthcare facilities (OR=3.15; CI95%=1.14-8.69), to get transportation to get to a medical appointment (OR=6.66; CI95%=1.14-38.83), to get medication other than ART (OR=5.14; CI95%=1.34-19.77) and to continue affording health insurance (OR=3.00; CI95%=1.00-8.95).

Additionally, those who reported missing doses were more likely to report interruptions in mental health care (OR=1.60; CI95%=0.93-2.73) and exhibited more depressive symptoms and more perceived stress.

Conclusions: One third of participants missed at least one daily ART dose in the last month, which was significantly associated with socioeconomic hardships, difficulties to access healthcare and negative mental health indicators, during the COVID-19 pandemic. Public policies should prioritize PLHIV during pandemics to ensure access to basic needs and healthcare to maintain viral suppression and a good quality of life.

EPD518

Distribution of Opioid Substitution Therapy (OST) during COVID 19: experience of take-home dosage under National AIDS Control Programme in India

D.S. Rajan[1], D.B. Singh[1], D.S. Purohit[1], G. Ngaihte[1], V. Singh[1]

[1]*National AIDS Control Organization, Ministry of Health and Family Welfare, New Delhi, India*

Background: National AIDS Control Programme (NACP) provides Opioid Substitution Therapy (OST) under the comprehensive harm reduction package for People Who Inject Drugs (PWID) in India. The programme under the Ministry of Health and Family Welfare reaches out to 40,937 active clients across 32 states through 248 centres and 111 satellite centres.

The OST program is primarily provided as a directly observed treatment (DOTS) under trained medical supervision.

Description: Since early 2020, the COVID-19 outbreak had an immense impact on the PWIDs enrolled on OST due to a nation-wide lock down and subsequent containment zones in the different states. To address this problem of clients unable to present for daily dispensation, National AIDS Control Organisation (NACO) rolled out a policy on take home dosage for OST centres during COVID19 pandemic which included take home provision for upto 15 days for stable clients, fast-track induction of new clients, flexible timings, virtual counselling and COVID-19 prevention. Monitoring of the take home policy was done through an online questionnaire filled by medical doctors at the OST centres.

Lessons learned: NACO's take home policy immediately led to a reduction in direct physical interaction and required number of visits. OST clients received regular counselling to cope with the psychological distress of COVID and to ensure compliance with prescribed dosage regimens. Fast-Track induction reduced the waiting period and allowed for increased new registration (upto 29 percent).

Adherence on OST improved significantly (up to 82 percent) with no noteworthy instances of diversion. Flexible timings and travel pass issued to OST clients reduced access barriers during curfews. WhatsApp messaging groups for the Medical Doctors and PWIDs provided constant support.

In instances where returnee migrants were known to be PWIDs, a separate quarantine space was offered to assist them with withdrawals, detoxification and OST.

Conclusions/Next steps: NACO's take home policy helped to ensure uninterrupted service delivery and prevention of COVID among OST clients. This has resulted in better adherence and retention.

In the containment zones, take home dosage through outreach workers and virtual counselling was effective, however requires close monitoring. Virtual medical consultation was shown to be a feasible option for follow up and counselling.

EPD519

Impact of COVID-19 on HIV service delivery and access in U.S. Health Departments in two urban juridictions: findings from the Rapid Risk and Resilience Assessment (R3A)

C.J. Gray Le Compte[1], E. Staryzk[1], T.J. Moore[1], M. Shankle[1], A. Bacharach[1], B. Hujdich[1]

[1]*HealthHIV, Washington, United States*

Background: The impact of the COVID-19 pandemic on HIV services in the U.S. has exacerbated inequities in delivery and access of HIV care. A distinct gap exists in the literature regarding how COVID-19 impacted delivery of and access to HIV prevention and treatment services among persons with and at risk for HIV. HealthHIV, (a U.S. national non-profit) in collaboration with DC Health and the Maryland Department of Health, conducted the CO-

VID-19 Rapid Risk and Resilience Assessment Project (R3A) to produce a deeper understanding of the experiences of HIV service providers and patients of HIV prevention and care services.

Methods: R3A utilized an exploratory sequential multiple methods approach including quantitative and qualitative instruments through a provider online survey (n=94), provider key informant interviews (n=48), and client focus groups (2 groups, n=17). Data collection was from June 2021 to September 2021. Quantitative survey data were assessed using regression analysis; qualitative data were organized in NVivo and thematically analyzed using theoretical saturation.

Results: Provider-reported challenges during COVID-19 reflected gaps in emergency response preparation and limitations in virtual healthcare infrastructure, delivery, and engagement. Organizations delivering care to racial/ethnic minorities (including racial/ethnic minority LGBTQ+ persons) were more likely to close or reduce services and experience service delivery challenges.

They had higher odds of patient psychosocial barriers due to COVID-19 (fear of infection, testing, vaccines, contact tracing, mental health, and stigma), compounding existing psychosocial barriers. Patient use of telehealth was associated with new engagement in care, financial hardship, and preference for virtual engagements.

Conclusions: R3A documented a COVID-19 eclipse that overshadowed the resources and needs around HIV prevention and care services for providers and clients.

The social and medical crises elicited by COVID-19 have intersected extant social determinants of the lived experiences of persons with and at risk for HIV in Washington, DC and Maryland, especially underserved populations.

COVID-19 has amplified the pandemic's impact, resulting in food and housing insecurity, insurance complications, unemployment, disrupted healthcare access due to insufficient technological and transportation resources, mental health challenges, and isolation.

EPD520

Assessing the impact of COVID-19 on event based testing activities in the Central Region, Ghana

J. Mensah[1]

[1]*African University College of Communication, Development Communication, Accra, Ghana*

Background: Ghana has marked successes in responding to HIV and AIDS through integrated and multi-sectorial approaches. The Central Regional Technical Support Unit (TSU) of the Ghana AIDS Commission (GAC) takes advantage of public events and social gatherings to reach people with HIV testing service.

However, efforts to mitigate the spread of COVID19 placed a ban on public events and social gathering. The TSU assessed the impact of COVID 19 and its effect on Public HIV testing activities in the central region, Ghana.

Description: The TSU embarked on a program review and assessment on event based HIV activities specifically carried out in 2020. The assessment involved tracking all HIV activities that were carried out by the TSU at the regional level and Municipal District Assemblies (MDAs) at the District level. All HIV programs and implementation of interventions were measured at the regional and district through a program target and result analysis framework. The measure indicators covered number of public events organized, HIV activities carried out at events, number tested, number of condoms distributed, number tested positive and linkage to treatment, care and support.

Lessons learned: The result showed that organization of public event had reduced from 90% in 2019 to 20% 2020, event HIV testing had reduced by 70% with public condom distribution reducing by 60% Additionally, access to ART had reduced from 51.3% to 47% as a lot of persons living with HIV were scared to visit the health facility due to exposure to COVID 19. Public sensitization on stigma reduction and education on HIV prevention were not carried out as a result of the pandemic there by reducing the coverage of new HIV infection.

Conclusions/Next steps:

- The Ghana AIDS Commission must develop innovative approaches to provide public HIV testing services amidst COVID 19.
- The TSU must engage stakeholders in the implementation of a household centered HIV testing and referral.
- The TSU must continue to advocate for a comprehensive health coverage and delivery system.
- Increase education and create awareness on HIV self-testing.

Social and behavioural aspects and approaches to COVID-19

Changes in sexual behavior among men who have sex with men during the spread of COVID-19 in China: results of an online survey

H. Lyu[1], S. Zhen[2], Y. Zhou[1], W. Tang[3,4]

[1]*Zhuhai Center for Disease Control and Prevention, Zhuhai, China,* [2]*China Medical University, Shenyang, China,* [3]*University of North Carolina Project-China, Guangzhou, China,* [4]*Dermatology Hospital of Southern Medical University, Guangzhou, China*

Background: Sexual behavior can influence sexually transmitted infection uptake, especially HIV, among men who have sex with men (MSM).

This study aims to evaluate the different sexual behavior changed among MSM duringthe coronavirus disease 2019 (COVID-19) and find the associated factors of sexual behavior.

Oral abstracts

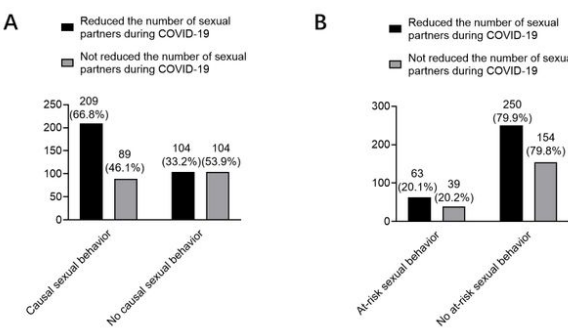
Poster exhibition

E-posters

Late-breaker abstracts

Author Index

Methods: An online survey was conducted to collect sociodemographic, sexual behavioraland HIV testing information before and over COVID-19 epidemic.
We first divided MSM by reduce sexual partners or not during COVID-19, then compared the characteristic of the two groups;
Secondly, we compared the casual sexual behavior and at-risk sexual behavior change during the COVID-19 between the two groups of MSM;
Finally, we identified the factors associated with sexual behavior among MSM using bivariate and multivariable logistic regression.
Results: A total of 502 MSM participated in the online survey. Compared with participants who did not reduce number of sexual partners, participants who reduced sexual partners had higher values of multiple sexual partners, causal sexual partner, used a condom with causal sexual partner and seeking sexual partners using apps (all p< 0.05).
A higher proportion of participants who reduced the number of sexual partners compared to before COVID-19, reported have causal sexual behavior (66.77% vs 46.11%,c^2= 21.047, p< 0.001,). But at-risk behavior did not change significantly between the two group during COVID-19 (p>0.05). Multiple factors related to casual sexual behavior and at-risk sexual behavior.



Figures A & B.

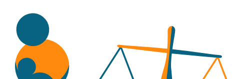
Conclusions: During the COVID-19 pandemic, the lockdown measures of government can effectively reduce the number of sexual partners and casual sexual behavior among MSM, but it cannot affect the occurrence of at-risk sexual behavior in MSM. To prevent HIV, we should focus on MSM who have dangerous sexual behavior, and adopt a variety of methods.

EPD522

Experiences of the COVID-19 epidemic: a participatory qualitative study with people living and/or working with HIV in the UK

V. Papageorgiou[1], J. Bruton[1], K. Dsouza[2], H. Hamza[2], W. Thamm[2], J. Anderson[2], S. Petretti[2], E. Cooper[1], H. Johnson[1], H. Ward[1]
[1]Imperial College London, Patient Experience Research Centre, London, United Kingdom, [2]Positively UK, London, United Kingdom

Background: We aimed to explore the experiences of HIV service providers (community- and clinic-based) and people living with HIV during the COVID-19 epidemic in the United Kingdom of how HIV services had adapted, the experience of these adaptations, and the wider implications of government restrictions and the pandemic itself on daily life, health, and wellbeing.
Methods: We conducted fieldwork in October-December 2020 (people working in HIV services) and June-August 2021 (people living with HIV), using the same qualitative method (online semi-structured interviews) with peer researchers participating in the second phase.
Participants were based in England or Wales and people living with HIV were sampled from the 2017 Positive Voices study. Interviews were conducted using Microsoft Teams, Zoom or by telephone. Data were managed using NVivo and analysed by thematic analysis. We triangulated findings from both studies and present these together.
Results: We interviewed 33 people: 19 people living with HIV, 9 community-based and 5 healthcare workers (some of whom were also living with HIV). Twenty-three identified as cisgender men and 10 as cisgender women and most were based in London (n=21).
We identified themes relating to the impact on relationships, government guidelines/restrictions and challenges specific to people living with HIV. For instance, issues surrounding confidentiality and sharing of HIV status were raised because of initial government advice for people living with HIV to 'shield'; some people had household members who were unaware of their status.
Services adapted quickly to provide remote support for people living with HIV which made them more accessible for some but created challenges for others who became more isolated.
Conclusions: Peer/social support and HIV charities remain essential resources for some of the most disadvantaged people living with HIV but have faced financial pressures due to the pandemic. We find that HIV services have generally adapted well to the pandemic with the changes being acceptable to most people living with HIV although most people prefer the idea of returning to pre-pandemic practices (e.g., face-to-face). Digital exclusion remains a barrier for research participation and accessing services. Additionally, there is an expected emotional toll on those providing services.



EPD523

Loneliness and sexual risk-taking among gay, bisexual and other men who have sex with men in the context of HIV and COVID-19, two ongoing pandemics

S. Skakoon-Sparling[1], A. Zahran[2], T. Hart[2], N. Lachowsky[3], J. Sang[4], J. Cox[5], D. Moore[4], M. Dvorakova[5], D. Grace[6]
[1]Ryerson University, Psychology, Toronto, Canada, [2]Ryerson University, Toronto, Canada, [3]University of Victoria, Victoria, Canada, [4]British Columbia Centre for Excellence in HIV/AIDS, Vancouver, Canada, [5]McGill University, Montreal, Canada, [6]University of Toronto, Toronto, Canada

Background: During the COVID-19 pandemic, social distancing and isolation measures have been imposed—however, both areassociated with increases in loneliness and decreases in social support. In the context of COVID-19, younger age has also been linked with increased loneliness and lower social support (Lisitsa et al., 2020; Groake et al., 2020).
According to the loneliness and sexual risk model, higher levels of loneliness should be associated with increased sexual risk-taking; however, it's unknown whether this held true during COVID-19, when most Canadians were ordered to isolate, nor how age might impact this association.
We examined these associations using data on gay, bisexual, and other men who have sex with men (GBM), living in Canada's three largest urban centers.
Methods: Participants (n=1134) were recruited (09/2020-04/2021) from an ongoing cohort study of GBM aged 16+ in Montreal, Toronto, and Vancouver.
We examined the associations of baseline perceived social support (SS) with emotional support (ES) during the early phase of the COVID-19 pandemic (March-May 2020).
We used linear regressions to examine the association of age with loneliness and ES during COVID-19.
We also examined whether age moderated associations between loneliness and sexual risk-taking (at least one episode of group sex, transactional sex, chemsex, or sex with anonymous or new casual partners). Analyses controlled for education, income, recruitment city, living alone, and HIV status.
Results: Partial correlation analysis indicated a significant positive correlation between SS at baseline and ES during COVID-19 ($r(1134)=.21$, $p<.001$). Linear regressions revealed a significant association between age and loneliness (beta=-.144, $p<.001$) and age and ES (beta=-.170, $p<.001$).
Further, age moderated the association between loneliness and the likelihood of reporting sexual risk-taking ($B=-.02$, $p=.003$, 95%CI: -0.04, -0.01), such that younger participants experiencing more loneliness were more likely to report engaging in sexual risk-taking.
Conclusions: GBM who began with higher levels of perceived social support pre-COVID-19 tended to be better able to access emotional support from family and friends during the early months of COVID-19.
Further, younger GBM were particularly impacted by loneliness and may benefit from additional support to reduce their risk of transmission for both HIV and COVID-19.

EPD524

How the COVID-19 pandemic is changing sexual relations and HIV risk practices in eastern Zimbabwe

M. Skovdal[1], T. Maunzagona[2], F. Dzamatira[2], T. Museka[2], R. Maswera[2], C. Nyamukapa[2,3], S. Gregson[3,2]
[1]University of Copenhagen, Copenhagen, Denmark, [2]Biomedical Research and Training Institute, Harare, Zimbabwe, [3]Imperial College London, London, United Kingdom

Background: The coronavirus disease 2019 (COVID-19) and necessary restrictive public health measures present numerous challenges for sexual health and HIV prevention. Whilst some work is beginning to document the sexuality-related effects of COVID-19, none has empirically examined how COVID-19 risk and prevention efforts come to affect sexual relations and HIV risk practices in a sub-Saharan African setting.
Methods: This article draws on qualitative data from the first four data collection points (involving phone interviews, group activities, and photography) of a WhatsApp-enabled qualitative longitudinal study to explore how the COVID-19 pandemic is changing sexualities in eastern Zimbabwe. Data was collected from 11 adolescent girls and young women, six of whom engage in transactional sex, and five men over a 5-month period (March-July 2021).
Results: Three themes – identifying six changes to sexual relations – arose from our thematic analysis:
i. More or less relationship sex;
ii. More or less casual sex; and,
iii. More or less transactional sex.
As we examine and illustrate these changes, we reveal how they appear to be contingent on, or mediated by, the way COVID-19 prevention measures affect participants and their sexual partners differently, personal fears of being infected by COVID-19, relationship status, COVID-19 induced poverty and access to HIV prevention methods.
Conclusions: Our findings paint a complex picture of how COVID-19 and associated prevention measures come to affect sexual relations and risk practices in different ways.
We draw on our findings to discuss how these changes may reduce HIV risk for some, but may also pose a considerable threat – across the HIV prevention cascade – for others.

Socioeconomic impact of the COVID-19 pandemic and typologies of COVID-19 preventive behaviors in an Indian megacity

R.T. Khan[1], E.U. Patel[2], S.H. Iqbal[1], M.A. Rodgers[3], M. Anderson[3], A.K. Srikrishnan[1], G.A. Cloherty[3], S.H. Mehta[2], S.S. Solomon[4]

[1]Y R Gaitonde Centre for AIDS Research and Education, Chennai, India, [2]Johns Hopkins Bloomberg School of Public Health, Baltimore, United States, [3]Abbott Laboratories, Chicago, United States, [4]Johns Hopkins School of Medicine, Baltimore, United States

Background: There is limited population-representative data on typologies of COVID-19 preventive behaviours in low-and-middle-income countries where the barriers to adoption are substantial. India experienced the first and arguably most severe epidemic of the Delta variant.

We identify typologies of COVID-19 preventive behaviours and associated correlates before and during the Delta wave in Chennai, India.

Methods: From January-May 2021, we enrolled 4,657 individuals aged ›5 years from 2,610 unique households across 103 spatial locations in Chennai, India using a probability proportional to population density sampling approach. Participants underwent an interviewer-administered survey including COVID-19 impacts and nine preventive behaviours. Latent class analysis (LCA) was used to identify typologies of preventive behaviours among adult participants.

We assessed sociodemographic predictors of class membership using multinomial logistic regression with cluster-robust standard errors to account for household-level clustering.

Results: The median age was 38 years (IQR=26-51); 300 were children and 2,258 self-identified as female. Over two-thirds of households (68.1%) had a decrease in household-level income due to the pandemic; 52.9% of adults reported decreased wages or losing their jobs/businesses.

The most common preventive behaviours were washing hands or using hand sanitiser (55% of children; 87% of adults) and public mask use (38% of children; 76% of adults). Among adults, LCA identified a 3-class model of preventive behaviours characterized by low engagement (45.7%), high engagement in masking and disinfection practices (but not distancing, 29.2%), and high engagement in masking and social distancing practices (but not disinfection, 25.1%). In multivariable analysis, compared to the low engagement class, membership in the high masking/distancing class was significantly associated with female gender, older age, later recruitment and markers of higher socioeconomic status including higher educational attainment and home air conditioning.

Notably, those experiencing job or income loss were more likely to be in the high masking/disinfection class (aOR=2.92 [95%CI=1.65-4.84]) and less likely to be in the high masking/distancing class (aOR=0.12 [95%CI=0.09-0.15]), as compared to the low engagement class.

Conclusions: The COVID-19 pandemic resulted in a significant loss of socioeconomic stability, which was associated with engagement in COVID-19 preventive behaviours. Structural interventions and social protection schemes to financially support individuals may facilitate sustainable COVID-19 prevention efforts.

EPD526

An assessment of burnout and depression among health care workers providing HIV care during the COVID-19 epidemic in Malawi

J. Songo[1], K. Phiri[1], H. Whitehead[2], E. Chikuse[1], C. Moucheraud[3], A. Moses[1], K. Dovel[2], S. Phiri[1], R. Hoffman[2], J.J. van Oosterhout[2,1]

[1]Parteners In Hope, Implementation Science, Lilongwe, Malawi, [2]David Geffen School of Medicine, UCLA, Department of Medicine, Los Angeles, United States, [3]Fielding School of Public Health, UCLA, Los Angeles, Department of Health Policy and Management, California, United States

Background: Burnout and depression among health care workers (HCWs) may be more common than previously reported due to anxiety and increased work pressure during the COVID-19 epidemic. We assessed the prevalence of burnout, depression and associated factors among HCWs who provide HIV care in Malawi.

Methods: In April-May 2021, between the second and third Covid-19 waves, we randomly selected up to 14 HCWs per facility to participate in an anonymous survey, stratifying by HCW cadre. Thirty PEPFAR/USAID-supported health facilities were included in the study.

We used the World Health Organization Self Report Questionnaire for depression screening (a score of ≥8 indicating positive screen) and the Malslach Burnout Inventory tool for burnout screening (moderate or high burnout on Emotional Exhaustion and/or Depersonalization and/or Personal Accomplishment domains indicating positive screen). Burnout analyses excluded cadres that were not directly involved in patient care. Descriptive statistics and logistic regression models were used.

Results: We included 435 HCWs, median age 32 years (IQR 28-38), 54% female. Thirty-four percent were clinical cadres and 66% lay cadres. Prevalence of positive screen for depression was 28% and for burnout 29%. Co-prevalence of positive depression and burnout screen was 13%.

Controlling for age, sex, marital status and years of work, positive depression screen was associated with working in the southern region (aOR 2.3, 95%CI 1.4, 3.6), previous confirmed or suspected COVID-19 episode (aOR: 2.2, 95%CI: 1.2, 4.2), and feeling that one would probably or definitely get COVID-19 in the next 12 months (aOR 2.8, 95%CI 1.3, 5.9).

Being a clinical staff vs. lay health staff was associated with positive burnout screen (aOR 2.0 95%CI: 1.1, 3.5).

Finally, screening positive for burnout was strongly associated with positive depression screen (aOR 3.2, 95%CI 1.9-5.4).

Conclusions: HCWs screened positive for burnout and depression commonly but prevalence rates were not higher than reported before the Covid-19 epidemic.

Regular screening for both conditions should be encouraged given high prevalence, consequences for mental health and work performance and availability of feasible interventions for confirmed cases.

More research is needed on how prevalence of burnout and depression fluctuates during and after Covid-19 waves.

EPD527

Evaluating COVID-19 vaccine hesitancy among PrEP-eligible individuals living in Mississippi: a qualitative study

A. Leigland[1], T. Arnold[1,2], K. K. Haubrick[1], A. P. Barnett[1,2], Z. Bertone[1], L. K. Brown[2,1], L. Whiteley[2]

[1]*Rhode Island Hospital, Department of Psychiatry - Young Adult Behavioral Health Program, Providence, United States,* [2]*Brown University, Providence, United States*

Background: Mississippi has lagged behind other states in COVID-19 vaccination rates as well as the uptake of pre-exposure prophylaxis (PrEP). This is of special concern as the South has higher HIV rates and thus a larger proportion of immunocompromised individuals.

This study investigated COVID-19 vaccine and PrEP hesitancy to ascertain if concerns may be addressed similarly.

Methods: Semi-structured interviews were conducted between April 2021 and January 2022, which included the following content: vaccine/PrEP willingness, COVID-19 vaccination uptake barriers and facilitators, and sources of vaccine information. Coded data were entered into NVivo, and reflexive thematic analysis was conducted.

Results: Fifteen clinical staff and 37 PrEP-eligible patients living in Mississippi were interviewed. The patient sample was aged 23-66, 65% female and primarily Black (67%). Overall, 40% of patients were on PrEP or had previously taken PrEP, and 60% received the COVID-19 vaccine.

Among PrEP users, 72% had received the vaccine; similarly, 70% of those without a history of PrEP use were vaccinated. Participants reported similar hesitations regarding PrEP and the COVID-19 vaccine. These shared concerns included lack of trust in product efficacy, fear of side effects, and perceived lack of need. Participants also reported similar reasons for vaccine and PrEP uptake, which included taking control of their health and protecting themselves and others. Unique barriers for the vaccine included lack of knowledge and understanding of how the vaccine worked, distrust of the government, fear of vaccine side effects, and social pressure to stay unvaccinated.

Facilitators specific to the vaccine included high accessibility, the ability to protect oneself and vulnerable populations (children, those with pre-existing conditions, elderly), and avoiding future negative COVID-19 illness experiences. Participants reported that vaccine information should be provided by health organizations and familiar, respected individuals.

Conclusions: Results evidenced common motivational factors accounting for reluctance to utilize both preventive measures in populations that could benefit.

These findings will inform COVID-19 vaccination and PrEP uptake efforts and could increase overall immunization rates in Mississippi.

Future research sampling individuals at risk for, and living with HIV, could further assess shared barriers and facilitators to vaccine and PrEP uptake.

EPD528

Reaching communities in the context of COVID-19: lay workers improve HIV linkage at a health center in Kapchorwa district, Uganda

C. Cheptoris[1], O. Apok[1], I. Mirembe[1], P. Nakimbugwe[1], H. Bisaso[1], A. Musimenta[1], D. Wamboya[1], D. Ako-Arrey[1]

[1]*IntraHealth International/USAID RHITES-E Activity, Mbale, Uganda*

Background: Kapchorwa district in Eastern Uganda has an HIV prevalence of 4.8%; less than two-thirds of persons newly diagnosed with HIV are successfully linked to care. Barriers to ART uptake are multifactorial, and frequently include patient denial surrounding their diagnosis, perceived stigma related to HIV, and fear of disclosure by health workers.

Myths and misconceptions regarding COVID-19 have further impeded HIV care linkage. In Kapchorwa, the USAID RHITES-E Activity led by IntraHealth International supported Kaserem Health Center III to engage lay workers in offering quality, integrated information and counseling to clients to improve ART linkage.

Description: In October 2020, RHITES-E engaged lay workers to intensify interpersonal communication to families with clients who tested HIV positive and were not on treatment through:

1. Home visits;
2. Home-based counseling; and,
3. Social behavior change communication around COVID-19 myths and misconceptions and fear of COVID-19 infection.

Lay workers were oriented on key components of community follow-up and given a line list of all clients not linked, including contact details and physical locations. Village health teams coordinated scheduling and assignments.

Lessons learned: Data show sustained improvement in ART linkage rates from 64% in December 2020 to 94% at end of September 2021.

Our approach targeted many of the psychosocial, social, cultural, and behavioral barriers related to HIV linkage and successfully engaged existing community structures to offer information and counseling that addressed myths and misconceptions surrounding COVID-19.

Oral abstracts

Poster exhibition

E-posters

Late-breaker abstracts

Author Index

Figure. Trend of linkage at Kasarem HCIII Oct 2020-Sep 2021

Conclusions/Next steps: Strengthening community engagement structures and systems for client tracing, counseling, referral, and linkage into care, including line-listing patients, reaching them at home, and providing home-based COVID 19-specific counseling, improved linkage to ART.

Scaling-up efforts to eliminate stigma and discrimination directed toward people living with HIV and other vulnerable groups in communities and health care settings is key to achieving global HIV eradication targets.

EPD529

Implementing a linked community- and school-based adolescent HIV and sexual and reproductive health program during the COVID pandemic: lessons learnt

N. Katota[1], C. Bolton[1,2], C. Mulubwa[1], J. Chipungu[1], C. Chilambe[1], B. Chibwe[1], D. Lee[3], M. Musonda[3], B. Mukandawire[3], J. Liu[4], C. Chiu[5]

[1]*Center For Infectious Diseases Research In Zambia, Social and Behavioral Science Research, Lusaka, Zambia,* [2]*University of Alabama, Medical Science, Alabama, United States,* [3]*Grassroot Soccer, Programmes, Lusaka, Zambia,* [4]*University of California, Social and Behavioral Sciences, San Francisco, United States,* [5]*University of California, Public Health, Berkeley, United States*

Background: Led by peer educators, SKILLZ Girl is a sports-based program offering in-school education on HIV and sexual and reproductive health (SRH) rights linked to community-based distribution of HIV and contraceptive products and facility-based treatment and services. Our study follows a cohort of schoolgirls (≥16 years) from 23 high density population areas in Lusaka, Zambia.

Although SKILLZ Girl was planned and piloted in 2018/2019, the cluster-randomized trial study, which aims to evaluate the programs impact on uptake of HIV testing and care and contraceptives, occurred during the COVID pandemic. Between February 2020 and December 2021, schoolgirls were invited to participate in SKILLZ Girl. Process data related experiences and lessons learnt were documented during implementation.

Description: After the first COVID-19 case emerged in Zambia (March 2020), the Government of Zambia closed all schools restricting large gatherings for an unknown period of time. Although schools were reopened in September 2020, COVID-related restrictions severely affected planned implementation of SKILLZ Girl. To continue offering critical HIV and SRH information and services, we adjusted SKILLZ Girl as follows:

- Revised the protocol to suit COVID related restrictions, including community sensitization outreach,obtaining verbal parental consent via phone and implementing program activities in smaller, socially-distanced groups.
- Through consultations with authorities and institutional partners, we obtained approval to continue implementing our revised project activities
- To improve service delivery, we worked with the Ministry of Health to train and certify coaches as community-based distributors to directly distribute HIV self-testing kits, condoms, emergency contraceptives, oral pills, and Sayana Press to participants.
- Trained staff on collecting data via phone.
- Due evidence of high moderate- and severe depression found during the pilot, we trained coaches in and implemented basic mental health screening, counselling, and referrals.
- Escorted referrals by coaches to facility appointments for SRH services not offered by coaches to ensure linkage while avoiding queuing.

Lessons learned: Provision of SRH services through a school-based program during the COVID pandemic required substantial delivery adaptations and additional financial and human resources.

Conclusions/Next steps: Despite myriad challenges, our experience show that, school-based HIV and SRH interventions are feasible during the pandemic if adjusted to fit within constraints.

EPD530

Improved viral load uptake and suppression among transgender persons with implementation of differentiated care adaptations during the COVID-19 pandemic

P. Owira[1], G. Githinji[1], G. Manguro[1]

[1]*International Centre for Reproductive Health Kenya, Mombasa, Kenya*

Background: Enforcement of COVID-19 pandemic restrictions and curfews in Kenya greatly disrupted the provision of routine HIV services and created an urgent need to adapt existing HIV service delivery models to ensure continuity of access to essential HIV services.

We describe adaptations in HIV service delivery made to a Transgender HIV program implemented in Mombasa, Kenya between April 2020 and September 2020, and the impact of the adaptations on viral load uptake and suppression.

Description: In line with Ministry of Health Kenya directives for differentiated care antiretroviral therapy (ART) provision during the onset of the COVID-19 pandemic in March 2020, the program offered multi-month (>3 months) dispensing of ART to HIV positive transgender persons regardless of ART regimen, duration on ART or viral load status. This included implementation of community ART groups with service providers who were au-

thorized to move between restricted areas providing ART refills and viral load sample collection in the communities with the assistance of peer navigators. The program also strengthened mental health support and adherence counselling through provision of weekly telecounselling services to Transgender cohort on ART.

Lessons learned: There was improvement in viral load uptake and suppression among Transgender persons with the adaptation of community differentiated care models and weekly telecounselling support. Between October 2019 and March 2020 when 90% (26) of the cohort were dispensed to ART for 1 to 3 months and only 10% (3) were dispensed to ART for >3 months, the viral load uptake and suppression was 54% and 57% respectively.

However, with adaptation of differentiated care and telecounselling entailing provision of 92% (34) of the cohort with ART for 3 to 5 months and only 8% (3) of the cohort with ART for 1 to 3 months, the viral load uptake and suppression increased to 70% and 100% respectively. Service providers felt that these interventions helped them listen more to their clients while beneficiaries appreciated not having to travel far for ART and viral load sampling services.

Conclusions/Next steps: Adaptation of community differentiated care models is feasible and can be strengthened to optimize viral load uptake and suppression among Transgender persons.

EPD531
Digital campaign to influence the uptake of COVID-19 vaccination

A. Shetty[1], S. Abbasi[1], A. Dange[1], Y. Singh[1], V.R. Anand[1]
[1]*Humsafar Trust, Mumbai, India*

Background: COVID-19 vaccinations began in India in early 2021, within a year since the pandemic reached India. Vaccination drives were surrounded by mistrust, false information leading to a large number of trans men and -women who were at various stages of gender reaffirmation or were living with HIV to avoid Covid-19 vaccinations due to myths associated with side-effects, impact on HIV, or interactions with ART/hormones.

To mitigate this the Humsafar Trust implemented the second phase of our digital campaign *Samajh* (Understanding) II to address misconceptions, vaccine hesitancy, and improve vaccine uptake.

Description: Phase II of the Samajh digital campaign began with a series of community vaccine belief consultation to formulate strategies addressing urgent health communication needs and highlighting focus on improving vaccine uptake among LGBTQ+. The campaign emphasized on transgender communities dealing with isolation, misinformation and those facing discrimination at vaccination centres. The digital campaign developed IEC that aimed to also help communities navigate 2nd wave of the COVID-19 delta variant by motivating independence, positive mental health, and adherence to recommended COVID-19/ART guidelines. The campaign also supported information for revving the HIV program to incorporate COVID-19 care.

Lessons learned: We have learnt that in scenarios of constrained time and resources for community research, community consultations are helpful in understanding ground situations to inform behaviour-change campaigns. Focus on mental health with COVID-19 information is vital as continues to be a concern in the ongoing pandemic. Campaign needs to empower individuals to cope with isolation, living with unaccepting families and away from offline peer support. Hence practical information and tips need to be shared to strengthen resilience. HIV services needed to be reimagined to incorporate virtual delivery of services to retain focus on testing and linkage to treatment/care.

Conclusions/Next steps: The 2nd edition of the campaign Samajh was successful in herding community focus on vaccine uptake, resilience to COVID-19, individual coping skills, HIV/STI services, mental health and individual empowerment which was the need of a community that experienced pandemic at multiple, intersecting level.

EPD532
Virtual monitoring, evaluation and learning on HIV service accessibility during COVID 19: learnings & best practices

T.J. Matsebula[1], N. Ndzinisa[1]
[1]*Pact World, Eswatini, Strategic Information, Mbabane, Eswatini*

Background: The Ready, Resourceful, Risk-Aware (Triple-R) project is supporting the government of Eswatini to prevent new HIV infections and reducing the HIV vulnerability for orphans and vulnerable children, adolescent girls and young women. Robust practices of MEL are the best tools to monitor and measure the success and performance of projects. COVID 19 restrictions however presented challenges in traditional ways of conducting data collection and program monitoring through site visits and physical interactions. This called for new strategies to ensure that people continue receiving quality services and documentation is done properly.

The purpose of the study is to measure service delivery with the new incorporated MEL systems during the COVID 19 pandemic.

Description: *Challenges in implementing MEL during the pandemic*

Due to COVID 19 pandemic restrictions, there were some data loss and gathering referral completion data became difficult.

Adapted MEL practices during the pandemic

- Data management systems were digitized and expanded to virtual platforms like CommCare, Power Apps.
- Integrating Pact and Dreams clinical service providers electronic database for referral completion data collection.

- Beneficiary feedback through phone calls incorporated into monthly project activities. Follow-ups on services received were made and calls documented using Power App and stored on secure, locally hosted SQL servers for analysis and validation.

Lessons learned: On average 97% of verified clients indicated to have received services in year 2021. About 20,765 referrals issued in 2020 where completion rate was 86% and 113% referrals completion rate in 2021.

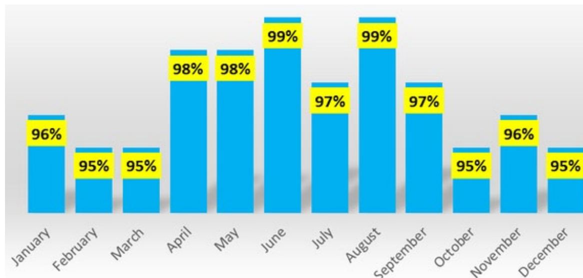

Figure. Monthly service delivery rate in 2021-power app verified

MEL changes improved partner collaborations, strengthen staff skills in mobile application use and remote working tools. Automated processes improved results production and data quality.

Conclusions/Next steps: Strengthened technological capacities and innovative skills for M&E staff bolster effective response mechanisms and real time monitoring of HIV programs resulting in improved data outcomes.

Keywords: MEL: Monitoring, Evaluation and Learning.

EPD533

Let's talk! Harnessing the power and influence of the media to accelerate COVID-19 vaccination in Zambia

M. Njelesani[1], J. Phiri[1], K. Kalangwa[2], M.P. Bobo[2], R. Chilengi[3,3], B. Siulanda[1], S. Hatchard[1], M. Paulson[4], M. Musonda[4], M. Chikuba-McLeod[1], M. Nyumbu[1]

[1]JSI Research & Training Institute, Inc., Lusaka, Zambia, [2]Ministry of Health (MOH), Lusaka, Zambia, [3]State House, Lusaka, Zambia, [4]United States Agency for International Development (USAID)/Zambia Mission, Lusaka, Zambia

Background: With a vaccination coverage of 12.5% (30 November 2021), the Zambian government introduced new COVID-19 vaccination guidelines, including requiring COVID-19 vaccination for public-sector workers and proof of vaccination for individuals wishing to gain access to public buildings, unleashing a storm of protest from anti-vaxxers.

This happened at the beginning of a national COVID-19 December Drive, intended to rally the country to achieve two million doses-in-arms by year-end.

Description: To mitigate the growing anti-vax push, the JSI-implemented USAID DISCOVER-Health Project supported the Zambian President's COVID-19 Advisor (COVID-Czar) to date the media in all ten provincial capitals to explain government policy, answer media questions, and address public concerns. In a marathon tour, the COVID-Czar and senior MOH staff explained GRZ vaccination policy, addressed concerns about the Omicron variant and vaccine effectiveness, and urged Zambia to get vaccinated.

In addition to engagements with the media, in each locality, the team went on local radio/television stations, engaging directly with citizens about vaccines. They responded to questions about vaccine safety, addressed myths/misconceptions, and visited vaccination-points to observe/learn about service-delivery experiences.

The COVID-Czar directly engaged 650 people during the tour, including 90% of media houses nationwide, in addition to religious, traditional and civic leaders. His radio and TV appearances were replayed nationally, reinforcing community-level vaccination efforts and significantly increasing vaccine uptake.

Lessons learned:

- An informed and supportive media is a powerful tool in public health interventions that require public buy-in and participation.
- Public health officials must connect directly with the public in order to understand vaccine rollout challenges and effectively/speedily address them.
- Direct engagement with civic, religious and traditional leaders harnesses their influence for increased vaccination uptake.

Conclusions/Next steps: Quick and comprehensive interventions by technical experts, including through engaging and obtaining the buy-in of the media and influential leaders, are a highly effective way to address people's concerns about COVID-19 vaccines and inform and reassure the public about government measures to protect them, their loved ones, and the country.

This intervention neutralized the anti-vax voice helping the country to reach its target of vaccinating 2 million people by December 2021.

EPD534

COVID-19 vaccine hesitancy and uptake among PLHIV in Lagos Nigeria

F. Durueke[1], P. Ingbian[2], D. Ita[1], O. Alaka[1]

[1]New HIV Vaccine and Microbicides Advocacy Society, Programme, Lagos, Nigeria, [2]Community Health Support and Empowerment Initiative, Programme, Lagos, Nigeria

Background: Globally, there has been concern about increased mortality of COVID 19 in PLHIV compared to people without HIV infection. Covid-19 vaccines are safe for use among PLHIV regardless of the viral load or CD4 count.

This study explores vaccine hesitancy and uptake among PLHIV accessing services in HIV treatment sites in Lagos.

Methods: A cross-sectional study was conducted among PLHIV enrolled for a treatment programme at an HIV treatment site in Lagos. A structured questionnaire was administered to 50 PLHIV, to assess vaccine knowledge, uptake, and hesitancy. FGD was held for qualitative data on vaccine hesitancy between November and December 2021.

Results: Most of the respondents (76%) knew COVID -19 can be contacted through cough/sneeze droplet, and 72% knew a COVID -19 positive can be contagious yet asymptomatic. More than half of the respondents perceived themselves as being at mild, low, or no risk of COVID-19. The majority (74%) noted that COVID -19 vaccine is useful; it will protect them from getting COVID 19.

However, about 20% identified the vaccine as neither useful nor useless but 6% noted the vaccine is useless. About one quarter (24%) of the respondents had a shot of the COVID -19 vaccines. Slightly more than half of the respondents (58%) noted they are unlikely or neutral to get a shot of the vaccine in the near future.

Concern raised includes fear of vaccine interaction with other drugs, not easily accessible in the community, negative social media reports. The factors identified for ease of access include making it available in HIV, TB treatment centers, proper education and counseling on covid 19 to addressing misinformation, and family support.

Conclusions: *S*afety concern as it relates to vaccine interaction with ART and its effect on the already compromised immune system is a major driver of hesitancy. PLHIV education on vaccine safety and effectiveness will promote COVID -19 vaccine uptake.

EPD535
Skill-based training to nurture Community Health Workers in LGBTQ+ community in India: outcomes of a virtual COVID-19 Volunteer Training Program

A. Royal[1], N. Mhaske[2], T. Chopade[3], M. Sivasubramaian[4], S. Rawat[5], A. Shetty[6], A. Dange[5], S. Parashar[2]
[1]*The Humsafar Trust, Research, New Delhi, India,* [2]*The Humsafar Trust, Transcend, Mumbai, India,* [3]*The Humsafar Trust, Advocacy, Mumbai, India,* [4]*The Humsafar Trust, Technical Directorate, Mumbai, India,* [5]*The Humsafar Trust, Research, Mumbai, India,* [6]*The Humsafar Trust, Communication Manager, Mumbai, India*

Background: The access to public health services has been exponentially compromised during COVID-19 pandemic. This has necessitated the need to widen the net of support with the help of trained community volunteers. This abstract reports the impact of a pilot skill-based virtual training to deliver COVID-19 services through community volunteers in India.

Description: We designed a skill-based training program to nurture volunteers from LGBTQ+ community for providing various health and social support services. The volunteers were trained through 5-weekly virtual sessions on topics related to basics of COVID-19 (prevention, diagnosis & treatment), home-based management of mild-to-moderate cases, management of HIV and other co-morbidities prevalent in the community. The training involved sessions on addressing myths & misconceptions related to ART, hormone therapy and substance abuse associated with COVID-19 vaccination. Practical training was given on effective usage of devices used in home-based monitoring of COVID-19 patients.

This online training was conducted in August – September 2021 and the volunteers were evaluated through various home and online assessments. Trained volunteers were followed for COVID-related services provided to the community as a post-training evaluation.

Lessons learned: The training was successfully completed by 13 out 15 volunteers. These volunteers are now providing COVID-19 relief services to LGBTQ+ communities in 7 states across India. The volunteers are now looking after the emergency needs of the community members in their area.

A total number of 617 packets of dry ration and 4585 masks were distributed within their community. 3102 individuals were provided various counselling and home-based care services through e-consultations.

40 persons were supported for COVID-19 testing; 14 were supported with referral services and 6 were provided medicinal support for hospital-based COVID care.

A total number of 192 individuals were supported to get vaccination services by these community health workers up to December 2021.

Conclusions/Next steps: Skill-based virtual training is an effective approach to nurture community health volunteers (CHVs). These CHVs can significantly improve the access of COVID-19 and public health services by LGBTQ+ community in current crisis. These low cost capacity strengthening initiatives can be scaled up to address the needs and vulnerabilities specific to LGBTQ+ community.

EPD536
It is not vaccine hesitancy; it is lack of access: increasing access accelerates COVID-19 vaccination in a Zambian district

L. Kawanga[1], N. Chibesakunda[1], T. Zimba[1], M. Chikaka[1], D. Tindi[1], D. Mumba[1], K. Mwanda[1], M. Chikuba-McLeod[1], M. Njelesani[1], M. Musonda[2]
[1]*JSI Research and Training Institute, Clinical Services, Lusaka, Zambia,* [2]*United States Agency for International Development (USAID) Zambian Mission, Clinical Services, Lusaka, Zambia*

Background: COVID-19 vaccine hesitancy has been blamed for low vaccination rates in Zambia, a credible assumption given the high prevalence of misinformation/myths. In December 2021, the USAID DISCOVER-Health Project, implemented by JSI, supported the Ministry of Health (MOH) to increase demand for and uptake of COVID-19 vaccination through the national COVID-19 Vaccination Drive.

Author Index

The nation planned to vaccinate 2 million people and each district was assigned a target according to its population. The Project opted to provide full cascade support to 22 districts, including Kalulushi District.

Description: The Project's support to Kalulushi district included:

- Entire cascade support, from micro-plans to service delivery.
- Pairing community sensitisation with vaccination service delivery, missing no opportunity to vaccinate.
- Taking vaccination into communities, door-to-door, in markets, schools and churches, taking services where people are.
- Implementing a full in-facility coverage model, from the highest to the lowest level facilities, integrating into existing service delivery.
- Hiring out-of-work healthcare workers to undertake supervised vaccination outreach.

As a result of the Project's support to the Kalulushi District COVID-19 Drive, the district achieved 116% of its December vaccination target compared to the 21% average district achievement, out-performing all the other 115 districts. Overall from the beginning of vaccination (April 2021), the December Drive contributed 55% of the people ever vaccinated in Kalulushi in one month.

Lessons learned:

- Supporting the full-service delivery cascade ensures optimum effectiveness with no missed vaccination opportunities.
- District ownership from leading planning meetings to coordinating rollout is key to success.
- Orientation of leaders (traditional, civic and religious) ensured buy-in, consistent messaging and showcased them leading by example encouraging constituents to get vaccinated.
- Hiring extra out-of-work staff safeguarded other ongoing health services, such as the HIV programme, and ensured quality provision of all health services.

Conclusions/Next steps: Vaccine hesitancy does not fully account for the low vaccination rates in Zambia. When the full vaccination cascade is supported and outreach is facilitated, people will get vaccinated in order to protect themselves and their loved ones.

Success in Kalulushi was achieved through MOH, Project staff and others working together at every stage, building on their collective strengths.

EPD537

Online COVID-19 prevention workshops within a sexual health and HIV/STI prevention program with a vulnerability and human-rights approach based on Freire's pedagogy in public schools in São Paulo, Brazil

G. Calazans[1], P.L.d.O. Borba[2], L. Oliveira da Silva[3], V.N. Silva[3], D.G.d.L. Lima[4], V.S.F. Paiva[3]

[1]*Universidade de Sao Paulo, Faculdade de Medicina, Hospital das Clinicas HCFMUSP, Dept. Medicina Preventiva, São Paulo, Brazil,* [2]*Universidade Federal de São Paulo, Departamento Saúde, Educação e Sociedade, Santos, Brazil,* [3]*University of São Paulo, Institute of Psychology, Social Psychology, São Paulo, Brazil,* [4]*Universidade Federal de São Paulo, Terapia Ocupacional, Santos, Brazil*

Background: COVID-19 crisis impacted the development of a program focused on sexual health and HIV/STI prevention among youth that actively incorporates teens as agents of research, a key principle in the multicultural approach of human rights. The program remained virtual while schools returned to face-to-face in August 2021 fostering some anxiety. Considering the perspective of integrated prevention, workshops were developed for the prevention of COVID-19 in schools.

Description: Three online workshops with two meetings each took place from Sept.-Dec., 2021 each with 4-11 participants (15-18yrs old) in three sites. Its development emphasized youth's participation, provisional scientific knowledge, fostering youth's skills of evaluating daily risk-exposure and how to reduce them, accepting possible errors. An eleven-question questionnaire on COVID-19 prevention was conducted before and after to dimension youth's knowledge and the feasibility of the workshops.

During the first meeting, participants were asked to imagine scenarios of SARS-CoV-2 exposure, experienced, or witnessed. One scenario was chosen to be thoroughly debated, enabling discussion on prevention and provision of information to expand their repertoire.

In the second meeting, participants played online the Gartic Phone, creating phrases and illustrations about preventative measures in schools. The material produced was displayed on a virtual mural and discussed. Later, participants created jointly memes to encourage adherence to COVID-19 preventative measures.

Lessons learned: Young people improved their understanding of the daily challenges of prevention, developed collective strategies to face risk situations in schools, expanded knowledge about prevention, and discussed anxieties related to COVID and resumption of face-to-face school activities. Still, the virtual nature of the workshops posed connectivity and communication difficulties, hampering the participation of some young people.

Workshop participants already had a lot of information on COVID-19 prevention but were introduced to the importance of ventilation and more effective masks on prevention.

Conclusions/Next steps: Building online COVID-19 prevention workshops with youth was feasible and well accepted, raising awareness on situations faced by young people in the school context. Next steps demand conversation with those responsible for schools to improve conditions for safe school attendance. Considering the synergistic interaction of HIV/AIDS and COVID epidemics, these workshops may help HIV prevention efforts with youth.

EPD538

Harnessing influence: accelerating COVID-19 vaccination in Zambia through engagement and involvement of local leaders

P. Mundende[1], B. Simpasa[1], S. Habbanti[1], N. Liywalii[1], S. Ndebele[1], S. Sampa[1], M. Njelesani[1], M. Nyumbu[1], M. Musonda[2], M. Chikuba-McLeod[1]

[1]JSI Research & Training Institute, Inc. (JSI), Lusaka, Zambia, [2]United States Agency for International Development (USAID)/Zambia Mission, Lusaka, Zambia

Background: The USAID DISCOVER-Health Project, implemented by JSI Research & Training Institute Inc. (JSI), supports the Ministry of Health (MOH) to increase demand and uptake for COVID-19 vaccines. In December 2021, the Project supported MOH with a national COVID-19 Vaccination Drive harnessing local civic, traditional and religious leadership. These trusted custodians of Zambian society are well placed to encourage their people to make the safe and smart choice to get vaccinated.

Description:

The Project supported the campaign in the Copperbelt and Central provinces in all 22 districts and it involved:

- Engagement and involvement of leaders to reassure beneficiaries of their support for vaccines, with outreach service delivery (door-to-door, schools, workplaces and other congregate settings) to reach beneficiaries within their communities.
- User-informed targeted Risk Communication Community Engagement (RCCE), especially interpersonal communication (IPC), through community mobilisers and fully-oriented leaders.
- Sensitisation with members of the media to equip them to share timely and accurate information, and to facilitate provision of radio/TV platforms for leaders to promote vaccination.
- Human resource for health (HRH) and logistical support to ensure availability of HR and other resources required for effective service delivery, including outreach vaccination services.

As a result of the Project's support to the campaign, 216,480 people were vaccinated against COVID-19 in Copperbelt and Central provinces during December 2021.

The two provinces (out of the 10 provinces) contributed 31% to the total national December Drive achievement of 701,000. Copperbelt Province is the best performing province in the country, recording the highest vaccination coverage.

Lessons learned: Harnessing the influence of respected civic, traditional, religious and other leaders, in addition to taking COVID-19 vaccination services door-to-door and in congregate settings close to where people live, decreases barriers to vaccine access and significantly increases uptake.

Conclusions/Next steps: Ensuring all components of the vaccination cascade were supported, equipping leaders with accurate information to support COVID-19 vaccination and expanding access to vaccines through outreach services enabled more people in Copperbelt and Central Province to get vaccinated. This model can be used to effectively scale-up COVID-19 vaccination in Zambia.

EPD539

COVID-19 vaccine intention and hesitancy among HIV research study staff in southwestern Kenya

A. Helova[1,2], E. Owengah[3], Z. Kwena[3], A. Jasani[4,1], M. Okombo[3], L. Darbes[5], A. Hatcher[6], L. Kimbo[2,1], K. Owuor[1,7], E. Bukusi[3], J. Turan[1,2]

[1]University of Alabama at Birmingham/School of Public Health, Sparkman Center for Global Health, Birmingham, United States, [2]University of Alabama at Birmingham/School of Public Health, Health Policy and Organization, Birmingham, United States, [3]Kenya Medical Research Institute/Centre for Microbiology Research, Research, Care and Treatment Programme, Nairobi, Kenya, [4]University of Alabama at Birmingham/Heersink School of Medicine, Birmingham, United States, [5]University of Michigan/School of Nursing, Center for Sexuality and Health Disparities, and Department of Health Behavior and Biological Sciences, Ann Arbor, United States, [6]University of North Carolina at Chapel Hill/Gillings School of Global Public Health, Department of Health Behavior, Chapel Hill, United States, [7]University of Alabama at Birmingham/School of Public Health, Biostatistics, Birmingham, United States

Background: Vaccine hesitancy has been declared one of the ten most important threats to global health. COVID-19 vaccine hesitancy is exacerbated by the novelty of the virus and vaccine. COVID-19 vaccine uptake is essential in southwestern Kenya, a region disproportionately affected by HIV and other conditions that pose a significant risk for severe COVID-19 presentation.

Methods: We conducted a cross-sectional survey among 200 HIV prevention and treatment research staff in southwestern Kenya in September-November 2021. Grounded in the Health Belief Model (HBM) framework, we explored COVID-19 vaccine uptake and intent to vaccinate in this population. We conducted bivariate comparisons between these outcomes, selected individual characteristics, and HBM constructs (perceived susceptibility and severity); and used content analysis to explore verbatim responses to open-ended questions.

Results: Of 200 respondents (125 women, 73 men, 2 unknown gender), the majority (85%) had been vaccinated for COVID-19. The unvaccinated were more likely to be

Oral abstracts

Poster exhibition

E-posters

Late-breaker abstracts

Author Index

women (21% vs. 6% men, p=0.004) and those who expressed high perceived susceptibility to COVID-19 (24% vs. 13%, p=0.041). Perceived severity of COVID-19 was not associated with vaccination status (p=0.674). Of those unvaccinated, main reasons for not vaccinating included fear of side effects/pain and delaying vaccination "to see what happens to those who have been vaccinated."

The most common rumors mentioned included that the vaccine causes decreased libido, impotency, infertility, and blood clots/death; and was developed to "reduce the world population."

About 27% of unvaccinated participants expressed that they do not intend to get vaccinated. Motivators to get vaccinated among all respondents included reducing risk, severity, and transmission of COVID-19; being able to socialize/live a "normal" life; and job-related mandates.

Perceived facilitators to vaccine uptake included access to free vaccines and a choice of vaccine brand. Perceived barriers included insufficient public education, mistrust of facility/vaccine distributors, fear of unknown side effects, health status, and advice from medical professionals to not vaccinate.

Conclusions: The results of this study show the need for interventions addressing COVID-19 vaccine hesitancy in a highly HIV-affected region. Interventions should include community education emphasizing vaccine benefits and messages from trusted sources addressing fear of side effects and common rumors.

EPD540

COVID-19 and HIV in the Philippines: a baseline assessment of the pandemic's impact on socioeconomic and mental well-being of Filipino PLHIV

D.A. Ching[1], A.J. Pecayo[1], R. Olete[2]

[1]HIV & AIDS Support House, Operations, Quezon City, Philippines, the, [2]Iloilo Doctors' College, College of Nursing, Iloilo City, Philippines, the

Background: Among 71,077 people living with HIV (PLHIV) in the Philippines, approximately 40% are not on antiretroviral therapy (ART) as of December 2019 and the COVID-19 crisis adds to the barriers towards UNAIDS 2020 90-90-90 target. This investigation aims to augment the dearth in evidence of COVID-19 impact on social determinants of health among Filipino PLHIVs.

Methods: A cross-sectional online survey was administered among Filipino PLHIV from July 1-4, 2020. *Google Form* was used for the questionnaire and was posted in social media. The instrument focused on the pandemic's impact to four main socioeconomic factors:

a. Perceived decrease in monthly income,

b. Job loss,

c. Residential displacement, and;

d. Social support received from the government, and mental well-being was assessed using PHQ-2 and GAD-2 questionnaires.

Descriptive statistics was used for data summary, and logistic regression analysis was performed to determine the association between socioeconomic impact and mental well-being of the respondents.

Results: From the total of 164 PLHIV respondents, there were 127/164 (77%) between 18 to 35 years old; 46% were living in Metro Manila. Majority (93%) self-identified as either gay or bisexual and 7% self-identified as heterosexual men who have sex with other men (hMSM). Results on socioeconomic impact of COVID-19 includes 125/164 (76%) with a decrease in monthly income, 63/164 (38%) unemployment, 21/164 (13%) residential displacement, and 126/164 (77%) without social support from the government. 48% had GAD-2 scores (as having anxiety-related symptoms), 40% had PHQ-2 scores (having depression-related symptoms). Regression analysis showed jobless PLHIV were 2.43 times likely to experience anxiety-related symptoms [Odds Ratio (OR)=2.4296, 95%Confidence Interval (CI)=1.2501-4.722, p=0.009]. After controlling respondents' age groups and location, there's a very strong evidence showing likelihood of experiencing depression-related symptoms is associated with job loss due to the pandemic, younger PLHIV group (18-35 years old), and those living in Metro Manila (OR=2.3360, 95%CI=1.1640-4.6880, p=0.017).

Conclusions: This investigation showed COVID-19 crisis affected both socioeconomic and mental well-being of Filipino PLHIV. Health programs in mitigating COVID19 effects should include socioeconomic and psychosocial support.

Study revealed the need to explore underlying political, structural, sociocultural, and individual factors to innovate and improve HIV services quality during COVID19.

EPD541

Longitudinal mixed-methods assessment of COVID-19 impact on the food insecurity of people living with HIV/AIDS in Uganda

S. MacCarthy[1], Z. Wagner[2], U. Saya[2], I. Ghai[2], S. Linnemayr[2]

[1]University of Alabama at Birmingham, Health Behavior, Birmingham, United States, [2]RAND, Santa Monica, United States

Background: Early qualitative evidence from Uganda suggests the COVID-19 pandemic and related lockdowns contributed to increases in food insecurity (FI) among people living with HIV/AIDS (PLWH). We longitudinally assessed the influence of COVID-19 on FI to better understand how it impacted PLWH over the course of the ongoing pandemic in Uganda.

Methods: HIV patients completed bi-annual surveys measuring FI (assessed via the FI Experience Scale) between March 2018 and September 2021 (n=297 quantitative respondents with a subsample of n=52 qualitative interviews). We used interrupted time series models to estimate the change in FI likelihood from before to after the pandemic started, adjusting for the pre-existing

trend in FI. Qualitative interview data (focused on factors driving FI, the impact of FI on ART medication adherence, and coping strategies to counter FI) were recorded, transcribed, dually coded (kappa 0.98) and then analyzed, with attention to subgroup differences based on sociodemographics and experiences with FI over time.

Results: The quantitative results showed FI rose by approximately 40% just within a few months of the COVID-19-related lockdowns in Uganda, and almost a year later, it increased by more than 80% compared to before the pandemic. The qualitative results show the factors driving FI appeared closely tied to the pandemic (e.g., job loss) and were exaggerated over time.

Except for those who reported FI both before and after the start of the pandemic, almost all other participants reported continuing taking their ART medication regardless of the pandemic.

Participants noted the use of several coping mechanisms to deal with and avoid FI, including minimizing their food intake. Mothers often said they would forgo food to so that their children could eat. Across all participants, support networks were of critical importance.

Conclusions: These results illustrate how the COVID-19 pandemic has exaggerated FI for PLWH over time. Qualitative results highlighted the unique vulnerability of those who experienced FI before the pandemic began and suggests that the lack of a social support network may be particularly problematic.

Going forward, programs, policies and research should consider if and how social networks of support can be leveraged to address FI.

EPD542

COVID-19 vaccine hesitancy among pregnant and postpartum women enrolled in a PrEP study in Western Kenya

M. Marwa[1], J. Kinuthia[1], A. Larsen[2], J. Dettinger[3], L. Gomez[3], F. Abuna[1], B. Ochieng[1], N. Ngumabu[1], P. Owino[1], G. John-Stewart[2,3,4], J. Pintye[3]

[1]University of Nairobi/Kenyatta National Hospital, Medical Research, Nairobi, Kenya, [2]University of Washington, Department of Epidemiology, Seattle, United States, [3]University of Washington, Department of Global Health, Seattle, United States, [4]University of Washington, Department of Pediatrics, Seattle, United States

Background: COVID-19 is associated with increased maternal morbidity and mortality, making preventive measures in pregnancy critical. COVID-19 vaccines lower the risk of severe illness and death. However, vaccine hesitancy can hamper uptake of COVID-19 vaccination.

Evaluating current COVID-19 vaccine hesitancy among pregnant and postpartum Kenyan women could help guide vaccine introduction strategies for this population.

Methods: We utilized data from HIV-negative pregnant and postpartum women enrolled in an ongoing evaluation of perinatal PrEP use at 4 public sector maternal child health (MCH) clinics in Western Kenya. From October 2020-January 2022, study nurses assessed COVID-19 experiences, including vaccine hesitancy, defined as reporting "unlikely" or "very unlikely" to the question, "If a vaccine for COVID-19 were available today, what is the likelihood that you would get vaccinated?". We identified correlates of vaccine hesitancy using Poisson regression models, clustered by facility.

Results: Among 790 women (140 pregnant, 650 postpartum), median age was 28 years (IQR: 24-33 years), 94% were married, and 60% had ≥12 years of education. Overall, 21% of women were currently on PrEP; among those 25% reported interruptions to PrEP access related to COVID-19.

Over half (57%) of women reported vaccine hesitancy. Women who perceived worsened MCH services during the pandemic had higher frequency of vaccine hesitancy than women reporting no change in quality (83% vs. 47%, prevalence ratio [PR]=1.79: 95% CI:1.68-2.73, p=0.0071).

Women who did not perceive masks as effective protection against COVID-19 had higher frequency of vaccine hesitancy than those who did (69% vs. 48%, PR=1.44, 95% CI:1.09-1.92, p=0.011).

Vaccine hesitancy was similar among pregnant and postpartum women (59% vs. 57%, p=0.536) and among women on PrEP and those not on PrEP (55% vs. 57%, p=0.37). Vaccine hesitancy was not associated with age, education, marital status, or perceived risk of COVID-19.

Conclusions: Among Kenyan pregnant and postpartum women, COVID-19 vaccine hesitancy was common and more frequent among those reporting worsened MCH care quality during the pandemic and those who felt masks were not effective for prevention.

It will be important to optimize vaccine information within MCH and to address vaccine hesitancy among pregnant and postpartum women attending MCH services.

EPD543

Improving collaboration on national level advocacy through differentiated models and interventions to address COVID-19 and PLHIV

A. Robinson[1], J. Shepherd[2]

[1]Ministry of Health and Human Services, Health Promotion and Advocacy Unit, Grand Turk, Turks and Caicos Islands, [2]Caribbean Regional Network of People Living with HIV (CRN+), Port of Spain, Trinidad and Tobago

Background: As the world continues to focus on Ending AIDS by 2030, the Turks and Caicos Islands (TCI) Health Promotion and Advocacy Unit (HPAU), within the Ministry of Health and Human Services (MHHS) with support from the Caribbean Regional Network of People Living with HIV (CRN+) and consultants has engaged in alternative models of intervention to continue reaching PLHIV and even more since the onset of COVID-19.

Description: Through alternative models of intervention for HIV, TCI has been able to strengthen healthcare access and human rights advocacy to PLHIV. This also created

Oral abstracts

Poster exhibition

E-posters

Late-breaker abstracts

Author Index

avenues to address COVID-19 through social distancing activities which promotes working between sectors, support synergies for action, and to engage communities in an easily understandable way.

Lessons learned: In 2019 we developed an Advocacy Strategy (to support treatment adherence relating to HIV, NCDs and COVID-19). This strategy today continues to address access to health care – HIV, NCDs, COVID-19 and 5250 persons have been reached with health services and improvement in continued access to medication; emergency responses and referrals; increased collaboration (including communication) with Private Health Facilities, Social-Support Services, NGOs and Private Sector Businesses are to be credited.

These strategies provided an alternative avenue for the collection of much needed data, especially for COVID-19 and people living with HIV. Increased communication-on PLHIV, COVID-19 and NCDs – encouraging being safe and getting vaccinated for COVID-19; Establishment of a Peer Support Programme that supports adherence to HIV medication virtually via SMS, WhatsApp, Zoom, etc; involvement of young people in the discussions around covid-19 and HIV through school debates and peer education sessions.

Conclusions/Next steps: The alternative models of intervention that have been implemented to continue reaching PLHIV even more during this COVID-19 period has made much needed headway in reaching clients; this has enhanced the response and allowed for synergies between sectors. These strategies aim to reduce the burden on clients and health-care providers in this present pandemic.

Crises can also be opportunities and the impending COVID-19 crisis pressed us to find innovative solutions. The next steps are to amplify efforts to continue implementing alternative models in an effort to reach more clients.

EPD544

The COVID-19 lockdown: increased cases of Gender Based Violence & Violence Against Women & Girls trigger in Uganda! The International Community of Women Living with HIV Eastern Africa (ICWEA)'s Experiences

M.K. Bernard Gift[1], L. Mworeko[2]

[1]The International Community of Women Living with HIV Eastern Africa (ICWEA), Business Development, Kampala, Uganda, [2]The International Community of Women Living with HIV Eastern Africa (ICWEA), Management/ Programmes, Kampala, Uganda

Background: Gender Based Violence (GBV) and Violence Against Women/Girls (VAW/G), is a global challenge thataffects 1 in 3 women in their lifetime including married partners more so in developing countries Uganda inclusive. Before the COVID-19 pandemic hit, globally, 243 million women and girls were abused by their intimate partners in the past year.In Uganda, 56% of ever-married women have experienced spousal violence and 22% women aged 15-49 have experienced sexual violence (Uganda Demographic Survey 2016). Before COVID-19, 593 girls reported being victims of sexual violence, 73 reported teen pregnancies, compared with 880 and 117 respectively during the lockdown.

Description: With that background, International Community of Women Living with HIV Eastern Africa (ICWEA) with support from Global Fund through The AIDS Support organisation (TASO) carried out Community Dialogues with the objective of assessing the impact of COVID-19 lockdown including GBV which became a very challenging turmoil on women and girls in the districts of Mubende, Jinja, Nebbi, Gulu, Wakiso, Kiryandongo, Lira & Namutumba. ICWEA, carried out Community Dialogues in 8 districts.70 Community Dialogues were conducted bringing together 3500 participants from networks and organisations of women and girls.

Lessons learned: GBV and VAW/G became more pervasive during the COVID-19 lockdown because many women lost their jobs, partners and co-habitants were locked up together and had no money to cater for their families.

Many women were physically assaulted by their spouses and this resulted into significant costs in order to seek for medical attention, 80 women were subjected to sexual violence by their partners, 120 young women aged 15-19 experienced forced sex, 60 testified that they forced into marriage leading to teenage pregnancies.

The lockdown impacted on mental health and limited access to health care services and exacerbated the pre-existing barriers to women's access to health and interrupted access to SRH services.

Conclusions/Next steps: To end GBV and VAW/G, we need sensitization and teamwork. We must encourage survivors to break the GBV cycle, ensure that women, men and children understand their roles in ending it.

The government should implement strong laws to protect women and awareness on GBV cases through radio and television.

EPD545

The unintended consequences of protecting learners from COVID-19: accounts from schools in South Africa

G. George[1], P. Nota[1]

[1]University of KwaZulu-Natal, Health Economics and HIV and AIDS Division (HEARD), Durban, South Africa

Background: The impact of the coronavirus 2019 (COVID-19) pandemic on South African schooling is significant, with learners unable to attend school as a result of national lockdowns, temporary school closures and the implementation of school rotation to minimise numbers. National lockdowns had simultaneously resulted in the downturn of economic activity with resultant job losses. Households and the learners face the dual challenge of economic hardship and limited access to schooling.

Description: In September 2021, researchers from the University of KwaZulu-Natal visited 10 schools in the Johannesburg West district in Gauteng and the Bohlabela district in Mpumalanga. These visits were part of an evaluation of the delivery of comprehensive sexuality education (CSE). Given the timing of the evaluation and the context, the scope of the evaluation extended to the impact of COVID-19 on learners, their households, and schooling. A total of 12 focus group discussions (FGD's) were conducted with grade 10 and 11 girl learners.
A total of ten FGDs were conducted with parents. Key informant interviews (KIIs) were conducted with 7 learner support agents (LSA's) and 2 educators who were members of school-based support teams (SBST).
Lessons learned: A lack of access to schools resulted in increased food insecurity, with many learners relying on school feeding programs for their daily meals. Learners have been forced to assist in income generation for the household, with some engaging in criminal activity or transactional sex, whilst many learners had dropped out of school.
The COVID-19 pandemic and the lockdown has also led to a spike in GBV and femicide in South Africa. Some homes have been and become enclaves of cruelty, with female learners reporting rape and violence for women and girls trapped with abusive family members.
Conclusions/Next steps: Schools need to take assertive steps in identifying vulnerable learners, with the expectation that they could facilitate access to social partners who can engage with affected learners and families, hopefully reducing the negative consequences of COVID-19 and specifically reducing the incidence of school drop-out. The DBE needs to ensure learners lost over this period are tracked and facilitated back into schools.

EPD546
Taking the HIV response into the digital ecosystem of young people

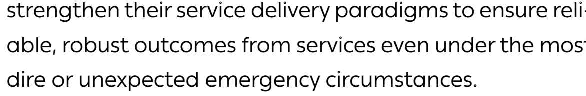
V.Y. Mlambo[1], J. Nyama[1], P. Kariezi[1], D. Zamuchiya[1]
[1]*Students and Youth Working on Reproductive Health Action Team (SAYWHAT), Regional Programming, Harare, Zimbabwe*

Background: Statistics in national studies noted challenges that include a decline in young women (15 -24 years) who tested for HIV and know their results from 84.5% in 2014 to 69.3% in 2019 as well as a decline in young men (15 -24 years) who tested for HIV and know their results from 58.9% in 2014 to 55.4% in 2019.
Description: Due to the COVID-19 pandemic in March 2022, the Students And Youth Working on reproductive Health Action Team (SAYWHAT) has expanded its digital programming.
Emerging evidence shows that the model has strong potential to optimize generation and sharing of HIV, TB, Sexuality and GBV information to more adolescents and young people. Programming has expanded the digital engagement to complement physical interactions on young people's HIV related issues. Interventions include Virtual Resource Centres, Call Centre and a Production and Broadcasting Studio all of which are mediums for young people to access HIV, sexuality information and education.
Furthermore, young people are taking a leading role in the development and creation of content for such platforms.
Lessons learned: Since 2020, there has been increased reach to adolescents and young people through the use of digital platforms**.** Reaching out to young people through physical engagements has been in many instances disrupted due to the nature of the pandemic.
Through the Studio of Choice, SAYWHAT has managed to keep young people informed on HIV Treatment and related sexual and reproductive health information and services as well as gender based violence and mental health issues.
However, SAYWHAT has also learnt that digital messaging is to some extent exclusionary because some rural communities do not have internet infrastructure to access health information services on virtual spaces.
Conclusions/Next steps: SAYWHAT aims to strengthen the linkages between information and knowledge management with access to HIV treatment and related SRH services among young people.
Furthermore there is an aim to strengthen the capacity of young people living with HIV so that they are able to contribute effectively to information generation and content creation. This include imparting advocacy skills to the young people for them to stand up and make their voice heard.

EPD547
Availability of contingency planning for key population HIV services in countries = HIV service continuity

N. Iangol[1]
[1]*Alliance for Public Health, Internation Department, Kyiv, Ukraine*

Background: With concurrent HIV epidemics, all highly concentrated amongst key populations, all countries shared one thing in common: the need for a robust COVID-19 response threatened to derail progress made in containing HIV transmission and supporting the health and well-being of people living with HIV.
Therefore, within the framework of the SoS project, a Guide for Contingency Planning for Key Population HIV Services during COVID-19 and Other Emergencies was developed. https://aph.org.ua/en/covid
Description: The following Guide to Contingency Planning for Key Population HIV Services provides a framework by which countries in EECA – or elsewhere – can examine the lessons of the COVID-19 pandemic and systematically



strengthen their service delivery paradigms to ensure reliable, robust outcomes from services even under the most dire or unexpected emergency circumstances.

This Guide adopts a framework which outlines essential health interventions for key populations:

1. HIV prevention;
2. HIV testing and linkage to care;
3. HIV treatment and care;
4. Prevention and Management of Coinfection and Co-morbidities;
5. General Care (including sexual and reproductive health, nutrition).

Lessons learned: Outreach services can be adapted to the new and changing realities of emergencies to maintain or even expand client outreach. Critical services typically provided in health care facilities can be made more accessible by moving them to the community level, and partnerships between the public and nongovernmental sectors can also be expanded.

New approaches and technologies for testing and monitoring treatment can expand access and optimize the use of limited health care resources by putting more power in the hands.

Conclusions/Next steps: Contingency planning and commitment from the community level all the way up through the political level, contingency planning for continuity of key population services during emergencies has the power to be a significant driver of change.

It is our hope that this Guide supports stakeholders in seizing the opportunity to create more accessible, equitable and sustainable systems of service for the populations who need it the most.

National action plans are currently being developed in 13 countries in the EECA region to help change national HIV strategies and develop national HIV plans to provide cost-effective services in situations related to or similar to COVID-19.

COVID-19: Associated mental health challenges for people living with HIV

EPD548

The role of carers in assisting OPWH with receiving HIV and non-HIV care during COVID-19 pandemic in Ukraine

I. Zaviriukha[1], T. Kiriazova[2], O. Zeziulin[1], L. Baxter[3], S. Shenoi[4], J. Rozanova[4]
[1]European Institute of Public Health Policy, Kyiv, Ukraine, [2]Ukrainian Institute on Public Health Policy, Kyiv, Ukraine, [3]University of London, London, United Kingdom, [4]Yale University, New Haven, United States

Background: To understand how older people with HIV (OPWH, defined as ≥50 years) cope during the Covid-19 pandemic when they need support with activities of daily living and HIV and non-HIV care, we explored experiences of both OPWH and their carers living in Kyiv.

Methods: In April-May 2021, we conducted 22 qualitative phone interviews with 11 pairs of OPWH and their carers. HIV psychologist at Kyiv AIDS center, referred eligible OPWH to the researcher. Our purposive sample included diverse OPWH by gender, sexuality, comorbidities (e.g., substance use disorder (SUD)), and their carers type. Recruited OPWH referred us to the person they considered their main carer (family member, friend or healthcare professional).

Participants within pairs were interviewed separately, with questions for OPWH mirroring questions for their carers. Interviews were audio-recorded, transcribed verbatim, and analyzed for themes using NVivo software.

Results: Among 11 pairs, there were mother-daughter (2), mother-son (1), sisters (1), girlfriends (1), heterosexual married couple (1), grandmother–grandson (1), and OPWH patient (including two gay men) and social worker (4). Age ranged from 50 to 77 for OPWH and from 25 to 72 for carers. Care relationship averaged 8 years, ranging from 1 to 17 years. Four key themes were highlighted in both OPWH and carers interviews:

1. The fear of HIV status disclosure stems from HIV identity rejection and restricts OPWH's intimate relationships and access to healthcare for comorbidities, including Covid-19 infection.

2. OPWH are primarily seeking companionship in carers with psychological support more important than any other help.

3. Burned-out relatives resented OPWH's HIV status when OPWH needed more assistance with HIV and SUD care during Covid-19 pandemic. Therefore, when carers also received support from OPWH they undervalued it.

4. Considering HIV a "shameful" diagnosis, OPWH often do not disclose it to children, instead looking for help in friends or social workers.

Conclusions: There is a need for interventions to help OPWH accept their HIV status and, make informed decisions about disclosing it to the closest people to continue

living fully. Interventions should be bilateral, simultaneously focusing on both OPWH and their carers to prevent burnout.

EPD549

Longitudinal changes in anxiety and depression among Ukrainian older people with HIV (OPWH) during the COVID -19 pandemic

K. Rich[1], S. Shenoi[2], I. Zaviryukha[3], O. Zeziulin[3], T. Kiriazova[3], D. Bromberg[2], N. Radich[4], T. Zubenko[5], J. Rozanova[2]

[1]Harvard Medical School, Boston, United States, [2]Yale School of Medicine, Department of Internal Medicine, Section of Infectious Diseases, Yale AIDS Program, New Haven, United States, [3]Ukrainian Institute on Public Health Policy, Kyiv, Ukraine, [4]New Way Psychotherapy Rehabilitation Center, Kyiv, Ukraine, [5]Ukrainian Union of Psychotherapists, Kyiv, Ukraine

Background: The COVID-19 pandemic amplified mental health challenges especially anxiety and depression. We sought to understand longitudinally how Covid-19 impacted the mental health of older people with HIV (OPWH) living in Ukraine.

Methods: We surveyed OPWH living in Kyiv, Ukraine by phone first between April-June 2020 (Wave 1) and again from December 2020-February 2021 (Wave 2).

The primary outcomes were depressive symptoms and anxiety symptoms, defined as scores on the Patient Health Questionnaire-9 (PHQ-9) ≥5 and scores on Generalized Anxiety Disorder-7 scale (GAD-7) ≥5, respectively. Participants PHQ-9 and GAD-7 scores were compared between Wave 1 and 2 to assess for changes in depressive and anxiety symptoms.

Other variables of interest were: age, gender, history of a substance use disorder (SUD) and/or alcohol use disorder (AUD), living situation (living alone, not living alone), and employment. Differences were assessed with chi-square and t-tests.

Results: Of the 110 OPWH who completed both Wave 1 and Wave 2 surveys, 55 (50.9%) were women and average age was 55.4y (SD=6.45). Nearly half (47.3%) had a history of a SUD and/or AUD. During Wave 1, 51 participants (46.4%) reported symptoms of depression and 39 (35.5%) reported symptoms of anxiety. During Wave 2, the prevalence of depressive and anxiety symptoms was 40.9% and 22.7%, respectively. At the individual level, 27 (24.5%) participants had decreased depressive symptoms, whereas sixteen (14.5%) had increased symptoms. Twenty-five (22.7%) participants had decreased anxiety and eleven (10.0%) had increased anxiety. Individuals without full time employment were more likely to have increased depressive symptoms than individuals with full time employment (p=0.01). Younger age (p<0.01) and a history of an AUD or SUD (p=0.01) were associated with increased anxiety symptoms between Wave 1 and Wave 2. Gender and living situation were not associated with changes in depressive or anxiety symptoms.

Conclusions: Among OPWH in Kyiv, prevalence of depressive and anxiety symptoms have remained substantial but have not increased during Covid-19. OPWH with comorbid addiction experienced increased anxiety symptoms. Targeted interventions to address mental health, such as peer-support, are warranted.

EPD550

COVID-19 lockdown and suicide risks: findings from a 5-year prospective cohort study of young MSM living with HIV in Bangkok

Y. Kongjareon[1], W. Waratworawan[1], K. Jonas[2], S. Lim[3], T.E. Guadamuz[1]

[1]Mahidol University, Center of Excellence in Research on Gender, Sexuality and Health, Faculty of Social Sciences and Humanities, Salaya, Thailand, [2]Maastricht University, Work and Social Psychology, Faculty of Psychology and Neuroscience, Maastricht, Netherlands, the, [3]University of Malaya, Social and Preventive Medicine, Faculty of Medicine, Kuala Lumpur, Malaysia

Background: Suicide rates are disproportionately higher among groups like men who have sex with men (MSM)—where in Bangkok, 1 in 3 MSM are living with HIV (YMSM+). Since COVID-19 lockdown in April 2020, daily life in Bangkok has been severely disrupted.

In this paper, we used data from 2018 to 2021, covering pre- and post-COVID lockdown, to examine suicide risks among Bangkok YMSM+.

Methods: With guidance of a community advisory board and community partners, 199 YMSM+ age 18-29 years residing in Bangkok were recruited via online methods into an online prospective cohort study that assessed demographics, sexual and drug risks, suicide risks, and access to HIV care and treatment between 2018-2021 (6 data points). The *Suicide Behaviors Questionnaire-Revised (SBQ-R)* was used to assess suicide risks.

After testing to ensure significant variability in the slopes and intercepts; Nagin's semi-parametric, group-based approach was used to identify distinct groups of trajectories in suicide risks over time.

Results: During the six data points between 2018-2021, the COVID-19 lockdown happened between third and fourth assessments with mean suicide prevalence pre lockdown 12.7% (range: 10.6%-14.8%) and post lockdown 13.1% (range: 11.4%-14.8%).

Group-based trajectory analyses yielded a three groups solution over time: increasing suicide risks (13.1%, P= 0.003), decreasing suicide risks (13.6%, P <0.001), and consistently low suicide risks (73.4%, P =0.399) (see figure 1).

Characteristics of these trends will be discussed, particularly access to HIV medications, social isolation, and fear of COVID-19.

Conclusions: We found a significantly increasing trend of suicide risks following the COVID-19 lockdown. However, we also found stable low suicide risks group and a decreasing suicide risks group, suggesting that these groups

may indeed be resilient to the lockdown. Suicide prevention programs need to be better at identifying at-risk groups so that prevention measures can be effectively tailored to their needs.

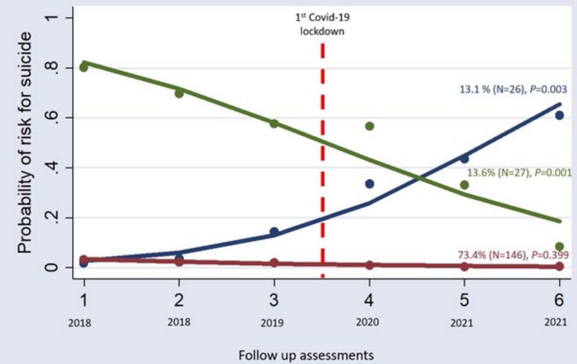


Figure 1. Trajectories of risk for suicide among MSM living with HIV from 2018 to 2021 in Bangkok, Thailand.

EPD551

Changes in depression after COVID-19 lockdown: Findings from a 4-year longitudinal study of young MSM living with HIV in Bangkok

W. Waratworawan[1], Y. Kongjareon[1], K. Jonas[2], S.H. Lim[3], T.E. Guadamuz[1]

[1]Mahidol University Center of Excellence in Research on Gender, Sexuality and Health (MUGSH), Faculty of Social Sciences and Humanities, Nakorn Pathom, Thailand, [2]Maastricht University, Department of Work and Social Psychology, Faculty of Psychology and Neuroscience, Maastricht, Netherlands, the, [3]University of Malaya, Department of Social and preventive medicine, Faculty of Medicine, Kuala Lumpur, Malaysia

Background: One-third of Bangkok men who have sex with men (MSM) are living with HIV and experiencing difficulties accessing HIV care and treatment. During the COVID-19 lockdown, young MSM living with HIV (YMSM+) were asked to refrain from visiting hospitals/clinics, except for emergency services. This study examines depression trajectories among YMSM+ that included the April 2020 lockdown.

Methods: Working with a local YMSM+ community-based organization, we recruited 199 YMSM+ age 18-29 years via online methods into an online prospective cohort that assessed demographics, sexual and drug risks, depression, and access to HIV care and treatment between 2018-2021 (6 data points). Depression was accessed using the validated Center for the Epidemiological Studies of Depression Short Form (CES-D-10) over a four-year period. After testing to ensure significant variability in the slopes and intercepts; Nagin's semi-parametric, group-based approach was used to identify distinct groups of trajectories in depression slopes over time.

Results: Group-based trajectory analyses yielded three distinct groups: consistently high-depression symptoms (27.4%), consistently intermediate-depression symptoms (35.7%), and an increasing from low-depression to intermediate-depression symptoms after COVID-19 lockdown (37.1%) (see Figure 1).

What was remarkable was the change of the low to intermediate depression group due to COVID-19 lockdown (i.e., depression rates increased over time). Characteristics of these stable and increasing trends will be discussed, particularly with respect to stigma, discrimination and breach of HIV status confidentiality from health care providers (*P*=0.033, 0.036 and 0.006, respectively); HIV status disclosure among sex partners (*P*=0.001), sex without condoms (*P*=0.041), and experiencing bullying (*P*=0.002).

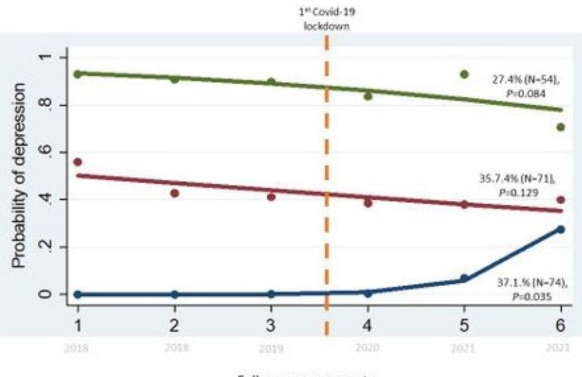

Figure 1.

Conclusions: Conclusion: We found high prevalence of depression among YMSM+ and those with low depression symptoms to intermediate depression symptoms showed a significant increase, suggesting that COVID-19 lockdown indeed had a significant impact on experiencing depression symptoms.

Participants reporting increased stigma and discrimination experiences by healthcare providers may have resulted from COVID-19 policies.

Effects of the COVID-19 on key populations

EPD552

Intersection of STI testing and positivity with COVID-19 among bathhouse clientele

A. Hazra[1], T. Wasanwala[2], N. Sachdev[3], T. Guidry[4], I. Tabidze[4], S. Mehta[2]

[1]University of Chicago Medicine, Section of Infectious Diseases and Global Health, Chicago, United States, [2]University of Illinois Chicago, Chicago, United States, [3]Steamworks Chicago, Chicago, United States, [4]Chicago Department of Public Health, Chicago, United States

Background: The COVID-19 pandemic has significantly disrupted the management of sexually transmitted infections (STIs) and delivery of comprehensive sexual health care, especially for men who have sex with men (MSM).

We examined sex behaviors, COVID-19 protection practices, as well as STIs and SARS-COV2 testing and positivity of clienteles of Steamworks, a bathhouse and collective sex venue.

Methods: An anonymous, web-based survey was sent to the Steamworks newsletter list-serve to assess demographics, COVID-19 protection practices, sexual behaviors, as well as self-reported STIs and SARS-CoV2 testing/results. Adjusted prevalence rate ratios (aPRR) and 95% confidence intervals (CI) were calculated using multivariable Poisson regression with robust variance estimation to examine factors associated with STI/SARS-CoV2 testing and positivity.

Results: From July 19, 2021 through August 19, 2021, 515 surveys were completed. Black race, age 35-45, and greater number (≥4) of sex partners were associated with increased STI testing during this period. Self-reported STI positivity was increased for all individuals aged < 45 years old, and highest in those aged 18-24 years (aPRR=3.75, p=0.012).Self-reported STI positivity was also higher in those who reported ≥6 sex partners in the past 3 months (aPRR=4.10, p=0.001), those meeting new partners online (aPRR=1.72, p=0.027), or stating that social distancing did not have any effect on sexual behavior (aPRR=1.70, p=0.043).The latter group was also more likely to self-report testing positive for SARS-CoV2 (aPRR=3.22, p<0.001).
Nearly 40% of all respondents reported no STI testing during the pandemic, the majority (89%) citing lack of STI symptoms and low self-perceived risk (80%), though 34% of those without STI testing had 3 or more sex partners in the past 3 months.

Conclusions: As regional re-opening strategies continue to change based on COVID-19 metrics and vaccine uptake, challenges remain in understanding how new phases of the pandemic impact sexual behaviors.
Factors associated with STI testing and positivity mainly were in keeping with expectations; however those whose sexual practices were not affected by COVID-19 were found to be at risk for SARS-CoV2 and STIs, highlighting needs for further exploration.
These findings can help adapt and augment city-wide sexual health services in real-time during this pivotal public health period.

EPD553

Impacts of the COVID-19 Pandemic on HIV Testing and Condom Use among Two-Spirit, gay, bisexual, and queer (2SGBQ+) men in Manitoba, Canada

R. Souleymanov[1], A. McLeod[2], S. Amjad[3], S. Moore[3], M. Payne[4], L. Ringaert[5], L. Larcombe[6], G. Restall[6]
[1]University of Manitoba, Social Work, Winnipeg, Canada, [2]Two-Spirited People of Manitoba, Inc., Winnipeg, Canada, [3]University of Manitoba, Community Health Sciences, Winnipeg, Canada, [4]Nine Circles Community Health Centre, Winnipeg, Canada, [5]Manitoba HIV-STBBI Collective Impact Network, Winnipeg, Canada, [6]University of Manitoba, Winnipeg, Canada

Background: This study examined the impacts of the COVID-19 pandemic on access to HIV testing and condom use among Two-Spirit, gay, bisexual, and queer (2SGBQ+) men in Manitoba.

Methods: Data were drawn from a community-based cross-sectional online survey (July–October 2021) among 2SGBQ+ men in Manitoba. Logistic regression analyses assessed the relationship between socio-demographics/social determinants of health (age, ethnicity, sexual orientation, gender identity, education, geographic location, relationship status) and the impact of COVID-19 on access to HIV testing and use of condoms (when bottoming with another partner who is living with HIV and/or whose HIV status or HIV viral load is unknown).

Results: Of 347 participants, 17.3% self-reported as living with HIV. Among those who answered a question on testing (n = 282), 27.7% reported that COVID-19 affected their access to HIV testing in Manitoba. In multivariate analyses, living in Brandon, medium size city of 30,000 to 49,000 people (*AOR*=11.58, *95%CI*= 3.48 - 38.48) and living in rural and remote areas with less than 1,000 people (*AOR*=25.19, *95%CI*= 1.98 - 32.01) compared to living in Winnipeg, were both associated with higher odds of reporting a reduced access to HIV testing during the COVID-19 pandemic.
Participants who were dating (compared to those who were married or partnered) were also significantly more likely to report a reduced access to HIV testing (*AOR*=6.07, *95%CI:*2.06-14.95). Among those who answered questions on condom use (n = 327), 48.6% reported that since the COVID-19 pandemic they have decreased their use of condoms when bottoming. In multivariate analyses, younger people were more likely to report decreased use of condoms due to the COVID-19 pandemic *(AOR =0.93, 95%CI = 0.88 – 0.99).*
As compared to participants who were married or partnered, participants who were dating were significantly less likely to report decreased use of condoms *(AOR =0.27, 95%CI = 0.13 – 0.54).*

Conclusions: Service providers must be prepared to respond to the impact of COVID-19 on HIV testing and sexual risk practices among younger, sexually active 2SGBQ+ men, as well as 2SGBQ+ men who live in medium size cities or rural and remote areas in Manitoba.

Self-perceived impact of changes in sexual activity on MSM's quality of (sex) lives in times of COVID in Peru: EPIC community-based research program

C.F. Caceres[1], M. Reyes Diaz[1], J.C. Enciso Durand[1], C. Sandoval Figueroa[1], O. Apffel Font[2,3], R. Diagne[4], V. Villes[2], L. Riegel[2], D. Rojas Castro[2,5], EPIC Study Group

[1]Universidad Peruana Cayetano Heredia, Center for Interdisciplinary Research in Sexuality, AIDS & Society, Lima, Peru, [2]Coalition Plus, Community-Based Research Laboratory, Pantin, France, [3]Coalition des Organismes Communautaires Québécois de Lutte Contre le Sida (COCQ-SIDA), Montréal, Canada, [4]Coalition Plus, Community-Based Research Laboratory, Dakar, Senegal, [5]Aix Marseille Université, Inserm, IRD, Sciences Economiques et Sociales de la Santé et Tratitement de l'Information Médicale, Marseille, France

Background: In 2020, COVID19-related lockdowns led to severe restrictions that affected men who have sex with men (MSM)'s sexual experience, perceived quality of life (PQOL) and perceived quality of sex life (PQOSL) in diverse ways. We assessed PQOL and PQOSL, and their relationship with reported changes in sexual experience among MSM in Peru.

Methods: EPIC is a international community-based research program coordinated by Coalition PLUS, assessing the impact of COVID19 on HIV key populations. In Peru, this study, conducted between March and July 2021, targeted MSM. Data was collected on changes in sexual experience, and questions on whether PQOL and PQOSL had improved, stayed unchanged, or worsened during lockdowns. Fisher's exact test was used to assess the relationship between reported changes in sexual experience, and both PQOL and PQOSL.

Results: When asked if their PQOL had changed during lockdowns, the 302 respondents stated that it was better, the same, or worse in equal proportions. Conversely, when asked about their PQOSL, 42% considered it had worsened, 20% felt it had improved, and 38% considered it had not changed. Reporting no opportunities for sex was the only sexual experience associated with a worse PQOL (44% vs.29%,p=0.039); it was also associated with a worse PQOSL (69% vs.31%,p<0.001), together with postponing dates (66% vs.33%,p<0.001) and reporting fewer new partners (68% vs.28%,p<0.001). PQOSL was not associated with frequency of sex with live-in partners, virtual sex, or HIV prevention during sex (Table 1).

Sexual Experiences		Much / a little better n (%)	Almost the same n (%)	Much / a little Worse n (%)	Total n (%)	P-value (bold = p<0.05)
No opportunities for sex	No	45 (24%)	85 (45%)	60 (31%)	190 (100%)	**<0.001**
	Yes	7 (9%)	17 (22%)	52 (69%)	76 (100%)	
Postpone dates	No	45 (23%)	85 (44%)	65 (33%)	195 (100%)	**<0.001**
	Yes	7 (10%)	17 (24%)	47 (66%)	71 (100%)	
Less sex with new partners	No	44 (26%)	80 (46%)	48 (28%)	172 (100%)	**<0.001**
	Yes	8 (9%)	22 (23%)	64 (68%)	94 (100%)	
More sex with live-in partner	No	46 (19%)	94 (38%)	107 (43%)	247 (100%)	0.233
	Yes	6 (32%)	8 (42%)	5 (26%)	19 (100%)	
More virtual sexual activities	No	42 (20%)	84 (41%)	80 (39%)	206 (100%)	0.135
	Yes	10 (17%)	18 (30%)	32 (75%)	60 (100%)	
Less protection during sex	No	47 (19%)	98 (39%)	103 (42%)	248 (100%)	0.286
	Yes	5 (28%)	4 (22%)	9 (50%)	18 (100%)	

Table 1. Changes in perceived quality of sex life (PQOSL) during the COVID19 crisis, according to sexual experiences.

Conclusions: Due to COVID restrictions in Peru, MSM's PQOL changed in both directions, while PQOSL worsened, as correlated with their reporting lack of sex, postponing dates or having fewer new partners, but not with less sex with live-in companions, or less HIV prevention during sex. COVID changes provide an opportunity for gay men to understand what they value most in sex, and to decide whether or not it is what they want for themselves.

EPD555

Pervasive COVID-19 pandemic impacts on access to HIV prevention and sexual and reproductive health services, mental health and substance use among racialized sexual and gender minority people in Toronto (#SafeHandsSafeHearts)

P.A. Newman[1], N. Massaquoi[2], C. Williams[3], W. Tharao[3], S. Tepjan[4], J. Forbes[3], S. Sebastian[3], P. Akkakanjanasupar[4], M. Aden[3], T. Nyoni[1]

[1]University of Toronto, Factor-Inwentash Faculty of Social Work, Toronto, Canada, [2]University of Toronto Scarborough, Department of Health and Society, Scarborough, Canada, [3]Women's Health in Women's Hands, Toronto, Canada, [4]VOICES-Thailand Foundation, Chiang Mai, Thailand

Background: Due to ongoing marginalization, racialized sexual and gender minority populations experience adverse social determinants of health and resulting health disparities, which increase vulnerability amid the COVID-19 pandemic. Nevertheless, pandemic response preparedness and public health measures typically operate from Eurocentric, heteronormative and cis-normative perspectives that fail to address marginalization. We assessed impacts of the COVID-19 pandemic on access to HIV prevention, sexual and reproductive health services, mental health, and substance use among racialized LGBTQ+ individuals in the Greater Toronto Area.

Methods: Sexual and gender minority, predominantly racialized, people ≥18-years were recruited online from March to November 2021 through community-based or-

ganization, community health center and LGBTQ+ listservs and social media. A 40-minute, mobile-optimized online survey assessed COVID-19 pandemic impacts on HIV prevention and sexual and reproductive healthcare access, mental health (PHQ-2, GAD-2), and alcohol (AUDIT)/substance use. Gender- and sex-based analyses identified subgroup differences.

Results: Participants (n=199) (median age: 27 [IQR: 23-32]) identified as African/Caribbean/Black (29.6%), South/East/Southeast Asian (27.2%), Latinx/Hispanic (9.0%), white (20.1%), and other (14.1%).

Half (53.8%) identified as cisgender lesbian/bisexual/women who have sex with women (LBWSW), 29.6% cisgender gay/bisexual/men who have sex with men (GBMSM), and 19.6% transgender/gender-nonbinary people (TG/GNP).

Overall, participants reported pandemic-related decreases in access to HIV testing (10.5%), STI testing (19.1%), PrEP (13.6%), condoms (13.6%), other reproductive health products (15.1%; 20.6%* for LBWSW), and gender-affirming hormones (15.4%) among transgender people.

Depression and anxiety symptoms were pervasive, and significantly more prevalent among LBWSW (63.6%* / 73.8%*) and TG/GNP (66.7% / 71.8%) compared to GBMSM (43.4%* / 54.7%*; *p<.05).

Overall, 44.2% indicated hazardous drinking and 37.0% increased alcohol use since COVID-19. Among those indicating illicit drug use, the proportion reporting pandemic-related increases differed by ethnicity (38.1% white; 26.7% Black; 11.0% other POC) and sexuality/gender identity (42.9% LBWSW; 30.0% GBMSM; 17.6% TG/GNP).

Conclusions: Widespread pandemic-related decreases in access to HIV and sexual and reproductive health services, increases in illicit drug and problematic alcohol use, and pervasive mental health issues indicate an urgent need for innovation in key population-specific HIV prevention/sexual health (i.e., HIV/STI self-testing) and mental health services (i.e., telehealth/teleconsultation) for racialized, sexual and gender minority populations in response to future waves of COVID-19 and other pandemics and emergency situations.

EPD556

For us, by us: community-led/based approaches to reduce the vulnerability of COVID-19 pandemic on LGBTQ+ community in India - #humsafarfightscovid19 initiative

T. Chopade[1], V. Anand[1], M. Sivasubramaian[2], S. Mane[3]
[1]The Humsafar Trust, Advocacy, Mumbai, India, [2]The Humsafar Trust, Capacity Building, Mumbai, India, [3]The Humsafar Trust, Health, Mumbai, India

Background: It is now over two years that the COVID-19 pandemic waves continue to pose challenges and threats to the lives of millions of individuals in the world. Due to pandemic and resulting stringent lockdown measures, LGBTQ+ communities in India were further invisibilized and marginalized increasing their vulnerability to violence, mental health challenge, and issues related to HIV, STIs, and access to treatment.

Description: The Humsafar Trust (HST) is a community-based organization (CBO) working for the health and rights of LGBTQ+ communities for over 27 years. HST anticipated the impact of stringent lockdown measures on LGBTQ+ communities and soon after the first lockdown, we started getting distress calls from LGBTQ+ seeking support. HST set up #humsafarfightscovid19 initiative in April 2020 in the form of a community-led service delivery mechanism in partnership with community-based organizations across India.

HST staff contributed 5% of their salaries; In addition, financial and in-kind-aid received from >185 individuals and 15 corporate; government; and semi-government agencies contributed to us providing emergency sustenance, health consultations costs, medical supplies including providing access to HIV treatment over 52,000+ individuals in 19 Indian states.

A helpline was established to cater to community members requesting emergency support. Within 7 hours, we received 700+ support requests and 90+ distress calls. We delivered essential sustenance, ART, other medicines via in-person delivery following COVID-19 safety protocols; requests for financial aid were supported on a case-to-case basis via e-payment options. In instances of outstation support, payments were directly made to vendors.

Lessons learned: Despite government efforts to manage the COVID-19 pandemic, LGBTQ+ remain in hindsight. Economic disenfranchisement and social unacceptance have compounded the challenges of LGBTQ+ in the pandemic. Forced confinement with abusive families/partners and lack of access to safe spaces/peer support exposed LGBTQ+ to increased domestic violence and harassment.

Our lessons indicate mental health, interrupted medical care, and economic disenfranchisement as key issues impacting LGBTQ+ during this pandemic.

Conclusions/Next steps: The larger responsibility of ensuring the safety of LGBTQ+ communities during lockdown was undertaken by local community-based groups. Community ownership played a vital role in responding to COVID-19 emergencies and were key in mitigating COVID-19 adversities faced by LGBTQ+ communities.

EPD557

Smoking behavior during the COVID-19 pandemic among people living with HIV

I. Tami-Maury[1], O. Mgbere[2], K. Garcia[3], M. Acevedo[3], M. Onigbogi[1], K. Vigil[3]

[1]The University of Texas Health Science Center at Houston, School of Public Health, Houston, United States, [2]University of Houston, Institute of Community Health, Houston, United States, [3]The University of Texas Health Science Center at Houston, McGovern Medical School, Houston, United States

Background: There is no clear understanding regarding the impact of the COVID-19 pandemic on cigarette smoking behavior among people living with HIV (PLWH) in the United States (US). Smoking has been shown to impose a high burden of morbidity and mortality among PLWH, and it could further have a tremendous and negative impact exacerbated by the intersectionality of race/ethnicity, financial burden, and social stressors prompted by the COVID-19 pandemic.

Methods: Data were collected using a cross-sectional survey assessing smoking behavior (12/2020 to 06/2021) during the COVID-19 pandemic among individuals (n=124) seeking care at an HIV-specialized urban health center in Houston, Texas. Current smokers were classified as individuals who smoked ≥100 cigarettes in their lifetime and reported smoking every day or some days. Relevant demographic, behavioral, and psychosocial factors for current smoking were evaluated using multivariable logistic regression.

Results: Among study participants, 60% self-identify as male, 37% female, and 3% non-binary. The majority were 35-54 years old (46%) and Latinx (49%). The prevalence of current cigarette smoking during the pandemic among PLWH participating in our study sample was 31%.

During the pandemic, PLWH were more likely to self-report current smoking if they were Latinx (OR=2.99; 95% CI: 1.236-7.070; p=0.013) or experienced the death of a loved one (OR=4.33; 95% CI: 1.187-15.799; p=0.027).

Conclusions: These findings suggest intersectional inequalities in smoking behavior among PLWH during the COVID-19 pandemic. The need for culturally specific, tailored, and/or competent smoking cessation interventions targeting marginalized groups such as Latinx communities living with HIV are warranted, considering the burden posed by the COVID-19 pandemic in this population.

EPD558

Impact of COVID-19 on women who exchange sex and use drugs in Kazakhstan and their risks for HIV

V. Frye[1], N. Zholnerova[2], E. Grigorchuk[3], B. West[4], M. Darisheva[5], A. Terlikbayeva[5], S. Primbetova[5], T. McCrimmon[6], O. Cordingley[4], A. Kuskulov[4], L. Gilbert[4], N. El-Bassel[4]

[1]City College of New York (CUNY), School of Medicine, New York City, United States, [2]Public Association "Amelia", Taldykorgan, Kazakhstan, [3]Public Association "Union of Leaders Sau Bolashak", Almaty, Kazakhstan, [4]Columbia University School of Social Work, New York City, United States, [5]Global Health Research Center of Central Asia (GHRCCA), Almaty, Kazakhstan, [6]Columbia University Mailman School of Public Health, Sociomedical Sciences, New York City, United States

Background: The COVID-19 pandemic has affected workers across multiple industries, with public-facing workers particularly impacted. Impacts on women who exchange sex and use drugs (WESUD) have not been well-characterized, despite the potential negative health effects of engaging in sex work during the COVID-19 pandemic and the potential negative impacts of COVID-19 on delivering critical HIV care continuum services to WESUD.

Methods: Between March and July 2021, we surveyed 48 WESUD in Kazakhstan and conducted online in-depth interviews and focus groups with 30 and 18 WESUD, respectively. Representatives from local non-profit sex worker advocacy/service organizations recruited and interviewed participants.

The survey collected data on sociodemographics, HIV-related factors, sexual behavior, substance use, and the impact of the COVID-19 pandemic on sex work. The qualitative interviews also explored this issue. Survey data was analyzed descriptively and qualitative data was recorded, transcribed, analyzed using a pragmatic analytic approach.

Results: One-fifth of participants reported temporarily stopping and over 50% reported decreasing sex work during the pandemic; 5-6% reported starting or increasing drugs sales or sex without condoms, respectively.

Nearly one-third of women self-treated for health concerns during the pandemic and 6% did not seek care due to fear of COVID-19 infection. WESUD expanded on the negative effects of COVID-19 in interviews and focus groups: "There was less work, it became more difficult to earn money...there were fewer clients...venues closed."

Some described using more drugs due to psychological distress during the pandemic. Some turned to internet-based sex work but found it difficult: "For me it's kind of distant." Other women had difficulty with daily living expenses: "I asked for help, I needed money...no one helped." Another woman said "In COVID-19 you find out who is your friend and who is your enemy...It decreased [my drug use]...practically I did not eat."

Conclusions: WESUD lost income and faced severe precarity due to COVID-19, depending on friends, family and sometimes clients. WESUD need significant support to reduce negative, syndemic impacts of COVID-19 and HIV. NGOs have an important role to play in mitigating impacts among key populations, providing medications, food, and preventive/social services and should be supported.

EPD559

COVID-19-related changes in sexual activity, condomless anal sex, HIV testing, and PrEP use among men who have sex with men (MSM) in Thailand. When the pandemic compounds pre-COVID-19 challenges

P.C.G. Adam[1,2], N. Salvadori[3,4], I. Ketsuwan[2], W. Khamduang[4], J.B.F. De Wit[5], G. Jourdain[3,4]
[1]*UNSW Sydney, Centre for Social Research in Health, Sydney, Australia,* [2]*Institute for Prevention and Social Research (IPSR Bangkok), Bangkok, Thailand,* [3]*University of Montpellier, CNRS, IRD, MIVEGEC, Montpellier, France,* [4]*Chiang Mai University, Faculty of Associated Medical Sciences, Chiang Mai, Thailand,* [5]*Utrecht University, Department of Interdisciplinary Social Science, Utrecht, Netherlands, the*

Background: The COVID-19 pandemic has impacted MSM's sexual activity and access to sexual health services in various countries, potentially influencing the dynamics of HIV epidemics. We therefore assessed COVID-19-related changes in sexual activity, condomless anal intercourse (CAI), HIV testing, and PrEP use among MSM in Thailand from January 2020 to mid-February 2021.

Methods: MSM were recruited in March-June 2021 via social media to complete an online survey. Eligibility criteria were being at least 15 years old, born male and having had sex with men or transgender women.

Of the 1017 eligible respondents who started the survey, 586 (58%) provided data on their sexual behaviour, HIV testing and PrEP use in five periods: pre-lockdown (T1, 1 Jan.–19 Mar. 2020), first lockdown (T2, 20 Mar.–14 Jun. 2020), relaxation of restrictions (T3, 15 Jun.–14 Sep. 2020), normalisation (T4, 15 Sep.–16 Dec. 2020), and second lockdown (T5, 17 Dec. 2020–14 Feb. 2021). Between-period differences in behaviour were assessed.

Results: Respondents' mean age was 29.4 years, and 74% identified as gay. 42% tested for HIV in the past 12 months; 66% ever tested, of which 10% had HIV. The sexual activity rate decreased between T1 and T2 (from 70% to 61%; -13%, p<.001) but did not significantly differ between baseline and T3-T5. CAI decreased from 27% at T1 to 22% at T2 (-19%, p=.001) and rebounded thereafter. 48% of CAI occurred without knowledge of partners' HIV status.

Only 7.5% of respondents used PrEP at T1 and 59% of these stopped using PrEP at some point due to COVID-19. 14% of MSM had not been able to test for HIV at some point because of COVID-19; 50% of these tested for HIV later. Reasons for delayed testing included confinement (53%), testing services disruptions (31%), fear of COVID-19 infection (21%), and cost (19%), including COVID-19-related hardship.

Conclusions: MSM's sexual activity and CAI were somewhat reduced during the first lockdown. In subsequent periods, CAI appeared similar to before the first lockdown. In view of the observed ongoing HIV risk behaviours, COVID-19-related disruptions in HIV testing and PrEP use are worrying, as they compound pre-COVID-19 challenges.

EPD560

Characterization of the microbiome in breast cancer patients diagnosed with COVID-19

M.C. Viana[1], C. Gislaine[2], M.L. Bendall[3], B. Singh[3], M.A. Soares[2], M.A. Moreira[1]
[1]*Brazilian National Cancer Institute, Genetics, Rio de Janeiro, Brazil,* [2]*Brazilian National Cancer Institute, Oncovirology, Rio de Janeiro, Brazil,* [3]*Division of Infectious Diseases, Department of Medicine, Weill Cornell Medicine, New York, United States*

Background: The severe acute respiratory syndrome COVID-19 still represents an extreme concern given the peculiar and imprecise features of this disease. Although severe cases and deaths have been observed in clinically healthy people, patients with an exacerbated chronic immunosuppressive status, such as cancer patients, are more vulnerable to the development of COVID-19 severe form. However, the interplay between endogenous factors and COVID-19 and their role on infection progression in cancer patients is unknown.

We aim to characterize and compare the nasal/oropharyngeal microbiome from breast cancer (BC+) patients diagnosed with (CV+) or without (CV-) COVID-19, through ribosomal 16S metagenomic analysis.

Methods: The nasal/oropharyngeal swabs were collected for COVID- diagnosis between April and May 2020. Breast cancer cases were patients from the National Cancer Institute, Brazil, and non-breast cancer cases healthcare professionals from the same institution. DNA from nasal/oropharyngeal swab of 89 patients were collected, being: 36 patients with breast cancer and diagnosed with COVID-19 (BC+/CV+), 13 patients with breast cancer (BC+/CV-), 32 patients diagnosed with COVID-19 (CV+/BC-), and eight healthy controls (CV-/BC-). The V3-V4 region from 16S rRNA gene was PCR-amplified, DNA libraries were prepared and sequenced in MiSEQ Illumina platform. Bacterial taxa were identified using SILVA database in QIIME2. Differential bacterial abundance was analyzed using DESEQ2 and bacteria with adjusted p-values <0.05 and absolute log2FoldChange >1.5 were considered upregulated or downregulated in the samples.

Results: We found 75 bacterial taxa with differential relative abundance between BC+/CV+ and BC-/CV+ patients; and 42 between BC+/CV+ and BC+/CV-. Seventeen and 25

taxa were overrepresented in BC+/CV- and BC+/CV+, respectively. In addition, we also compared the bacterial microbiota between BC-/CV+ and BC-/CV- samples and six taxa were overrepresented in BC-/CV+ patients.
We also compared the relative abundance between cohorts. BC+/CV+ vs BC+/CV-, BC+/CV+ vs BC-/CV+ and BC+/CV- vs BC-/CV- showed 47, 41 and nine taxa with significant differential relative abundance. Interestingly, *Alicycliphilus* was overrepresented in COVID-19 patients, independently of cancer status.
Conclusions: Our data showed that specific bacterial taxa were differentially represented in nasal/oropharyngeal region with respect to status of COVID-19 and breast cancer.

EPD561

Impact of the COVID-19 pandemic on access to sexually transmitted and bloodborne infections (STBBI) prevention, treatment and testing services in African, Caribbean and Black (ACB) communities across Canada

J. Etowa[1], S. Baidoobonso[2], A.J. Odhiambo[3], A. Ogunleye[4], J. Osuji[5], R. Edet[6], W. Tharao[7], E. Etowa[8]
[1]University of Ottawa, School of Nursing, Ottawa, Canada, [2]Government of Prince Edward Island, Chief Public Health Office, Charlottetown, Canada, [3]Public Health Agency of Canada, Surveillance and Epidemiology Division Centre for Communicable Diseases and Infection Control Infectious Disease Prevention and Control Branch, Ottawa, Canada, [4]Black Cultural Society of PEI, Charlottetown, Canada, [5]Mount Royal University, Calgary, School of Nursing & Midwifery, Calgary, Canada, [6]Somerset West Community Health Centre, Ottawa, Canada, [7]Women's Health in Women's Hands Community Health Centre, Toronto, Canada, [8]University of Windsor, Department of Sociology, Anthropology & Criminology, Windsor, Canada

Background: African, Caribbean, and Black (ACB) communities in Canada have been disproportionately impacted by the pandemic, but there is limited research on how much the pandemic has impacted access to STBBI related services in these communities. From existing research, it is known that racialized people face barriers to accessing healthcare. With the negative impact of COVID-19 on the delivery of non-essential health services, including STBBI-related services, ACB communities may face worse access to these services.
This paper presents results from a national survey that examined the impact of the pandemic response on access to STBBI-related services in ACB communities across Canada.
Methods: A national online self-administered anonymous cross-sectional survey co-led by Public Health Agency of Canada (PHAC), the University of Ottawa and, an ACB National Expert Working Group (NEWG) and informed by the tenets of community-based participatory research (CBPR).
Results: 1,556 participants completed the survey, and they were diverse in age (11.4% were <25 years, 73% were 25-54, and 15.6% were 55+), gender (cis-gender (97%), transgender (3%)), and sexual orientation (11.9% identified as LGBTQ).
The study revealed that among participants who accessed or considered accessing STBBI-related services, the most common barrier reported was difficulty getting an appointment (43.0% of participants). In addition, 70.8% of these participants were not always able to access mental health counselling and referral services.
Among ACB community members living with HIV (10.3%), 38.1% experienced difficulties accessing HIV care providers and clinics since the start of the pandemic. 48.9% of participants living with HIV reported COVID-19 related public health measures as a barrier to accessing HIV-related services.
Conclusions: These findings are consistent with those related to healthcare access for ACB people in general. The pandemic has negatively impacted Canada's ACB communities in many ways. The reduced access to HIV and other STBBI services has negative impacts on population health for ACB communities.
There is a need for health equity and system-wide lenses when developing and implementing policies to curtail the spread of COVID-19. Further, these findings highlight the need to compensate for lost ground with regards to HIV and STBBI prevention and care.

EPD562

A synergy of plagues and interventions: challenges of COVID-19 and increasing gender inequality in a HIV prevention program among high school students at impoverished territories in São Paulo State, Brazil

J. Billand[1], V. Nanci Silva[1], V. Paiva[1]
[1]Universidade de São Paulo (USP), Instituto de Psicologia, São Paulo, Brazil

Background: Brazil's Federal Government combined backlash to sexual and reproductive health promotion policies with denial of the COVID-19 pandemic. While blocking programs that promote gender equality and sex education, the president stated that domestic violence was an inevitable consequence of men being "stuck at home" because of local social distancing/lockdown policies.
We aimed to understand how experiences and everyday lives of adolescents who participate in an HIV/AIDS intervention-research project were impacted by governmental responses to the COVID and HIV epidemics.
Methods: During 2020-2021, we followed the everyday lives of high school students, distributed over 9 public high schools in impoverished territories of 3 cities in the state of São Paulo. Approximately 150 students were educated as research collaborators and peer-educators and participated in weekly meetings.

Through a gender lens, we analyze the transcripts from in-person meetings and workshops, as well as of meetings and workshops that were virtual during the longest period of remote learning.

Results: From the outset of the pandemic and suspension of in-person learning, boys experienced boredom/idleness and increased videogame playing. Their biggest anxieties came from not being able to continue their education and losing their employability. The growing need to work outside the home to help family was notable and the leading cause of interrupting participation in the project.

Girls complained about not having time for leisure or study and shared grievances about domestic work and care of other children being unequally distributed and intensified. Adults used prevention of COVID-19 to reprimand only girls when going out for romantic or sexual encounters. Until the beginning of vaccine distribution, fear and guilt of causing illness and death of family members raised the psychosocial suffering of girls – nothing equivalent among boys.

Conclusions: Conservative discourses that linked advisable preventive measures against COVID-19 – "stay home" – and gender norms that favor confinement of women at home and to caregiving exemplify the impacts of the COVID context that change gender inequality dynamics, which has been addressed in our prevention program.

Designing a comprehensive approach with student collaborations termed "Integral prevention", integrating HIV/AIDS, COVID, and mental health, an equity-based health promotion and prevention program was innovational.

EPD563

The impact of the COVID-19 pandemic on young people living with HIV in Latin America

J.I. Romaní Adorni[1]

[1]*Fundación Chile Positivo, Santiago, Chile*

Background: The objective of this study was to learn about the effects of the COVID-19 pandemic on young people living with HIV in selected countries in Latin America.

Methods: This was a qualitative and exploratory study conducted between June and August 2021. 25 young people (aged between 20-30) from Argentina, Chile, Perú, Brazil and Venezuela, participated in focus groups which were conducted online through Zoom. A total of 7 focus groups were conducted. The collection and analysis of data was done through Grounded Theory using the Atlas.ti software.

Results: The findings show that young people living with HIV in Latin America had numerous barriers accessing healthcare services related to HIV, including their HIV treatment, due to the COVID-19 pandemic. Fear of COVID-19 infection, overcrowded hospitals, lack of COVID-19 safety measures in hospitals and appointment cancelations were some of the difficulties that young people faced in order to access HIV related services and treatment. The pandemic also had a negative impact on the finances of young people, as many were fired from their jobs and were forced to take a pay cut.

Concerns about the lack of information regarding the impact of COVID-19 on people living with HIV, the fear of illness and death, difficulty accessing medication and HIV treatment as well as social distancing measures, like mandatory confinements, had negative effects on the mental health of young people living with HIV, including experiences with anxiety and depression.

Due to the difficulties to access HIV treatment and HIV related services, and to mental health problems caused by social distancing measures, many young people interrupted their HIV treatment or stopped taking them entirely.

Conclusions: Addressing these problems would improve the wellbeing, quality of life and health of young people living with HIV, by ensuring that young people have access to HIV related services, access to their medication and a better HIV treatment adherence.

The COVID-19 pandemic is not over and the threat of future variants require intersectoral work and the participation of young people living with HIV in all decision making processes in order to guarantee that their needs and rights are being properly fulfilled.

EPD564

The early impacts of COVID-19 on LGBTQ+ persons in Guyana: a quantitative analysis

J. Simpson[1], C. George[2]

[1]*SASOD Guyana, Management, Georgetown, Guyana,* [2]*University of Southern Maine, Department of Exercise, Health and Sports Sciences, Portland, United States*

Background: The COVID-19 pandemic has led to social, health, economic and political upheavals throughout the world but these problems are greater in some communities than others. This study explores the experiences of LGBTQ+ communities in Guyana during the early stages of the pandemic, prior to the availability of vaccines and the normalization of COVID-19 testing.

Methods: A cross-sectional, self-administrated survey was conducted among LGBTQ+ communities in Guyana in May 2020. Access to the study was through social media messages and platforms of LGBTQ+ organizations, and snowball strategy.

On passing the screening questions (residence, sexuality, age >=18 years), participant read and accepted the consent sheet, and completed the survey. Information on COVID-19 knowledge, attitudes and beliefs, access to services during periods of lockdown, sexual and gender violence, among other variables were requested. Mental health status was measured with the PHQ4 scale. Data analysis

Late-breaker abstracts

Author Index

included descriptive statistics in SPSS® v26. This study received research ethics approval from the University of the West Indies (Cave Hill) (IRB No. 200409-B).
Results: Of the 285 who initiated the survey, 257 provided valid survey data. Participants self-identified as 44.5% men, 32.6% women, 12.3% transgender and 10.6% non-binary persons. This mostly urban (59.2%), university graduate (48.2%) group reported high job loss (70.8%) during the early phases of the pandemic. And 1 in 5 had less than one month savings to live on, yet 56.3% of participants were the main breadwinners. While 63.7% reported very good/fairly good heath, 28.4% had severe and 24.9% had moderate depression. Less than 1/3 of the sample responded to the question on sexual or domestic violence of which, 18.8% reported abuse.
Conclusions: The economic hardships created by the pandemic had a pernicious effect on LBGTQ+ persons in Guyana. This group has had to deal with sexuality-based discrimination and the appearance of resilience, based on their general health outcomes, may mask high levels of anxiety and depression.
This leads us to ponder why few participants completed the question on sexual, physical and emotional abuse (although there are high levels among the respondents). There is a need to further explore the mental health needs of this group.

EPD565

Effect of COVID-19 on risky behaviours of female sex workers in Ga South Municipal of Ghana and its wider implications: evidence from a qualitative study

N.A. Acheampong[1], E.O. Ankrah[1], R. Afriyie[1], K. Atuahene[2], F.N. Poku[1]
[1]*Ghana AIDS Commission, Accra, Ghana,* [2]*Ghana AIDS Commission, Director General, Accra, Ghana*

Background: The government of Ghana in response to reducing the spread of covid-19 enforced physical distancing measures, banned social gatherings, closed down nightclubs and hospitality centres etc. Vulnerable groups such as Female Sex Workers (FSWs) who were already suffering from poverty were amongst those hardest hit. The close contact nature of sex work and the closure of nightclubs, pubs and hospitality centres which are hotspots for sex work suggested that FSWs will be affected.
Given that there is a positive relationship between income from sex work and unprotected sex, FSW may adopt risky sexual behaviours as means to cope with this pandemic. Thus, evidence on whether the pandemic has the potential to increase the transmission of HIV and other STIs among FSWs is crucial.
Methods: We elicited respondents' perception of the effect of covid-19 on FSWs and their sexual behaviours from April through to September 2020. Thirty (30) semi-structured in-depth interviews were conducted with FSWs within Ga South Municipal.
The inclusion criteria for FSWs to participate in this study were if they were; aged 18 years or older; engaged in sex for money or gift within the last six months. Audio recordings were coded and analysed using a thematic analytical framework.
Results: The majority of FSWs reported a reduction in the number of clients seen within a week. FSW reported that the ban on social gatherings and the closure of nightclubs had negatively affected their earnings. FSW reported that they were less likely to demand a client to use a condom given the decline in earnings over the past few months.
Although the reduced number of clients may offset the transmission of HIV and STIs, the use of unprotected sex as a means to cope with the financial effects of the pandemic may have an impact on the transmission of HIV and STIs.
Conclusions: Demand for use of condoms by FSWs has declined as a means to cope with the financial burden brought on by covid-19. To reduce risk and vulnerability as a result of financial challenges, policy objectives should target FSWs to dampen the adverse financial impact of the covid-19 pandemic.

EPD566

Livelihood challenges and pathways to sustainable earning for male sex workers and transgender women: Anthropological exploration in the context of COVID-19 in Bangladesh

S.I. Khan[1], S.D. Irfan[1], M. Rahman[1]
[1]*International Centre for Diarrhoeal Diseases Research, Bangladesh, Programme for HIV and AIDS, Dhaka, Bangladesh*

Background: The COVID-19 pandemic has engendered global economic fallout. Socioeconomic adversities are particularly pronounced among vulnerable and marginalized populations such as male sex workers (MSW) and transgender women (TG). During the pandemic in Bangladesh, these populations received some food relief, albeit as a temporary solution for alleviating immediate hunger.
This underscores the need for sustainable pathways to financial gateway, a relatively unexplored domain. Therefore, we aimed to understand the livelihood challenges and mitigation strategies among these populations.
Methods: We undertook a rapid anthropological assessment of MSW and TG enrolled in HIV prevention services in major divisional cities of Bangladesh. We chose this specific methodology as it can quickly elicit in-depth, intimate perspectives. Given their emotional fragility in the COVID-19 context, we did not create a conventional research environment.
Rather, we had one-to-one informal conversations and mini-group discussions with a total of 100 participants, while maintaining COVID-19 health guidelines. As this assessment generated qualitative findings, we applied thematic analysis conventions.

Results: The participants relied on transient sources of income or humanitarian aid, which ultimately could not safeguard their livelihood. The pandemic made them realize that they would ultimately need to achieve self-sufficiency by generating a stable earning source through exhibiting their diligence and persistence.

However, they believed that attaining a sustainable livelihood would require them to receive vocational training and employment opportunities with minimal academic education and technical expertise. Although participants were interested in socially and legally acceptable occupations, they opined that socio-structural impediments need to be addressed first by government and non-government initiatives.

Specifically, participants emphasized that the government needs to invest efforts in increasing their social acceptability. They perceived that involving these populations in the mainstream workforce would perpetuate a positive ripple effect, thus encouraging other job providers of private and public sectors to accommodate these populations.

Conclusions: The findings reflected participants' avid desires to pursue alternative income-generating pathways influenced by COVID-19 constraints. However, if sustainable income-generating avenues are not ensured with a supportive mainstream population culture, it would not be possible to achieve long-term outcomes.

This assessment recommends the piloting of some interventions in this line before adopting any large-scale intervention.

EPD567

The lock-down dilemma; innovative COVID-19 adaptation strategies for antiretroviral therapy adherence and retention among key populations living with HIV in Masaka, Uganda

M. Kigozi[1]

[1]*CHEDRA (Community Health Empowerment Development and Relief Agency), Reserach and Advocacy, Masaka, Uganda*

Background: Key populations (KPs) in Uganda share a disproportionate HIV burden. Access to HIV services is obscured by repressive health policies, criminalization and homophobia. High levels of adherence to antiretroviral therapy (ART) can dramatically improve treatment outcomes for persons living with HIV and reduce risk of HIV transmission.

In June 2020, Community Health Empowerment and Relief Agency (CHEDRA) was supported by Uganda Cares to address non adherence to ART targeting KPsimpacted by COVID 19 restrictions.

Description: Using medical records, we identified viral load (VL) non- suppressing KPs in our monthly ART refill cohort. Movement waivers were obtained from the district for front-line clinicians and counselors. Using a snowball approach and faith-based illustrations that demonstrate equality of mankind and therefore equal access to prevention services, we penetrated KP networks. We conducted VL bleeding at clients' convenient time and location, ART refills, personalized intensive adherence counseling, STI screening and treatment, condom and lubricant distribution. Data were collected using an interview guided questionnaire and analyzed using STATA 14.

Lessons learned: Through December 2021, we conducted 80 trips reaching 517 clients. Of these, 331 (64%) were Female sex workers while 186 (36%) were Men having sex with men (MSM).196 (38%) were below 29 years compared to 321 (62%) who were above 30 years. Of the 501(97%) that bleed for VL, 306 (61%) were virally suppressed while 195 (39%) were non suppressors.

Overall, ART adherence levels increased from 58% in June 2020 to 84% in December 2022 irrespective of gender. Compassion (55%), client preferred location and time (23%), use of peer leaders (13%) and use of holy scriptures (9%), were cited as primary reasons for improved ART adherence.

Conclusions/Next steps: Nontraditional, client centered and innovative approaches addressing structural, social and psychological barriers that could have an impact even in the precarious policy environment need to be tested.

EPD568

Impacts of Methadone Maintenance Therapy and Covid19 (HIV prevention among injecting drug users)

M.R. Qazizada[1], Z. Zia[1]

[1]*Ministry of Public Health, National AIDs Control Program, Kabul, Afghanistan*

Background: Almost four decades of war have had a devastating-impact on Afghanistan. Only 18% of the population over the age of 25 has received formal-education resulting in staggering illiteracy rates of 57% for males and 81% for females. Afghanistan is facing a concentrated-epidemic predominantly among PWID but also affecting other key populations. HIV rates in the general-population are under 0.1% while HIV among PWID/PLHIV is under 5%. There are 25,000 IDUs in the country (ANPASH Population Size Estimation for KPs, 2019), 1,291 people who inject drugs are under methadone-maintenance-therapy in 5 provinces Kabul, Herat, Balkh, Nangarhar and Konduz in community and prison settings (2021).

The ANPASH is now planning the scale up of methadone-maintenance-therapy for three other provinces with the support of Global Fund program that will run from 2021 to 2023.

Description: The high levels of stigma-discrimination against PWID affect access and retention in the OST-services. The clients on methadone have shown improvement in their social conduct including better family-relations, social-integration, and fewer criminal activities. The program has been able to achieve its objectives. OST is

Oral abstracts

Author Index

feasible and cost-benefit and extremely-necessary for the country. Interestingly some National-NGOs are now having experience of the-implementation of OST-program. lack of shelter-services, vocational-training programs for OST-clients and psychosocial-support have been key challenges to the implementation of OST-programs in the country.

Lessons learned: On lockdown, based on program-SOP circumstances MMT-clients were provided home-take-dose weekly and quarterly basis in combination with psychosocial-support, for stable-patients. To facilitate better coverage and better adherence to treatment, and to allow them flexibility in their social and economic-life during covid19.

Very less of OST-clients were dropped-out of the maintenance but most of them were prevented from-covid19. Human-resources were recruited to follow MMT and MMT+PLHIV clients for their both treatments at home and site.

Conclusions/Next steps: There is a need to scale up the MMT services. The community consultation highlighted the desire of MMT clients to self-organize and ANPASH with the support of Global Fund will develop a national MMT client network in the community.

In-addition, provision of shelter, vocational-training, psychological-interventions which are globally accepted, and enhancement of capacity-building of OST services providers should be considered.

EPD569

Barriers of access to healthcare services due to C19 interruptions of HIV service delivery points

K. Mohammed[1], G. Samuel[1]

[1]*Kenya Red Cross Society, Global Fund, Nairobi, Kenya*

Background: Kenya as many parts of the world was affected by COVID pandemic with restrictions affecting service delivery in all sectors of the economy. Kenya Red Cross through the GF grant implementers supported communities with necessary personal protective equipment's as well as community education.

Methods: The assessment employed a mixed-method approach consisting comprehensive document reviews, analysis of routine data from Kenya's health information system (KHIS) and primary data collected through qualitative and quantitative methods.

Qualitative methods consisted of focus group discussions (FGDs), in-depth interviews (IDIs) and key informant interviews (KIIs). Quantitative data consisted of KHIS data and three other surveys.

The assessment was conducted within 30 counties clustered in five geographic clusters. All the counties with a HIV prevalence of under 3.0% and very low HIV incidence were excluded from the potential counties for selection. Four counties were randomly selected per cluster using the online randomizer.

Results: The onset of COVID 19 has negatively affected service delivery for the three programs, across prevention, treatment, and client support.

Health Facility Survey outcome	Main causes of service disruption reported by the facilities
49.3% of facilities reported that their service delivery was very much disrupted	Providers' fear of contracting COVID 19 (85.9%)
42.4% reported services were disrupted to some extend and only the remainder were not affected at all	Lack of handwashing facilities at service points (61.1%)
Majority (72.3%) of facilities reported reduction of client numbers	Providers experiencing stigma from the communities they reside (32.2%)
Staff missing work (17.7%)	
conversion to COVID 19 isolation centers (7.5%)	
Only 19.5% of facilities reported an increase in clientele, mostly due to receiving increased traffic when adjacent facilities were converted to isolation facilities.	

Table.

Other important reasons were increased workload (22.9%), lack of adequate commodities (18.8%) and delayed salaries (14.5%).

Conclusions: At the Health facilities continuing adaptations are proving that a rebound to normalcy is attainable. However, integrated service delivery systems for COVID-19 diagnosis, treatment and the HIV, TB and malaria programs in high-volume health facilities is unable to shoulder the programs from the consequences of service disruption which are commencing to be experienced at health facilities. Financing, human resource capacity, supply chain and data systems are not strong enough to ensure programs remain resilient against any future COVID-19 waves.

Further, demand-side barriers such as fear of acquiring COVID-19, fear of symptoms being conflated with COVID-19 and high transport costs are preventing clients from seeking services. Hence the need for a differentiated service delivery model to safe guard the investments and gains made for HIV programs.

EPD570

It's in Your Power to act: best practice and stories of confronting the COVID-19 pandemic and HIV/AIDS in Eastern Europe and Central Asia and Balkans region

I. Gavrylova[1]

[1]*Alliance for Public Health, International Program Department, Kyiv, Ukraine*

Background: During the lockdown, the countries of the EECA region faced a double epidemic: HIV and covid-19. During the lockdown period (April-May 2020), vital HIV services were under threat. Since the start of the COVID-19 pandemic, HIV testing and detection rates have declined. In Russia (Jan-June) the increase in patients on ART decreased by 4 times - from 88,000 in 2019 to 22,000 in 2020, in Belarus "-57%", Moldova "-61%"' Georgia "-41".

Description: The team of the ICF_Alliance_for_Public_Health, having regional resources, expertise and contacts #SoS_project, decided to contribute as much as possible to maintaining the sustainability of HIV services.

During the pandemic and total isolation, it is important to demonstrate the strength of the communities in the region, to inspire and motivate them to action, prompt ideas. It was important to come up with an easy and accessible format for presenting stories.

In a short time, the best practices from the countries of the region on maintaining the sustainability of HIV services were collected and published on the Official website with further promo campaign of this experience.

Lessons learned: The online initiative including of an interactive online map of 19 countries of Eastern Europe and Central Asia, the Baltic region and the Balkans, which presents about 60 best practice and stories about how sustainability of services for people from key populations was created during the pandemic and who are people behind it. Coverage of a promotional video with the presentation of a interactive map составил порядка 46 thousand on Facebook during one week.

Heroes of the site's stories, partners from NGOs and civil society during the period of severe restrictions in April-May provided support and assistance to at least 30 thousand people.

Conclusions/Next steps: Key populations and people living with HIV have shown their ability to self-organize, quickly and efficiently solve vital issues, and work effectively with the state. Thanks to the exchange of experience on pandemic time the lock down rallied the world community, activists and doctors more and more: patents revoked, personal protective supplies for doctors and lung ventilators are quickly procured, mobile teams for medications delivery between and within countries are organized.

EPD571
Effects of COVID-19 to access for services affecting MSMs in Mombasa, Kenya

J.M. Kyana[1]
[1]*HIV People Alliance of Kenya, Health, Mombasa, Kenya*

Background: During Covid19 , health services delivered by CHVs and Peer Educators were predominantly affected by reduced training opportunities (60.9%), fear of COVID-19 infection (52.9%), lack of adequate PPE (49.6%), reduction of monthly supervision meetings (35.4%), stigma from the community (32.5%); a lack of CHV/ PE kits (314%), reduced support from donors(29.8%), poor referral mechanisms (28.8%) and limited working duration due to night curfews (24.9%).

Description: From the HIV survey, attendance to support group sessions (38.5%), refills for septrin and other opportunistic infection drugs (34.8%) and ARVs (29.8%) were the most predominant HIV services that HIV positive clients were unable to access due to COVID 19. Other services that clients were unable to access include viral load testing (16.6%), attendance for clinic appointments (14.3%), adherence counselling (12.8%). Importantly, access to PrEP for their HIV negative partner was reported by 4.3% of respondents. When these services were unavailable, half (50.7%) of clients reported that they gave it to fate, 26.6% bought septrin from chemists, A few bought ARVs from local shops/vendors and 11.6% shared drugs with their friends. A small proportion (9.8%) sought religious interventions or traditional remedies (1.3%). Key Population especially MSM were greatly affected.

Lessons learned: HAPA Kenya resorted into taking services and prevention commodities in the hotspots. Nutritional supplies and cash transfers was applied to MSM on ARVs and at risk of defaulting due to economic crisis as a result of COVID 19. virtual mental health counselling by the Mental health counsellor. The Drop in Center operating on appointment basis for the MSM to continue accessing services. Paralegal were provided with additional airtime and transport to actively follow up SGBV cases.

Conclusions/Next steps: Service delivery to MSM was greatly disrupted, however continuing adaptation are proving that a rebound to normalcy is attainable. Nutritional support and cash transfers are key intervention to address economic impact to C19 to Key population including MSM.

There is progressive awareness of the COVID-19 mitigation measures among MSM reached in the DIC. Peer Educators have played a vital role in awareness creation. There is need for programs to invest more on behavior change interventions.

Track E - Implementation science, economics, systems and synergies with other health and development sectors

Implementation science of scaling up prevention (including PrEP)

EPE001

Acceptability of various HIV pre-exposure prophylaxis modalities among people who inject drugs (PWID): findings from a qualitative study in San Diego County, CA, USA

A. Bazzi[1], C. Valasek[1], C. Vera[1], A. Harvey-Vera[1], M. Philbin[2], K. Biello[3], S. Streuli[1], S. Strathdee[1], H. Pines[4,4]
[1]University of California, San Diego, La Jolla, United States, [2]Columbia University, New York, United States, [3]Brown University, Providence, United States, [4]San Diego State University, San Diego, United States

Background: People who inject drugs (PWID) in the United States experience elevated HIV risk but have low knowledge of HIV pre-exposure prophylaxis (PrEP). Understanding PWID interest in and willingness to use PrEP is imperative as long-acting modalities are in various stages of development and implementation.
Long-acting PrEP modalities hold promise for HIV prevention among PWID, necessitating an improved understanding of PrEP acceptability across new modalities.
Methods: From September - November 2021, we conducted in-depth interviews with HIV-negative adults (≥18 yrs) PWID in San Diego County to explore perspectives on daily oral PrEP pills and longer-acting PrEP injections, implants, intravaginal rings, and broadly neutralizing antibodies (bnAbs).
Prior to open-ended questions, we explained modalities using standard scripts. Thematic analysis identified PrEP modality interest and acceptability.
Results: Among 28 participants, median age was 40 years (IQR: 32-53); 18 (64%) identified as male (10 [36%] as female), and 18 (64%) identified as Hispanic/Latinx.
Participants had generally low PrEP knowledge and only moderate interest, primarily due to low perceived HIV risk and concerns about potential side effects.
When asked about various PrEP modalities, most preferred injectable PrEP. Three key acceptability considerations emerged: convenienceof use,invasiveness, and familiarity (based on past experience).
For example, while participants deemed daily oral pills to benon-invasive and highly familiar, they viewed oral PrEP as inconvenient. In contrast, PrEP injections were highly convenient, familiar, and generally non-invasive.
Reactions to PrEP implants were largely negative (unfamiliarity, invasiveness), but some equated implants' long duration with greater convenience.
Reactions to bnAbs were similar, though they were viewed as slightly less invasive than implants. Despite familiarity with intravaginal ring technologies, female participants generally viewed intravaginal PrEPringsas inconvenient and invasive.
Conclusions: PrEP modality preferences varied among PWID we interviewed according to perceivedconvenience, invasiveness, and familiarity. This suggests that a range of PrEP options are needed to help meet the HIV prevention needs of this population.
While injectable PrEP was the most acceptable modality in this sample, and extended-release injectable cabotegra virwas recently approved for use in the United States, efforts are needed to improve "next generation" PrEP knowledge, motivation, and delivery to PWID.

EPE002

Implementation strategy package improves PrEP implementation for pregnant women in antenatal care clinics in western Kenya

A. Wagner[1], J. Sila[2], F. Abuna[2], J. Dettinger[1], B. Odhiambo[2], N. Mwongeli[2], G. Oketch[2], E. Sifuna[2], L. Gómez[1], S. Hicks[3], G. John-Stewart[4], J. Kinuthia[2]
[1]University of Washington, Global Health, Seattle, United States, [2]Kenyatta National Hospital, Research and Programs, Nairobi, Kenya, [3]University of Washington, Epidemiology, Seattle, United States, [4]University of Washington, Global Health, Epidemiology, Pediatrics, Medicine, Seattle, United States

Background: Pre-exposure prophylaxis (PrEP) is safe and effective during pregnancy and postpartum and recommended by the WHO and Kenyan Ministry of Health. Integration of PrEP into antenatal care is promising, but gaps exist in resource-limited settings.
Methods: Between June-December 2021, we conducted a difference-in-differences study (3 months pre and post intervention; 4 intervention & 4 comparison facilities) in Western Kenya. We tested 3 implementation strategies – video-based PrEP information, HIV self-testing, and dispensing PrEP in antenatal care rooms – together to improve PrEP delivery.
We compared absolute changes in: proportion of antenatal attendees screened for PrEP (PrEP penetration), proportion receiving all PrEP steps (HIV testing, risk screening, PrEP counseling) (PrEP fidelity), client PrEP knowledge, client satisfaction, and waiting time and service time (*a priori* outcomes); *post hoc* we compared the proportion offered PrEP and receiving HIV testing. We measured provider perceptions of acceptability and appropriateness.
Results: Overall, 1,919 women were assessed for PrEP outcomes (960 in intervention and 958 in comparison) and 768 for service timings.
PrEP penetration (+5 percentage points; p=0.010), PrEP fidelity (+7 percentage points; p=0.073), and PrEP offer (+4 percentage points; p=0.004) changes were higher in intervention versus comparison facilities.

Client PrEP knowledge (+1.8/6 total points; p<0.001) and client satisfaction (+0.7/30 total points; p=0.003) changes were higher in intervention versus comparison facilities.
Provider perceptions of implementation strategies was favorable (median acceptability: 20/20; median appropriateness: 19.5/20).
We observed no differences in service time (+0.9 minutes; p=0.328) or HIV testing (-5 percentage points, p=0.46), and a small increase in waiting time (+1.4 minutes; p=0.009).
However, absolute levels in the PrEP cascade remained suboptimal; no step besides HIV testing exceeded 33% coverage.

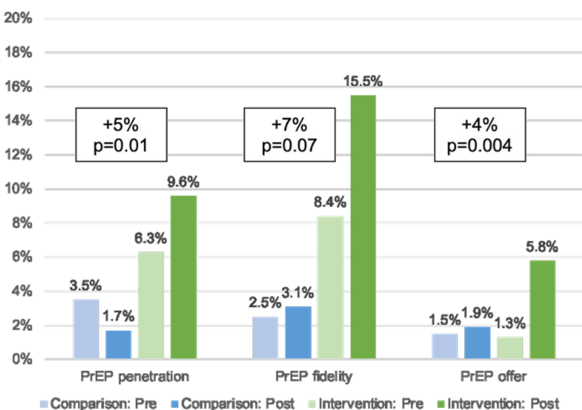

Figure.

Conclusions: This implementation strategy package may be useful to integrate PrEP provision into antenatal clinics. It enhanced PrEP delivery across implementation outcomes and client satisfaction without meaningfully increasing wait time or decreasing provider-client time.

EPE004
Introducing a comprehensive approach to implementing, scaling up, and strengthening HIV pre-exposure prophylaxis (PrEP) service delivery in Ukraine

A. Ihnatiuk[1], A. Shapoval[1], N. Puttkammer[2], M. McDowell[2]
[1]*International Training and Education Center for Health, Kyiv, Ukraine,* [2]*University of Washington, Department of Global Health, International Training and Education Center for Health, Seattle, United States*

Background: The WHO recommends the use of antiretroviral drugs by HIV-negative individuals to reduce HIV acquisition. In 2018, Ukraine adopted this recommendation by launching PrEP on a limited scale, with a primary focus of reaching men who have sex with men (MSM).
Ukraine's national goal is to cover 10% of key populations, or >60,000 people, with PrEP services, including people who inject drugs, MSM, sex workers, and partners of people living with HIV. In 2019, only 1,735 individuals received PrEP in Ukraine.
Description: To scale up and strengthen PrEP delivery in Ukraine, the International Training and Education Center for Health (I-TECH) initiated a technical assistance program for PrEP. The program aimed to establish PrEP provision as a standard of care in 39 public-sector healthcare facilities (HCFs). Baseline needs assessment showed a lack of standardization in PrEP provision and demand for comprehensive PrEP training among healthcare workers (HCWs). I-TECH developed guidelines for daily and event-driven PrEP delivery and conducted two training sessions for HCWs. PrEP clients in the program received free creatinine and HBV testing. I-TECH also supported PrEP information campaign.
Lessons learned: From October 2020 to September 2021, 39 HCFs engaged in program, including 19 clinics new to PrEP delivery. During the program year, 1,540 clients received PrEP at least once, this exceeded anticipated annual client target (n=891). Two-thirds were males in their thirties, 39% (n=451) of ART-naïve clients who started PrEP were referred from the I-TECH-supported HIV assisted partner testing program implemented at participating clinics. Coverage of key populations increased significantly (Figure 1).

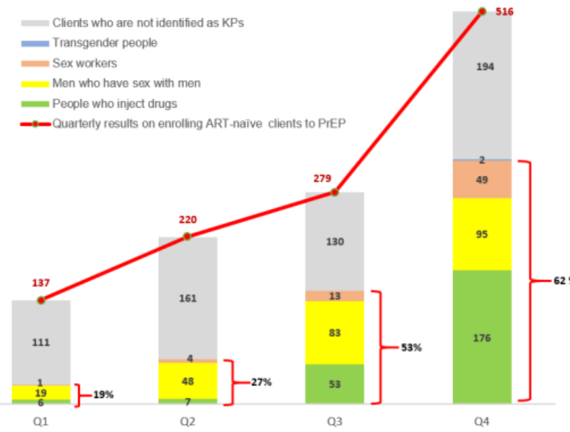

Figure 1. Quarterly results on enrolling new clients and coverage of key populations over first year of PrEP program span in 39 public-sector health facilities in Ukraine.

Conclusions/Next steps: The first-year program results demonstrated increasing demand for PrEP among clients of public-sector HCFs. The program also identified positive synergies of HIV partner testing and PrEP in engaging new PrEP clients. In 2021-2022, I-TECH is expanding its technical assistance to 89 HCFs to increase access and ultimately client enrollment.

EPE005
PrEP awareness and factors associated with PrEP interest among adults in Malawi: results from the MPHIA 2020

V. Singano[1], A. Kabaghe[1], A. Maida[1], A. Jahn[2], F. Zulu[1], A. Auld[1], E. Kim[1], P. Patel[3], L. Tenthani[4], K. Brown[3], F. Kayigamba[4], F. Ogollah[4], M. Farahani[5], D. Payne[1], W. Msungama[1], MPHIA Study Team
[1]*U.S. Centers for Disease Control and Prevention, Lilongwe, Malawi,* [2]*Ministry of Health and Population, Lilongwe, Malawi,* [3]*U.S. Centers for Disease Control and Prevention, Atlanta, United States,* [4]*ICAP at Columbia University, Lilongwe, Malawi,* [5]*ICAP at Columbia University, New York, United States*

Background: The World Health Organization recommends Pre-Exposure Prophylaxis (PrEP) for all populations at substantial risk of HIV infection. Understanding PrEP awareness and interest is crucial for designing PrEP programs; however, data are lacking in sub-Saharan Africa. In Malawi, PrEP was rolled out nationally in December 2020.
We analyzed data from the 2020 Malawi Population-based HIV Impact Assessment (MPHIA) to assess PrEP awareness and factors associated with PrEP interest in Malawi.
Methods: MPHIA 2020 was a national cross-sectional, two-stage,cluster sample household-based survey targeting adults aged 15+ years. PrEP was first described to the survey participants as a process of taking a daily pill to reduce the chance of getting HIV. To assess awareness, participants were asked if they had ever heard of PrEP and to assess interest, were asked if they would take PrEP to prevent HIV, regardless of previous PrEP knowledge.
Only HIV-negative participants are included in this analysis. We used multivariable logistic regression to assess sociodemographic factors associated with PrEP interest. All results were weighted.
Results: We included 20,089 HIV-negative participants; median age was 28 years old (interquartile range: 20-40). Overall, 14.6% (95% confidence interval (CI): 13.8-15.4) of participants were aware of PrEP. A higher proportion of male (17.3% (95% CI: 16.2-18.4)), those with post-secondary education (42.8% (95% CI: 37.6-48.1)) and urban (22.1% (95% CI: 19.7-24.6)) participants were aware of PrEP than female (12.1% (95% CI: 11.3-12.8), those with no education (10.0% (95% CI: 8.6-11.4)) and rural (13.1% (95% CI: 12.4-13.8)) participants, respectively. Of those aware of PrEP, 8.3% (95% CI: 7.2-9.5) had been offered PrEP and of those, 33.8% (95% CI: 27.1-40.5) had ever used it.
Overall, 70.0% (95% CI: 68.9-71.0) of participants were interested in using PrEP. Younger age, being male, primary education, rural and northern zone participants and being divorced/separated were associated with PrEP interest in multivariable logistic regression analyses.
Conclusions: In this survey, prior PrEP knowledge and use were low while PrEP interest was high. Additional research is needed to understand and address low uptake of PrEP. Strategies to increase PrEP awareness and access targeting subpopulations at HIV risk with low knowledge can help to reduce HIV transmission.

EPE006
High demand for HIV pre-exposure prophylaxis (PrEP) services amongst key populations in Sierra Leone: early lessons from the country's first PrEP program

E. Ikoona[1], M. Msukwa[2], O. Eleeza[1], L. Parmley[3], L. Chingumbe[1], J. Franks[3,4], E. Morrison[3,5,6], M. Murray[7], A.R. Sessay[8], J. Zech[3], M. Rabkin[3,5,6], S. Michaels-Strasser[3,6], M. Toure[1]
[1]*ICAP Columbia University, Freetown, Sierra Leone,* [2]*ICAP Columbia University, Pretoria, South Africa,* [3]*ICAP Columbia University, New York, United States,* [4]*Department of Sociomedical Sciences, Columbia University Mailman School of Public Health, New York, United States,* [5]*Department of Medicine, Columbia University Vagelos College of Physicians and Surgeons, New York, United States,* [6]*Department of Epidemiology, Columbia University Mailman School of Public Health, New York, United States,* [7]*Sierra Leone National AIDS Control Program, Freetown, Sierra Leone,* [8]*Sierra Leone National AIDS Secretariat, Freetown, Sierra Leone*

Background: HIV pre-exposure prophylaxis (PrEP), recommended since 2015 by WHO for high-risk groups, including key populations (KPs), has been unavailable in Sierra Leone (SL), a low-income country with limited data on KP population size and HIV prevalence. In 2021, the SL Ministry of Health and Sanitation (MoHS) and National AIDS Secretariat partnered with ICAP at Columbia University (ICAP) to launch the country's first PrEP program with support from the U.S. Health Resources and Services Administration (HRSA).
Description: Following stakeholder consultation, ICAP partnered with nine KP-led community-based organizations to design and implement PrEP services with a goal of initiating PrEP for 800 clients within six months. Eight KP-led drop-in centers (DICs) were supported to provide PrEP and linked to four public-sector health facilities (HFs) to manage clients testing positive for HIV.
Guidelines, training materials, job aids, monitoring and evaluation (M&E) systems, and safety monitoring protocols were developed. PrEP medications were procured with HRSA support, DICs were refurbished, and 24 healthcare workers were trained. DIC staff provided information, eligibility screening, PrEP prescriptions, condoms, lubricants and other commodities, adherence support, and side effect monitoring.
Peer educators generated demand for PrEP via their social and sexual networks. Blood samples were collected at DICs, and screening tests were performed at accredited laboratories. ICAP staff provided supportive supervision, mentorship, and M&E support.

Lessons learned: Between May and September 2021, 1450 KPs were assessed; 1308 (90.2%) initiated PrEP. 83.4% of the clients enrolled on PrEP were female, the median age was 23 years (range 14-71 years), 83% were sex workers, 10% injected drugs, and 7% were men who have sex with men.

Of the 142 ineligible for PrEP, 111 were HIV-positive at screening, and all were linked to care. Suspected acute HIV infection (30) and abnormal creatinine (14) delayed PrEP initiation for others. No PrEP-related side effects were reported, and 5-month retention was 97.1% (1270/1308).

Conclusions/Next steps: Demand creation and delivery of PrEP via KP-led DICs supported by public-sector HFs and an implementing partner facilitated rapid PrEP roll out to a high-risk population. Close monitoring as the program matures will be important as MoHS and its partners scale up PrEP in SL.

EPE007

Delivery of HIV self-testing and pre-exposure prophylaxis through private retail pharmacies in Kenya: a mixed methods evaluation

P. Mugo[1]
[1]*Kenya Medical Research Institute - Well Trust Research Programme, Health Economics Research Unit, Nairobi, Kenya*

Background: Private retail pharmacies (community pharmacies) present a highly accessible channel through which HIV prevention interventions can be delivered. Interest to include this sector in scaling up interventions is growing rapidly.

In Kenya, two HIV policies launched in 2017 (HIV self-testing services [HIVST] and pre-exposure prophylaxis [PrEP]) formally recognized pharmacy-based delivery as a key implementation strategy. We carried out an in-depth evaluation of the two policies in the pharmacy sector, aiming to:

i. Enhance implementation by feeding back findings to implementers and

ii. Provide insights for future implementation of similar polices.

Methods: We used a mixed-methods approach consisting a cross-sectional questionnaire survey at randomly selected pharmacies (November-December 2019), a simulated client (mystery shopper) survey at pharmacies that were providing HIVST and or PrEP (Feb-March 2020), in-depth interviews with stakeholders involved in implementation (2019-2021), and review of relevant program documents (2019-2021).

Results: Of 195 pharmacies included, 107 (55%; 95% CI [42-68 %]) were providing HIVST test kits, but none had performed a HIV test within the pharmacy in the last week. The Table below summarizes the level of service and integration of HIVST services in the pharmacy sector.

Implementation parameter (n% [95% CI])	All counties combined (n=107)	Kisumu county (n=31)	Mombasa county (n=42)	Nairobi County (n=63)
Staff trained on HIVST service delivery	84 (79% [70-86] %)	18 (58% [48-67%])	39 (93% [87-97])	27 (79% [70-87])
HIVST kits added stock management system	77 (72% [63 - 80%])	19 (61% [51 - 70%])	26 (62% [52 - 71%])	32 (94% [89 - 98%])
HIVST kits in stock in the last one month	101 (94% [89 - 98%]	27 (87% [80- 93%)	42 (100% [100 - 100%])	32 (94% [89 - 98%])
Sold at least one HIVST kit in the last one week	72 (67% [58 - 76%])	16 (52% [41- 61%])	30 (71% [62- 80%])	26 (77% [68- 84%]
HIVST discussed in staff meetings (only pharmacies that hold regular meetings)	19 (30% [20- 38%])	6 (35% [26 - 44%])	6 (31% [22 - 40%])	7 (25% [16- 33%])

Table.

Only 6 (3%) of pharmacies were providing PrEP. Reasons for this low adoption level included lack of a proper program to get PrEP supplies, lack of demand from clients and lack of knowledge.

With regard to structures and resources, 37% of pharmacies had a consultation room, 62% had a computerized stock management system, 83% had a HIV testing centre <1km away, and 70% opened 7 days a week.

Conclusions: Approximately three years after policy launch, HIVST services had been adopted by the majority of pharmacies. Adequate structures and resources exist in the private pharmacy sector for the delivery of HIV prevention interventions. Forthcoming qualitative data from the project will provide insights into the barriers hindering adoption of PrEP services.

EPE008

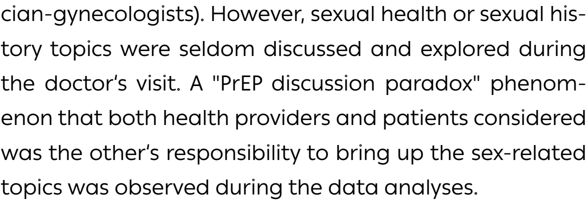
"PrEP Discussion Paradox" at primary care settings: perspectives regarding PrEP care from patients and healthcare providers

C. Zhang[1], S. Przybylek[1], Y. Liu[2]
[1]*University of Rochester, School of Nursing, Rochester, United States,* [2]*University of Rochester, Public Health Science, Rochester, United States*

Background: To facilitate PrEP provision, Nunn and colleagues proposed a "PrEP implementation cascade" model, which suggests that progression along stages of the cascade must involve interaction and engagement among patients and health providers in the system. Primary care providers (PCPs) are considered the ideal PrEP providers as they usually encounter more HIV-negative patients with indications for PrEP use. However, PrEP care is generally underperformed in primary care settings. We explored potential factors that may hinder the PrEP initiation using a qualitative study design in the current study.

Methods: In the current study, we employed a semi-structured in-depth interview to collect information about factors related to PrEP care implementation at primary care settings among 18 PCPs and 25 PrEP- eligible patients in New York State. The grounded theory was used to code and integrate main themes.

Results: Overall, recruited women reported a trusted and reliable relationship with their PCPs (e.g., family medicine practitioners, internal medicine practitioners, obstetri-



cian-gynecologists). However, sexual health or sexual history topics were seldom discussed and explored during the doctor's visit. A "PrEP discussion paradox" phenomenon that both health providers and patients considered was the other's responsibility to bring up the sex-related topics was observed during the data analyses.
Besides, HIV/PrEP related stigma, low perceived HIV risk, and low priority for PrEP use were reported by some patients. PCP reported heavy workload, embarrassment for sex-related discussions, and lack of navigation as the major reasons for not offering PrEP care in primary care settings.
Conclusions: Our study is one of the first to identify that the "PrEP discussion paradox" may hinder the PrEP care implementation. As an icebreaker of the "paradox", a pre-screening tool for sexual history/behaviors before the visit or a PrEP navigator onsite might facilitate PrEP care during the healthcare visits.
Future studies are urgently needed to explore the efficacy and effectiveness of these potential tools to facilitate the PrEP discussion at primary care settings to engage critical stakeholders along the PrEP implementation cascade.

EPE009
Gamification of peer mobilizers to increase pre-exposure prophylaxis uptake among transgender women

N. Rongram[1], R. Apiputhipan[2], N. Manojai[2], T. Thephawan[2], P. Sanksung[2], M. Avery[1]
[1]FHI 360, Bangkok, Thailand, [2]Mplus Foundation, Chang Mai, Thailand

Background: Transgender women (trans women) are disproportionately affected by HIV and would benefit from additional prevention options; however, fewer than 10% of HIV-negative trans women at community clinics in Thailand access free HIV pre-exposure prophylaxis (PrEP) services.
We introduced a "gamified" peer-driven model, encouraging influential community members to competitively recruit transwomen to increase PrEP uptake.
Description: The Mae Koe ("community leader") project was implemented by Mplus Foundation, a community-based organization in Chiang Mai. Influential community "leaders", including trans women, were purposively selected, trained about HIV prevention, and tasked with promoting HIV services in their community and via Facebook Live sessions, and recruiting trans women to initiate PrEP. Each leader was given a unique, trackable link to an online reservation platform.
The leader earned one point for each referred client who either initiated PrEP or tested HIV positive. No monetary incentives were provided — competitors were motivated by social recognition. The competition was promoted via a beauty pageant. Mplus reported point totals to each of the "leaders" on a weekly basis, though clinic staff were reminded to follow protocols to protect client confidentiality. In the final red-carpet event, the leader who earned the most points was crowned the winner, and a special award was given to the leader referring the most trans-women clients.
Lessons learned: Between August and September 2021, 21 community leaders recruited 219 clients for HIV testing (including 96 trans women). The mean number of new clients recruited per leader was 2.81. There were 143 new PrEP users, including 65 trans women.
Of the HIV-negative trans women participants, 71% initiated PrEP, accounting for 41.38% of Mplus' annual PrEP service delivery among this population. In just one month, the Mae Koe competition contributed 60% of annual PrEP uptake among trans women aged 15–19, and 48% among those aged 30–34; these groups had the highest HIV prevalence in program data over the most recent 12-month period (20% and 27%, respectively). Four trans women tested HIV positive.
Conclusions/Next steps: This gamified peer-driven recruitment model is a promising strategy for initiating trans women on PrEP while managing privacy concerns and warrants further implementation and evaluation.

EPE010
PrEP Prescription from Nurses: strategy to scale up access to HIV prophylaxis in Brazil

A.F. Kolling[1], T.B. Rocha[1], T.C. Morelli[1], R.V. Brizolara[1], A.F. da Silva[1], B.B. Kamiensky[1], A.C.G. Ferreira[1], G.F.M. Pereira[1]
[1]Ministry of Health of Brazil, Department of Diseases of Chronic Condition and Sexually Transmitted Infections, Brasília, Brazil

Background: Prevention strategies have always played a prominent role in Brazilian HIV/AIDS epidemic response, resulting from combined action of Brazilian government, health workers and social movements. Considering the need to reduce HIV epidemic, MoH Brazil is focusing on improving and qualifying HIV prevention strategies, including new prevention technologies, especially those structured from the use of antiretrovirals, such as PrEP.
After 3 years of PrEP implementation, Brazil is now in an expansion of PrEP access. Nurse prescription was one of strategies implemented. The MoH Brazil articulated with the Federal Council of Nursing (COFEN) to enable nurses to start prescribing prophylaxis. This abstract aims to evaluate the impact of beginning Nurse PrEP prescription in expanding access to prophylaxis in Brazil.
Description:
In Brazil, PrEP prescriptions are directly related to other activities already developed by Nurses, such as carrying out rapid tests, pre-test and post-test counseling for HIV, Syphilis and Viral Hepatitis diagnosis or requesting tests for diagnostic confirmation.
Nurse PrEP Prescription started with publication of a technical document by COFEN in August 2020. MoH adapted the Medication Logistic Control System (SICLOM) to vali-

date Nurses prescriptions, held training and Webinars for these professionals and included Nurse prescriptions in National Protocols. The charts below demonstrate the expansion of Nurse PrEP prescriptions from August 2020 to December 2021 across the country.

The chart presents a linear regression by the Prais-Winsten (1954) model and calculates average monthly growth rate for the entire series. Data included the confidence interval and R squared.

Figure. PrEP prescription from nurses.
MoH Brazil (2022)

Lessons learned: Data show that beginning Nurse PrEP prescriptions had an important impact on expanding PrEP access in Brazil, representing a growth rate of 10,68% (CI 95%: 9,09-12,30); R Squared (0,934) in relation to total prescriptions made.

Conclusions/Next steps: Next steps involve making possible for other health professionals prescribing prophylaxis and supporting training process professionals.

EPE011

Evaluating the future use of the dapivirine ring: qualitative key informant interviews with Kenyan policymakers, health managers, and HIV advocates

M.M. Kiruki[1], P. Jeckonia[2], S. Forsythe[3], P. Stegman[3], M. Larson[4], D. Castor[5]

[1]LVCT Health, Research and Strategic Information, Nairobi, Kenya, [2]LVCT Health, HIV Prevention, Nairobi, Kenya, [3]Avenir Health, Economics/ Costing, Glastonbury, Connecticut, United States, [4]Family Health International 360, HIV Prevention Programs, Durham, United States, [5]Columbia University, Health Equity in Implementation and Dissemination Science, New York, United States

Background: Women in Kenya are disproportionately affected by HIV. However, the reduction of HIV infections in Kenya has slowed in recent years. Achieving greater gains may require new strategies and/or technologies for reaching women. The monthly dapivirine vaginal ring (pre-exposure prophylaxis [PrEP] ring or "the ring") is one such technology. The ring eliminates the need to consistently take pills, has minimal side effects, and is not noticeable during sex. Women can self-insert the ring discreetly, with minimal visits to a health facility.

To inform its rollout in Kenya, LVCT Health carried out a qualitative study to explore stakeholders' perspectives on the ring, available national policies and guidelines, and ring service delivery and financing.

Methods: LVCT Health conducted one-on-one online interviews with 15 purposively sampled key informants from May to July 2021. Those interviewed included Ministry of Health officials at the national and county levels, HIV advocates from civil society, and health managers representing nongovernmental organizations (NGOs) and the private health sector. A thematic analysis was conducted using NVivo 12 qualitative software.

Results: Overall, stakeholders thought the ring would benefit women by expanding choice and complementing available HIV prevention methods. Stakeholders believed that existing health providers could offer the ring at the health facility level. Stakeholders also pointed out that integration of HIV prevention and family planning services could reach more HIV-negative women. Some stakeholders discussed the possibility of providing ring services at pharmacies, noting that health providers in pharmacies are already offering antiretroviral therapy, HIV self-testing, and family planning. Stakeholders also identified concerns, including the level of efficacy and cost of the ring, the need for a potential funder for scale-up, and the potential social impact of its use. They also wondered if clients accessing services through the public and NGO sectors might expect free ring services.

Conclusions: Interviews with stakeholders revealed overall support for the ring as a long-acting, discreet, and woman-led intervention. Considerations to be addressed through further research include the ring's price and relative efficacy, possibilities of social impact, and the best service delivery channels to reach potential clients.

Not just about knowledge and money: most Taiwanese sexual health physicians require standard operating procedure and non-physician professionals' support to deliver PrEP services

I.Y.-H. Chu[1], C. Strong[2], C.-W. Li[3], S.W.-W. Ku[4], N.-Y. Ko[5], H.-J. Wu[6], A. Bourne[6,7], H. Burchett[1], F. Hickson[1]

[1]London School of Hygiene & Tropical Medicine, Department of Public Health, Environments and Society, Faculty of Public Health and Policy, London, United Kingdom, [2]National Cheng Kung University, Department of Public Health, College of Medicine, Tainan, Taiwan, Province of China, [3]National Cheng Kung University, Center for Infection Control and Department of Internal Medicine, National Cheng Kung University Hospital, College of Medicine, Tainan, Taiwan, Province of China, [4]Taipei City Hospital Renai Branch, Department of Medicine, Division of Infectious Diseases, Taipei, Taiwan, Province of China, [5]National Cheng Kung University, Department of Nursing, National Cheng Kung University Hospital, College of Medicine, Tainan, Taiwan, Province of China, [6]UNSW Sydney, Kirby Institute, Sydney, Australia, [7]La Trobe University, Australian Research Centre in Sex, Health and Society, Melbourne, Australia

Background: Taiwan's government-verified Sexually-Transmitted-Infection-friendly Physicians (STIPs) could maximise PrEP service capacity/accessibility and expedite PrEP roll-out, but fewer than 5% of STIPs currently deliver PrEP.

We present findings from a theory-informed questionnaire to explain the limited engagement by measuring the unmet needs of STIPs for PrEP service delivery.

Methods: All 1361 STIPs verified by the Taiwan Centers for Disease Control were invited to a self-administered online questionnaire via post and onsite events, from August to October 2021. We used a 52-item Traditional Chinese questionnaire applying all 14 domains of the Theoretical Domains Framework. Items measured STIPs' PrEP knowledge, service provision needs and demographics. We defined the key unmet needs as domains requested by ≥50% of survey respondents while ensuring each domain was measured by ≥2 items.

Results: Of 212 respondents, most (72%) self-identified as men and almost half (47%) practised outside the hospital. 14% were unaware of PrEP, 44% felt incompetent to provide PrEP services and 88% had never prescribed it. Regarding STIPs' PrEP knowledge, three-quarters (74%) recognised that PrEP prevents HIV infection, 58% knew about daily PrEP and 51% knew about event-driven PrEP.

The extent of unmet PrEP prescribing needs ranged widely from 3% to 86%. The most commonly unmet needs concerned provider-friendly standard operating procedures and clinical support from non-physician professionals (e.g., nurses) to deliver PrEP care (85%). Other key unmet needs included (Figure): remembering how to prescribe it (78%); adequate financial reimbursement from governments (65%); initiating PrEP conversations with patients (63%); tackling the time-consuming process of PrEP service and the costs of drug procurement and stocking (both 63%).

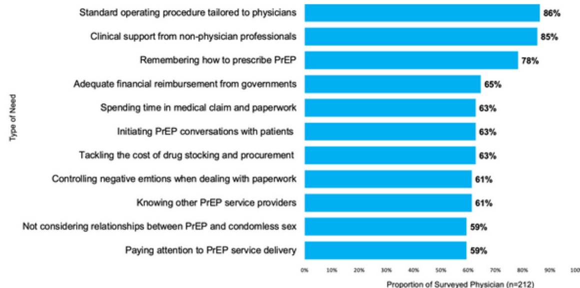

Figure. Key unmet needs of Taiwanese sexual health physicians for PrEP delivery.

Conclusions: Taiwanese sexual health physicians most commonly identified procedural regulation and interprofessional support as their unmet needs for PrEP service delivery. Interventions aiming to increase physicians' PrEP prescribing should consider creating streamlined standard operating procedures for PrEP and/or fostering collaborative clinical teamwork.

EPE013

What motivated men to start PrEP? A cross-section of men starting PrEP in Buffalo City Municipality, South Africa, want convenient, tailored platforms

P.J. Smith[1], J. Daniels[2], L.-G. Bekker[3], A. Medina-Marino[3]

[1]University of Cape Town, Desmond Tutu HIV Centre, Institute for Infectious Disease and Molecular Medicine, Faculty of Health Science, Medicine, Cape Town, South Africa, [2]Arizona State University, Edson College of Nursing and Health Innovation, Tempe, United States, [3]University of Cape Town, Desmond Tutu HIV Centre, Institute for Infectious Disease and Molecular Medicine, Faculty of Health Science, Cape Town, South Africa

Background: Compared to women, men in South Africa are less likely to know their HIV status (78% vs 89%), have suppressed viral loads (82% vs 90%), or engage in HIV prevention services. To achieve epidemic control in high disease burden settings, gender responsive interventions to improve the uptake of testing and retention in HIV care, treatment and prevention services must also target cisgendered, heterosexual men.

Unfortunately, there is limited understanding of these men's needs and wants, especially with regards to the uptake of pre-exposure prophylaxis (PrEP).

Methods: Adult men accessing HIV testing at a community-based testing site, and who received a negative HIV test result, were offered same-day PrEP initiation, and consented to participate in a study investigating PrEP uptake, adherence, and HIV prevention needs.

A trained research assistant interviewed participants. Interview guides were developed using the Network-Individual-Resources model. The interview explored men's

perceived HIV acquisition risk, prevention needs, and preferences for PrEP uptake. Interviews were audio-recorded, transcribed, double-coded by two researchers, and analyzed using a constant comparison approach.

Results: Twenty-two men (mean age=28 years; IQR: 20-35) were enrolled and interviewed. Men reported elevated HIV acquisition risk associated with alcohol use, condom-less sex with multiple partners, and enthusiasm to initiate PrEP due to their perceived elevated risk for HIV. Men anticipated receiving social support from family members, main sexual partner, and close friends for PrEP use. Other men were important sources of support for starting PrEP.

Nearly all men expressed positive views generally of people using PrEP. However, participants believed that HIV testing would be a barrier to PrEP initiation for other men. Men highlighted the need for convenient, rapid, community-based, non-conventional clinic PrEP initiation and support.

Conclusions: Men's perception of their increased risk of HIV infection was cited as a facilitator for PrEP initiation. Men expressed positive perceptions of PrEP users, but noted that HIV testing may be a barrier to PrEP initiation. Men reported that convenient access points would facilitate PrEP initiation and sustained use. Interventions tailored to men's preferences will support their use of HIV prevention services.

Preference for injectable PrEP among PrEP non-users in Western Kenya: results from a discrete choice experiment

R. Barnes[1], J. Owuoth[2,3], V. Sing'oei[2,3], J. Otieno[3], C. Nwoga[4,5], M. Milazzo[4,5], T.A. Crowell[4,5], C.S. Polyak[4,5], J. McPeak[6], E. Asiago-Reddy[1]

[1]SUNY Upstate Medical University, Syracuse, United States, [2]HJF Medical Research International, Kisumu, Kenya, [3]U.S. Army Medical Research Directorate - Africa, Kisumu, Kenya, [4]U.S. Army Military HIV Research Program, Walter Reed Army Institute of Research, Silver Spring, United States, [5]Henry M. Jackson Foundation for the Advancement of Military Medicine, Bethesda, United States, [6]Syracuse University, Maxwell School of Citizenship and Public Affairs, Syracuse, United States

Background: HIV incidence and prevalence are high in Western Kenya. While oral PrEP is available free-of-charge through Kenya's Ministry of Health, uptake is suboptimal. Understanding consumer preferences may enhance uptake.

Methods: The RV393 cohort enrolled 671 men and women aged 18-35 years who were at risk for HIV in Kombewa, Kenya. From February 2020 through May 2021, participants who were active in the study, without HIV, and had never taken PrEP as of February 2020 completed a 5-attribute discrete choice experiment (DCE) with 10 random choice tasks related to PrEP preferences. Data were collected and analyzed in Qualtrics XM.

Results: A total of 102 female (12 reporting same-sex encounters) and 74 male (29 reporting same-sex encounters) participants completed the DCE. For the majority of participants, the preferred PrEP package was 99% effective, was in injectable form, could be used privately, was dosed monthly, and could be accessed within 1 kilometer of home.

Among female participants, preference for an injection over pills, vaginal rings, or implants most strongly drove stated interest in PrEP, accounting for 61% of the preference share with a utility score of +18.4. Vaginal rings were the least preferred PrEP modality among women, detracting from package uptake with a utility score of -22.6. Among male participants all 5 attributes contributed more evenly to interest in PrEP (preference shares ranged from 17-21%), though injections were also the preferred modality.

Reduced PrEP efficacy (50% vs. 90% or 99%) strongly detracted from PrEP uptake, with utility scores of -7.3 for female and -14.4 for male participants. Female participants were willing to compromise on privacy if PrEP retained other preferred attributes. Male participants were not willing to compromise on privacy but were willing to take PrEP that was 90% effective if other preferred attributes were retained.

Conclusions: In this DCE, PrEP-naïve Western Kenyans at risk for HIV showed a strong preference for highly efficacious monthly injectable PrEP. Preference for injectable PrEP over other modes of delivery was particularly strong among women, while vaginal rings were the least preferred PrEP modality. Incorporating injectable PrEP into current programs may substantially improve uptake among the highest risk individuals.

EPE015

Implementation of PrEP in Kinshasa, the Democratic Republic of Congo: the gaps between screening, initiation, and retention

N. Zotova[1], A. Shongo[2], F.L. Kasindi[2], N. Mbonze[2], D. Kaba[2], P. Ntangu[3], J. Ross[1], V. Patel[1], A. Adedimeji[4], A. Pierz[1], K. Anastos[1], M. Yotebieng[1]

[1]Albert Einstein College of Medicine, Division of General Internal Medicine, New York, United States, [2]University of Kinshasa, School of Public Health, Kinshasa, Congo, Democratic Republic of the, [3]National AIDS Control Program (PNLS), Provincial Coordination, Kinshasa, Congo, Democratic Republic of the, [4]Albert Einstein College of Medicine, Department of Epidemiology & Population Health, New York, United States

Background: The Democratic Republic of Congo (DRC) has a combination HIV prevention approach including screening key populations and free pre-exposure prophylaxis (PrEP). Early demonstration projects in DRC showed good initial acceptability of PrEP in healthcare settings, but sustainability of PrEP implementation remains in question.

This study describes PreP initiation and retention patterns among eligible clients in Kinshasa, DRC.

Methods: Data were extracted from clinical PreP registries in five health centers affiliated with Central Africa International Epidemiology Databases to Evaluate AIDS. All clients evaluated for PreP from January 2019 through December 2021 were eligible. DRC guidelines recommend PrEP for at risk individuals including: HIV-negative partners of people living with HIV (PLWH), sex workers (SW), men who have sex with men (MSM), injection drug users, and transgender people. We used Chi-square tests to examine differences between eligible populations in proportion initiating PrEP and proportion of those initiate with at least one refill (early retention).

Results: Over the three years period, the study sites cumulatively screened 12,829 people. 10,554 (82%) clients were HIV-uninfected and eligible for PrEP: 4,034 (31%) MSM, 4,788 (37%) female SW, 1,703 (13%) clients of SW, and 11 (<0.1%) HIV-negative partners of PLWH. The proportion of eligible clients initiated on PrEP increased over time: 5% (n=140), 21% (n=670), and 19% (n=880) in 2019, 2020, and 2021, respectively. MSM were significantly more likely to initiate PrEP (n=834, 21%, p=0.05) compared with female SW (n=722, 15%), and clients of SW (n=129, 8%). Among 1,259 PrEP clients evaluated for retention, including 658 (52%) MSM, 593 (47%) SW, and 9 others (1%), 62% received at least one PrEP refill (n=777). The difference in retention between MSM (53%, n=409) and SW (47%, n=362) was not significant (p=0.55).

Conclusions: The growing number of people screened for and initiating PrEP over the past 3 years suggests a huge need for PrEP in DRC. However, the significant gap observed between PrEP eligibility and initiation may indicate behavioral or other factors behind low PrEP initiation, which merit further investigation.

Acknowledgements: This work was supported by NIAID, NICHD, NCI, and NIDA, as part of Central Africa IeDEA (U01 AI096299).

EPE016

Shaping the implementation science agenda for injectable long-acting cabotegravir for PrEP: results from a workshop convened by the Biomedical Prevention Implementation Collaborative (BioPIC)

J. Rodrigues[1], M. Warren[1], M. Rodolph[2], R. Schaefer[2], H.-M. Schmidt[2], C. Johnson[2], R. Baggaley[2]
[1]AVAC, New York, United States, [2]World Health Organization, Geneva, Switzerland

Background: Data from two randomized clinical trials (RCTs) showed that injectable long-acting cabotegravir (CAB-LA) was effective in reducing HIV acquisition across populations. Recent US regulatory approval paves the way for introduction in the US, and regulatory approval is being sought in several low- and middle-income countries (LMIC). However, implementation experience beyond highly resourced and well-organized RCTs is limited. As countries consider CAB-LA introduction, there remain questions regarding delivery and involvement of populations not included in the trials. A coordinated approach is needed to ensure these are addressed and that CAB-LA can be introduced in LMICs in timely, acceptable, and effective ways.

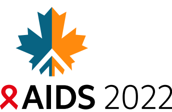
Description: In 2020, under Biomedical Prevention Implementation Collaborative (BioPIC), over 100 global health experts developed a comprehensive introduction strategy for CAB. Using this roadmap, country landscaping for CAB-LA introduction, and lessons from oral PrEP implementation, AVAC and WHO co-convened 50 researchers, donors, implementers and civil society in September 2021 to:

1. Identify common questions and evidence gaps related to CAB-LA across contexts and partners;
2. Define the implementation science agenda for CAB-LA, and
3. Agree on mechanism(s) for future coordination.

Lessons learned:

1. CAB-LA-related questions were identified, including: defining optimal and feasible HIV testing strategies that expand access; delivery models for CAB-LA; integration with family planning and antenatal care services; and how to embed CAB-LA in overall demand generation for HIV prevention choices.
2. Current and planned implementation research for CAB-LA needs to be mapped to identify gaps in populations, geographies, and delivery approaches.
3. To generate more comparative and generalizable data and identify scalable strategies, outcomes across projects and partners should be standardized.

Conclusions/Next steps: Ongoing policy and implementation dialogue, including with civil society, is critical to accelerate the development of CAB-LA implementation studies that adequately address priority knowledge gaps. Additional prevention products may be available over the next five years, increasing choice, but potentially making delivery and stakeholder engagement more complex.
The need for enhanced coordination has never been greater. BioPIC has established an open-source clearinghouse to improve knowledge sharing on CAB-LA implementation. Ongoing coordination with WHO will also accelerate adoption of evidence-based policies and wide scale implementation.



EPE017

Practice-based adaptive responses to overcome challenges in the scale-up of PrEP: a qualitative multiple case study of PrEP implementation in Belgian HIV clinics

J. Vanhamel[1], T. Reyniers[1], A. Rotsaert[1], E. Van Landeghem[1], C. Nöstlinger[1], H. Van Mieghem[1], T. Vanbaelen[2], G. Scheerder[1], M. Laga[1], B. Vuylsteke[1]
[1]Institute of Tropical Medicine, Public Health, Antwerp, Belgium, [2]Institute of Tropical Medicine, Clinical Sciences, Antwerp, Belgium

Background: To maximize the impact of PrEP on the HIV epidemic, we need to better understand and respond to barriers in real-world PrEP implementation. Very little research has applied health systems approaches to studying PrEP delivery in routine care. In Belgium, PrEP is formally delivered in a centralized system of 12 HIV clinics.
This study aimed to provide a contextualized understanding of how PrEP providers in these clinics develop PrEP implementation strategies in response to emerging contextual challenges.
Methods: We conducted a qualitative multiple case study in eight Belgian HIV clinics. Data collection between January and December 2021 consisted of: 21 interviews with a purposive sample of different provider profiles (e.g. medical and paramedical), semi-structured observations of delivery settings and clinical care processes, and review of documents relevant to understanding care practices and structure.
We analyzed field notes and verbatim transcribed data comparing 'within-case' and 'across-case' thematic coding.
Results: We identified three common themes of organizational challenges across the study sites: accommodating a continuously growing cohort of PrEP clients, dealing with competing clinical priorities at facility-level, and operating in a restrictive policy environment (e.g. where prescription of reimbursed PrEP is limited to HIV specialists).
In response, several context-specific innovations emerged through provider-initiated change, which we classified in five broader implementation strategies:
1. Expanding on-site PrEP services,
2 Simplifying care processes,
3. Task-shifting care aspects to non-physician professionals,
4. Differentiating care according to clients' needs and;
5. Collaborating with professionals outside HIV clinics.
The boundaries of these strategies were largely determined by system "hardware" factors, such as available infrastructure and workforce.
Yet, within these limits, we identified several underlying and less visible "software" factors as crucial enablers of change: the role of local leadership, provider agency and motivation, and shared values on quality of care, particularly creating a non-judgmental environment to accommodate the needs of sexual minority populations.
Conclusions: Within the structural constraints of limited resources, policy frameworks and a centralized PrEP delivery model, "software" factors emerged as essential enablers of provider-initiated adaptive change. Our results stress the need to consider aspects of organizational culture in ongoing efforts to improve and scale-up PrEP service delivery.

EPE018

Assessing the reach, adoption, implementation, and maintenance (R-AIM) of the systems analysis and improvement approach for prevention of mother-to-child transmission of HIV in Manica Province, Mozambique 2018-2021 (the SAIA-Scale Program)

J. Crocker[1], M. Agostinho[2], F. Amaral[2], K. Asbjornsdottir[3], J. Coutinho[2], E. Cruz[2], A. Dinis[1], S. Gimbel[4], C. Inguane[1], I. Ramiro[2], K. Ronen[1], K. Sherr[1]
[1]University of Washington, Department of Global Health, Seattle, United States, [2]Health Alliance International, Beira, Mozambique, [3]University of Iceland, Centre of Public Health Sciences, Reykjavik, Iceland, [4]University of Washington, Child, Family, and Population Health Nursing, Seattle, United States

Background: Optimal delivery of prevention of mother to child transmission of HIV (PMTCT) programs is challenging, including in Mozambique. The Systems Analysis and Improvement Approach (SAIA) is a multi-component systems engineering strategy that has demonstrated PMTCT cascade improvement in a previous cluster randomized trial. To facilitate scale-up and improve integration into routine management systems, the SAIA-Scale trial (NCT03425136) evaluates delivery of SAIA to health facilities by maternal and child health District Supervisors, with minimal external support. SAIA-Scale uses the RE-AIM framework to evaluate essential ingredients for public health impact that are infrequently reported, including intervention reach, adoption, implementation, and maintenance.
Methods: SAIA-Scale is a stepped-wedge trial in 36 facilities covering all 12 districts of Manica province, central Mozambique, from 2018–2021. Each district received a one-year intensive phase with external research staff support, followed by a maintenance phase with only limited financial support.
We used data from health management information systems and activity tracking to assess reach, adoption, implementation, and maintenance of the SAIA strategy.
Results: SAIA-Scale reached 36 facilities covering over 146,000 births and 206,000 first antenatal care visits during the study period. Mean scores on two organizational readiness predictors of adoption were 24.1/25 for change commitment and 33.5/35 for change efficacy. The program was adopted by all 12 targeted districts attending initial training, and 36 facilities initiating the SAIA strategy. Intensive and maintenance phases comprised equal fa-

cility-months. Each facility received an average of 1.1 and 1.0 mentorship visits from district supervisors per month during the intensive and maintenance phases, respectively.

Across all facilities, 429 workplans were developed during the intensive and 432 during the maintenance phase. Facility staff reported implementing 91.8% of intensive phase workplans, and 85.9% of maintenance phase workplans. Facilities reported adopting into routine practice 70% and 62% of micro-interventions tested during the intensive and maintenance phases, respectively.

Conclusions: Assessment of reach, adoption, implementation, and maintenance revealed the successful integration of a systems engineering strategy for PMTCT into routine healthcare management systems in Mozambique. R-AIM should be reported alongside effectiveness more frequently for a deeper understanding of sustained public health impact of HIV prevention programs.

EPE019

Can evidence based from robust trials be translated into routine practice? The adoption of an evidenced-based innovative REMSTART package to reduce mortality in advanced HIV disease individuals starting ART in Tanzania

S. Mfinanga[1,2], S. Kivuyo[1], F. Eric[1], A. Loyse[3], G. Kimaro[1], T. Harrison[3], S. Jaffar[2]

[1]National Institute for Medical Research, Muhimbili Medical Research Center, Dar es Salaam, Tanzania, The United Republic of, [2]Liverpool School of Tropical Medicine, Department of International Health, Liverpool, United Kingdom, [3]St. George's, University of London, Centre for Global Health, Institute of Infection and Immunity, London, United Kingdom

Background: In Africa, Cryptococcal meningitis (CM) is still associated with high mortality among people living with HIV. We scaled up and evaluated Cryptococcal Antigen (CrAg) Screening and pre-emptive treatment with fluconazole of asymptomatic CrAg positive individuals.

Methods: We implemented the intervention among patients with HIV who had CD4 counts < 200 cells/µl or were at WHO clinical stages 3 or 4 in 18 health facilities while in another 18 facilities we deferred implementation.

The study was done rural and urban settings in Tanzania in Dar es Salaam, Tanzania. Several meetings were conducted with the Ministry of health (MoH) and implementing partners supporting MoH in efforts to ensure guidelines and tools were in place.

By the end of our study, the MoH scalled up cryptococcal screening to 201 facilities.

Results: A total of 2602 patients were enrolled in the 18 health facilities. The median (IQR) CD4 count(cells/µl) was 39 (19,94) among CrAg +ve asymptomatic(n:64), 47(9,99) among CrAg +ve with symptoms of meningitis (n:30), 96 (46,150) among CrAg -Ve (n:2162). The median follow-up in days (IQR range) was 356 (4-395), 16 (1-117), and 365 (0-663)) among CrAg +ve asymptomatic, CrAg +ve with symptoms of meningitis, and CrAg -Verespectively.

3/76 (3.9%), 0/39(0%), 278/2487 (11.2%) participants were lost to follow-up among CrAg positive asymptomatic, CrAg positive symptomatic and CrAg negative participants respectively over 12 months.

Overall mortality was comparatively low 17/76 (22.4%) at 12 months among CrAg positive asymptomatic participants; 16/39 (41.0%) at 10 weeks among CrAg positive symptomatic participants; 214/2487 (8.6%) at 12 months among CrAg negatives patients. If we assume those lost have died, then the mortality figures are 26/76(34.2%) and 20/39 (51.3%) among CrAg positive asymptomatic and symptomatic participants.

Conclusions: The TRIP translational trial provides evidence that Cryptococcal Screening and pre-emptive fluconazole could be effectively translated and scaled up to reduce mortality among people with HIV under pure routine health care settings.

The effectiveness is demonstrated by low mortality among CrAg positive asymptomatic, but very high mortality is still observed in CrAg positive with meningitis.

EPE020

Utilizing electronic health record best practice alert to promote PrEP awareness among U.S. cisgender women who attend OB/GYN clinics: what have we learned?

R. Wang[1], S. Sao[1], E. Gingher[1], M. Bielman[1], T. Fruhauf[1], J. Coleman[1]

[1]Johns Hopkins University School of Medicine, Baltimore, United States

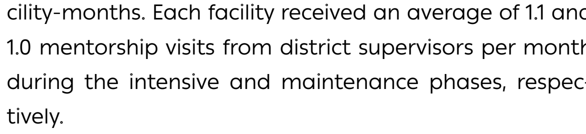
Background: Pre-exposure prophylaxis (PrEP) awareness and uptake are low among cisgender women, despite indications. Therefore, we created electronic medical record (EMR) Best Practice Alerts (BPA) to promote provider-initiated HIV prevention counseling, including PrEP, with women.

Description: EMR changes were implemented as part of a quality improvement project in OB/GYN clinics in Baltimore, Maryland, U.S.. EMR BPAs were created to:

1. Encourage nurses and providers to add HIV risk-related ICD-10 codes to the problem list;
2. Offer comprehensive and easily accessible order sets that facilitate initiation of PrEP;
3. Offer templates for note documentation and to ensure adequate HIV prevention counseling (*Figure 1*).

The BPA were launch for pregnant patients with a positive HIV risk screen and non-pregnant patients with a sexually transmitted infection (STI). Six months prior to EMR changes were served as the baseline.

Lessons learned: After EMR changes, PrEP was discussed with 20.2% of patients (52/257) in total, which was significantly increased from the baseline (vs. 0.9%, p<0.001). Although providers took no action or overrode BPAs more often for non-pregnant than pregnant patients (61.6% vs.



33.2%, p<0.001), PrEP discussion occurred more frequently among non-pregnant than pregnant patients (18.7% vs. 5.5%, p<0.001). Most prenatal care providers overrode the BPA because they believed a PrEP discussion was unnecessary for pregnant women with a remote history of STI, whereas providers for non-pregnant patients reported not having enough time to discuss it with patients. Our project finds that BPAs effectively promote PrEP discussion; however, additional interventions are needed to enhance this effect. Further education about the increased risk of HIV acquisition associated with STIs, PrEP effectiveness,and the safety of PrEP, including during pregnancy, is warranted.

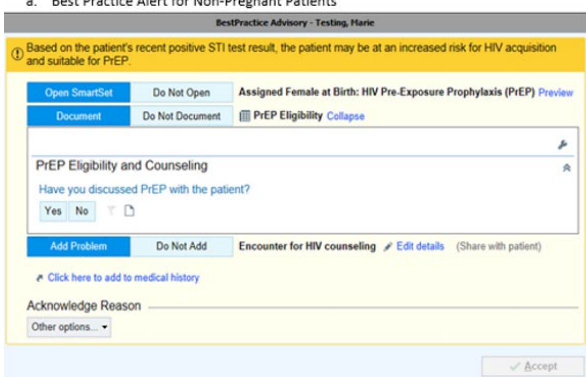


Figure 1. Electronic health record best practice alert for PrEP.

Conclusions/Next steps: Providers will be updated about the new CDC recommendations to inform all sexually active adolescents and adults about PrEP. Strategies to incorporate HIV prevention messaging into clinic visits will be explored.

EPE021

Development and implementation of a rapid PrEP initiative at a sexual health center in New Orleans, Louisiana

M. Clement[1], R. Lillis[1], A. Lovett[1], R. Luder[1], I. Butler[2], J. Siren[2], J. Halperin[2], K. Kamis[3], O. Obafemi[3], S. Rowan[3,4], S. Baral[5]

[1]Louisiana State University Health Sciences Center, Division of Infectious Diseases, New Orleans, United States, [2]CrescentCare Federally Qualified Health Center, New Orleans, United States, [3]Public Health Institute at Denver Health, Denver, United States, [4]University of Colorado School of Medicine, Division of Infectious Diseases, Denver, United States, [5]Johns Hopkins School of Public Health, Department of Epidemiology, Baltimore, United States

Background: In 2022, pre-exposure prophylaxis (PrEP) is still not reaching Americans at highest risk of HIV, especially those living in the Southern US. Rapid PrEP services provided by sexual health centers (SHC) can facilitate access and overcome barriers such as referral requirements. Here, we are studying the adaption of a successful Rapid PrEP Initiative (RPI) in Denver, Colorado for an SHC in New Orleans, Louisiana, an epicenter of HIV in the South.

Description: Applying the ADAPT-ITT process model (Figure 1) to the Denver Program to inform development of the New Orleans RPI, our investigators and the Denver team ("topical experts") identified core components of the Denver program. We then conducted focus group discussions (FGDs) with SHC and PrEP providers ("local stakeholders"), and with SHC clients ("target population"). Table 1 lists the Denver Model's core components, with suggested modifications.

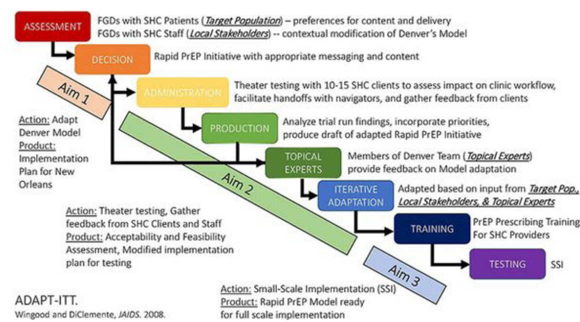

Figure 1. ADAPT-ITT Process Model

Core Components	What is being modified (content vs context)?	Who is making the modifications?	Comments	Illustrative Quote
Check in with Medical Assistant (MA) to assess PrEP interest	Content – the check in will be eliminated.	SHC providers	MA doesn't have time; provider should be the one asking about PrEP readiness	"…she's already, doing their vitals, getting their weight." – *Provider 4* "[the MA] doesn't really know much about the patient when they're coming in her room, you know." – *Provider 1*
Provider Initiation	No major modifications – agree with steps outlined by Denver team	N/A	Providers voiced support for program and interest in discussion PrEP with more clients. They also desire training to address: 1. labs to order and rationale 2. symptoms of acute HIV 3. who is a candidate for PrEP 4. How long until PrEP is effective 5. TAF/FTC vs TDF/FTC – when to prescribe 6. Initial counseling for anyone starting – side effects, etc	"So, my - just a basic thought, it's to get them right there and then." – *Provider 3* "And I do think it helps the more people you talk to about it just because so many people don't know it's out there. And it might be the friend that needs it, not …the person you're seeing. But the more people that know about it…" – *Provider 1* "And this is where a checklist and, like, the EMR for, like, symptoms of acute HIV…[would be helpful]." – *Provider 4*
			Clients desire providers to thoroughly address concerns about side effects. Clients also noted that providers should address stigma and talk to all SHC clients about PrEP so that no one feels targeted.	"I just would focus more on like the long-term side effects" – *Client 6* "There's enough stigma for people to not want to engage in conversations at all, or even open up to the – like, be real about, "Hey, I'm engaging in sexual activity that could be risky, and so I should take this drug." – *Client 13* "It is damaging whenever you go to a doctor's office, and the doctor might look at you and be like, "Oh, maybe this person needs that." They're pegging you in some type of category, and it feels a little like if everyone were asked then it wouldn't feel so heavy." – *Client 21*
Navigational Services	Context – navigator desired but unclear availability, will likely be shared with PrEP clinic	PrEP providers	Clients suggested using navigation as an opportunity for patient education on continued STI risks. They also suggested that navigator address social, emotional, and physical concerns, adherence, and stigma.	"I don't have anything. I'm on PrEP." It's like, okay, you don't have one of the many STD's that's out there. You know. So, when people tell me that, that means that they are having sex without condoms because they're on PrEP. And so, they might carry other things. So, that needs to be educated definitely" – *Client 1* "People are probably going to want space to verbalize whatever other needs they might have. So, offering space for that, like, "Are you up-to-date on all of your other medications? Do you need to schedule a follow-up for anything else?" You know, just making it full circle." – *Client 20*
Lab review – shared pool	Content – shared pool not necessary	SHC providers	Each provider can review his/her own labs	"So, we can all handle reviewing our own labs." – *Provider 4*
Space/ workflow	Content – room for navigator not available	SHC providers	Need space for navigational services. Proposed starting with Medicaid patients only so that required navigational services are minimal during initial rollout.	"We don't really have the space for a …navigator to spend a half an hour with the patient in our room…You know what, maybe the way we pilot this is we just do it for Medicaid or sliding scale patients." – *Provider 4*

Table 1. ADAPT-ITT Denver core components and planned modifications

Oral abstracts

Poster exhibition

E-posters

Late-breaker abstracts

Author Index

Lessons learned: Providers and clients voiced support for the RPI. Providers noted several barriers (time constraints, navigating financial assistance programs), but suggested contextually appropriate solutions (note templates, additional navigational support). Clients similarly supported the RPI, particularly the ease of consolidated appointments. They had concerns about costs and voiced a desire for financial counseling and navigational services.
Conclusions/Next steps: The use of ADAPT-ITT has informed specific adaptations to the content and delivery of well-established rapid PrEP initiation model in Denver to inform and enhance implementation in New Orleans. Next steps include theater testing (i.e. trial runs) of a draft implementation plan and evaluation of small-scale implementation of the RPI at our SHC.

EPE022

Using health care providers' perspectives to refine a clinical decision support implementation strategy for increasing the adoption of PrEP provision in Alabama clinics

D. Humphries[1], C. Simon[2], E. Rhodes[2,3], V. Wang[2], D. Hicks[4], D. Spiegelman[5], J. Marcus[6,7], D. Krakower[8], A. Rana[9]
[1]Yale School of Public Health, Chronic Disease Epidemiology, New Haven, United States, [2]Yale School of Public Health, Social and Behavioral Sciences, New Haven, United States, [3]Yale School of Medicine, New Haven, United States, [4]Jefferson County Department of Health, Birmingham, United States, [5]Yale School of Public Health, Department of Biostatistics, New Haven, United States, [6]Harvard Medical School, Boston, United States, [7]Harvard Pilgrim Health Care Institute, Boston, United States, [8]Beth Israel Deaconess Medical Center, Boston, United States, [9]University of Alabama Birmingham, Heersink School of Medicine, Birmingham, United States

Background: The southern U.S. accounts for a disproportionate number of new HIV infections annually, and pre-exposure prophylaxis (PrEP) is underused in this region. Our objective was to understand healthcare providers' perspectives on utilizing a clinical decision support (CDS) tool to prompt PrEP discussions and prescribing and to refine strategies for implementing the tool in Alabama, a priority state in the national Ending the HIV Epidemic initiative.
Methods: We conducted two virtual focus groups with providers from two federally qualified health centers in Alabama that were either offering or planning to offer PrEP. Moderators used a semi-structured guide to elicit providers' perspectives on
1. Barriers and facilitators to prescribing PrEP, and;
2. How to successfully implement a CDS tool to prompt providers to discuss PrEP with patients at increased risk of HIV infection.
Using rapid qualitative analysis to generate findings quickly, we summarized data from focus group transcripts using a structured template, transferred the summaries into an Excel matrix, and synthesized results using a team-based approach. We then worked closely with a multidisciplinary research team of clinicians, epidemiologists, and public health authorities to refine the implementation strategies based on the results.
Results: Providers identified multiple barriers to PrEP prescribing, including:
1. Providers' negative attitudes and concerns about side effects, patient adherence, and costs;
2. Providers' lack of knowledge about PrEP and neutral sexual history taking;
3. Structural barriers including time constraints; and
4. Features of the CDS tool, such as the potential to cause alert fatigue among clinicians.
Facilitators to PrEP included:
1. Training of clinic staff to support clients on PrEP;
2. Clinical resources, including prescribing guidance for providers; and
3. Patients' motivation about PrEP.
We adapted preliminary implementation strategies based on the results, to include providing tailored communication materials about PrEP for multiple stakeholders (e.g., clinicians, new and potential PrEP clients and community members) and including all clinic staff in the CDS system training and implementation.
Conclusions: Using qualitative analysis, we rapidly identified feasible adaptations for strategies to implement a CDS intervention for PrEP, with the potential to increase PrEP discussions and prescribing in a high-priority jurisdiction.

EPE023

Strategies to improve PrEP uptake among women receiving ANC services at Tondoro Health Centre, Namibia

T. Danda[1], I. Billah[1], S. Ncube[1], N. Forster[1], L. Ndeikemona[2], G. Barnabee[3], G. Barnabee[3], A. Ensminger[3], G. O'Malley[3], R.M. Mwin Mat[1]
[1]I-TECH Namibia, Windhoek, Namibia, [2]Ministry of Health and Social Services, Windhoek, Namibia, [3]University of Washington, Washington, United States

Background: Women are at substantially increased risk of HIV acquisition during pregnancy and post-partum periods, with possible onward transmission to their babies. PrEP is highly effective in preventing HIV. The Namibian HIV prevention guidelines recommend PrEP be offered to all HIV negative pregnant and breastfeeding women (PBFW) at risk. Much is still to be learnt, however, on how to effectively integrate PrEP in routine antenatal care (ANC) and postnatal care.
Description: A quality improvement (QI) project was conducted over a 12-month period to increase PrEP uptake among pregnant women at Tondoro Health Centre. A facility-based QI committee conducted a root cause analysis identifying multiple contributors to low PrEP uptake including health care worker (HCW) reluctance to

initiate PrEP, staff rotation, PrEP being only offered at the ART clinic, knowledge gaps on PrEP priority populations and service delivery, and client refusals. The committee developed, tested, and either adopted, adapted, or abandoned change ideas using plan, do, study, act (PDSA) cycles. Routine program data were used to describe PrEP uptake, defined as initiations among women attending ANC.

Lessons learned: Key change ideas that were adopted included sensitization of all staff about PBFW being a priority population for PrEP implementation, scaling PrEP integration in the ANC clinic through capacity building of HCWs, PrEP orientation of new staff who rotated to the primary health care clinic, and health education to clients about PrEP at the clinic waiting area and during HIV testing and clinical consultation.

Between October 2020 and September 2021, a total of 322 women attended ANC, of whom 42 (13%) were known HIV-positive and three (0.9%) were newly diagnosed HIV-positive. Among the 277 women who tested HIV-negative, 227 (82%) initiated PrEP, at a monthly average of 19. In comparison, no pregnant women had been initiated on PrEP in September 2020.

Conclusions/Next steps: Regular sensitization and continuous health education of HCWs on PrEP as a pivotal HIV prevention tool for PBFW as well as commitment and teamwork among the staff were key in improving PrEP uptake among pregnant women at Tondoro Health Centre. Facilities facing similar challenges could adopt these strategies to improve PrEP uptake.

EPE024

Ask for PEP: the experience of the response to demand of information about Post-Exposition Prophylaxis (PEP) after weekends in Argentina

F. Gadea[1], F. Sierra[1], D. Fiore[1], G. Devisich[2], V. Zalazar[2], A. Gonzalez[3], R. Cavallo[3]

[1]*Fundación Huésped, Comunications, CABA, Argentina,* [2]*Fundación Huésped, Social Research, CABA, Argentina,* [3]*Fundación Huésped, Programs, CABA, Argentina*

Background: The NGO site provides free personalized attention on prevention, diagnosis and care of HIV and STIs, on weekdays. In February 2021 we noticed that 75% of HIV exposure related inquiries occured on Mondays and needed a quick response. Therefore, the Communications department implemented a 360 digital campaign to respond to demands of this information after weekends from February to May 2021.

Description: The intervention Ask for PEP consisted of a 5-steps process on our digital marketing channels so people would not need to wait until Monday to get information.

First, we updated the information about PEP available on our Website, relocated it to the homepage and set up a digital promotional campaign through Google Ads that showed the information after google searches related to condom fails/ HIV exposure. Then, posts about similar topics were promoted on Facebook and Instagram prompting people to subscribe to get more information by email. Also, we increased the frequency of organic posts on social media.

Finally, an email was sent to our contact bases of people wanting to receive this current information.

Lessons learned: Even though our goal was to reduce inquiries, they did not decrease significantly (Figure 1). However, they became more specific and related to PEP access because, despite being available for free through public and private health systems, the treatment was delayed and limited.

Also, organic content on social media about "condoms fails" got more engagement on social media than PEP as itself probably because people were not familiar with the meaning of PEP.

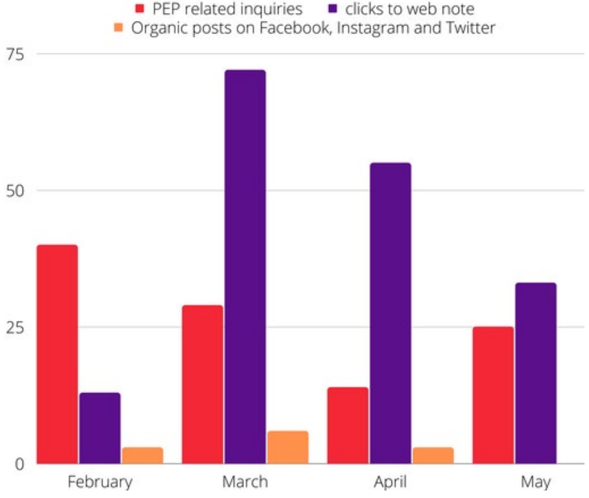

Figure 1

Conclusions/Next steps: Even though a digital strategy was effective to increase the quality of information about PEP, it was not enough to facilitate access. It is necessary to combine it with public advocacy for better access and community education on what PEP is and when to ask for it.

The acceptability of pharmacy-based HIV PrEP delivery among private pharmacy clients in Kenya: findings from a pilot study

P. Mogere[1], V. Omollo[2], A.P. Kuo[3], M. Asewe[2], S. Gakuo[4], J. Odoyo[2], S. Roche[5], J.M. Baeten[6,7,8], E. Buksui[2,6,9], K. Ngure[10], K.F. Ortblad[5]

[1]Partners in Health Research and Development, Thika, Kenya, [2]Kenya Medical Research Institute, Centre for Microbiology Research, Kisumu, Kenya, [3]University of Washington, Department of Pharmacy, Seattle, United States, [4]Kenya Medical Research Institute, Center for Clinical Research - PHRD Project, Thika, Kenya, [5]Fred Hutchinson Cancer Research Center, Public Health Sciences Division, Seattle, United States, [6]University of Washington, Department of Global Health, Seattle, United States, [7]University of Washington, Department of Epidemiology, Seattle, United States, [8]University of Washington, Department of Medicine, Seattle, United States, [9]University of Washington, Department of Obstetrics and Gynecology, Seattle, United States, [10]Jomo Kenyatta University of Agriculture and Technology, Department of Community Health, Nairobi, Kenya

Background: The delivery of PrEP at health facilities has limited reach and access. Private pharmacies often fill a gap in overburdened health systems and are frequently a preferred venue among clients. We conducted a pilot study in Kenya to test a model of pharmacy-based PrEP delivery and understand its acceptability among pharmacy clients.

Methods: We offered PrEP in 5 private pharmacies in Kisumu (n=2) and Kiambu (n=3) Counties. Eligible individuals were clients ≥18 years who reported behaviors associated with HIV risk and met PrEP eligibility criteria (e.g., no history of kidney disease) on a standardized prescribing checklist. Participants who initiated PrEP were eligible for follow-up visits at one, four, and seven months.

At each visit, a questionnaire was administered to measure client perceptions of model acceptability, including component constructs of acceptability (e.g., affective attitude, burden) borrowed from the Theoretical Framework of Acceptability (TFA). We also measured predictors and downstream outcomes of acceptability (e.g., willingness to recommend; likeliness to continue) using a 5-point Likert scale.

Results: Between November 2020 and December 2021, we screened 575 pharmacy clients for HIV risk and enrolled 287 (50%), all of whom initiated PrEP at enrollment. At one, four, and seven months, 54% (156/287), 65% (102/156), and 57% (58/102) of participants due for follow-up continued PrEP. At enrollment, 95% (272/287) of participants strongly agreed that they liked pharmacy-based PrEP (TFA: affective attitude) and 87% (249/287) strongly agreed that receiving PrEP at the pharmacy was easy (TFA: burden).

Additionally, 92% (263/287) strongly agreed that they would recommend pharmacy PrEP to friends/family members, and 95% (273/287) strongly agreed that they would like to continue getting PrEP at a pharmacy. These findings remained consistent across all follow-up periods.

Conclusions: The pharmacy clients at HIV acquisition risk participating in this pilot study found pharmacy-based PrEP delivery acceptable, which suggests that this model reaches and meets the care preferences of at least some portion of the target population for PrEP. More research is needed to quantify the potential gains in reach, PrEP initiation, and PrEP continuation that expanding PrEP delivery to private pharmacies might support.

EPE026

Uptake and completion of tuberculosis preventive therapy (TPT) in people living with HIV/AIDS in Nigeria: the APIN program experience

E. Edigah[1], O. Ibiloye[1], K. Pwol[2], M. Obaje[3], P. Jwanle[1], P. Okonkwo[1]

[1]APIN Public Health Initiatives, Clinical Services, Abuja, Nigeria, [2]APIN Public Health Initiatives, Pharmacy and Supply Chain, Makurdi, Nigeria, [3]APIN Public Health Initiatives, Strategic Information, Abuja, Nigeria

Background: Despite WHO recommendation to start people living with HIV (PLHIV) who are at greater risk of Tuberculosis (TB) infection on TB Preventive Therapy (TPT), PLHIV access to TPT and TPT completion rate is still poor in Nigeria. In the CDC/APIN supported HIV Programme, we implemented strategies to improve access to TPT and completion among PLHIV.

Interventions such as capacity building on TPT demand creation, aligning TPT with multi-month dispensing (MMD), TPT gate keeping, kitting, and regular TPT data analysis for monitoring, the use of case management approach to patients' TPT initiation, adherence and completion monitoring, were implemented within 4 years period. The aim of this analysis is to determine the uptake and completion rate of TPT among eligible PLHIV during the period of interventions in 7 APIN states in Nigeria.

Methods: We conducted a retrospective review of routine data for PLHIV who initiated TPT in 425 facilities between October 1, 2017 and September 30, 2021. Data from the electronic medical record, facility health medical record, and reporting trackers. Variables of interest include clients HIV status, TB status, TPT status, date of TPT initiation, date of TPT completion, and TPT completion status. We estimated the TPT completion rate per year and plot the trend on a line graph. TPT completion rate was defined as the proportion of clients who initiated and completed TPT in a given fiscal year (Oct – Sept). Analysis was done using an Excel Microsoft.

Results: A total of 331,181 PLHIV were initiated on TPT between 2018 and 2021. Of the 331,181 that commenced TPT during the period, 92.4% (n=305876) completed. TPT completion rate per fiscal year increased from 78% at baseline in 2018 to 98% in 2021. The trend of annual TPT completion rate is as shown in figure 1 below.

Conclusions: The implementation of the TPT strategic interventions coincided with a significant and progress TPT uptake and completion rate among PLHIV. Therefore, we recommend adaptation of these strategies in similar contexts in Nigeria. There is need for further studies to explore patient-level and health system factors associated with TPT uptake and completion in the program.

EPE027

Missed opportunities when we focus only on risk: Using value-added items to identify potential PrEP candidates

M. Mueller Johnson[1], N. Brooks[2], K.R. Amico[1]

[1]University of Michigan, Health Behavior Health Education, Ann Arbor, United States, [2]University of Michigan, Health Management and Policy, Ann Arbor, United States

Background: PrEP implementation programs commonly use risk assessments to identify individuals who could benefit from PrEP. While consistent with CDC guidelines to prescribe PrEP to those 'at elevated risk,' self-report of condomless sex, multiple partners or recent STIs has known limitations and maps poorly onto actual risk for HIV for some groups. Questions about protection-related desires, concerns and experiences could identify potential PrEP candidates otherwise missed in behavioral risk-based screeners.

Methods: Five items reflecting potential benefits of PrEP (value-added items) were added to the 2019 cycle of the American Men's Internet Survey, a nationwide survey of men who have had sex with men. Answers to the value-added items were characterized overall and in relation to PrEP indication (based on adapted CDC criteria- having a partner living with HIV or 2 or more partners plus any condomless sex or an STI in the past 12 months) and willingness to use PrEP.

Results: 1606 survey respondents not using PrEP were half (50%) below age 25, 11% Black, 16% Latino, and 64% White. 61% met CDC PrEP-indication while 80% were identified by value-added items (Table 1). 28% were uniquely flagged by the value-added items, 9% uniquely by the risk-based items, and 52% were flagged by both (Figure 1). Of those uniquely identified by the value-added items, 56% reported being willing to use PrEP.

VALUE-ADDED QUESTIONS		AT RISK (CDC INDICATION BASED ITEM SET)		TOTAL
		Not Indicated 39% (623)	Indicated 61% (988)	
Did you ever wish you had a better strategy to protect yourself from HIV?	No	251 (49%)	251 (30%)	502 (37%)
	Yes	259 (51%)	598 (70%)	857 (63%)
	Total	510	849	1359
Did you ever experience stress or distress because of HIV-related thoughts or concerns?	No	363 (61%)	360 (38%)	723 (47%)
	Yes	232 (39%)	592 (62%)	824 (53%)
	Total	595	952	1547
Did thinking about getting HIV ever interfere with your sex life or sexual relationships?	No	310 (53%)	393 (42%)	703 (46%)
	Yes	270 (47%)	540 (58%)	810 (54%)
	Total	580	933	1513
Did you ever worry about a partner's HIV status?	No	275 (47%)	309 (33%)	584 (38%)
	Yes	312 (53%)	639 (67%)	951 (62%)
	Total	587	948	1535
Thinking back to the last time you had a cold or flu, did you worry it might be HIV?	No	495 (82%)	670 (70%)	1165 (75%)
	Yes	111 (18%)	287 (30%)	398 (25%)
	Total	606	957	1563
Flagged by any value-added item	No	177 (29%)	151 (15%)	328 (20%)
	Yes	443 (71%)	835 (85%)	1278 (80%)
	Total	620	986	1606 (100%)

Figure 1. PrEP indication by value-added and risk-item screeners.

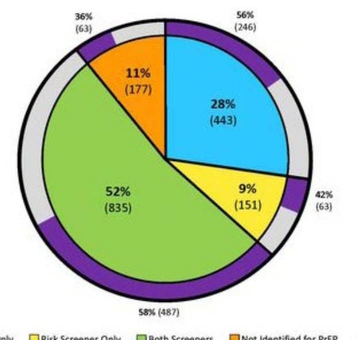

Figure 2. PrEP indicated by screen type (% and (n) of total sample) and associated willingness to use PrEP.

Conclusions: Value-added screening identified MSM missed by risk-screening; over half of them willing to use PrEP. Value-added screening should be considered in efforts to promote shared decision-making and reduce stigmatization in PrEP implementation

EPE028

Public health stakeholder perspectives on implementing molecular HIV surveillance for next generation cluster detection and response for ending the HIV epidemic: a qualitative study

M. McNulty[1], J. Kerman[1], S. Devlin[1], K. Fujimoto[2], L. Hirschhorn[3], G. Phillips II[3], M. McNeese[4], M. Garcia[5], J. Schneider[1]

[1]University of Chicago, Chicago, United States, [2]University of Texas Health Science Center, Houston, United States, [3]Northwestern University, Chicago, United States, [4]Houston Health Department, Houston, United States, [5]San Jose State University, San Jose, United States

Background: The U.S. government's plan for Ending the HIV Epidemic (EHE) has invested in cluster detection and response (CDR) as a promising approach to target limited public health resources to optimize engagement in HIV testing, treatment as prevention, and preexposure prophylaxis. Despite interest and rapid development of molecular cluster-guided public health activities, methods for optimal usage remain underdeveloped.

Methods: We conducted semi-structured qualitative interviews with key stakeholders in HIV elimination initiatives in Texas and Illinois to examine capacity, readiness, and challenges to adopting strategies for CDR. Interviews were held via video conference or telephone, audio recorded, and transcribed. Rapid qualitative analysis was performed to identify relevant themes using the Consolidated Framework for Implementation Research (CFIR).

Results: Between February 2020 and September 2021, 15 interviews were conducted, the majority being with public health practitioners. While stakeholders in Texas and Illinois faced different local contexts, several shared themes emerged:

1. Data concerns, including infrequent genotype collection by providers [outer setting] and disjointed data systems [inner setting] for CDR;

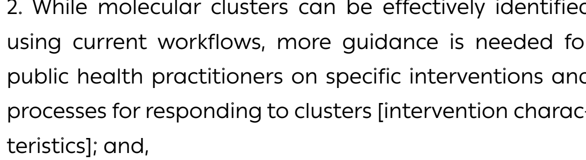
Oral abstracts

Poster exhibition

E-posters

Late-breaker abstracts

Author Index



2. While molecular clusters can be effectively identified using current workflows, more guidance is needed for public health practitioners on specific interventions and processes for responding to clusters [intervention characteristics]; and,

3. CDR is not fully accepted by the community, with uncertainty as to whether the benefits outweigh possible negative legal consequences [outer setting].

Several participants noted that local and national policies around HIV criminalization and immigration negatively impact participation in health department activities and trust in CDR approaches. Possible strategies include securing support and understanding of CDR through community- and provider-public health partnerships, and rigorously testing response interventions.

Most participants felt more staff are needed to effectively scale up CDR activities while continuing to prioritize traditional partner services; however, participants were split on whether CDR activities should stand alone or be integrated into current partner services workflow.

Conclusions: For CDR to realize its full potential, additional strategies are needed to address identified barriers across CFIR domains including the development and evaluation of clear interventions for responding to clusters, additional staff support, a focus on decriminalization of HIV, and engagement with community and providers.

EPE029

A Digital Mother-to-Child Transmission (MTCT) risk screening tool increases oral PrEP initiation in Matabeleland Province, Zimbabwe

T. Bepe[1], K. Takarinda[1], P. Hlongwane[1], P. Chimberengwa[1], E. Dhodho[1], K. Webb[1], S. Page-Mtongwiza[1], T.T. Chinyanga[1]
[1]*Organization for Public Health Interventions and Development, Programs, Harare, Zimbabwe*

Background: Recent HIV estimates show that the Mother-to-Child Transmission (MTCT) rate in Zimbabwe remains high at 7.11%. To reduce the MTCT rate and ensure healthy mothers and their babies, pregnant and lactating women should be encouraged to use a combination of HIV prevention methods, including Oral Pre-Exposure Prophylaxis (PrEP). However, the uptake of Oral Pre-Exposure Prophylaxis (PrEP) in the peripartum period remains low in our context. We therefore rolled out a clinical decision support enabled MTCT-risk screening tool for improved PrEP uptake in selected health facilities of Matabeleland South from October-December 2021.

Description: The tool targeted women aged 15-24 years attending antenatal and postnatal clinics and was administered by a clinician. It consists of pre-defined MTCT-risk screening questions with prompts to offer PrEP to HIV-negative women identified to be at risk of MTCT. To assess impact of utilization of the risk screening tool on the increase in PrEP initiations we compared the proportion of HIV-negative women in antenatal and postnatal care initiated on PrEP before (July-September 2021) and after (October – December 2021) roll out of the tool using the Student T-test in Stata V17.

Lessons learned: Across the 9 health facilities assessed, there were 456 (67%) of 684 HIV-negative pregnant and lactating women aged 15-24 years who were screened using the MTCT risk screening tool. 168 women (24.6%) were eligible and initiated on PrEP. There was a significant increase the proportion of PrEP initiations among HIV negative women in ANC/PNC when compared to the July-September 2021 period ($p<0.05$).

Indicator	Before Roll Out of MTCT Screening Tool (July-Sept 2021)	After Roll Out of MTCT Screening Tool (Oct - Dec 2021)	p-value
Number of HIV-negative in ANC & post ANC	854	684	
HIV-negative women screened for PrEP eligibility, n (%)	0 (0)	456 (67%)	
HIV-negative women eligible & initiated on PrEP in ANC & PNC, n (%)	21 (2.5%)	168 (24.6%)	<0.01

Table.

Conclusions/Next steps: We demonstrate that decision support enabled MTCT risk assessment tools have the potential to scale up PrEP initiations among pregnant and lactating women. There is need to scale-up their use going forward and to monitor implementation fidelity among all HIV-negative women in ANC and PNC.

EPE030

Effectiveness of telehealth for PrEP clinical follow-up in public services in Brazil (Combina Study)

A. Grangeiro[1], L. Santos[1], M.T. Couto[1], M.M. Escuder[2], E. Zucchi[3], W. Cunha Portella[4], D. Lotufo[5], R. Munhoz[5], M. Livramento de Sousa Rocha[5], R. Moraes[6], É. Arruda[6], A. Fachel Leal[7], L. Quadros Winkler[8], M. Kruppa[9], L. Aparecida de Souza Neves[10], O. Combine Research Group[1]

[1]Universidade de São Paulo, Faculdade de Medicina, São Paulo, Brazil, [2]Instituto de Saúdo, São Paulo, São Paulo, Brazil, [3]Universidade Católica de Santos, Santos, Brazil, [4]Universidade Federal de São Paulo, São Paulo, Brazil, [5]Centro de Referência e Treinamento DST/Aids, Sao Paulo State Health Department, São Paulo, Brazil, [6]Hospital São Jose de Doenças Infecciosas, Ceará State Health Department, Fortaleza, Brazil, [7]Universidade Federal do Rio Grande do Sul, Instituto de Filosofia e Ciências Humanas, Porto Alegre, Brazil, [8]AIDS Specialized Care Service - IAPI, Municipal Health Department of Porto Alegre, Porto Alegre, Brazil, [9]Counseling and Testing Center - COA, Municipal Health Department of Curitiba, Curitiba, Brazil, [10]Municipal Health Department of Ribeirão Preto, Ribeirão Preto, Brazil

Background: Close clinical follow-up geared to users' needs can enhance PrEP access and impact. We examined whether telehealth for daily oral PrEP clinical follow-up could change the effectiveness of the prophylaxis.

Methods: A desktop/mobile app was developed to assist three asynchronous and one in-person consultations per year. Between Jul/2019-Dec/2020, participants of the demonstration study taking PrEP for at least 6 months, with regular access to internet and without clinical contraindications, were given the option to transition to telehealth in the five cities. Indicators of individuals who chose telehealth were compared with those who remained in-person, including information prior to and after the choice. Predictive factors of the choice of telehealth and outcomes were analyzed: interruption of PrEP (not having the medication for more than 90 days), adherence (average rate of possession of the medication for daily use); occurrence of STI (syndromic); and HIV incidence.

The analyses considered the first choice (telehealth or in-person) and were adjusted for sexual practices, schooling, age, time on PrEP, and follow-up situation at the moment the choice was made.

Results: Out of a total of 470 users, 52% chose telehealth, with adjOR increasing over time of PrEP use (adjOR_25 to 32 months:4.90; CI95%1.32-18.25) and having had interrupted PrEP at the time of the choice (aOR:2.91; CI95%1.40-6.06); and diminishing for those reporting higher-risk behavior (adjOR_active_anal_without_condom:0.51 CI95% 0.29-0.88). After an average follow-up period of 1.6 years post-follow-up choice (CI95%:1.5-1.7), the risk of interrupting PrEP was 34% lower with telehealth (adjHR:0.66; CI95%:0.45-0.97). When adjusted by mixed linear regression, no differences in adherence were found between in-person and telehealth (p=0.486)nor at the pre- and post-follow-up choice (p=0.245). STI occurrence, calculated by generalized estimating equations, increased between the pre- and post-follow-up choice, though not associated with in-person or telehealth (p=0.528). No HIV infections occurred.

Conclusions: Opting for telehealth is driven by more experience with PrEP and lower infection risk, which may represent individuals with better ability and resources to manage self-care. In addition, telehealth for PrEP reduced the risk of interrupting the prophylaxis, thus strengthening the prevention cascade.

Implementation science of scaling up HIV testing

EPE031

HIV self-testing reached the our key populations regardless of COVID-19

T. Van Nguyen[1], H.S. Vo[2], D.M. Pham[2], M.T. Huynh[3], T.G. Dap[3], A.T. Pham Nguyen[3], D. Nguyen Van[4], T.T. Le[5], H. Dinh Van[6], B.N. Lung[6], Q.L. Pham[6], K. Park[1], T.T. Cao Thi[7], C. Johnson[8]

[1]World Health Organization, Country Office in Viet Nam, Hanoi, Viet Nam, [2]Viet Nam Authority for HIV/AIDS Control, Ministry of Health, Hanoi, Viet Nam, [3]Provincial Centre for Disease Control, Can Tho, Viet Nam, [4]Provincial Centre for Disease Control, Nghe An, Viet Nam, [5]Social Enterprise and Community Support, Nghe An, Viet Nam, [6]Hanoi Medical University, Hanoi, Viet Nam, [7]Hospital of Hanoi Medical University, Hanoi, Viet Nam, [8]World Health Organization, Department of Global HIV, Hepatitis and STI Programmes, Geneva, Switzerland

Background: Access to facility-based HIV testing is challenging in the context of Covid-19 due to travel restriction. Viet Nam has been heavily affected by Covid-19 especially in 2021. To ensure HIV testing services is accessible to key populations (KP), a web-based HIV self-test (HIVST) distribution and linkage to ART and PrEP (https://tuxetnghiem.vn) was piloted in three provinces to assess the uptake, feasibility, and effectiveness in linking self-testers to HIV services to inform national scale-up.

Methods: The pilot was started in Can Tho city in Nov 2020 and expanded to Nghe An and Hanoi in April 2021. Clients are encouraged to create a website account to request HIVST. Clients choose how test kits are delivered (courier/peer educator) or opt for self-pick-up. Reporting of self-test result is encouraged, but not required.

Following distribution, staff or peers supported clients to access further testing, PrEP or ART. User demographic information and risk behaviors were collected at account registration and via voluntary client-satisfaction survey.

Oral abstracts

Poster exhibition

E-posters

Late-breaker abstracts

Author Index

Data were automatically stored and compiled in the web-system. Linkage was documented by staff and peers in the same system.

Results: Between Nov 2020 and December 2021, of 4454 clients registered on the website, 4192 clients received HIVST. Almost of them were male (90.0%) and aged between 15 and 34 (82.3%). No disruption of HIVST distribution via the website occurred during the fourth wave of Covid-19, although monthly kit distribution was variable. Of 4192 received HIVST, 3088 (73.7%) reported their test results; 168 (5.4%) had reactive results; 163/168 (97%) confirmed HIV positive and 157/163 (96.3%) received ART.

Of 2915 clients reported HIV negative, 609 (20.9%) accessed to PrEP service. The satisfaction survey results show 99% of the clients reported "very satisfied with the services" and 95% reported that HIVST was easy.

Conclusions: Results of the pilot shows how web-based HIVST can be utilized as a critical COVID-19 adaptation for reaching KP, including younger age groups and those not previously tested. This approach was feasible, acceptable and facilitated linkage to ART and PrEP services which overcame service delivery challenges during the pandemic. Viet Nam is scaling up the programme nationally to cover 23 provinces in 2022.

EPE032

Acceptability and cost-effectiveness of blood sample transport by drone for HIV-testing of infants exposed to HIV in the city of Conakry, Guinea (ANRS 12407 AIRPOP)

M. Inghels[1,2], G. Laborde-Balen[3], O.H. Diallo[4], P. Mee[1], M. Cissé[5], A. Montoyo[6], A. Diakité[7], F. Tanser[1], Y. Koita[8], G. Breton[9]

[1]University of Lincoln, Lincoln International Institute for Rural Health, Lincoln, United Kingdom, [2]Paris-Descartes University, Centre Population et Développement (UMR 196 Paris Descartes – IRD), SageSud (ERL INSERM 1244), Institut de Recherche pour le Développement, Paris, France, [3]University of Montpellier, TransVIHMI, Montpellier, France, [4]ONG Solthis, Conakry, Guinea, [5]CHU Donka, Service de Dermatologie, Centre de Traitement Ambulatoire, Laboratoire de Biologie Moléculaire, Conakry, Guinea, [6]ONG ALIMA, Paris, France, [7]Cellule Nationale de Lutte contre le VIH SIDA (CNLS), Conakry, Guinea, [8]Programme National de Lutte contre le VIH SIDA et les Hépatites (PNLSH), Conakry, Guinea, [9]ONG Solthis, Paris, France

Background: Early infant diagnosis (EID) of HIV is essential because of the high mortality of HIV-infected infants during the first months of their lives. In Conakry timely EID is difficult as traffic congestion prevents the rapid transport of blood samples to the central laboratory. We investigated the cost-effectiveness and acceptability of transporting EID blood samples by drone.

Methods: The incremental cost-effectiveness ratio (ICER) per life-year gained of drone transport compared to motorcycle transport was estimated using Monte Carlo simulations. The local annual GDP per capita (1,160 USD) was set as the threshold. The main parameters and data sources used are presented (Figure 1). Interviews were conducted with 65 stakeholders including postpartum women, local residents and policy makers. The drones were demonstrated to these individuals.

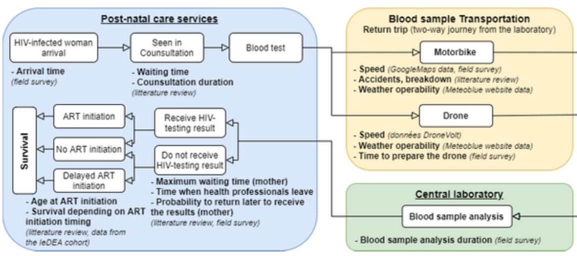


Figure 1. Main parameters and data sources of the cost-effectiveness simulation.

Results: Based on the current purchase price for a drone of 22,500 USD, the ICER of 2,504 USD/ life-year gained is above the cost-effectiveness threshold. The ICER would fall below the threshold if the price reduced to 8000 USD. The ICER is sensitive to weather-related downtime, number of exposed infants, and drone speed (Figure 2).

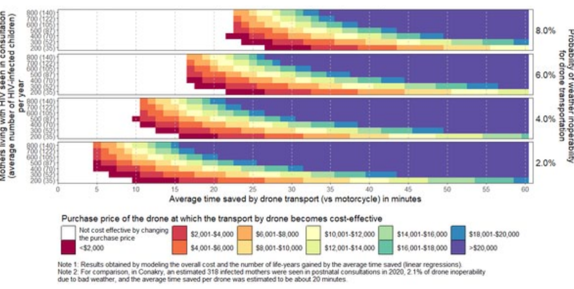

Figure 2. Cost-effectiveness of blood samples transportation by drone depending on main parameters.

Post-partum women perceived that the use of drones could reduce the time taken to receive EID results. Health policy makers expressed the view that drone use could improve care decentralization and allow for the transportation of other health products.

Conclusions: The transportation of EID blood samples by drone whilst highly acceptable is not currently cost-effective in Conakry. Expected improvements in drone technology and decreases in purchase costs suggest it may soon be an acceptable option.

EPE033

Trauma patients in an emergency department with routine opt-out HIV screening have lower screening rates and higher HIV rates than medical patients

K. Stanford[1], D. Eller[1], M. McNulty[1], D. Pitrak[1], T. Spiegel[1]

[1]University of Chicago, Medicine, Chicago, United States

Background: Limited published data and trauma-associated risk factors suggest rates of HIV may be very high among trauma patients. However, it is unknown if this

simply reflects higher local prevalence of HIV in communities where trauma patients originate. This study compares rates of HIV screening and diagnosis among trauma and medical patients at a busy Level 1 trauma center emergency department (ED) with a robust universal HIV screening program.

Methods: A retrospective cross-sectional study was performed of all patients who visited the ED from May 1, 2018, through May 1, 2021. Duplicate encounters, encounters with repeat testing within one year, and patients younger than 18 or older than 65 were excluded. Encounters were categorized as trauma (trauma team activated or consulted) or medical (non-traumatic complaint or minor trauma managed by ED team only).

Chi-squared analysis was used to compare demographics, rates of HIV testing, new and known HIV infections, and linkage to care between trauma and medical patients. Modeling with a General Estimating Equation (GEE) was used to produce adjusted outcomes.

Results: Over the three-year study period, there were 225,101 patient encounters. After exclusion criteria were applied, 147,430 encounters from 91,468 unique patients were analyzed. Trauma comprised 7,487 (5.4%) encounters. Trauma patients were less likely to be screened for HIV than medical patients (18.1% vs 25.6%; OR 0.64; 95%CI, 0.61-0.68, p<.01).

When adjusted for demographics (age, gender, and race), the difference in screening rates remained significant (OR 0.47; 95%CI, 0.44-0.51, p<.01). Trauma patients had significantly higher rates of HIV (2.2% vs 1.3%; OR 1.78; 95%CI, 1.2-2.6, p<.01), although the adjusted association was not statistically significant. Trauma patients were less likely to have a new diagnosis of HIV (OR 0.21; 95%CI 0.05-0.91, p=0.01). Linkage to care rates were similar between the groups.

Conclusions: Trauma patients are an especially vulnerable population who may otherwise have limited contact with the medical system. Trauma patients in this study were both significantly more likely to have HIV and significantly less likely to be screened for HIV.

Including trauma patients in routine ED HIV screening should be a priority to increase diagnosis rate and linkage to care in vulnerable populations.

EPE034

Understanding gaps in index case testing cascade: Experience from Partners in Hope supported health facilities in Malawi

K. Phiri[1], M. Sanena[1], E. Lungu[1], J. Songo[1], J. van Oosterhout[1,2], S. Phiri[1], K. Dovel[1,2]

[1]Partners in Hope, Lilongwe, Malawi, [2]University of California Los Angeles, Department of Medicine, David Geffen School of Medicine, Los Angeles, United States

Background: Index case testing (ICT) is critical to reaching the minority of people still unaware of their HIV status. Implementation challenges limit the impact of ICT in sub-Saharan Africa. We use programmatic data from Partners in Hope supported facilities in Malawi to identify gaps across the ICT cascade, and in-depth interviews (IDIs) to understand why these gaps exist.

Methods: ICT strategies were taken to scale in October 2020 at 48 facilities in two districts in Malawi, with a focus on testing sexual partners (SP) and biological children (BC) of individuals recently diagnosed with HIV or with viral load results ≥1000copies/ml. Programmatic ICT data from October 2020-January 2021 were reviewed from 48 facilities to assess outcomes across the ICT cascade. We conducted IDIs with a random subset of index clients, their contacts (SP and BC), and health care workers (HCWs) from four facilities who were ≥18 years old and engaged in ICT during the same time-period. We analyzed data using constant-comparison methods in Atlas.ti.v9.

Results: The largest gaps in the ICT cascade were: 1) not successfully tracing eligible contacts; and 2) low HIV-positivity rates among those tested (Figure).

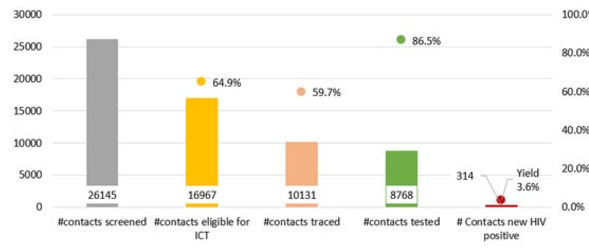

Figure. Description of the ICT testing cascade for contacts across 48 facilities in Malawi (October 2020 - January 2021)

We analyzed 49 IDIs: 13 index clients, 21 contacts (13 SP, 8 BC), and 15 HCWs. Barriers to contact *tracing* were index clients giving inaccurate contact information due to fear of unwanted disclosure (especially for new or extra-marital partners), as well as due to poor counseling/lack of trust in HCWs, and lack of privacy at ICT screening locations. Transport challenges for HCWs hindered community tracing. Barriers to high *HIV-positivity rates*were testing BCs of men and testing non-eligible BCs who were easy to reach during home visits to increase test productivity.

Conclusions: Improving quality of counseling and privacy, facilitating tracing activities, and promoting fidelity of ICT protocols are key to success across the ICT cascade.

EPE035

Implementing safe and ethical index testing services: adapting provider referral contact tracing method to suit client and provider needs in the Western Region of Ghana

O. Dotse[1], H. Nagai[1], E. Adiibokah[1], A. Kodua Nyanor[1], D. Nartey[1], E. Bruce[1], M. Kwashie[1], C. Agyapong[1], Y. Abdul Rahman[1], R. Chintalova-Dallas[1]
[1]*JSI Research & Training Institute, Inc., USAID Ghana Strengthening the Care Continuum Project, Takoradi, Ghana*

Background: Breaking the chain of HIV transmission is key to preventing new infections and achieving epidemic control. Disclosure of HIV status to sexual partners and children who may have been exposed persists as a huge challenge to HIV positive clients in communities where stigma, discrimination, and the fear of intimate partner violence is pervasive. Assuring and maintaining the confidentiality of index clients enhances contact elicitation, tracing and testing.

Description: The USAID Strengthening the Care Continuum Project, implemented by JSI Research & Training Institute, Inc. with the Population Council, trained healthcare providers (HCP) from 43 facilities in Western Region of Ghana to support clients to notify and contact their sexual partners and biological children below 19 years to test for HIV. Due to sociocultural difficulties with the partner notification approaches, the project introduced the adapted provider-assisted strategy where traceable addresses of clients' contacts are given to Community-Based Organizations to anonymously trace and conduct HIV testing within the community, the workplace or the social network of contacts.

Lessons learned: A review of index testing registers showed about 70% of clients selected passive referral, where contacts elicited had to visit the health facility for testing. Sexual partners, in particular, did not show up for testing or were probably never informed by their HIV positive partners that they needed to test.Under the provider-assisted strategy, providers had difficulties informing HIV-exposed contacts by phone for fear of exposure of the identity of the index client. With the introduction of adapted provider-assisted strategy the projectidentified 760 undiagnosed HIV infections out of 4,356 persons tested and 489 known positives between April 2020 and March 2021 compared to 296 HIV+ clients diagnosed out of 1848 persons tested and 75 known positives between October 2019 and March 2020. When HCWs maintain the confidentiality of index clients and elicited contacts, and trace contacts anonymously, high contact tracing and testing rates are achieved.

Conclusions/Next steps: Theadapted provider-assisted strategy provides a feasible adaptation of the traditional provider-assisted testing strategy and is appropriate in situations where the risk of partner violence, stigma and discrimination, and other adverse events is high.

EPE036

Improving HIV testing in the primary care setting: results from a multifaceted, educational intervention study in Amsterdam, the Netherlands

S. Bogers[1], M. Schim van der Loeff[1,2], A. Boyd[2,3], P. Reiss[1,3,4,5], G. de Bree[1], S. Geerlings[1], J. van Bergen[6,7], on behalf of the HIV Transmission Elimination AMsterdam (H-TEAM) Consortium
[1]*Amsterdam University Medical Centers, Department of Internal Medicine, Amsterdam, Netherlands, the,* [2]*Public Health Service of Amsterdam, Department of Infectious Diseases, Amsterdam, Netherlands, the,* [3]*HIV Monitoring Foundation, Amsterdam, Netherlands, the,* [4]*Amsterdam Institute for Global Health and Development, Amsterdam, Netherlands, the,* [5]*Amsterdam University Medical Centers, Department of Global Health, Amsterdam, Netherlands, the,* [6]*Amsterdam University Medical Centers, Department of General Practice, Amsterdam, Netherlands, the,* [7]*STI AIDS Netherlands, Amsterdam, Netherlands, the*

Background: In the Netherlands, general practitioners (GPs) are a key provider for HIV testing, but opportunities for HIV diagnosis are being missed in the primary care setting. We implemented a multifaceted, educational intervention for GPs in Amsterdam to improve HIV testing in primary care.

Methods: All GPs in Amsterdam were invited to participate in an educational program between 2015-2020, which included repeat sessions using audit and feedback, interactive discussion and quality improvement plans. Data on HIV testing by all Amsterdam GPs were collected from 2011-2020.

The primary outcome was the HIV testing frequency, which was compared between GPs before participation (reference group), never participating, and after participating, in quarterly time-periods using Poisson regression. Due to the disruption of healthcare service delivery by COVID-19, data from quarters 2-4 of 2020 were excluded.

Analyses were adjusted for city district and secular trends in testing from 2011-2020; additionally analyses stratified by patient sex and age were done. In a sensitivity analysis, GPs with >30 tests/quarter before the intervention started (n=30) were excluded, as participation and effect of the intervention were expected to be low amongst these GPs.

Results: Data from 106,424 HIV tests in 2011-2020 were included. Overall, 36% (229/632) of GPs active in 2015-2020 participated. In the model adjusting for city district and secular trends, GPs who participated performed 5% more HIV tests compared to GPs before participation (Table 1); excluding already high testing GPs this was 8%. Increases in HIV testing associated with participation were observed for both male and female patients.

Participation was associated with increased HIV testing for patients 20-34 and 50-64 years, but not ≤19, 35-49, and ≥65 years.

Patients	GP participant category*	Main analysis		Sensitivity analysis**	
		Relative Test Ratio	95% CI	Relative Test Ratio	95% CI
Overall	Never participated	1.17	1.15 - 1.19	1.01	0.99 - 1.03
	Participated	1.05	1.03 - 1.08	1.08	1.05 - 1.10
Males	Never participated	1.23	1.20 - 1.26	1.05	1.03 - 1.08
	Participated	1.05	1.01 - 1.08	1.05	1.01 - 1.09
Females	Never participated	1.10	1.08 - 1.13	0.96	0.94 - 0.98
	Participated	1.06	1.03 - 1.10	1.12	1.08 - 1.16

*reference category = GPs before participation. **excluding GPs that had already ordered >30 HIV tests/quarter at baseline. CI: confidence interval. GP: general practitioner.

Table 1: Adjusted relative HIV test ratio by GPs who never participated and by GPs after participation in the educational intervention, compared to GPs before participation, overall and by patient sex.

Conclusions: The intervention was associated with a statistically significant, but very modest increase in HIV testing among participating GPs. Whether HIV testing became more targeted could not be assessed from these data.

EPE037

Realized potential: results from a post-demonstration nationwide rollout of a community-run COVID-responsive unassisted HIVST service in the Philippines

J.M. Pe Benito[1], J.L. Dinglasan[1], P. Junio[1], D. Cruz[1,2], H.I. Jeremias[1], J.O. Corciega[1], J.D. Rosadiño[1,2], J.D. Ruanto[1], R. Pagtakhan[1], M.L. Averilla[3], J. Fontilla[3]
[1]*LoveYourself, Inc., Mandaluyong, Philippines, the,* [2]*University of the Philippines - Open University, Faculty of Management and Development Studies, Los Baños, Philippines, the,* [3]*Australian Federation of AIDS Organisations, Bangkok, Thailand*

Background: HTS in the Philippines fell from 1,220,765 to 480,285 tests between 2019-2020 due to COVID-related disruptions. Only 68% of the country's 115,100 estimated PLHIV were diagnosed, well below global targets. To narrow this gap, the Global Fund SKPA program, through KP-led CBO LoveYourself, ran a 2020 HIVST demonstration study, dubbed SelfCare, in the National Capital Region (NCR). Post-demonstration, LoveYourself scaled up the service nationwide in 2021 with 1,799 additional HIVST kits for qualified KPs.

Description: SelfCare leverages a chatbot for clients to order, process delivery, administer the test guided by online instructional videos, report results, and access counseling, linkage to confirmatory testing and HIV prevention and treatment information and services. From February to November 2021, 1,763 qualified men-having-sex-with-men and 36 transgender individuals received free HIVST kits, 609 of whom had never been tested before.

No. of people who expressed interest via SelfCare chatbot	12,873
No. of people who answered all eligibility questions	7,341
No. of people who were eligible	5,097
No. of people who proceeded to order	2,413
No. of kits delivered	1,799
No. of clients who reported their HIVST result	772 (42.9%)
No. of reactive clients among those who reported their HIVST result	78 (10.1%)
No. of HIVST-reactive clients linked to care to date	55 (70.5%)

Table.

Lessons learned: Consistent with results from the NCR pilot1, SelfCare's nationwide rollout2 demonstrated significant reach among first-time testers (26.9%[1], 33.9%[2]), high client self-reporting (56.4%1, 42.9%[2]) and reactivity rates (9.8%[1], 10.1%[2]), and a considerable proportion of first-time testers among reactive clients (13.4%[1], 53.8%[2]).
While 53% of rollout clients still come from NCR, SelfCare received orders and served clients from all regions, resulting from complementary online demand generation strategies (e.g., materials in multiple local languages, engagement of influencers, etc.) where online post reach averaged 14,300 individuals.

Conclusions/Next steps: Access to HIVST, coupled with courier delivery options and online outreach strategies, combats the negative impact of COVID-19 on HTS and resonates with hard-to-reach groups, especially first-time testers.
Updates and expansion to national HTS guidelines, including increasing providers and strengthening linkage mechanisms for confirmatory testing and treatment, must be fast-tracked to reinforce HIVST and other differentiated testing approaches as COVID-adaptive measures to reaching and linking to care remaining undiagnosed PLHIV.

EPE038

Increasing access and utilization of HIV services among Key Populations (KPs) in Namibia

I. Mendes-Siyamba[1], L. Shikongo[1], F. Velishavo[1], A. Zezai[1]
[1]*IntraHealth Namibia, Windhoek, Namibia*

Background: The KP-STAR project implemented by IntraHealth Namibia with funding from USAID, has interventions to increase HIV testing Services (HTS) uptake by KPs. The project offers HTS to clients at to clients at their convenient time and comfort zone. The 2019 Namibian Integrated Biological and Behavioural Surveillance Survey (IBBSS) amongst Female Sex Workers (FSWs) and Men having Sex with Men (MSM) reported poor HIV testing uptake for FSWS with estimates in Windhoek at 25.9%, Walvis Bay/Swakopmund at 10.9 %, and Katima Mulilo with only 25% respectively. HIV testing uptake for MSM was estimated at 10.6% in Windhoek, while it is estimated that the uptake by MSM is 24.5% in Walvis Bay/Swakopmund. Treatment uptake for MSM was below 90% in Windhoek and Walvis Bay/Swakopmund. We demonstrate the value of flexibility in HIV service provision.

Description: The KP-STAR consortium, implement activities targeting increased demand and access to comprehensive HIV prevention and treatment services for KPs. Interventions include community mobilisation, peer-to-peer outreach, health education, case management, condom, lubricant, HIV self-testing kits distribution at hotspots, "moonlight" HIV testing services using mobile vans and gazebos; and home testing for those who preferred to be tested at home.

Lessons learned: Between April 2020 and September 2021 the following results were achieved:

	FY20(April-Sept 2020)			FY21(Oct2020-Sept 2021)		
	MSM	FSW	TG	MSM	FSW	TG
KP PREV	1943	5596	269	3640	12293	374
Tested	1139	4894	153	3366	11410	320
Percentage HTS uptake	59%	87%	57%	92%	93%	86%
Positives	134	363	12	267	946	33
TX NEW	122	359	13	266	943	30
Linkage to ART	91%	99%	108%	100%	100%	91%
Tested Negative	1100	4695	169	3099	10464	287
PrEP NEW	374	1045	56	718	2491	101
PrEP Uptake for newly tested negatives	34%	22%	33%	23%	24%	35%

Table.

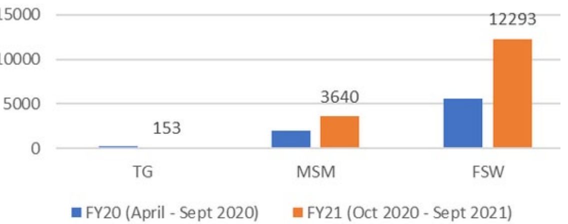

Figure. KP_PREV: Number of KPs reached with individual and/or small group-level HIV prevention interventions designed for the target population.

Conclusions/Next steps: Provision of HTS at times and places convenient for KPs led to increased service access, HIV testing, detected new positives and treatment uptake among KPs. This approach also identified HIV negative clients eligible for PrEP, hence strengthening HIV prevention among KPs.

EPE039

Use of hot spots for promoting HIV Self Testing (HIVST) services and distribution of self testing kits for Key Populations (KPs) in Namibia

I. Mendes-Siyamba[1], L. Shikongo[1], A. Zezai[1], F. Velishavo[1]

[1]*IntraHealth Namibia, Windhoek, Namibia*

Background: HIV Self Testing is useful for increasing case finding among Key Populations (KPs) with an unknown HIV status. The 2019 Namibian Integrated Biological and Behavioural Surveillance Survey (IBBSS) amongst Female Sex Workers (FSWs) and Men having Sex with Men (MSM) established poor testing uptake with estimates in Windhoek at 25.9% for FSWs, Walvis Bay/Swakopmund had HIV testing uptake of 35.7 % for FSWs, while in Katima Mulilo among FSWs was only at 10.9% respectively. The IBBSS findings indicated HIV testing uptake for MSM was at 10.6% in Windhoek and 24.5% in Walvis Bay/Swakopmund.

Description: Between April 2020 and December 2021 Peer Educators (PEs) and Case Managers (CMs) were trained on HIVST, and hotspots were identified for HIVST interventions. Posters on HIVST messaging were designed, printed, and placed at the identified hotspots. Bartenders were trained on HIVST data collection tools for easy follow up of clients by PEs and CMs. Specific messages on HIVST were developed at populated on various social media platforms such as WhatsApp and Facebook. An online app called QuickRes that allows people to make appointment and booking was developed and populated.

Extra HIVST kits were given to clients for their sexual contacts. Clients with HIVST positive results were linked to health facilities for confirmatory test using and were enrolled in case management. Contact numbers of PEs and CMs were printed on HIVST posters and kits for easy access to clients in need of more information and support.

Lessons learned: From April 2020 to December 2021, a total of 18,154 HIVST kits were distributed among FSWs, MSM and TG and yielded the following results.

	Assisted HTS SELF	Positive	Yield
MSM	4564	246	5.4%
FSW	13146	677	5.1%
TG	444	20	4.5%

Conclusions/Next steps: HIVST initiatives to increase case finding essential to attainment of the UNAIDS 2030, 95-95-95 targets among key populations in Namibia. Using hotspot for promoting and distribution of HIVST is effective to reach out to KP who are at high risk of HIV exposure. The intervention can be used increase HIV testing and treatment uptake, which leads to early diagnosis and linkages to care and treatment.

EPE040

Who is providing HIV testing services? The profile of lay counsellors providing HIV testing services in South Africa in the UTT era

I. Mokhele[1], T. Sineke[1], M. Vujovic[2], R.A. Ruiter[3], D. Onoya[1]

[1]*Health Economics and Epidemiology Research Office, Department of Internal Medicine, School of Clinical Medicine, Faculty of Health Sciences, University of the Witwatersrand, Johannesburg, South Africa,* [2]*Anova Health Institute, Johannesburg, South Africa,* [3]*Maastricht University, Department of Work and Social Psychology, Maastricht, Netherlands, the*

Background: Lay counsellors are critical in maintaining large-scale access to HIV testing services (HTS) and ensuring ongoing treatment support for persons living with HIV (PLHIV). We aim to characterize the training background, current work context, and emotional well-being of lay

counsellors working in the primary health care (PHC) setting in South Africa and deficiencies that may affect their impact in the universal-test-and-treat (UTT) policy context.

Methods: We report on a cross-sectional survey among adult (≥ 18 years) lay counsellors enrolled from June 2018 to March 2019 from 20 PHC facilities in Johannesburg, South Africa. Major depression was defined as scoring ≥12 on the Centre for Epidemiologic Studies-Depression-10 scale (CES-D-10) (Cronbach's alpha = 0.78). Low psychological well-being was defined as scoring <3.5 on the Ryff's-shortened 18-item, six-point Psychological Well-Being scale (Cronbach's alpha = 0.63). Moderate Job satisfaction was defined as scoring 2 to<3 on the Job satisfaction survey (Cronbach's alpha = 0.79).

Results: 55 lay counsellors (92.7% female, median age 37 years, interquartile range [IQR]: 33-44, and 27.3% HIV diagnosed) were surveyed. Most (85.5%) were department of health lay counsellors (considered volunteers at the time); the remainder were from non-governmental organizations (NGO) supporting HTS at PHC clinics. 85.5% reported high English literacy, but 23.6% did not complete high school. All participants had received basic counselling training, and 13.0% attended a training of less than the guideline-recommended 10-days.

Additionally, 45.2% had not attended a refresher training within the requisite 24-months. Participants reported operational barriers, including lack of designated space for counselling (56.4%), inadequate supervision and support (40.7%), inadequate emotional support (over 56.4%), 39% felt inadequately trained, and 60% were overwhelmed by their workload.

A total of 18.2% were screened with major depressive symptoms, with 18.2% reporting low psychological well-being. While the majority (87.3%) reported being moderately satisfied with their job, 50.91% actively sought alternative employment.

Conclusions: Despite the significant role of lay counsellors in expanding access to HIV care in South Africa, little has been done to invest in their ongoing training, emotional support, and integration into the formal health workforce. Counsellors' persisting unmet psychosocial, training, and professional needs could impact their efficacy in the UTT-era.

EPE041
Introducing and optimizing safe and voluntary partner notification services in Indonesia

L. Ferradini[1], A. Human[1], S. Sulami[1], B. Putro[1], L. Permana[1], L. Umboh[1], A. Yahya[1], N. Hadi[1], M. Ali[1], T. Rohman[1], A. Fahlevi[1], F. Febriana[1], M. Cassel[2], C. Francis[1]
[1]FHI 360, Jakarta, Indonesia, [2]FHI 360, Washington, DC, United States

Background: With funding from the PEPFAR and USAID, the Linkages across the Continuum of HIV Services for Key Populations Affected by HIV (LINKAGES) and the Meeting Targets and Maintaining Epidemic Control (EpiC) projects have helped the Government of Indonesia establish and implement guidelines for the introduction of voluntary partner-notification services for people living with HIV (PLHIV). They do this using routine program data to identify opportunities for further improvement.

Description: In 2019, team members helped adapt the 2016 World Health Organization index testing guidelines into standard operating procedures relevant to the local Indonesian context. They emphasized key-population-friendly services, given the concentration of HIV infections in these groups, and incorporated strategies that could be implemented through a mix of community- and facility-based service providers. LINKAGES and EpiC supported implementation in Jakarta beginning in October 2019. They collected and analyzed routine program data on PLHIV participation in voluntary partner-notification services, assessing rates of acceptance, contact referrals, successful linkage of contacts to HIV testing services, and new HIV case-finding rates by population, service setting, and geography.

Lessons learned: From October 2019 through September 2021, 13,710 offers of partner-notification services were accepted among a total of 22,323 PLHIV. PLHIV who accepted partner-notification services referred 18,899 contacts, of whom 9,121 (48.3%) were reached and 5,702 (30.2%) received HIV testing. Among the contacts tested, 978 (17.2%) received positive results.

Community-based services contributed to case-finding rates 4.7 times higher than those in facility-based settings (11.1% vs. 2.4%) among PLHIV who had been offered partner notification. In community settings, PLHIV who identified as men who have sex with men were significantly less likely (aOR=0.29, [95% CI: 0.25-0.33]) than clients of other categories to accept partner notification, but those who did accept were significantly more likely (aOR=5.3 [3.76-7.45]) than clients of other categories to refer HIV-positive contacts.

Conclusions/Next steps: Project team members are working with national HIV program partners to mainstream offers of partner notification into PLHIV community support services and expand online and anonymous contact referral options to improve participation among men who have sex with men.

Factors influencing confirmatory testing and linkage after a reactive HIV self-test result: a private sector-focused insight from young people in Nigeria

B. Abdullahi Yaradua[1], D. Aizobu[1], S. Malaba[2], G. Omoregie[1], O. Idogho[1], J. Anyanti[1], D. Ukaga[1], P. Omodele[1], B. Adesina[1]
[1]Society for Family Health, Abuja, Nigeria, [2]Population Services International, Nairobi, Kenya

Background:
HIV self-testing (HIVST) has been found to be acceptable, feasible, accurate, and effective in increasing the number of people who test for HIV. However, less is known about whether and how those who access HIVST through the private sector access confirmatory testing, linkage to HIV care and treatment following a reactive result. This qualitative study identified the factors that influence young people to take the next step after a reactive result following the use of a purchased HIVST kit.
Methods: Forty-five in-depth interviews and seven focus group discussions with sexually active men and women between 18 – 29 years were conducted in Lagos, Kano and Anambra. Using thematic analysis, data collected from the participants was analyzed into themes related to barriers and enablers to confirmatory testing and linkage to care and treatment after a reactive HIV self-test result.
Results: Key enablers to confirmatory testing and linkage to care include the availability of good quality healthcare delivery, support from loved ones, instructional materials that stipulated next steps following test results, experiencing poor health and implications of a reactive result.
Furthermore, key barriers identified were emotional trauma, lack of transport fee to a healthcare facility, fear of status disclosure and avoiding being treated as sick.
Conclusions: The findings from this research have demonstrated the need for sensitization of healthcare providers on high-quality HIV service delivery, provision of pre and post-test counselling at the point of purchase, adequate and clear information on HIVST, interventions to address HIV stigma in the community.
All of these would ensure timely linkage of clients and ultimately reduce HIV-related morbidity and mortality among clients in the private sector

EPE043

Integrating quality improvement methodologies in improving index testing positivity yield in 19 selected sites in Southern province Zambia

M.C. Nzala[1], R. Lungwebungu[1]
[1]Ministry of Health, Choma, Zambia

Background: As the proportions of people living with HIV (PLHIV) who do not know their HIV infection status decrease, reaching the remaining few who are asymptomatic and not in contact with the health care system becomes a critical challenge. Therefore, reaching the first 90 of the UNAIDS 90-90-90 targets will require effective and efficient HIV testing approaches. Index testing model has demonstrated an increase in identification of HIV positive cases among children and adults and linkage into care and treatment services.
Methods: A baseline assessment was conducted and found the index positivity yield of 14% in September 2020. Following a baseline assessment, a root cause analysis was conducted to establish the magnitude of the problem.
The root causes were found to be:
1. Non appointment of an Index Champion,
2. Incomplete locator information for the elicited contacts for easy follow-ups,
3. Inadequate knowledge and counselling skills on safety and ethical index testing,
4. Inconsistent departmental data review meetings,
To address the route cases facilities enrolled into QI project with following intervention:
1. Provided integrated ART outreach service and engaged community partner (DAPP) in making follow ups,
2. Provided TORs and oriented facility index champion on the Job Aids,
3. Involved Facility/ART in charges in index testing services to enhance supervision,
4. Built capacity in counsellors and other providers in Ethical & Safe Index Testing through trainings and onsite mentorship,
5. Holding data review meetings, daily, weekly and monthly.
Results: The index positivity yield improved from 14% in September 2020 to 25% by end of the first quarter and increased to 36% by end of second quarter with a further increase to 48% by the end of the third quarter and further improved to 57% by the end of FY21.
Furthermore, it was observed the average (12 months) index positivity yield and contribution was 29% and 55% respectively. It was also observed that Index reduced untargeted testing by 1. 1% by the end of quarter one and by 4.8% by the end of the second quarter.
Conclusions: Application of quality improvement methodologies remains pivotal in index positivity yield improvement and achieving the first 95%.

EPE044

I'm Ready Research Program: Outcomes from the first 6 months of the first national HIV self-testing program in Canada to reach the undiagnosed and link them to care

S.B. Rourke[1], R. Galli[2], K. McBain[2], C. Westendorf[2], D. Maraj[2], J. Duddy[3], L. Zubowski[3], M. Clayton[4], P.B. McDonald Kuhne[5], J. Watson[2], R. Baran[2], P. Chan[2], W. Tharao[6], M. Owino[6], M. Aden[6], N. Lachowsky[7], C. Draenos[8], S. Child[8], T. Geatros[9], E. Goldhar[9], G. Westler[10], P. Boscher[10], S. Leslie[11], R. Ahmed[11], D. Gauthier[12], B. Hagon[13], A. Filiatrault[14], A. Watts[15]

[1]*St. Michael's Hospital, MAP Centre for Urban Health Solutions, REACH Nexus and University of Toronto, Toronto, Canada,* [2]*St. Michael's Hospital, MAP Centre for Urban Health Solutions and REACH Nexus, Toronto, Canada,* [3]*Pacific AIDS Network and REACH Nexus, Vancouver, Canada,* [4]*Hotsa Consulting Ltd and REACH Nexus, Vancouver, Canada,* [5]*St. Michael's Hospital, MAP Centre for Urban Health Solutions, Toronto, Canada,* [6]*Women's Health in Women's Hands and REACH Nexus, Toronto, Canada,* [7]*University of Victoria, Community-Based Research Centre and REACH Nexus, Victoria, Canada,* [8]*Community-Based Research Centre and REACH Nexus, Vancouver, Canada,* [9]*ConsumptionCo, Toronto, Canada,* [10]*Plazus, Vancouver, Canada,* [11]*Pharmacy.ca, Toronto, Canada,* [12]*Sandboxsoftware.ca, Toronto, Canada,* [13]*forgoodntent.com, Toronto, Canada,* [14]*Canadian Foundation for AIDS Research, Toronto, Canada,* [15]*esri canada, Toronto, Canada*

Background: The COVID-19 pandemic has negatively impacted facility-based HIV testing in Canada. To reach the estimated 8,300+ undiagnosed people living with HIV, we implemented the I'm Ready research program in June 2021, 7 months after the first HIV self-test (INSTI® HIV Self-Test) was licensed in Canada. I'm Ready is a national integrated online program (mobile app, telehealth platform and website) that offers access to free HIV self-tests, care pathways, and optional virtual support by trained peer navigators (www.readytoknow.ca).

We aimed to evaluate the impact of using technology and peer navigation support to reach those undiagnosed with HIV and link them to care.

Methods: Through the *I'm Ready, Test* mobile app, participants aged 18+ and who lived in Canada can consent, create an anonymous profile, answer surveys, order up to 3 free HIV self-tests for delivery or pick-up at 80 community sites across Canada, take the test, and provide/upload results. Participants could connect directly with peer navigator support before, during or after taking the test through the *I'm Ready, Talk* platform.

Results: In the first 6 months, 2,676 people from all regions across Canada consented. Mean age was 32 years, with 65% self-identified as men, 25% as women and 10% gender-diverse (e.g., non-binary, trans, genderqueer). About 55% reported reduced access to facility-based HIV testing due to COVID. Of the 4,854 HIV self-test kits ordered, 60% were delivered by mail to a chosen address and 40% were picked up at community sites. Among those who submitted at least one test result, 62% self-identified as belonging to at least one key population group (gay/bisexual/MSM, Indigenous, African, Caribbean or Black, or people who use/inject drugs).

The program reached 635 first-time HIV testers (31.5% of total), and 5 previously HIV-undiagnosed participants, all from key populations. There were 68 appointments with 15 different peer navigators for support to participants with testing and linkage to care.

Conclusions: The *I'm Ready* program leveraging its innovative/integrated technology platform provides an acceptable and effective low barrier option for reaching those with undiagnosed HIV infection, particularly those from key populations who have been difficult to reach and engage in HIV testing and care.

EPE045

Innovative use of power BI desktop to track partner/family notification/testing services (PNS) for contacts of newly diagnosed HIV+ cases to increase Index Case Testing (ICT) performance in Oromia, Ethiopia 2020-2021

K. Delele[1], B. Tesfaye[1], Y. Leta[1], G. Mamo[1], T. Tilahun[2]

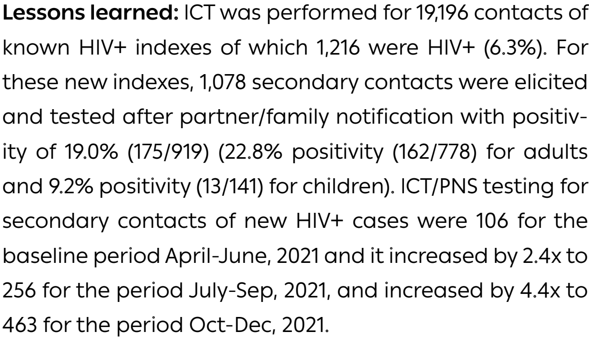
[1]*Integrated Services for Health and Development, Addis Ababa, Ethiopia,* [2]*USAID, Addis Ababa, Ethiopia*

Background: The USAID Family Focused HIV Prevention Care and Treatment Activity in Oromia, Ethiopia works to improve HIV case finding at community level using ICT/PNS in a low HIV prevalence setting (adult 15-49 prevalence <0.7%). Newly diagnosed HIV+ cases are said to have contacts with high positivity rate. There is an electronic system to track ICT but none for PNS performance for contacts of newly diagnosed HIV+ cases.

Description: We analyzed project data on ICT from October 2020-December 2021 in 39 towns in Oromia. ICT for contacts of index cases was done based on risk assessment. Every new HIV+ adult is expected to receive counseling to elicit a minimum of two sexual partners and two children and get them tested for HIV. This means a newly diagnosed HIV+ person is expected to appear as contact when receiving testing while as index when his/her secondary contacts are elicited and tested for HIV partner/family notification.

We exported electronic data used to track ICT performance and used it to locate secondary contacts of newly diagnosed HIV+ cases by matching name or medical record number (MRN). Power BI Desktop was used analyze the data by using LOOKUP function to identify how many secondary contacts of newly diagnosed HIV+ cases were tested for HIV and how many of those tested positive.

An interactive dashboard was also developed and shared to implementers using Power BI Desktop to track performance on daily basis starting July 2021.



Lessons learned: ICT was performed for 19,196 contacts of known HIV+ indexes of which 1,216 were HIV+ (6.3%). For these new indexes, 1,078 secondary contacts were elicited and tested after partner/family notification with positivity of 19.0% (175/919) (22.8% positivity (162/778) for adults and 9.2% positivity (13/141) for children). ICT/PNS testing for secondary contacts of new HIV+ cases were 106 for the baseline period April-June, 2021 and it increased by 2.4x to 256 for the period July-Sep, 2021, and increased by 4.4x to 463 for the period Oct-Dec, 2021.
Conclusions/Next steps: Power BI Desktop was used to develop a tool to effectively track elicitation of secondary contacts resulting in improvement in data use and performance.

EPE046
HIV risk screening: a systematic and efficient approach for improving identification of HIV-positive children in Ethiopia

D. Haile[1], G. Aschale[1], M. Mergia[1], M. Bereda[1], T. Abamo[1], A. Silesh[1], Z. Hika[2], M. Getachew[2], J. Joseph[3], N. Medina-Jaudes[3], S. Dowling[3], J. Drakes[3], K. Suggu[3]
[1]Clinton Health Access Initiative, Addis Ababa, Ethiopia, [2]Ministry of Health - Ethiopia, Addis Ababa, Ethiopia, [3]Clinton Health Access Initiative, Boston, United States

Background: In Ethiopia, universal testing of children under five and targeted testing of older children was recommended in national guidelines to support identification of children. However, as universal testing led to test kit shortages, and health care workers (HCWs) had limited guidance on targeted testing, sick children presenting with opportunistic infections were prioritized.
To minimize missed opportunities for identifying at-risk children, Ministry of Health adopted a HIV risk screening tool (HRST), informed by known risk factors and existing guidance, to systematically screen all children and offer HIV testing based on symptoms, family status and vulnerability. Since September 2020, Ministry and CHAI have provided training and mentorship to support implementation and monitoring of the screening tool.
Methods: The HRST was administered by trained HCWs to children <15 years in outpatient departments (OPD). Those who screened positive, defined as providing an affirmative response to one or more screening questions, were offered HIV testing. Data were collected on screening and testing, pre-(2020) and post-(2021) introduction of screening at 24 facilities.
We assessed testing uptake among those screened and the number of children identified HIV-positive, and compared testing yields using a t-test.
Results: In 2021, 70% (127,192/180,832) of eligible children were screened. Among those screened, 12% (15,334/127,192) screened positive, 85% (13,031/15,334) were tested and 0.42% (55/13,031) were identified HIV-positive. An additional 91 (2.19%) children were identified among 4,150 who were tested without being screened, likely due to presentation with opportunistic infections or for index testing. Overall, from 2020 to 2021, identifications increased 54% from 95 to 146, with 38% identified through screening, and there was a statistically significant increase in yields from 0.72% to 0.85% (p-value: 0.049). The number needed to test (NNT) to identify one child declined 15% from 139 to 118.
Conclusions: Increases in overall identifications and yields suggest that screening is an efficient way to identify HIV-positive children who may otherwise not be tested, and should be considered if universal testing is not feasible. To maximize impact, screening coverage should be increased, and outcomes routinely monitored.
Further research should also review cases of children prioritized for testing without screening, and identified, to refine screening criteria.

Implementation science of scaling up HIV treatment

EPE047
Perception and acceptability of delivery of chronic medication through the use of Unmanned Aerial Vehicles (UAVs) in the district of Ekurhuleni, South Africa

J. Pienaar[1], S. Day[2], L.-A. Swart[3], R. Clark[4], P. Clark[4], D. Rech[5]
[1]The Aurum Institute, Global Health, Johannesburg, South Africa, [2]Centre for HIV-AIDS Prevention Studies, Research, Johannesburg, South Africa, [3]UNISA, The Institute for Social and Health Sciences, Pretoria, South Africa, [4]Kusasa Aerospace, Johannesburg, South Africa, [5]Aurum Institute, Johannesburg, South Africa

Background: Unmanned aerial vehicles (UAV), otherwise known as Drones, have the potential to increase capacity and efficiency of healthcare systems and circumvent challenges to healthcare delivery in hard-to-reach and isolated areas. As a relatively inexpensive and rapid transport solution, Drones may expand healthcare access through greater reach and meet urgent human need in challenging environments. The Aurum Institute, CHAPS and Kusasa AeroSpace conducted a safety, feasibility and acceptability study to explore the use of Drones to deliver medication.
Methods: The Aurum Institute, CHAPS and Kusasa AeroSpace conducted a safety, feasibility and acceptability study to explore the use of drones to deliver medication. The pilot phase included an acceptability study among 396 public health patients receiving chronic medication in Ekurhuleni, Gauteng, South Africa.
Participants were recruited and enrolled at local public health clinics between June and September 2021. Upon consenting for participation, they were shown a video of

a drone where medication is dropped via a small parachute to a client receiving the package on the ground. A study staff member guided the participant through an online survey, conducted on Android tablets at the clinic. Data was analyzed using SPSS 27.0.

Results: Perceptions of drones use were largely positive among clients receiving chronic medication at public health facilities. The Pearson's chi-square test of contingencies revealed several factors that positively impact clients' preference for Drone-delivered medication. These comprised spending more than R20 ($2) to travel to the clinic (p=0.000), not regularly being able to refill a prescription (p=0.001), forgetting to fill a prescription and safety concerns (p=0.030).

Conversely, people who would not want their medication delivered via drones currently access their medication using alternative modes of collection and perceive more risks of using drones.

Conclusions: Drone use for chronic medicine delivery has many benefits and given the impetus to decongest clinics and facilitate continuity of treatment access, this modality may provide long-term benefits to the medical field.

Supporting accessibility and adherence to treatment, drone use could improve local and national treatment outcomes. However, further research is needed to understand community perceptions and concerns to support the acceptability of this method in the future.

EPE048

Accelerating HIV epidemic control in Benue State, Nigeria, 2019-2021: the APIN program experience

J. Plang[1], O. Ibiloye[1], M. Obaje[1], K. Ngwoke[1], U. Thomas[1], T. Omole[1], H. Okpe[1], M. Odido[1], E. Enenche[1], I. Onwatuelo[1], S. Jay Osi[1], P. Okonkwo[1]

[1]*APIN Public Health Initiatives, Clinical Services, Abuja, Nigeria*

Background: Benue state has the second highest HIV prevalence of 4.9% in Nigeria. In 2018, about 35,623 people living with HIV (PLHIV) were yet to commence antiretroviral treatment (ART) in the state and they accounted for ART coverage gap of 11% in the country. To close this HIV treatment gap and fast track epidemic control, we implemented the Benue ART surge (BAS) intervention to increase PLHIV access to quality comprehensive HIV services.

The aim of this study was to describe the BAS strategic approaches and demonstrate progress in expanding ART access for PLHIV in Benue State, Nigeria.

Methods: We implemented BAS in 252 health facilities from May 2019 to September 2021. The BAS was a flexible model of Incident Command System and the State Surge Consortium. BAS strategic approaches prioritized stakeholders engagement, small area estimation, tiered facility management, targeted community-based HIV testing, comprehensive HIV services for key populations, enhanced program management, and viral load optimization. Data were collected and reported using an excel-based dashboard and electronic medical record. We described the trend of HIV case identification, ART initiation, viral load suppression rate, and rate of interruption in treatment during the BAS period.

Results: Out of 893,462 clients reached and tested for HIV during BAS implementation, 15% (n=60,297) were diagnosed with HIV and 99.8% (n=60,236) were initiated on ART. HIV case identification per month increased by 467% from 650 at baseline to a peak of 3,685 in August 2020, and then declined by 35% to 2,380 in September 2021. All new HIV infected patients (100%) were linked to ART. Viral load testing coverage and viral load suppression rate increased from 30% (43,185/126,004) and 84% (n=36,165/43,185) at baseline to 95% (n=193, 890/204,095) and 96% (185,785/193,890) respectively.

Conclusions: Implementation of the BAS improved access to comprehensive HIV services in Benue State. The increase in HIV case identification and ART initiation significantly reduced HIV treatment gap in the state. To fast track the attainment of UNAIDS 95-95-95 goals, lessons learnt from the BAS should be adapted and scale up in the national HIV programme in Nigeria.

Evaluating the impact of WHO's Treat-All guideline on disease progression for people living with HIV in Central Africa from cohort data by target trial design and multi-state modeling

J. Zhu[1,2], H. Zhang[3,2], E. Brazier[3,2], O. Tymejczyk[3,2], M. Yotebieng[4], A. Kimmel[5], K. Anastos[6], J. Ross[6], D. Hoover[7], Q. Shi[8], G. Murenzi[9], D. Nsonde[10], A. Dzudie[11], P. Lelo[12], C. Twizere[13], D. Nash[2,3]

[1]Graduate School of Public Health and Health Policy, City University of New York, Epidemiology & Biostatistics, New York, United States, [2]Institute for Implementation Science in Population Health, City University of New York, New York, United States, [3]Graduate School of Public Health and Health Policy, City University of New York, New York, United States, [4]The Ohio State University, Columbus, United States, [5]Virginia Commonwealth University School of Medicine, Department of Health Behavior and Policy, Richmond, United States, [6]Montefiore Medical Center/ Albert Einstein College of Medicine, Department of Medicine, New York, United States, [7]Health Care Policy and Aging Research, Rutgers the State University of New Jersey, Department of Statistics and Institute for Health, Piscataway, United States, [8]New York Medical College, Department of Epidemiology and Community Health, Valhalla, United States, [9]Einstein-Rwanda Research and Capacity Building Program, Rwanda Military Hospital and Research for Development (RD Rwanda), Kigali, Rwanda, [10]CTA Brazzaville, Brazzaville, Congo, the, [11]Clinical Research Education, Networking and Consultancy, Yaounde, Cameroon, [12]Pediatric Hospital Kalembe Lembe, Kinshasa, Congo, Democratic Republic of the, [13]Centre National de Reference en Matiere de VIH/SIDA, Bujumbura, Burundi

Background: By the end of 2018 nearly all countries in Central Africa had adopted WHO's "Treat All" guideline, which eliminates eligibility thresholds for people living with HIV (PLWH) to receive antiretroviral therapy (ART). Previous studies showed that implementation of this guideline led to increased ART initiation and viral load monitoring, plus prolonged retention in care. However, the impact of the Treat All policy on critical clinical outcomes, such as HIV disease progression and mortality, is largely unexplored.

Methods: We utilized a "target trial" design with individual-level longitudinal data collected between 2013 and 2019 from the Central Africa International Epidemiology Databases to Evaluate AIDS (IeDEA) consortium, from Burundi, Cameroon, the Democratic Republic of Congo (DRC), the Republic of Congo and Rwanda. Multi-state models (MSMs) infered the transitional hazards of disease progression among four disease stages (Stages 1-4 and death) which consisted of WHO clinical stages and death. The hazard ratios (HR) between a cohort enrolling in HIV care under Treat All guideline implementation and a cohort enrolling prior to Treat All guideline implementation were estimated, with and without adjusting covariates: sex and age.

Results: A total of 9,293 patients were included, 4,680 in the Treat All cohort and 4,613 in the pre- Treat All cohort. The Treat All policy was significantly associated with a reduced hazard of transition from WHO stage 1 to death with an adjusted HR (AHR) of 0.35, 95% CI 0.16 to 0.76, and from stage 2 to stage 3 (AHR = 0.63, 95% CI 0.43 to 0.92).

Conclusions: The adoption of Treat All was associated with a reduced likelihood of disease progression and death, especially for people with no or mild clinical symptoms at care enrollment. Prevention of HIV disease progression from the early-stage HIV infection suggests that 'treat all' policies can improve both short- and long-term clinical outcomes, and ultimately the quality of life and life expectancy.

Background: The Extension Phase of the FLAIR trial demonstrated similar efficacy and safety in maintaining viral suppression at week 124 among cabotegravir (CAB) and rilpivirine (RPV) long-acting (LA) stable switch participants receiving 4 weeks of oral lead-in (OLI) compared to those who start with injections (SWI).

The Phase IIIb SOLAR study comparing efficacy and safety of the daily oral medication bictegravir/emtricitabine/tenofovir alafenamide versus CAB+RPV LA therapy every 2 months allowed participants and health care providers (HCPs) the option of utilizing OLI prior to LA initiation versus SWI. Factors influencing HCPs' future intentions regarding OLI versus SWI are presented.

Methods: An online survey conducted among HCPs in 13 countries during SOLAR assessed reasons for utilizing an OLI prior to LA injections versus SWI. Eligible HCPs were involved in the participant-provider decision-making pro-

cess. Bivariate and multivariate logistic regression analyses were used to identify factors, including geographic region, provider role, LA antiretroviral therapy experience, and participant-provider dynamics that influenced a provider's decision to use OLI prior to LA dosing.

Results: 110 HCPs participated in the survey; 32% reported a future preference to use OLI, whereas 54% reported a future preference for SWI. HCPs had greater odds of reporting future intentions for SWI if they were: from Continental Europe compared to North America (aOR: 3.83, $p<0.05$); from sites with a greater number of participants who initiated CAB+RPV LA without OLI (aOR: 1.56, $p<0.01$); and those who reported comfort with the medication safety profile (aOR: 6.39, $p<0.01$). HCPs who participated in CAB+RPV LA trials prior to SOLAR had decreased odds of reporting a preference for SWI compared to those with no prior CAB+RPV LA trial experience (aOR 0.11; $p<0.01$).

Conclusions: The SOLAR on-line survey indicated higher levels of future intentions to SWI over OLI among HCPs initiating participants on CAB+RPV LA. A major factor leading HCPs to SWI was provider comfort with safety related data. HCPs with prior clinical trial experience were less likely to proceed without OLI reinforcing the role of continued training and education regarding the safety and tolerability of CAB+RPV LA using a SWI approach.

Single center experience evaluating patients for and initiating long acting cabotegravir/rilpivirine

L. Hill[1], K. Abulhosn[1], J. Yin[1], L. Bamford[1]
[1]*University of California San Diego, San Diego, United States*

Background: Long-acting injectable (LAI) cabotegravir and rilpivirine (CAB/RPV) was approved in the United States in January 2021. We describe a single center experience evaluating patients interested in LAI CAB/RPV and examine factors associated with initiation and reasons for not initiating CAB/RPV.

Methods: Retrospective single center study conducted at a primary care HIV clinic in San Diego. Our practice for evaluation of resistance is to consider an archive genotype if no baseline or prior resistance test is available.
Patients were evaluated between March and December 2021 and included in the study if a clear determination was made to start or not start CAB/RPV. Baseline characteristics were compared between those that did and did not start, and reasons for not initiating were evaluated.

Results: 202 patients were included, with 73 (36.1%) initiating LAI CAB/RPV. Baseline characteristics are shown in Table 1, with type of insurance and type of baseline ARV regimen associated with initiating CAB/RPV. An archive genotype was completed in 65 (32.2%) patients.
Of those that had an archive genotype completed, 15.4% had a mutation identified that may impact effectiveness of CAB/RPV. In those that did not initiate CAB/RPV (n=129) reasons included previously identified resistance (23), inconsistent clinic attendance/not easily reached (21), patient choice (17), uncertain out-of-pocket costs (17), not covered (11), not virally suppressed (11), failure to complete resistance work-up (10), resistance found on archive genotype (10) and other (9).

	Total (n=202)	Initiated CAB/RPV (n=73)	Did not start CAB/RPV (n=129)	p-value

On PPI at baseline	25 (12.4)	11 (15.1)	14 (10.9)	0.38

Table.

Conclusions: One of the main barriers to initiation of LAI CAB/RPV is insurance coverage, particularly for those with commercial insurance. Those that initiated CAB/RPV were more likely to be on a two drug regimen, possibly due to a lower likelihood of resistance concerns in these patients. The use of archive genotypes provides an additional tool to evaluate for transmitted or polymorphic CAB/RPV resistance that may impact the effectiveness of this regimen.

Implementation of the CD4 advanced disease rapid test: lessons learned from the pilot test in Uganda

R. Kirungi[1], V. Nabitaka[1], A. Nuwagira[1], A. Musoke[1], A. Omar[2], A. Moore[2], D. Rathakrishnan[2], J. Conroy[2], P.M. Namuwenge[3], W. Nyegenye[4], C. Okiira[4], V. Kasone[4], A. Carolyn[2]

[1]Clinton Health Access Initiative, Inc., Kampala, Uganda, [2]Clinton Health Access Initiative, Inc., Boston, United States, [3]Ministry of Health, Uganda, Kampala, Uganda, [4]Uganda National Health Laboratory Services, Kampala, Uganda

Background: In 2018, WHO recommended several interventions to prevent mortality among individuals with advanced HIV disease (AHD), most of which have since been adopted by Uganda. Identifying people with AHD begins with performing a CD4 cell count (CD4+), since most individuals remain asymptomatic for some time even when their CD4+ is less than 200. Since only about 50% of ART treatment centers have CD4+ machines, the introduction of VISITECT CD4 Advanced Disease rapid test (VISITECT), a semi-quantitative instrument-free test, could improve CD4 coverage at lower-level treatment centers that have limited laboratory capacity.

Description: Between January and August 2021, the Ministry of Health with support from Clinton Health Access Initiative, Inc. (CHAI), through funding from UNITAID, field tested VISITECT at 12 health facilities across Uganda with the aim of understanding its performance in an uncontrolled setting for consideration of potential scale-up.

The healthcare workers (HCWs) at these 12 facilities were trained in January 2021 and given a tool to collect the comparative data from VISITECT and point-of-care (POC) CD4+ machines at the facilities. Periodic supportive supervisions were conducted to assess the feasibility of VISITECT.

Lessons learned: Data from 681 comparative tests were collected from February to August 2021, highlighting 177 CD4 ≤200 and 504 CD4 >200 test results for the POC CD4+ machines while VISITECT had 195 CD4 ≤200 and 486 CD4 >200 test results. From this data, the VISITECT sensitivity and specificity was determined to be 97% and 95%, respectively.

Although HCWs highlighted the long turnaround time with VISITECT (45 minutes) as a challenge, they reported that access to such a test would facilitate quick clinical action in lower-level facilities without CD4+ machines as opposed to referring samples to other health facilities. It was also noted that VISITECT was portable, easy to use, and fit for facilities with limited technical expertise.

Conclusions/Next steps: Implementation of VISITECT testing is feasible besides yielding good results and could significantly increase access to CD4+ testing and the AHD package of care.

Virological outcomes and ARV switch profiles one year after dolutegravir transition among children in southern Mozambique

M.M. Gill[1], R. Guilaze[2], N. Herrera[1], D. Aly[2], A.V. Nhangave[3], J. Mussá[4], A. Mussa[2], C. Muchuchuti[5], N. Bhatt[2]

[1]Elizabeth Glaser Pediatric AIDS Foundation, Washington, United States, [2]Elizabeth Glaser Pediatric AIDS Foundation, Maputo, Mozambique, [3]Ministério da Saúde, Direção Provincial de Saúde, Gaza, Mozambique, [4]Ministério da Saúde, Direção Provincial de Saúde, Inhambane, Mozambique, [5]Elizabeth Glaser Pediatric AIDS Foundation, Harare, Zimbabwe

Background: The WHO recommends treatment optimization with dolutegravir (DTG) for first-and second-line ART among children. We describe DTG treatment in children approximately one year after DTG introduction in pediatric programs in Gaza and Inhambane provinces, Mozambique.

Methods: Clinic records from children 0-14 years with HIV-related clinic visits between September 2019 and October 2020 were extracted from paper and electronic records in 16 health facilities.

Among children aged ≥5 years (proxy for weight ≥20kg, the threshold for DTG 50mg), we report treatment switches, defined as change in anchor drug, ignoring changes only to NRTI backbones.

Among those on DTG-based regimens, we described treatment changes and available viral load (VL) outcomes.

Results: Of 3,205 children aged ≥5 years (52.7% female), 2,685 (83.8%) switched ART regimens during this period; 995 (37.1%) children switched ≥ 2 times; 34 (1.3%) changed 5-7 times.

Of those who switched, 2,523 (94.0%) switched to DTG-based ART, including 146 who started on DTG, but switched off and then back to DTG; 1,955 switches (77.5%) were from NNRTI-based ART. At last visit, 89.7% (2,785/3,104) of children were receiving DTG, excluding 101 without a documented regimen during follow-up.

Among children who switched to DTG, 2014/2523 (79.8%) were on continuous DTG for ≥6 months. Of these, 725 children had VL results available at median 9.1 [7.4-10.8] months after DTG start; 571 (78.8%) had suppressed VL <1,000 copies/mL. Among 372 with pre-DTG VL results, 187 (50.3%) were virally suppressed.

Of those who switched to DTG for ≥6 months, 1657 (83.1%) also changed NRTI backbone; 474/602 (78.7%) with available VL were virally suppressed. Of 336 DTG switches with same NRTI backbone, 89/114 (78.1%) were suppressed; 21 children changed from 3 NRTI-ART to DTG-ART.

Conclusions: 90% of eligible children were on DTG after one year of rollout, though DTG was not consistently maintained for all. Among ART-experienced children, viral suppression rates were higher following DTG switch. Most children with VL results also changed NRTI backbone; sup-

pression rates were similar to those who switched with same backbone, though numbers were limited. Further exploration, including drug resistance testing, is needed to understand why 21% are unsuppressed after nearly a year on DTG.

EPE054

HIV test and treat policy increases retention on ART in Zambian adults living with HIV. A multi-site cross sectional time series analysis

S. Mutembo[1], S.K. Masenga[2], L. Sikazwe[3], M. Sakala[3], G. Mweemba[3], J. Mvula[3], S. Kunda[3], S. Kabesha[3], C. Cheelo[2], I. Fwemba[4], B.M. Hamooya[2]

[1]*Johns Hopkins Bloomberg School of Public, International Vaccine Access Center, Department of International Health, Baltimore, United States,* [2]*Mulungushi University, School of Medicine and Health Sciences, Livingstone, Zambia,* [3]*Ministry of Health, Southern Provincial Medical Office, Choma, Zambia,* [4]*University of Zambia, School of Public Health, Lusaka, Zambia*

Background: Most countries are using the ART test and treat approach to achieve UNAIDS 95-95-95 targets. However, the impact of this approach has not been appraised in many settings. We evaluated treatment outcomes of adults on ART and assessed the impact of the strategy.

Methods: We conducted a cross sectional time series data analysis of 6,909 individuals who initiated ART between January 1st, 2014 - July 31st, 2016 (before test and treat cohort (BTT), n=3,143 (45.9%)) and August 1st, 2016 - October 1st, 2020 (after test and treat cohort (ATT)). The study was conducted in 42 health facilities in Southern province.

The primary outcome was retention defined as regular attendance of ART appointments at 3, 6, 12, 24 and 24 months after ART initiation. Viral suppression (viral load <1000 copies/ml) and attrition were assessed. To assess factors associated with retention, we used logistic regression (xtlogit model).

Results: There were more females (60% BTT and 61% ATT). The median age was 40 years (IQR: 34 - 47) and 37 years (IQR: 30 - 45) in BTT and ATT cohorts respectively.

Variable	Retention	
	cOR (95%CI)	aOR (95%CI)
Cohort		
BTT	ref	ref
ATT	3.10 (2.92-3.29)	3.63 (3.35-3.94)
Facility location		
Urban	ref	ref
Rural	1.46 (1.36-1.55)	1.30 (1.21-1.40)
Marital status		
Never married	ref	ref
Married	1.31 (1.09-1.58)	1.30 (1.17-1.86)
Divorced	1.20 (0.93-1.54)	1.10 (0.97-1.26)
Windowed	1.38 (1.02-1.86)	1.30 (1.09-1.52)

Table 1. Factors associated with retention using GEE to account for correlation within observations.

Overall retention was 83.4%, higher in the ATT cohort (90.4% vs. 75.1%, p<0.001). At all-time intervals retention was higher (p<0.001) in the ATT cohort: at 3 months (92.7% vs. 76.0%); 6 months (91.4% vs. 76.2%); 12 months (91.9% vs. 77.3%); 24 months (91.9% vs. 78.5%) and >24 months (92.6% vs. 87.3%). Attrition was due to: transferred out (0.2%), LTFU (9.5%) and death (0.8%). Viral suppression at 6, 12 and 24 months was 80.4%, 92.2% and 94.7% respectively. ATT cohort was 4 times more likely to be retained on ART (Table 1).

Conclusions: Retention increased after test and treat while viral suppression was still low. LTFU was the main reason for attrition. Our findings demonstrate the need for improved clinical monitoring of ART patients.

EPE055

Experiences and early lessons from adoption and introduction of the generic paediatric Dolutegravir 10mg dispersible, scored tablets (pDTG) in Malawi

E. Longwe Matupa[1], D. Telela[1], Y. Gumulira[1], C. Chimhundu[2], M. Maulidi[3], A. Gunda[1], R. Nyirenda[3]

[1]*Clinton Health Access Initiative, Lilongwe, Malawi,* [2]*Clinton Health Access Initiative, Harare, Zimbabwe,* [3]*Ministry of Health, Department of HIV and AIDS (DHA), Lilongwe, Malawi*

Background: Despite notable progress towards adult 95-95-95 targets in Malawi by end of 2020 (88-98-97), significant work remains for children (75-100-74). By end 2020, ~77% of all children living with HIV (CLHIV) on treatment were virally suppressed, suggesting treatment inequalities when compared to adults (96%). In 2021, Malawi prioritized pDTG adoption to expand paediatric access to the life-saving formulation, which was not available at a sustainable price until 2020.

Description: Malawi's treatment guidelines were revised in 2021 to include pDTG as the preferred first-line treatment for children between 3kg-19.9kg and aged above four weeks. Through Unitaid funding, CHAI procured pDTG for ~2,500 children to catalyse product access in 50 targeted high-volume sites, while large-scale resource mobilization took place.

Enhanced monitoring was adopted from Phase I of implementation to provide rapid insights on patient safety, product experience, health care worker (HCW) capacity to introduce the product and to support troubleshooting ahead of national scaleup. Phase II followed with 48 additional sites by August 2021. Across the 98 Phase II sites, 3,631 children were on pDTG by the time Global Fund delivered pDTG in October 2021, enabling Phase III implementation across all 671 sites serving CLHIV.

Lessons learned: Relative to most countries, a high proportion of the 6,900 eligible children (~53%) were on pDTG by December 2021. Swift stakeholder coordination, site-level trainings, monitoring visits, distribution of HCW materials and a comprehensive package of community resources enabled an effective rollout. A phased transition ensured building of supply chain experience with a

Author Index

new product during the COVID-19 pandemic. Caregivers, CLHIV, and HCWs across the 50 Phase I sites cited a preference of pDTG over LPV/r due to improved tolerability, simpler administration and palatability for children. A highlighted challenge has been pDTG 90-pack sizes, which have clinical implications on prescribing practices and patient monitoring in early phases of initiation.

Conclusions/Next steps: Malawi is one of the first countries to adopt and scale-up pDTG nationally. Given pDTG's superior clinical profile and tolerability, optimal viral suppression rates in children are anticipated. National HIV programs can learn from Malawi's experience as a best practice for rapid adoption of child-friendly treatment products.

EPE056

High mean weight gain among patients on Dolutegravir in Malawi

T. Maphosa[1], A. Ahimbisibwe[1], R. Machekano[2], L. Kapanda[1], R. Lumala[1], E. Masina[1], I. Muchacha[1], H. Nkhoma[1], R. Kanyenda[1], G. Woelk[2]

[1]Elizabeth Glaser Pediatric AIDS Foundation, Lilongwe, Malawi, [2]Elizabeth Glaser Pediatric AIDS Foundation, Washington DC, United States

Background: DTG ART was rolled out in Malawi starting January 2019. Some studies suggest excess weight gain after DTG initiation or switch, we evaluated weight gain after DTG ART initiation/switch in Malawi.

Methods: We conducted a retrospective study in children, adolescents and adults on ART using routine data from 40 selected Elizabeth Glaser Pediatric AIDS Foundation-supported sites across nine districts in Malawi.

We used multi stage systematic random sampling from nine districts, 179 health facilities categorized by age groups for children (0-9 years), adolescents (10-19) and adults (=> 20years). Data were abstracted from patient files, ART registers, laboratory registers and clinical cards for January 2017 to October 2020.

Primary outcome was "mean weight gain" at 6 and 12 months from DTG initiation/switch, defined as the difference in baseline weight (before DTG) and weight at the respective time points, stratified by sex and age.

Results: Of 3,109 clients, 60% were female and median age was 31 years (15-48) for females and 37 (20-54) for males. Overall, 96.1 were on DTG-based regimen. For ART-naïve clients, 6 months after initiating DTG there was no observed mean weight gain difference by sex: males, 1.7 [1.08,2.25], females, 1.2 [0.72,1.58] kg.

Children aged 0-9 years had lower mean weight gain, 0.1 [-1.45,0.63] kg compared to adolescents aged 10-19 years (1.7 [1.03, 2.38] kg) and adults aged $\geq$20 years (1.3 [0.93,1.69] kg). Twelve months after initiating DTG, overall mean weight gain was 2.9 [1.77,3.98] kg; there was no difference in mean weight gain by sex (males 2.7 [1.37,3.96] kg; females 3.1 [1.18,5.04] kg), but higher weight gain in adolescents aged 10-19 years versus adults (3.5 [2.83,4.22] vs 0.8 [0.32,1.29] kg, respectively). For ART-experienced clients transitioned to DTG from non-DTG regimen, mean weight gain at 6 and 12 months was 0.8 [0.57, 1.19] kg and 1.5 [1.098, 1.92] kg respectively; there were no differences in mean weight gain by sex and age.

Conclusions: The high mean weight gain in some sub-populations was observed and may present potential challenges to client's overtime. Weight gain among clients on DTG needs to be systematically monitored for possibility of adverse events through cased based surveillance systems.

EPE057

An increase in pediatric ART retention after the HIV test and treat policy implementation. A multi-site longitudinal analysis

S. Mutembo[1], S.K. Masenga[2], L. Sikazwe[3], M. Sakala[3], G. Mweemba[3], J. Mvula[3], S. Kunda[3], S. Kabesha[3], C. Cheelo[2], I. Fwemba[4], B.M. Hamooya[2]

[1]Johns Hopkins Bloomberg School of Public, International Vaccine Access Center, Department of International Health, Baltimore, United States, [2]Mulungushi University, School of Medicine and Health Sciences, Livingstone, Zambia, [3]Ministry of Health, Southern Provincial Medical Office, Choma, Zambia, [4]University of Zambia, School of Public Health, Lusaka, Zambia

Background: The test and treat approach has been used in pediatric antiretroviral therapy (ART) as a critical child survival strategy for children living with HIV. Because these children will be on ART for a lifetime, regular assessment of the impact of this approach is critical.

We evaluated outcomes of children enrolled on ART and assessed the impact of the pediatric ART test and treat policy.

Methods: We conducted a cross sectional time series data analysis in 845 children commenced on ART between January 1st, 2014 - July 31st, 2016 (before test and treat cohort (BTT), n=352 (41.7%) and August 1st, 2016 - October 1st, 2020 (after test and treat cohort (ATT)). The study was conducted in 42 health facilities in Southern province.

The primary outcome was retention, defined as regular attendance of ART appointments at 3, 6, 12, 24 and ³24 months after ART initiation. We assessed reasons for attrition and proportion of viral suppression (viral load <1000 copies/ml). To assess factors associated with retention, we used logistic regression (xtlogit model).

Results: The median age was 3 years (interquartile range (IQR): 1- 6) and 6 years (IQR: 2 - 9) in BTT and ATT cohorts, respectively. Overall retention was 80.7%, being higher in the ATT cohort (90.8% vs. 68.5%, p<0.001). At all-time intervals retention was significantly higher in the ATT cohort (Table1).

The reasons for attrition were stopped treatment (0.1%), transferred out (11.4%), lost to follow up (7.4%) and death (0.5%).

Viral suppression was 71.1% at 6 months and 80.0% at 12 months. ATT cohort were 4 times likely to remain on ART than the BTT cohort (aOR: 4.34 95%CI: 3.71-5.16) (Table 2).

Time point	(BTT)	(ATT)	P-value
	n=352	n=493	
3 months	68.2%	94.9%	<0.001
6 months	67.6%	91.4%	<0.001
12 months	68.2%	92.3%	<0.001
24 months	71.3%	91.8%	<0.001
>24 months	82.4%	92.3%	<0.001

Table 1. Comparison of retention at different time points.

Variable	aOR (95%CI)
Cohort	
BTT	ref
ATT	4,34 (3.71-5.16)
Age at enrollment (yrs)	1.01 (1.00-1.05)
Sex	
Male	ref
Female	0.73 (0.63-0.86)
Baseline ART based regimen	
NNRTIs (NVP & EFV)	ref
INSTI (DTG)	9.72 (4.91-19.25)
PI (LPV/r & ATV/r)	1.96 (1.16-3.31)

Table 2. Adjusted analysis of factors associated with retention using GEE to account for correlation structure within observations.

Conclusions: Although retention on ART has improved after ART test and treat, HIV viral suppression is still suboptimal. Our findings underscore the need to improve clinical management of children on ART.

EPE058

The impact of integrating person-centered accompaniment into HIV test-and-treat strategies in remote and low-resource settings: a case study of HIV quality improvement initiatives in Maryland County, Liberia

J. Lusaka[1], A.S. Bayiah[1], W.F. Badio[2], R. Cook[1], I. Sanoe[2], S. Toussaint[1]

[1]Partners in Health, Clinical, Monrovia, Liberia, [2]Ministry of Health, Clinical, Monrovia, Liberia

Background: HIV test-and-treat strategies, which were recommended by the World Health Organization in 2009 and universalized to include all people living with HIV (PLHIV) in 2015, have expanded antiretroviral therapy (ART) coverage worldwide. In low-resource settings, pervasive poverty, under-resourced health systems, and prevalent stigma nevertheless impede PLHIV from accessing testing and continuing treatment.

The conditions are exacerbated in Liberia,where just 65% of PLHIV knew their status in 2020. Nationally, 53% of PLHIV were on ART in 2020, while a 2013 cohort study found that only 70% of PLHIV remained on ART after 12 months.

In remote Maryland County, Partners In Health Liberia has strived to address these challenges and provide equitable, holistic care for PLHIV by implementing a comprehensive test-and-treat strategy.

Methods: This test-and-treat strategy paired quality improvement (QI) interventions on provider-initiated family testing (PIFT) and tracking and client enrollment (TRACE) with performance-based incentives for community health workers (CHWs) and clinicians to accelerate case finding and strengthen care linkages. Incorporated within this model, PLHIV received structured social support – including food, transportation, livelihoods training, peer counselling and HIV education – to address social-economic barriers to treatment access and adherence.

Under this person-centered accompaniment model, care providers walked should-to-shoulder with PLHIV throughout testing and treatment, with care delivery molded to patient needs, preferences and motivations. To institutionalize QI interventions, clinicians and supervisors regularly reviewed implementation and developed solutions to emerging challenges.

Results: From October 2020 to September 2021, 64% of newly diagnosed PLHIV (210/330) were linked to care, compared to 53% nationally in 2015. Under PIFT, 16 children below 15 were diagnosed with HIV, 81% of whom were linked to care. Through TRACE, CHWs reengaged and retained 79% of PLHIV (154/194) with interrupted treatment. Ten PLHIV received agricultural training to promote economic autonomy and wellbeing holistically.

Conclusions: Implementation strategies guided by QI and person-centered accompaniment models are fundamental for integrating high-quality HIV care in primary care. Project learnings have informed further interventions to improve treatment retention, clinical outcomes and economic self-sufficiency for PLHIV.

Additional research on behavioral and social factors that impact testing uptake and treatment retention can strengthen comprehensive test-and-treat frameworks.

EPE059

Assessing drivers of implementing the 'Scaling-up the Systems Analysis and Improvement Approach' for Prevention of Mother to Child Transmission in Mozambique (SAIA-SCALE) over implementation waves

C. Inguane[1], S. Gimbel[2], C. Soi[1], E. Tavede[3], F. Murgorgo[3], X. Isidoro[3], Y. Sidat[3], R. Nassiaca[3], J. Coutinho[4], M. Cruz[5], M. Agostinho[5], F. Amaral[5], A. Dinis[6,1], K. Ásbjörnsdóttir[7,8], J. Crocker[1], N. Manaca[9], I. Ramiro[10], M.d.F. Cuembelo[11], K. Sherr[1]

[1]University of Washington, Global Health, Seattle, United States, [2]University of Washington, Department of Child, Family and Population Health Nursing, Seattle, United States, [3]Direcção Provincial de Saúde, Chimoio, Mozambique, [4]Comité para a Saúde de Moçambique (CSM), Beira, Mozambique, [5]Comité para a Saúde de Moçambique (CSM), Chimoio, Mozambique, [6]Ministério da Saúde, Direcção Nacional de Saúde Pública, Maputo City, Mozambique, [7]University of Iceland, Centre for Public Health Sciences, Reykjavík, Iceland, [8]University of Washington, Department of Epidemiology, Seattle, United States, [9]Health Alliance International, Beira, Mozambique, [10]Comité para a Saúde de Moçambique (CSM), Maputo City, Mozambique, [11]Universidade Eduardo Mondlane, Medical School, Maputo City, Mozambique

Background: The Systems Analysis and Improvement Approach (SAIA) is an evidence-based package of systems engineering tools designed to improve patient flow through the prevention of mother-to-child transmission of HIV (PMTCT) cascade. SAIA is a potentially scalable model for maximizing benefits of universal antiretroviral therapy (ART) for mothers and their babies. SAIA-SCALE is a stepped wedge trial being implemented in Manica province, Mozambique, to evaluate SAIA's effectiveness when administered by health facility workers, rather than by study nurses.

We present results of a qualitative assessment of drivers of successful implementation of SAIA-SCALE over two implementation waves, covering two intensive phases and one maintenance phase.

Methods: We used an extended case study design which embedded the Consolidated Framework for Implementation Research (CFIR) to guide data collection, analysis, and interpretation. Between March 2019 and March 2020, we conducted in-depth individual interviews (IDI) and focus group discussions (FGD) with district managers, health facility Maternal and Child Health (MCH) managers and frontline nurses in 21 health facilities and seven districts of Manica Province (Chimoio, Báruè, Gondola, Macate, Manica, Sussundenga, and Vanduzi).

Results: We included 82.5% (n=85/103) of the anticipated participants: 50 through IDIs and 35 from 3 FGDs. Nearly all study participants were women (98%), mostly frontline nurses (49.4%) and MCH health facility managers (32.5%). The key facilitator of successful implementation of the intervention (regardless of intervention wave or phase) was related to the intervention's compatibility with organizational structures, functioning, processes, and priorities of Mozambique's health system at the district and health facility levels. Key barriers to successfully implementing SAIA-SCALE were

a. Inadequate health facility and road infrastructure preventing mothers from accessing MCH/PMTCT services at health facilities, and those inadequacies distracting nurses from focusing on improving data quality and service provision; and

b. Challenges in managing intervention funds in some districts.

Conclusions: Our qualitative evaluation suggests that SAIA's scalability for PMTCT depends on the intervention's amenability to fit within organizational structures, functioning, processes, and priorities of local health systems. Inadequate infrastructures and resource management at the health facility and district levels of those health systems can threaten scalability.

EPE060

Effects of Dolutegravir on the liver: a meta-analysis involving 37 965 HIV patients

I.S. Onwubiko[1], N.M. Isiozor[2], D. Vogelsang[3], H. Laitinen[4], G. Ndubueze[5]

[1]Achieving Health Nigeria Initiative, Prevention, Care and Treatment, Umuahia, Nigeria, [2]University of Eastern Finland, Research, Eastern Finland, Finland, [3]Maastricht University, Faculty of Health, Medicine and Life Sciences, Maastricht, Netherlands, the, [4]University of Eastern Finland, Information Department, Eastern Finland, Finland, [5]Achieving Health Nigeria Initiative, Prevention, Care and Treatment, Nnewi, Nigeria

Background: HIV implementation in the tropics especially sub-Sahara Africa is still under the support of donor agencies. Over the years, the region has experienced donor fatigue resulting in cutdown of activities to be supported. This includes cutdown in supporting baseline and routine investigations especially liver function test (LFT) for persons living with HIV (PLHIV). This has contributed to a financial burden to the individuals as they have to do out-of-pocket expenses for LFTs.

One of the recommended first-line antiretroviral therapy for HIV patients is dolutegravir (DTG), which is also a major component of various antiretroviral combinations. Some studies have reported deranged liver enzymes, however, the hepatoxic effects of DTG is not yet proven.

The objective is to conduct a preliminary meta-analysis evaluating the hepatotoxic effects of DTG among PLHIV.

Methods: PubMed was searched for relevant articles published until January 2022. Relevant articles from references were included. Relevant English language articles using the search terms dolutegravir, soltegravir, Liver/drug effects, Liver Diseases, hepatic disease, hepatitis and hepatic failure.

Case reports, reviews, and articles without data on outcome were excluded.Articles were initially screened based on title and abstract by two reviewers. Discrepancies are settled by discussion and consensus including a third reviewer. Relevant data were extracted and the pooled relative risk (RR) with 95% confidence intervals (CIs) were estimated. The heterogeneity was measured using I^2 test. A total of 84 papers were retrieved, of which sevenmet the inclusion criteria, but one study did not record any hepatic derangements leaving six studies which were then analyzed.

Results: A total of 736 cases of elevated liver enzymes and liver diseases were recorded. There was no significant association found between DTG or DTG-containing combinations and the risk of liver toxicity or deranged liver function enzymes with pooled risk ratio (95%CI) 0.75 (0.55-1.02) p=0.07, I^2 =75.35.

Conclusions: There is no significant hepatic burden of DTG and DTG-containing antiretroviral medications in PLHIV. Routine practice of requesting LFTs prior to the use of DTG, particularly in sub-Saharan Africa, may not be necessary unless there are other underlying medical conditions that would make such investigation beneficial to PLHIV.

EPE061

The effect of a targeted quality improvement intervention to improve access to antiretroviral therapy (ART) services for key populations in Zambia

M. Nalwamba[1], S. Wenson[1], J. Kamanga[1], N. Phiri[2], M. Bateganya[3], F. Mwape[1], E. Oladele[1]

[1]FHI 360 Zambia, Lusaka, Zambia, [2]United States Agency for International Development, Lusaka, Zambia, [3]FHI 360, Durham, United States

Background: The USAID Open Doors Project (ODP) is a five-year project aiming to increasing access to and use of comprehensive HIV prevention, care, and treatment services by key population individuals including female sex workers (FSWs), men who have sex with men (MSM) and transgender people. An ODP implementing partner, ZANERELA+, faced challenges in linking HIV-positive key populations to clinical HIV services, after joining the project in October 2020. A quality improvement (QI) intervention was implemented with a goal of 95% of newly diagnosed clients were linked.

Description: A QI team of two clinical officers and two medical doctors implemented QI activities over six weeks in collaboration with ZANERELA+. Starting December 1, 2020, the following interventions were implemented:

- Engaged ZANERELA+ staff in a root cause analysis and driver diagram to identify specific issues
- Developed job descriptions with defined responsibilities for health care providers and lay counselors
- Developed and implemented weekly virtual and onsite mentorship on pre-ART counseling for program/clinical staff over six weeks
- Demonstrated field-based HIV status probing skills for staff counselor
- Established designated zones for client outreach

Lessons learned: In the first quarter of fiscal year 2021 (Q1 FY21), the linkage rate for key population groups was 48% (FSW n=32 (50%), MSM n=5 (80%), transgender n=2 (0%)). Majority of unlinked clients were tested during community-based outreach (n=11) and were between the ages 20-29 (n=8). Linkage increased to 99.4% (FSW 99%, MSM 100%, transgender 100%) by March 2021, after the completion of Q1 interventions. Among previously unlinked FSWs, 92% (n=12) were initiated on care. All MSM (n=1) and transgender (n=2) clients were initiated, resulting in 100% linkage.

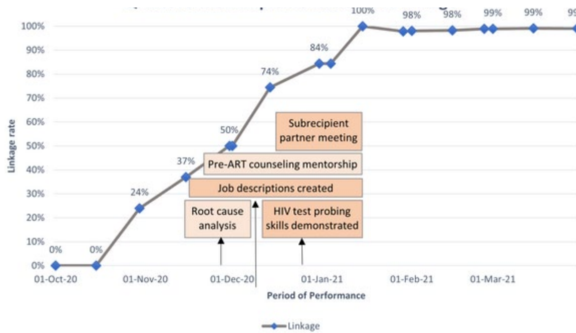

Figure. QI intervention implementation and linkage.

Conclusions/Next steps: Average monthly linkage increased from 27% before the QI intervention to 98% after intervention activities were completed. We recommend that QI be extended to other subrecipients to improve service delivery and organizational capacity.

EPE062

How are interventions implemented to improve global HIV prevention and treatment? A systematic review of published implementation strategies used in low- and middle-income countries

S. Lujintanon[1,2], C.G. Kemp[1,3], I. Eshun-Wilson[4], L. Beres[1,3], S. Schwartz[1,2], S. Baral[1,2], R. Thompson[2], N. Le Tourneau[4], B. Fox[4], E.H. Geng[4]

[1]Johns Hopkins Bloomberg School of Public Health, Center for Implementation Research and Practice, Baltimore, United States, [2]Johns Hopkins Bloomberg School of Public Health, Department of Epidemiology, Baltimore, United States, [3]Johns Hopkins Bloomberg School of Public Health, Department of International Health, Baltimore, United States, [4]Washington University School of Medicine in St. Louis, Division of Infectious Diseases, St. Louis, United States

Background: Understanding the characteristics, breadth, and overall landscape of current HIV implementation research can help identify critical gaps and inform future investigation and service delivery. The LIVE project (Living Database of HIV Implementation Science) conducted a systematic review to describe the features of implementation strategies included in published studies of HIV interventions in low- and middle-income countries (LMICs).

Methods: Embase and Medline databases were searched for HIV studies published after 2004. Abstract and full texts were screened for studies of any design, in any LMIC population, that described intervention implementation and reported at least one HIV cascade outcome. Strategies were extracted per the Proctor et al. framework (e.g., actor, action, action target). Waltz et al. clustered strategies were used to characterize strategies across the HIV care cascade.

Results: Between 1-Jan-2014 and 3-Feb-2022, 42,595 abstracts were identified, 1,531 (3.6%) were included for full-text review, and 418 (27.3%) met inclusion criteria. Included studies were from Africa (82.5%), Asia-Pacific (11.5%), the Americas (4.8%), and Europe (1.2%).

We identified 3,253 total strategies (Figure 1, median 6 per study, range 1-44), representing 409 unique actor-action-action target combinations. Strategies targeted HIV prevention (5.3%), testing (29.5%), and treatment (65.2%).

The most used strategies involved members of the healthcare workforce engaging patients (e.g. providing education on HIV treatment or prevention, providing routine HIV counseling; 45.5%) and adapting and tailoring interventions to the implementation context (12.8%). Many strategies also involved study teams engaging patients (9.1%) or training providers and other stakeholders (6.3%). Evaluative/iterative and financial strategies were less commonly applied.

Implementation strategies	Actors implementing the strategy							Total
	Patients	Community/ society	Healthcare workforce	Policymakers	Researchers	Other organization employees	Not Applicable	
Adapt and tailor intervention to context	1 (0.0%)	1 (0.0%)	415 (12.8%)	6 (0.2%)	74 (2.3%)	2 (0.1%)	7 (0.2%)	506 (15.6%)
Change infrastructure	0 (0.0%)	1 (0.0%)	158 (4.9%)	3 (0.1%)	16 (0.5%)	0 (0.0%)	1 (0.0%)	179 (5.5%)
Develop stakeholder interrelationship	2 (0.1%)	4 (0.1%)	74 (2.3%)	6 (0.2%)	32 (1.0%)	2 (0.1%)	1 (0.0%)	121 (3.7%)
Engage patients	28 (0.9%)	41 (1.3%)	1480 (45.5%)	4 (0.1%)	297 (9.1%)	7 (0.2%)	23 (0.7%)	1880 (57.8%)
Provide interactive assistance	0 (0.0%)	0 (0.0%)	12 (0.4%)	0 (0.0%)	5 (0.2%)	0 (0.0%)	0 (0.0%)	17 (0.5%)
Train and educate stakeholders	0 (0.0%)	7 (0.2%)	153 (4.7%)	6 (0.2%)	204 (6.3%)	2 (0.1%)	17 (0.5%)	389 (12.0%)
Use evaluative and iterative strategies	2 (0.1%)	4 (0.1%)	32 (1.0%)	1 (0.0%)	39 (1.2%)	1 (0.0%)	1 (0.0%)	80 (2.5%)
Utilize financial strategies	0 (0.0%)	2 (0.1%)	23 (0.7%)	5 (0.2%)	48 (1.5%)	2 (0.1%)	1 (0.0%)	81 (2.5%)
Total	33 (1.0%)	60 (1.8%)	2347 (72.1%)	31 (1.0%)	715 (22.0%)	16 (0.5%)	51 (1.6%)	3253 (100.0%)

Figure 1. Implementation strategies and actors.

Conclusions: Use of healthcare workforce to engage patients has been commonplace in published evaluations of HIV services. Few studies reported providing technical assistance, changing financial systems, conducting service evaluation, or involving individuals affected by HIV and policymakers in the implementation process. There is a need to evaluate other promising strategies for implementation effectiveness.

EPE063

Implementation of a readiness assessment tool to support the transition of adolescents living with HIV to adult care in Kenya

N. Gitahi[1,2], D. Mangale[2], I. Njuguna[3], C. Mburu[4,2], C. Mugo[5,1], D. Wamalwa[6], G. John-Stewart[7], K. Beima-Sofie[8]

[1]Kenyatta National Hospital, Nairobi, Kenya, [2]University of Washington, Departments of Global Health, Seattle, United States, [3]University of Washington, Nairobi, United States, [4]University of Nairobi, Nairobi, Kenya, [5]University of Washington, Departments of Global Health, Nairobi, United States, [6]University of Nairobi, Department of Pediatrics and Child Health, Nairobi, Kenya, [7]University of Washington, Seattle, United States, [8]University of Washington, Departments of Global Health, Nairobi, Kenya

Background: Tools assessing the transition from child-centred to adult care can improve outcomes among youth living with HIV (YLH). Within an ongoing clinical trial (Adolescent Transition to Adult Care for HIV-infected Adolescents in Kenya – ATTACH) evaluating the effectiveness of an Adolescent Transition Package (ATP), we determined experiences of clinic-based study staff who administered a transition readiness assessment tool.

Methods: Between January and March 2021, we conducted semi-structured interviews with ten research staff who administered a transition readiness assessment to 1066 YLH (ages 14-24) enrolled in the ATTACH study. The ATP was delivered to YLH by existing health care workers physically and later by phone during the Covid 19 pandemic. The effectiveness outcome &transition readiness was assessed by study staff. The tool included a combination of open-ended and rubric questions. Interviews were audio-recorded, transcribed, converted into structured debrief reports. We utilized thematic analysis grounded in the RE-AIM (Reach, Effectiveness, Adoption, Implementation Maintenance) framework, to identify attributes impeding or facilitating assessment of transition readiness.

Results: Participants described rapport building with YWH, access to private spaces, and supportive facility staff as critical in optimizing reach. Shifting to phone delivery of the assessment during COVID-19 negatively affected reach, limiting access to YLH lacking consistent phone access.

Participants perceived the tool to be adequate in assessing transition readiness. YLH engaged in facility support groups, had family social support & had received early disclosure performed better. Males often had not disclosed to partners and had little knowledge on sexual and reproductive health compared to females. Most YLH struggled with remembering antiretroviral names and understanding viral load cut-off measures.

Questions about sensitive topics, such as disclosure and sexual and reproductive health topics, were most challenging to ask. Participants recommended standardized rubrics for open-ended questions on HIV literacy and

strategies for asking sensitive questions. Incorporation of the tool within patient encounter forms and leveraging peer educators to address overwhelmed clinic staff were described as potential strategies for adoption of the tool.

Conclusions: Integration into routine clinic settings of the transition assessment tool will require optimization to include rubrics for grading open-ended responses and incorporation into routine clinic tools.

EPE064

Improving TLD transition coverage among people living with HIV in Nkurenkuru District, Namibia

T. Danda[1], M. Saidi[1], M. Sahani[2], F. Mutuku[2], S. Ncube[1], J. Sikwaya[1], V. Kamenye[1], U. Kornelius[1], A. Katura[1], E.-L. Kafidi[1], M. Shephard[1], A. Ensiminger[3], J. Kamangu[2], L. Bikinesi[2], G. O'Malley[3], N. Forster[1], R.M. Mwin Mat[1]

[1]I-TECH Namibia, Windhoek, Namibia, [2]Ministry of Health and Social Services, Windhoek, Namibia, [3]University of Washington, Washington, United States

Background: The Namibia Ministry of Health and Social Services' (MoHSS) revised ART guidelines launched in August 2019 adopted the WHO recommendation of Tenofovir, Lamivudine, and Dolutegravir (TLD) as the preferred first-line antiretroviral therapy (ART) regimen for people living with HIV as TLD has a high genetic barrier, potential to improve adherence and retention with better drug tolerance, and reduced side effects. Transition of patients to TLD started in October 2019 but nationwide transition was slow. In January 2020, the MoHSS decided to improve TLD transition by setting regional and district targets for patient transition.

At the time of target setting, Nkurenkuru Health District (Kavango West region, Namibia) had transitioned 585 patients (16%) to TLD out of an estimated 3,727 eligible patients.

Description: Health facility teams used a quality improvement (QI) approach to identify challenges to TLD transition. Gaps included: lack of HCW training on how to transition patients; HCW discomfort with transitioning female clients due to presumed DTG side effects; and no monitoring tool in place. In response to these findings, change ideas were developed using plan, do, study, act (PDSA) cycles.

Lessons learned: From January to December 2020, TLD transition improved from 585 (16%) to 3,515 (94%) of the 3,727 estimated eligible patients. A significant improvement was noted in the first month with TLD transitions doubling from 16% to 33%. In that month, key change idea(s) implemented which proved successful were strengthening teamwork and team spirit, training of staff on TLD transition, generating lists of patients eligible for TLD transition from the electronic Patient Management System (ePMS) to distribute to the facilities, appointing a focal nurse in each facility, establishing a monitoring tool to track progress, holding monthly QI meetings to review performance data and discuss progress, and providing of regular onsite and virtual mentorship support.

Conclusions/Next steps: Strengthening HCW teamwork and commitment, establishing a dedicated monitoring tool, and consistent monthly QI meetings to review results and plan next steps were key in improving TLD transition across ART sites in Nkurenkuru Health District. Other health facilities could adopt these processes to accelerate and improve TLD transition.

EPE065

Outcomes and implementation considerations for optimizing dolutegravir based antiretroviral therapy among PLHIV in Northern Uganda

R. Nasambu[1], R. Nekaka[1], S. Ajedra[1], J. Okello[1], A. Kateemu Nuwahereza[1], G. Sangadi[2], P. Ddongo[1], M. Makumbi[1]

[1]John Snow Initiative Inc., USAID Regional Health Integration to Enhance Services North Lango Programme (RHITES-N Lango), Kampala, Uganda, [2]Joint Clinical Research Centre, USAID Local Partner Health Services North Lango Programme (LPHS-N Lango), Kampala, Uganda

Background: In 2018, Ministry of Health (MOH) Uganda adopted WHO's guidance to switch 1st line ART from NNRTIs to dolutegravir (TLD/DTG) following optimal efficacy and safety. This study assesses the outcomes and implementation considerations for TLD/DTG optimization to guide policy action.

Description: *Setting*: 70 health facilities in nine districts of Lango sub-region, post-conflict northern Uganda with 78,000 people living with HIV (PLHIV) supported by USAID Regional Health Integration to Enhance Services-North, Lango (RHITES-N Lango) project.

Intervention design: An implementation study was conducted between March–December 2018 (before) and January 2019–September 2021 (after). The phase one trainer-of-trainer TLD/DTG course for 30 participants was followed by onsite facility-based trainings in 18 priority hospitals. This informed phase two of 52 health facilities. MOH and RHITES-N Lango supervised and provided hands-on mentorship.

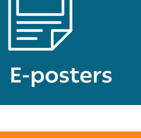
Outcome measures: Viral load suppression and uptake of TLD/DTG.

Data analysis: The DHIS-2 was used for data management and analysis.

Lessons learned: All 70 health facilities optimized TLD/DTG by September 2021, within three years. Emerging safety data permitted inclusion of reproductive age women mid-implementation, doubling targets from 40,000 to 80,000 PLHIV; with a slow initial uptake of TLD/DTG during phase one that markedly improved in phase two (15% to 92%, Figure 1). PLHIV with suppressed viral load increased from 85% to 94% after optimization of TLD/DTG (figure 2). Key implementation concerns were the national guidelines, laboratory systems, knowledge, and perceptions of healthcare providers. These included:

Oral abstracts

Poster exhibition



E-posters

Late-breaker abstracts

Author Index

- Initial deficits in DTG-specific knowledge among providers
- The requirement for baseline viral load testing
- Stock outs from multi-month dispensing
- Hesitancy to transition thriving PLHIV on NNRTI regimen to TLD/DTG.

However, the MOH guidelines were unclear around effective contraception for women of childbearing age; had a discrepancy of weight bands (30kgs versus 35 kgs in checklist versus guidelines) and there was a delay in providing official consent forms.

Conclusions/Next steps: This study depicts successful optimization of TLD/DTG with high viral load suppression in a resource-constrained setting. Health systems bottlenecks contributed to the initial lag in TLD/DTG optimization that were effectively circumvented. Formative evaluations at start of ART optimization could inform future programming.

EPE066

Observed time to HIV treatment initiation in the era of same-day initiation in Malawi, South Africa, and Zambia

A. Huber[1], K. Hirasen[1], B. Phiri[2], T. Tchereni[3], A. Gunda[3], H. Shakwelele[2], P. Haembe[2], B. Matola[4], L. Mulenga[4], S. Rosen[5]

[1]University of the Witwatersrand, Health Economics and Epidemiology Research Office, Johannesburg, South Africa, [2]Clinton Health Access Initiative, Zambia, Lusaka, Zambia, [3]Clinton Health Access Initiative, Malawi, Lilongwe, Malawi, [4]Ministry of Health, Lusaka, Zambia, [5]Boston University School of Public Health, Department of Global Health, Boston, United States

Background: Since 2017 global guidelines have recommended "same-day initiation" (SDI) of antiretroviral treatment (ART) for patients considered ready for treatment on the day of HIV diagnosis. Many countries in sub-Saharan Africa have incorporated a SDI option into national guidelines, but uptake of SDI is not well documented. We estimated average time to ART initiation at 12 public healthcare facilities in Malawi, 5 in South Africa, and 12 in Zambia.

Methods: We sequentially enrolled patients who were eligible to start ART between January 2018 and June 2019 and reviewed their medical records from the point of HIV treatment eligibility (HIV diagnosis or first HIV-related interaction with the clinic) to the earlier of treatment initiation or 6 months. We estimated the proportion of patients initiating ART at their original healthcare facilities on the same day or within 7, 14, 30, or 180 days of baseline, stratified by country and gender.

Results: We enrolled 850, 535, and 1,990 patients in Malawi, South Africa, and Zambia, respectively (Table 1). 88% of patients in Malawi, 57% in South Africa, and 91% in Zambia were offered and accepted SDI. In Malawi, most patients who did not receive SDI had also not initiated ART ≤6 months. In South Africa, an additional 13% of patients initiated ≤1 week, but 22% had no record of initiation ≤6 months. Among those who did initiate within 6 months in Zambia, nearly all started ≤1 week. There were no major differences by gender.

Time to ART initiation after HIV diagnosis or first HIV-related clinic visit (n, %)	Malawi (n=850)		South Africa (n=535)		Zambia (n=1990*)	
	Male (n=412)	Female (n=438)	Male (n=233)	Female (n=302)	Male (n=973)	Female (n=1017)
0 days (same-day initiation)	363 (88.8%)	376 (87.4%)	131 (56.2%)	173 (57.3%)	886 (91.1%)	932 (91.6%)
7 days	7 (1.7%)	7 (1.6%)	33 (14.2%)	36 (11.9%)	57 (5.6%)	39 (3.8%)
14 days	2 (0.5%)	2 (0.5%)	3 (1.3%)	9 (3.0%)	12 (1.2%)	22 (2.2%)
30 days	2 (0.5%)	3 (0.7%)	11 (4.7%)	6 (2.0%)	8 (0.8%)	6 (0.6%)
31 days to 6 months	3 (0.7%)	1 (0.2%)	4 (1.7%)	11 (3.6%)	8 (0.8%)	17 (1.7%)
Did not initiate ≤6 months	35 (8.5%)	49 (11.2%)	51 (21.9%)	67 (22.2%)	2 (0.2%)*	1 (0.1%)*

*Zambia data for patients who never initiated ART may not be complete.

Table 1. Time to ART initiation in Malawi, South Africa and Zambia by gender and country.

Conclusions: Uptake of same-day ART initiation is widespread in Malawi and nearly universal in Zambia but is considerably less common in South Africa. Limitations of the study include pre-COVID-19 data that do not reflect pandemic adaptations and potentially missing data for Zambia. South Africa may be able to increase overall ART coverage by reducing numbers of patients who do not initiate ≤6 months.

EPE067

Different Anti-Retroviral Therapy dispensing intervals and distribution of adverse follow up outcomes in stable patients

H. Oo[1], M. Mon[1], P. Soan[1]

[1]Ministry of Health, Disease Control, Zabuthiri, Myanmar

Background: Extending clinic appointment intervals by dispensing more medication to stable patients was one of the strategies which can be implemented without any additional resources, it can minimize patient's opportunity cost, clinic congestion and improve quality of care. This study aimed to assess adverse follow-up outcomes (missed appointments and lost to follow up) among different following intervals in stable patients on Anti-Retroviral TherapyART in 83 ART facilities in Myanmar.

Methods: This study analyzed collected program data and data of stable patients (patients on ART for at least one year and having viral suppression or having baseline or recent CD4 count>200 cells/m^3) with valid visit dates extracted. The missed appointment was defined as >14 days late and lost to follow up (LTFU) was >90 days late for the appointment.

Results: A total of 68,824 stable patients visited study sites at least once between 1st September 2019 and 31st August 2020. The median age (interquartile range: IQR) was 39 (32-46) years, 31,272 (45.4%) were female, 38,834 (56.4%) were married, 41,251 (59.9%) were employed and 57.306 (83.3%) were literate. Appointment intervals and follow-up delays were calculated for visits with valid dates. The median (IQR) number of visits made by patients was 3 (2-4) visits. Of 190,972 visits with valid dates, 86,877 (45.5%) visits were three-month appointment interval, and 49,426 (25.8%) visits were ≥6 months appointment interval. Visits with the next appointment dates beyond the

study period were excluded in calculating the distribution of adverse follow-up outcomes. The proportion of visits having missed appointments and LTFU outcomes were 19.80% and 10.22% in <3weeks interval, 2.26% and 0.23% in 3 months interval and 2% and 0.16% in ≥6 months interval.

Conclusions: Visits with the shortest appointment interval had the highest proportion of missed appointments, and LTFU and 3 months and ≥6 months intervals had a similar proportion of adverse follow-up outcomes.

This study can be one of the supporting documents for making clinic appointments with multi-month dispensing in stable patients. It is recommended to extend the analysis to assess the effect of facilities level factors, individual factors and clinical conditions on adverse follow-up outcomes.

EPE068

PMTCT option B+ implementation at the primary level of care in the Ashanti Region of Ghana; challenges

D. Bandoh[1], D. Bandoh[2]

[1]Ghana Health Service/National Aids Control Programme, Ashanti Regional Health Directorate - Public Health Unit, Kumasi, Ghana, [2]Dr Thomas Agyarko Poku, Regional Health Directorate, Kumasi, Ghana

Background: The more efficacious Option B+ strategy for the prevention of mother-to-child transmission (PMTCT) of HIV has been implemented in Ghana over the past six years including the provision of ART services at the primary care. This baseline study assesses challenges facing service delivery at the primary care levels in the Ashanti Region of Ghana.

Methods: Four hundred and fifty health care providers made up of health care assistants, community nurses, enrolled nurses, midwives, physician assistants with between 2 and 4 years in services were selected from 75 health facilities.

The primary level of care is defined by the Ministry of Health, Ghana as CHPS compounds, clinics, maternity homes and health centres) in the Ashanti Region of Ghana offering PMTCT service. Facility geographical location (Urban and Rural) and ownership (public, private and mission) were conferred. Data including socio-demographic information was collected using a structured questionnaire. Data were analysed using SPSS 16.

Results: A majority (68.1%; 307/450) of respondents were aged 45 years and below. More than half (56.9%; 256/450) of the respondents had worked just under 2 years, with 32.1%; (144/450) and 11.0% (49/450) over 2 years and 4 years respectively. 90.1% (405/450) mentioned stigmatization as explained by the closeness of the health facility to their communities, preventing the women to access care. 65.1% reported the uncooperative attitude of pharmacists in terms of releasing of ARVs to lower levels. Lack of confidence among the respondents was a major issue from inadequate training (70.2%; 316/450). Inconsistent supplies of logistics including medicines were a major concern for over three-quarters of the respondents (72.9%; 328/450). There were no significant differences between the respondents' responses and geographical location (p-value 0.789) and facility ownership (p-value -0.699).

Conclusions: The study found stigmatization, erratic supply of commodities, inadequate training and lack of support from pharmacists as the main challenges facing health care providers at the primary levels of care.

There is the need to urgently attend to these challenges to ensure the success of the PMTCT option B+.

EPE069

Impact of Daily Situation Rooms (analysis) in increasing linkage to care among people living with HIV

M. Mumbalanga[1], B. Chirwa[2], E. Sadoki[3], F. Chirowa[4]

[1]Right to Care, HIV Testing Services, Kasama, Zambia, [2]Right to Care, Deputy Chief of Party, Lusaka, Zambia, [3]Right to Care Zambia, Technical, Lusaka, Zambia, [4]Right to Care, Monitoring and Evaluation, Kasama, Zambia

Background: Zambia has a high burden of HIV, with a prevalence rate of 11.1%, 85.4% on treatment, and 85% % virally suppressed. To achieve epidemic control, all HIV-positive individuals must be linked and retained on treatment. Zambia adopted the test and treat with a rapid treatment initiation approach following WHO guidelines.

Description: Right to Care is implementing HIV Direct service delivery in Northern, Luapula, and Muchinga Provinces. Activities are based on the 95-95-95 objectives (testing, linkage, and viral suppression. RTCZ's experience of linkage to treatment in Zambia is described through monitoring of linkage to care during the Daily Situation Room (DSR).

Data from facilities was analyzed and performance against targets discussed in the DSR. When facilities were not linking HIV-positive patients to treatment the same day, reasons and action points were documented in an issue log. These reasons included: client not ready had co-morbidity requiring treatment first, consulting partner, clinician unavailable to initiate treatment.

Lessons learned: At the inception of DSRs, linkage to care was as low as 83%. An increase of 22% linkage occurred between the first quarter and second quarter exceeding the expected target of 95% to 100% linkage. This increase was due to consistent follow-up of clients un-initiated, thus, linking 2,483 clients from 2373 positive clients. Linkage was sustained at 94% throughout the third and fourth quarters.

Northern and Muchinga Provinces consistently achieved above 95% target from first quarter to third quarter. Luapula Province improved linkage from 83% (first quarter) to 105% (second quarter).

Oral abstracts

Poster exhibition

E-posters

Late-breaker abstracts

Author Index

Linkage was consistently sustained at 95% in the third and fourth quarters. In the second quarter, there was over 100% linkage due to following up of uninitiated positives from the first quarter

Conclusions/Next steps: Consistent monitoring of performance during the DSR resulted in progressive improvement in the linkage of positive clients in the three Provinces.

This process helps identify problems in linkages take prompt action and offers such an opportunity for comparative analysis in performance.

EPE070

Predictors of unsuppressed viral load in pediatrics and adolescent HIV positive clients on ART in Zambia: an implementation study

T.M. Jere-Nonde[1]

[1]Right to Care Zambia, Technical, Kasama, Zambia

Background: Right to care Zambia, is providing direct service delivery in Northern, Muchinga and Luapula provinces since 2016. Data has shown a high proportion of children and adolescents usually present with a high viral load, leading to high rates of morbidity and mortality.

The understanding of the predictors leading to unsuppression in children will lead to implementations of improved care and treatment in children and adolescents.

Description: This is evidence from viral load results, enhanced adherence counselling (EAC) register. Unsuppressed viral load (VL) in PLHIV on antiretroviral therapy (ART) occurs when treatment fails to suppress the client's VL, this is associated with decreased survival increased morbidity and increased HIV transmission.

Data was analysed through the electronic medical records system SMARTCARE of ART patients with a VL result on record who started ART between January 2004 and April 2016 from 271 public health facilities. A descriptive and multivariable logistic regression for unsuppressed VL at last visit using a priori variables.

This triggered the need to conduct a cross sectional study, to find out, why pediatrics and adolescents present with unsuppressed VL. treatment outcomes.

Lessons learned: Children and adolescents are most likely to have no permanent home due to their parents being ill and not being able to provide for them or deceased. There was also a significant number that did not know why they were on treatment. The older children who had found out their HIV status by themselves held it as a grudge to their parents.

Other reasons were stigma, fear of change in body image, etc. With counselling, peer support the outcomes of care improved for alder children. The introduction of highly optimized drugs has also improved outcomes. Lopinavir syrup is very bitter and not palatable. Counselling and support of care givers has also helped to improve outcomes.

Conclusions/Next steps: There's need to develop and evaluate targeted interventions for children and adolescents in care who are at high risk of unsuppressed VL. Best suited interventions have proved to result in better outcomes. Differentiated models of care like multi-month dispensation have shown better adherence and compliance which leads to higher suppression rates.

EPE071

Task-shifting and differentiation of care for nurses and outreach workers in harm reduction strengthens HIV care continuum in Kazakhstan – Project Bridge

S. Primbetova[1], M. Darisheva[1], O. Shane Gatanaga[2], T. McCrimmon[3], A. Terlikbayeva[1], T. Hunt[2], E. Wu[2], L. Gilbert[2], A. Davis[2], A. Dasgupta[2], O. M Cordingley[2], N. El-Bassel[2]

[1]Global Health Research Center of Central Asia, Almaty, Kazakhstan, [2]Columbia University, School of Social Work, New York, United States, [3]Columbia University, Mailman School of Public Health, New York, United States

Background: There is a large increase of new HIV cases in Kazakhstan, where nurses and outreach workers in needle and syringe programs (NSPs) are one of the main providers of harm reduction services to key populations.

The Bridge intervention revolutionizes the NSPs' role in the existing HIV care system in Kazakhstan, transforming them from ordinary harm reduction programs into integrated HIV care continuum services. This task-shifting approach was reinforced through training and supervision of nurses and outreach workers.

Methods: We examined the impact of the Bridge intervention on NSP workers' roles in HIV care, their ability to perform jobs in HIV care. We conducted a pre-intervention and post-intervention survey with NSP staff (nurses (n=20) and outreach workers (n=44)) in three project sites (Almaty, Shymkent, Karaganda/Temirtau).

Survey questions focused on how Bridge's task-shifting and program training impacted staff attitudes towards HIV care services, motivations to change, and attitudes towards PWID. Data analytics software R was used to perform statistical analysis.

Results: A descriptive univariate analysis of attitudes towards Bridge services indicates that both nurses and outreach workers viewed HIV testing, HIV care service linkage, confirmatory HIV testing, and non-HIV service referrals favorably. From the beginning of the intervention, both nurses and outreach workers held relatively open-minded views about PWID and recognized the importance of HIV care services. Six months after the implementation, attitudes towards these topics remained consistently high.

A majority of staff agreed that:

1. PLWH should not feel ashamed of themselves (83.9%),
2. HIV is not a punishment for bad behavior (69.4%),
3. Women living with HIV should be allowed to have babies if they wish (95.2%), and;
4. Staff would prefer to provide services to PWID (85.5%).

On the other hand, staff overwhelmingly agreed that people get infected with HIV because they engage in irresponsible behaviors.

Conclusions: NSP could play an important role in all stages of the HIV care continuum. Task-shifting was implemented successfully in project study sites, as both nurses and outreach workers showed confidence and understanding about their roles in HIV care service delivery, and had favorable attitudes around the services they were trained to provide to PWID.

EPE072

Antiretroviral drug pick-up compliance and association with viral suppression among children living with HIV in north-central Nigeria

T.L. Jasper[1], O. Eniade[2], E. Amadosi[2], L. Ezekwe[2], N. Torbunde[3], N. Sam-Agudu[4,5]

[1]Institute of Human Virology Nigeria, Learning and Development, Abuja, Nigeria, [2]Institute of Human Virology, Nigeria, International Research Center of Excellence, Abuja, Nigeria, [3]Elizabeth Glaser Pediatric AIDS Foundation, Abuja, Nigeria, [4]Institute of Human Virology, Nigeria, Pediatric and Adolescent HIV, Abuja, Nigeria, [5]Institute of Human Virology, University of Maryland, Baltimore, United States

Background: The ultimate impact of increased antiretroviral therapy (ART) availability for Children Living with HIV (CLHIV) is on viral suppression as a result of timely drug pick-ups and medication adherence. Compliance with expected drug pick-ups may be used as a proxy for medication adherence. We assessed drug pick-up compliance and its association with viral suppression among CLHIV in North-central Nigeria.

Description: In this retrospective chart review, we abstracted data from ARV refill records for CLHIV aged 6 months to 10 years across six HIV treatment centers in Federal Capital Territory and Nasarawa State between June 2020 and May 2021. Compliant drug pick-up (pickup +/- 7 days of drug refill appointment date) and drug pick-up compliance rate (number of compliant drug pick-ups /total number of expected appointments in a 12-month period x 100) were assessed. Excellent compliance was benchmarked at ≥95%.

Viral suppression (Viral load <1000 copies/mL) was also evaluated. Age, gender and residence were considered explanatory variables. Chi-square was used to assess associations and binary logistic regression for multivariate analysis.

Lessons learned: We reviewed records of 133 CLHIV, with mean age of 7.2 yrs (SD ± 2.35 yrs). Approximately 18% (24/133) were under-5 years of age, and 78% were female. Only 30.1% of CLHIV had ≥95% compliant drug pickup rate. Furthermore, 48.9% (65/133) CLHIV had suppressed viral load. Compliant drug pickup rate was comparable among CLHIV ≥5 years old [32.1% (35/109)] and under-5 CLHIV [20.8% (5/24)], p= 0.275. Similarly, drug pickup adherence was comparable among male [32.7% (18/55)] versus female CLHIV [28.2% (22/78)], P=0.575. Viral suppression was also comparable among male [58.2% (32/55)] compared to female CLHIV [42.3% (33/78)], P=0.071. Multivariate regression revealed that CLHIV ≥5 years (AOR= 2.79, 95%CI= 1.04-7.47) were more likely to be virally suppressed, compared to under-5 children.

Also, non-compliant children (AOR=0.44, 95%CI= 0.20, 0.98) were less likely to be virally suppressed compared to the compliant children.

Conclusions/Next steps: Compliant ARV drug pick-up remains a challenge among CLHIV in North Central Nigeria, and is associated with poor viral load suppression. Our findings demonstrate a need for strategies to address patient/caregiver and facility-level challenges with drug pick-up compliance and viral non-suppression among CLHIV.

Scaling up access to models of integrated services (HIV, hepatitis, STI and other services, such as harm reduction, SRHR, gender affirming care, TB, NCDs and mental health)

EPE073

Sexually transmitted infection testing integrated with HIV prevention and contraceptive services in hair salons in urban South Africa

J. Jarolimova[1,2,3], S. Govere[4], S. Shezi[4], L.M. Ngcobo[4], A. Stuckwisch[2], D. Zionts[2], N. Dube[4], R.A. Parker[3,5,6], I.V. Bassett[1,2,3]

[1]Massachusetts General Hospital, Division of Infectious Diseases, Boston, United States, [2]Massachusetts General Hospital, Medical Practice Evaluation Center, Boston, United States, [3]Harvard Medical School, Boston, United States, [4]AIDS Healthcare Foundation, Durban, South Africa, [5]Massachusetts General Hospital, Biostatistics Center, Boston, United States, [6]Harvard University, Center for AIDS Research, Boston, United States

Background: Curable sexually transmitted infections (STIs) increase HIV transmission and acquisition risks and cause morbidity for women, yet access to STI testing is limited for women at risk for STIs and HIV in sub-Saharan Africa. Offering STI care in novel community-based venues may address barriers to access.

We are evaluating the implementation of STI testing integrated with HIV prevention and contraceptive services in hair salons in urban KwaZulu-Natal, South Africa.

Methods: Women accessing oral HIV pre-exposure prophylaxis or hormonal contraception in hair salons in an ongoing study are offered testing for four curable STIs. Self-collected vaginal swabs are tested by polymerase chain reaction for gonorrhea, chlamydia, and trichomoniasis.

Oral abstracts

Poster exhibition

E-posters

Late-breaker abstracts

Fingerstick blood is tested by non-treponemal and treponemal assays for syphilis. Participants with positive results are contacted and offered treatment at the hair salon or local clinic. Participant demographics, STI history, symptoms, risk factors, and risk perception are collected using structured questionnaires.

Results: Currently, we have enrolled 56 women eligible for STI testing, median age 26y [IQR 23-29], 61% unemployed. Fifty-four participants (96%) accepted STI testing: 53 (95%) provided vaginal swabs and fingerstick blood and one (2%) provided blood only.

At baseline, 18 participants (32%) reported a history of STI, 14 (25%) reported current STI symptoms, and 16 (29%) perceived a 'moderate' or 'great' chance of acquiring an STI within the next year. Twenty-five of 52 (48%) participants were in an age-disparate relationship (primary partner ≥5y older) and 27/40 (68%) reported never using condoms in the preceding month.

Among 51 participants with available results, 14 (27%) tested positive for at least one STI: 2 (4%) gonorrhea, 11 (22%) chlamydia, 1 (2%) trichomoniasis, and 3 (6%) syphilis. The majority (10/14, 71%) with an STI were asymptomatic. Of the 14 participants with STIs, 11 (79%) elected to receive treatment in the salons.

Conclusions: STI testing in hair salons in urban South Africa, integrated with HIV prevention and contraceptive services, is acceptable, reaches women with risk factors for STIs and HIV, and reveals a high STI prevalence. Hair salons may serve as novel venues to increase the reach of STI testing to women at risk for STIs and HIV.

EPE074
Leveraging Mobile clinics to provide differentiated service delivery HIV in conflict affected settings of the South West and North West regions of Cameroon

L.-A. Omam[1], E. Jarman[2], W. Ekokobe[2], E. Agbor[2], A. Metuge[2], E.N. Omam[2]
[1]*University of Cambridge, Department of Public Health and Primary Care, Cambridgeshire, United Kingdom,* [2]*Reach Out Cameroon, Health, Buea, Cameroon*

Background: In conflict-affected settings, health systems are strained, limiting access to HIV services. Although the policy guiding Differentiated Service Delivery (DSD) of HIV care in Cameroon was adopted in 2017, there is yet to be clear guidelines for DSD in conflict-affected settings. For 5 years now, the North West-South West regions(NWSW) of Cameroon are experiencing armed conflict, displacing over 800,000 persons. Several attacks on health care led to the closure of 253/933 health facilities, thus reducing access to health care for internally displaced persons (IDPs). The COVID-19 outbreak further limited humanitarian responses. A model of care that made use of mobile clinics (MCs) as DSD for HIV was piloted in conflict-affected regions, within the COVID-19 context.

Description: Between March – October 2020, MCs were used in 5 divisions across the NWSW to provide primary health care (PHC). To ensure continuum of HIV care for IDPs in the COVID-19 context, HIV prevention and treatment services were integrated into the benefit package of the MCs. All MC doctors received HIV and COVID-19 infection prevention and control trainings.

Results from this delivery model of HIV were analysed in 6 MCs. Within 7 months, 209 clinical consultations for persons living with HIV were conducted, 1,979 persons received HIV testing, from which 122 tested HIV positive. 33 positive persons were placed on treatment and 28 lost-to-follow up persons were re-linked to treatment. Also, 14,623 persons were sensitized on HIV prevention and treatment.

Lessons learned:
- In the mist of the COVID-19 pandemic, MCs offered an opportunity to deliver HIV DSD for IDPs in conflict-affected communities.
- 45 persons who tested HIV positive didn't receive ARVs due to poor coordination/referrals. A collaboration/engagement strategy between the MCs and ARV treatment centers is necessary to improve trust and allow for dispensation of ARV in hard-to-reach communities.
- Training on effective referral systems should constitute a module for training MCs staff.

Conclusions/Next steps: In conflict affected settings, MCs could be leverage as an alternative model of care for HIV DSD to ensure continuum of HIV care and treatment.
This should however be done in collaboration with the ARV treatment centres to supply the MCs with ARVs.

EPE075
Improving uptake of viral load tests by key populations in Zambia: a review of two models

J. Okuku[1], O. Chituwo[1], B. Kaliki[1], B. Musonda[2], A. Mwila[1]
[1]*US Centres for Disease Control and Prevention, HIV Prevention, Care and Treatment, Lusaka, Zambia,* [2]*Ministry of Health, Zambia, Infectious Diseases/HIV Prevention, Lusaka, Zambia*

Background: Viral load coverage (VLC) among key populations (KP) living with HIV in Zambia falls below that of the general population living with HIV at 54% and 70%, respectively. Evidence suggests this disparity is partly due to the established service delivery model in which KPs are referred to government health facilities. In response, CDC sponsored the implementation of an alternative model, in which HIV services are provided in the community from October 2019.

We review retrospective data on VLC among KPs in districts that implemented the community-based model versus the established model.

Methods: Data for the analysis was from routinely collected PEPFAR program indicators from October 2020 to September 2021 in districts with CDC-supported KP programs. During this period, Zambia experienced two waves of

covid-19 causing intermittent closure of community safe spaces supporting VL services among KPs. VLC was calculated as the number of KP with a VL result on file in the past year out of the total number of KP on treatment from six months prior.

Results: The community-based model was implemented in three districts of Lusaka Province while the facility-based model was implemented in nine districts in Southern, Eastern, and Western provinces. Between December 2020 and September 2021 there was greater improvement in VLC in the community-based model. VLC increased from 12% (66/530) to 86% (800/935), compared to 59% (1054/1800) to 67% (1675/2490) in the facility-based model.

Figure. Viral load coverage in two models of service delivery to key populations in Zambia - October 2020 to June 2021

Conclusions: This data suggests that the community-based model was effective in improving VLC in districts where the VLC was low, exceeding the average VLC level in the facility-based model districts within a year.

This Improvement is especially notable given that it coincided with the COVID-19 pandemic, and highlights the importance of conducting a more robust evaluation of the model as program managers, researchers, and policymakers explore better strategies for improving VLC among KP.

EPE076

Integration and decentralization of hepatitis C testing and treatment at district HIV outpatient clinics in Viet Nam to achieve micro-elimination

T.H. Phan Thi[1], N. Do Thi[1], H.H. Nguyen[1], A.D. Tran[1], T.V. Nguyen[2]

[1]Viet Nam Authority for HIV/AIDS Control, Ministry of Health, Hanoi, Viet Nam, [2]World Health Organization, Country Office, Hanoi, Viet Nam

Background: Nearly one million people are living with hepatitis C virus (HCV) in Viet Nam. Prevalence of anti-HCV among key populations (KPs) and people living with HIV (PLHIV) ranges from 47.5% - 98.5%. HCV diagnosis and treatment services in Vietnam are mainly available at provincial hospitals and thus, access to these services remains limited especially among KPs and PLHIV.

A demonstration model to integrate and decentralize HCV treatment services was implemented to assess feasibility and outcomes of integration and decentralization of HCV treatment at district HIV outpatient clinics (OPCs) in Viet Nam.

Methods: The project was started in April 2021 in 126 district HIV OPCs in 29 provinces. Health staff were trained on HCV diagnosis and treatment. Anti-HCV testing was provided to PLHIV patients receiving antiretrovirals therapy and if positive, lab-based HCV RNA or HCV cAg testing was performed to confirm viremic infection. Patients diagnosed with hepatitis C were treated with sofosbuvir and daclatasvir for 12 weeks. A lab-based HCV RNA test was performed at 12 weeks after treatment completion to evaluate the treatment outcomes. An electronic health record was used to collect patient information and monitor patient treatment.

Results: Between April and December 2021, 4587 patients were diagnosed with hepatitis C and started DAA treatment. Of which, 93.6% of the patients were men and 90.0% aged between 30-50 years old. As of 31 December 2021, 2083 (45.4%) completed 12 weeks of treatment, 2486 (54.0%) patients were on treatment, 18 (0.4%) patients stopped treatment for various reasons and 10 (0.2%) patients died. Of 2083 completed treatment, 2033 (97.6%) had completed treatment for at least 12 weeks and 447 (99.5%) of them had HCV RNA test to determine sustainable viral response (SVR 12) and 437 (97.8%) tested patients had undetectable HCV RNA.

Conclusions: The results demonstrated feasibility of integration and decentralization of HCV testing and treatment at district HIV outpatient clinics. Very high cure rate achieved in this project suggests that micro-elimination of hepatitis C among PLHIV is feasible. This programme is now being extended to all HIV clinic sites in 33 provinces.

EPE077

PrEP and family planning uptake among adolescent girls and young women in post-abortion care in Kenya

Y. Zia[1], W. Waituika[2], B. Nyerere[2], I. Nafula[3], C. Kiptiness[2], J. Odoyo[2], K. Ngure[1,4], S. Kimani[3], E. Bukusi[1,2], R. Heffron[1], N. Mugo[1,2]

[1]University of Washington, Seattle, United States, [2]Kenya Medical Research Institute, Nairobi, Kenya, [3]Marie Stopes Kenya, Nairobi, Kenya, [4]Jomo Kenyatta University of Agriculture and Technology, Juja, Kenya

Background: Women accessing care at post abortion care (PAC) clinics have had recent and potentially ongoing condomless sex, placing them at risk for subsequent unintended pregnancy, HIV, and other STIs depending on their geographic settings.

Few studies have assessed PAC settings to assess the uptake of HIV pre-exposure prophylaxis (PrEP) when integrated into PAC services, including family planning (FP).

Methods: Using medical records data abstracted from clients attending 14 PAC clinics in Kisumu and Thika, Kenya with an integrated PrEP program, we describe PrEP and FP uptake among adolescent girls and young women (AGYW) aged 15 to 30. Logistic regression models were utilized to estimate the effect of age on uptake of PrEP and FP.

Oral abstracts

Poster exhibition

E-posters

Late-breaker abstracts

Author Index

Oral abstracts

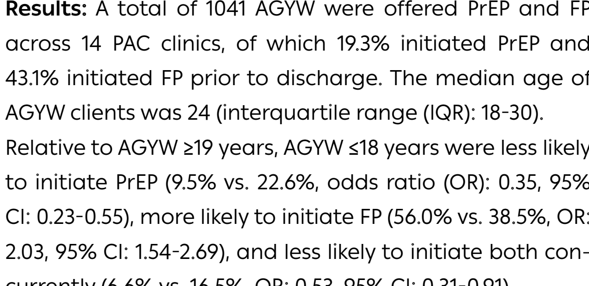
Poster exhibition

E-posters

Late-breaker abstracts

Author Index

Results: A total of 1041 AGYW were offered PrEP and FP across 14 PAC clinics, of which 19.3% initiated PrEP and 43.1% initiated FP prior to discharge. The median age of AGYW clients was 24 (interquartile range (IQR): 18-30).
Relative to AGYW ≥19 years, AGYW ≤18 years were less likely to initiate PrEP (9.5% vs. 22.6%, odds ratio (OR): 0.35, 95% CI: 0.23-0.55), more likely to initiate FP (56.0% vs. 38.5%, OR: 2.03, 95% CI: 1.54-2.69), and less likely to initiate both concurrently (6.6% vs. 16.5%, OR: 0.53, 95% CI: 0.31-0.91).
Conclusions: Uptake of PrEP and FP among AGYW in PAC settings in Kenya are associated with age. Younger women (15-18 years) are more likely to initiate FP following post-abortion care.
However, younger women are significantly less likely to initiate PrEP or FP and PrEP concurrently, and may benefit from additional and more age-tailored counseling around sexual health and prevention of HIV and unintended pregnancy after an abortion.



EPE078
Digital health intervention linking female entertainment workers to HIV and gender-based violence services in Cambodia: a randomized controlled trial

S. Yi[1], P. Chhoun[2], S. Tuot[2], A.E. Fehrenbacher[3], A. Moran[4], D. Swendeman[3], C. Brody[5]
[1]National University of Singapore, Saw Swee Hock School of Public Health, Singapore, Singapore, [2]KHANA Center for Population Health Research, Phnom Penh, Cambodia, [3]University of California Los Angeles, Department of Psychiatry and Biobehavioral Sciences, Los Angeles, United States, [4]University of California Los Angeles, Department of Epidemiology, Los Angeles, United States, [5]Touro University California, Public Health Program, Vallejo, United States

Background: Reaching female entertainment workers (FEWs) with health information and linking them to services has been difficult because of their hidden and stigmatized status.
This study evaluated the efficacy of the *Mobile Link* intervention in improving FEWs' health by engaging and connecting them to the existing HIV, sexual and reproductive health, and gender-based violence (GBV) services.
Methods: We conducted the *Mobile Link* randomized controlled trial between 2018 and 2021 in the capital city and three other provinces. Initially, we randomly selected 600 participants from a list of 4,000 FEWs by age group (18–24 and 25–30) and the study site using a random number generator and enrolled them in person. FEWs in the intervention arm (n=300) received automated twice-weekly short message services and voice messages with health information and direct links to outreach workers.
The control group (n=300) received the existing standard care. The outcome measures included self-reported HIV and STI testing, condom and contraceptive use, contact with outreach workers, escorted referral services use, forced drinking, and GBV experiences assessed through face-to-face structured interviews. Intervention effects were modeled using repeated measures, multilevel mixed-effects logistic regression.
Results: We included 218 FEWs in the intervention and 170 FEWs in the control arms in the per-protocol analyses after removing 212 dropouts. Evidence of positive intervention effects was detected for the following secondary outcomes: contacting an outreach worker (at 30 weeks: AOR 3.29, 95% CI 1.28–8.47), receiving an escorted referral (at 30 weeks: AOR 2.86, 95% CI 1.09–7.52; at 60 weeks: AOR 8.15, 95% CI 1.65–40.25), and never being forced to drink at work (at 60 weeks: AOR 3.95, 95% CI 1.62–9.60).
No significant differences between intervention and control groups were observed in the fully adjusted models for any primary outcomes.
Conclusions: The *Mobile Link* intervention effectively connected FEWs with outreach workers and escorted referrals but did show an effect on primary outcomes. Reduced forced drinking at work was also significantly more extensive in the intervention group than in the control group. Longer-term messaging may increase access to services and impact FEWs' health outcomes in the future.

EPE079
Moving from rhetoric to reality: lessons learned from integrating oral PrEP and family planning services in public health facilities in Nairobi, Kenya

P. Jeckonia[1], R. Wilcher[2], N. Ruiru[1], N. Njuguna[3], N. Mumo[1], L. Okoth[1], A. Kiplagat[4], C. Ngunu[4], H. Burke[2]
[1]LVCT Health, Nairobi, Kenya, [2]FHI 360, Durham, United States, [3]FHI 360, Nairobi, Kenya, [4]Nairobi Metropolitan Services, Nairobi, Kenya

Background: Recognizing that adolescent girls and young women (AGYW) in Kenya face both high HIV incidence and high risk of unintended pregnancies, the Kenyan government is committed to advancing the integration of HIV prevention services, including pre-exposure prophylaxis (PrEP), and family planning (FP) services for AGYW.
The USAID/PEPFAR-supported CHOICE consortium partnered with the National AIDS and STI Control Programme (NASCOP) and Nairobi Metropolitan Services (NMS) to pilot integrated PrEP-FP services in three public health facilities in Kenya.
Description: The project aimed to increase uptake of PrEP among AGYW accessing contraceptive services through a quality improvement (QI) approach. The facilities piloted a referral-based model of PrEP-FP integration from April to October 2021. Activities were led by national, county, and/or subcounty health managers and included: training providers; introducing job aids, screening tools, and tools to measure facility-level PrEP-FP integration indicators; supportive supervision and coaching of providers; and regular QI meetings to review data and identify actions to improve performance.

Lessons learned: Over seven months of implementation, 4,014 (61%) of 6,624 FP clients at the participating facilities were screened for HIV risk. Of those screened, 179 were determined to be eligible for PrEP; 77 (43%) of those eligible initiated PrEP, the majority of whom were ages 15-24.
Provider-related challenges included expectations for financial incentives to integrate services, inconsistent implementation of risk screening, inadequate completion of M&E tools, negative attitudes toward PrEP for AGYW, and turnover among trained providers.
Client-related challenges included lack of client readiness for PrEP and reluctance to initiate PrEP without partner support. Government leadership in QI workshops, trainings, and supervision was critical to integration.
We also recommend ongoing provider training to reinforce integration procedures and address negative attitudes, all-site QI and integration sensitization, digitizing M&E tools, and investing in demand generation for both AGYW and male partners.
Conclusions/Next steps: Although the number of FP clients who initiated PrEP over seven months was low, the project illuminated critical challenges — and potential solutions — related to operationalizing service integration in high-volume public health facilities. NASCOP is applying the lessons from this pilot to inform the national scale-up plan for PrEP-FP integration in Kenya.

Integrating gender-affirming care into HIV services for transgender women in three Asian countries: an implementation opportunity using rogers' diffusion of innovation theory

R. Janamnuaysook[1,2], K. Samitpol[1,2], P. Getwongsa[1], P. Srimanus[1], M.T.S. Aung[3], H.L. Oo[4], Y.A. Myat[4], A. Shrestha[5], K. Bam[5], R.P. Khanal[5], L. Sibunga[6], C.F. Salvador[7], J. Young[7], R.G. Pagtakhan[8], Y.S. Araña[8], A. Arunmanakul[9], M. Avery[9], S. Mills[9], R.A. Ramautarsing[1], P. Phanuphak[1], N. Phanuphak[1,2]
[1]*Institute of HIV Research and Innovation, Bangkok, Thailand,* [2]*Center of Excellence in Transgender Health, Chulalongkorn University, Bangkok, Thailand,* [3]*Ma Baydar Clinic, Lan Pya Kyel Association, Yangon, Myanmar,* [4]*FHI 360 Myanmar, Yangon, Myanmar,* [5]*FHI 360 Nepal, Kathmandu, Nepal,* [6]*Regional TB-HIV Support Network, Pampanga, Philippines, the,* [7]*FHI 360 Philippines, Manila, Philippines, the,* [8]*LoveYourself, Manila, Philippines, the,* [9]*FHI 360 Thailand, Bangkok, Thailand*

Background: The Tangerine Clinic in Thailand has successfully implemented the "integrated gender-affirming and sexual health service model" (the Integrated Trans Model) to serve more than 4,000 transgender women since 2015. We documented how the model was expanded to other Asian countries.
Description: The Tangerine Academy, the technical assistance platform supported by the USAID-funded EpiC project, worked with FHI 360 to provide South-South capacity strengthening on transgender health to HIV community-based organizations (CBOs) in Asia. Using Rogers' Diffusion of Innovation theory as the process of adopting new innovations, we documented how the Integrated Trans Model—an innovative intervention—was disseminated and adopted among CBOs in Myanmar, Nepal, and the Philippines during 2019–2021.
Lessons learned: We demonstrated to CBO leaders and staff in Myanmar, Nepal, and the Philippines the "relative advantage" of the Integrated Trans Model for increasing transgender women's access to sexual health services. This involved creating a learning collaborative in which CBO participants made on-site and virtual visits to the Tangerine Clinic.
Early adopters from the CBOs, along with local transgender opinion leaders, then explored the model's "compatibility" with serving the specific needs of the transgender community using Tangerine Clinic client service data. We trained health care providers and transgender community health workers on transgender-competent health care, supported them to develop guidelines, and discussed the "complexity" of the Integrated Trans Model.
Each CBO identified which levels of complexity they felt comfortable implementing:
1. Providing counseling on gender-affirming hormone treatment,
2. Conducting hormone-level measurement, and
3. Prescribing gender-affirming hormone medications.
Through a series of ongoing consultations and case conferences, Ma Baydar Clinic in Myanmar, Cruiseaids Clinic in Nepal, and LoveYourself and Lakan Clinics in the Philippines began implementing the Integrated Trans Model to test its "trialability." Direct "observability" from all clinics was reflected in increased accessing of HIV testing and pre-exposure prophylaxis (PrEP) services among transgender women. HIV case-finding rates ranged from 2% to 15%. PrEP linkage ranged from 20% to 27%.
Conclusions/Next steps: The Integrated Trans Model was successfully diffused and disseminated from Thailand to three other Asian countries using implementation strategies informed by community and CBO leaders and tailored to cultural context.

transgender men (TGM) as they are not regularly part of the HIV surveillance. Globally and locally, health issues of transgender individuals, particularly TGM who have sex with men (TGM-SM), remains to be barely explored. These translate to lack of differentiated approach to service delivery, poor uptake of health interventions, and suboptimal health outcomes. We aimed to determine the uptake of HPI among TGW and TGM and its predictors.

Methods: We performed a secondary data analysis of clinical data among transgender men (TGM) and women (TGW) enrolled in Victoria by LoveYourself, a community-led HIV and TG health clinic in Metro Manila, from 2018-2019. Use of HPI, specifically condom, PrEP, PEP, and/or HIV testing, was identified through self-reporting. A multivariable generalized linear model, using modified Poisson distribution with robust variance estimator, was developed to explore covariates for utilization of HPI.

Results: From 2018-2019, 465 individuals, 139 TGW and 326 TGM, median age of 25 (IQR 16-29), enrolled in the clinic; 116 TGW (83.5%) and 17 TGM (5.2%) reported having sex with men. Among the 465 individuals, 128 reported using at least one HPI, most common of which were condoms (60.1%) and HIV testing (55.5%). PrEP (0.8%) and PEP (0%) use remains negligible. Prevalence of HPI uptake was higher among TGW (vs TGM; adjusted prevalence ratio [aPR]=5.11, 95%CI 2.89 – 9.04) and those who have sexual preference for men (vs otherwise; aPR=4.81, 95%CI 2.67 – 8.66). There was significant interaction between gender identity and sexual preference (p<0.001), such that the prevalence of HPI uptake is lower among TGM having sex with men (TGM-SM) than TGW having sex with men.

Conclusions: HPI uptake remains limited among transgender individuals, especially among TGM. Although transgender individuals who prefer having sex with men were likely to utilize HPI, this remains relatively lower among TGM-SM. This justifies the non-exclusion of TGM-SM in both biobehavioral surveillance and HIV programs. TGM-SM, nevertheless, remain vulnerable to stigma related to being MSM and transgender and would benefit from further exploration of their health issues.

EPE082

Community-based promotion of cervical cancer screeningamong HIV positive women in Ethiopia

E. Seid[1]

[1]*Project HOPE Ethiopia, M&E, Addis Ababa, Ethiopia*

Background: WLHIV are at higher risk of developing invasive form of cervical cancer when compared to HIV negative women. Therefore, timely screening, management and follow-up care is necessary. We summarized the results of demand creation, social and behavioral change communication activities in community-based HIV prevention, care, and treatment project in Ethiopia.

Description: CxCa counseling and demand creation services were provided to WLHIV during community adherence support group meetings, community-ART refills, index case contacts testing by frontline community HCW, such as CEF and CRPs. Comprehensive SBCC package was developed to support demand creation activities including individual counseling, education, leaflet distribution and mass media campaigns.

Clients were offered CxCa screening test and those who accepted the offer were referred to the nearby health facility for VIA and treated when tested positive. The ComCare application system was used for electronic data collection, quality checking, and tracking client referrals. Data were exported to Excel and analyzed in STATA software.

Lessons learned: Between October 2020 and December 2021, a total of 8,427 WLHIV received CxCa counseling of which 6,718 (80%) were eligible and referred to a health facility for screening. In total, 6,688 (99.5%) women were screened of which more than half 3,664(55%) were from Addis Ababa, followed by 1,520(24%) Oromia and least 184 (3%) were from Gambella region.

Of total screened, 273 (4.1%; 95%CI: 3.51, 4.69) had lesions through VIA and 199 (92%) were treated on-site with Cryotherapy, 11 (5%) with Leep, and 6 (3%) with Thermo-coagulation. Whereas thirty-five (13%) women required referral to higher level for further investigation, and 22 (8%) women are on process to treatment. Majority 6,398 (96%) of women were screened for the first time of which 242 (4%) were screened positive, and 208 (3%) were re-screened t of which 5 (2.4%) were tested positive.

Age disaggregation showed that women aged ≥50 years had the highest positive result of 4/43 (9.3%) followed by age 25 - 49 years 259/6,303 (4.1%), and age 15 – 24 years 10/342 (2.9%) least.

Conclusions/Next steps: Result showed, community level CxCa demand creation and referral services helped to improve access to cervical cancer screening, care and treatment. Therefore, community-based demand creation, screening, and referrals should be scaled-up to all WLHIV in Ethiopia

EPE083

OK to not be OK in HIV care: experience and outcomes of integration of mental health screening, referrals and support in routine HIV care in Zimbabwe

K. Webb[1], C. Nyamukapa[2], G. Mujaranji[1], E. Chiriseri[2], O. Chisenye[1], P. Chimberengwa[1], E. Dhodho[1], S. Page-Mtongwiza[1], T. Apollo[3], T.T. Chinyanga[1], D. Chibanda[2]

[1]*Organization for Public Health Interventions and Development, Harare, Zimbabwe,* [2]*Friendship Bench Zimbabwe, Harare, Zimbabwe,* [3]*Ministry of Health and Child Care, AIDS & TB Unit, Harare, Zimbabwe*

Background: People living with HIV are two times more likely to experience common mental disorders. Annual mental health (MH) screening is recommended for all recipients of HIV care in Zimbabwe. In practice, however, integration of mental health in HIV care has not been im-

plemented with fidelity. Our objective was to strengthen mental health screening, referral and treatment in routine HIV care.

Description: We implemented a learning phase MH/HIV integration program to screen recipients of HIV care using the Patient Health Questionnaire-2 (PHQ-2) in Chitungwiza District, Zimbabwe. PLHIV screening positive were referred to Friendship Bench for Shona Symptom Questionnaire-14 (SSQ-14) administration and evidence-based problem solving therapy (PST). Screening outcomes were documented as to inform construction of a 'mental health cascade' and standardization of implementation models in routine HIV programs at scale.

Lessons learned: Among 14,933 recipients of HIV care at 5 participating high-volume facilities from March-May 2021, 11,983 (80%) were screened using the PHQ-2; the majority (94%;11,320/11,983) screened by nurses at the facility while attending appointments or collecting antiretroviral medication. PHQ-2 screen positive yield was 4% overall (425/11,983); appointment/treatment defaulters screened in the community had a 25% PHQ-2 screen positive yield (164/663). The majority of those received and screened by Friendship Bench had a clinically significant SSQ-14 score (84%;355/423); 14.9%(53/355) with 'red flag issues' (suicidal ideation and/or hallucinations). Follow-up sessions with clients showed a decrease in SSQ-14 scores among 73% after just one session of PST with Friendship Bench.

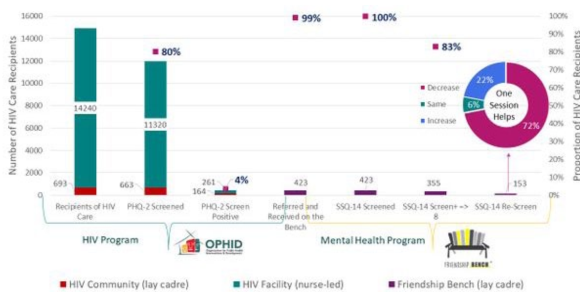

Figure. Cascade of integrated mental health screening, referral and support in routine HIV care, Chitungwiza District, Zimbabwe - March-May 2021

Conclusions/Next steps: We demonstrate feasibility of integration of mental health screening and referrals to community-based mental health interventions in routine HIV care. The program model and tools have been standardized and will be taken to scale at 44 high volume facilities, serving over 150,000 PLHIV.

Future implementation research is required to extend the MH/HIV cascade to include individual-level impact of integration on both HIV and mental health outcomes.

EPE084

High sexually transmitted infection prevalence/incidence among new, current, and non-users of pre-exposure prophylaxis and HIV-positive men who have sex with men and transgender women attending key population-led clinics in Thailand

N. Thammajaruk[1], S. Thongsuksangcharoen[1], S. Chumseng[1], A. Phunkron[2], T. Sangpasert[3], T. Pasansai[4], P. Brutrat[5], M. Avery[6], S. Mills[6], P. Phanuphak[1], R.A. Ramautarsing[1], N. Phanuphak[1]
[1]*Institute of HIV Research and Innovation (IHRI), Bangkok, Thailand,* [2]*The Service Workers In Group Foundation, Bangkok, Thailand,* [3]*Rainbow Sky Association of Thailand, Bangkok, Thailand,* [4]*Mplus Foundation, Chiang Mai, Thailand,* [5]*The Service Workers In Group Foundation, Pattaya, Chonburi, Thailand,* [6]*FHI 360, Bangkok, Thailand*

Background: Key population (KP)-led pre-exposure prophylaxis (PrEP) services contribute more than half of PrEP provision in Thailand. KP lay providers can legally perform HIV and sexually transmitted infection (STI) testing and give oral medications to clients as prescribed by doctors. We studied STI prevalence and incidence among new, current, and non-users of PrEP, and HIV-positive clients of KP-led clinics.

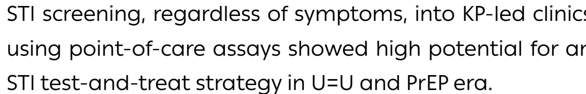
Methods: From August 2019 to September 2021, men who have sex with men (MSM) and transgender women ages ≥18 years, with ≥1 HIV risks in the past six months (condomless sex, >5 sexual partners, STI history, substance use), were enrolled and followed up for 12 months.

Provider-/self-collected urine, pharyngeal, and rectal samples from each participant were pooled for gonorrhea/chlamydia nucleic acid amplification testing using point-of-care Xpert at baseline and every three months, together with syphilis serology. Prevalence and incidence of any STIs, syphilis, gonorrhea, and chlamydia were reported by PrEP use and HIV status.

Results: We enrolled 1,696 MSM and 194 transgender women. Prevalence rates of any STIs, syphilis, gonorrhea, and chlamydia were 43.7%, 9.2%, 23.9%, and 27.0% among 390 new PrEP users; 49.7%, 11.9%, 28.0%, and 35.0% among 600 current PrEP users; 34.5%, 9.3%, 13.0%, and 24.2% among 600 PrEP non-users; and 61.0%, 27.7%, 31.3%, and 41.3% among 300 HIV-positive individuals. Incidence rates of any STIs, syphilis, gonorrhea, and chlamydia were 57.9, 7.9, 22.5, and 27.3/100 person-years (PY) among new PrEP users; 70.5, 10.1, 26.2, and 33.7/100 PY among current PrEP users; 38.1, 5.9, 8.7, and 20.5/100 PY among PrEP non-users; and 106.0, 20.0, 31.8, and 37.4/100 PY among HIV-positive individuals. No difference was found between MSM and transgender women. Median (IQR) duration from STI diagnosis to treatment was 4 (1–8) days.

Conclusions: MSM and transgender women accessing KP-led services had a high STI burden regardless of PrEP use and HIV status.

Overall STI prevalence and incidence were highest among HIV-positive individuals, followed by current PrEP users, new PrEP users, and PrEP non-users. Integrating regular



STI screening, regardless of symptoms, into KP-led clinics using point-of-care assays showed high potential for an STI test-and-treat strategy in U=U and PrEP era.

EPE085

Barriers and facilitators to use of male friendly clinical services in Quelimane, Zambézia province, Mozambique: results of a qualitative study, 2021

C. Fonseca[1], P. Paulo[2], R. Machado[3], E. Graves[4], W. Wester[4,5], A. De Louvado[6], C. De Schacht[1], S. Van Rompaey[1]

[1]Friends in Global Health, Evaluation, Maputo, Mozambique, [2]Friends in Global Health, Evaluation, Quelimane, Mozambique, [3]Direcção Provincial de Saúde, Área de Engajamento Masculino, Quelimane, Mozambique, [4]Vanderbilt University Medical Center, Vanderbilt Institute for Global Health, Nashville, United States, [5]Vanderbilt University Medical Center, Department of Department of Medicine, Department of Department of Medicine, Division of Infectious Diseases, Nashville, United States, [6]Centers for Disease Control and Prevention, Maputo, Mozambique

Background: Programmatic data in Mozambique have shown that access to health services and chronic disease treatment outcomes are better among women than men. A National Strategy for Male Engagement in Health Care, including the provision of male-friendly services (MFS) was launched in 2018. In Quelimane, MFS were provided through male-friendly clinics, dedicated to male patients only, where predominantly male healthcare providers provided care through a one-stop model outside of normal clinic hours.

This evaluation aimed to identify facilitators and barriers influencing utilization of these services.

Methods: A qualitative study was done between February-April 2021 at three health facilities providing MFS in Quelimane. All participants were selected via convenience sampling. In-depth interviews (IDI) were conducted among male and female HIV-positive patients and their healthcare providers.

Focus group discussions (FGD) were performed with male community members and male employees of two companies in Quelimane. Sessions were done in Portuguese or Chuabo (local language). All recordings were transcribed in Portuguese and coded by two independent investigators. Thematic analysis was performed.

Results: Eighty-three IDI (41 male and 24 female patients, 18 healthcare providers) and five FGD (three involving community members, two involving company employees) were conducted. Barriers to uptake of MFS included: not knowing such services were available; poor health care seeking behavior; competing priorities (e.g., work responsibilities); perception that poor quality care would be received; and prolonged wait times. Healthcare providers highlighted barriers such as limited human resources, equipment (e.g., sphygmomanometers) or infrastructure (e.g., confidential space), and long distances (for patients and providers) from home to the health facility, which could compromise one's safety after dark. Among the facilitators for MFS uptake, all groups mentioned extended hours, one-stop-model, and male providers as program elements which increased patient comfort and willingness to share personal/confidential information.

Conclusions: Male friendly services are an acceptable means of offering male-centered care, especially for patients not able to visit the health facility during routine hours. Demand creation messaging is needed to improve awareness of MFS in the communities. Given the acceptance of the model, MFS could cover screening and management of infectious disease (e.g., HIV/AIDS) as well as non-communicable disease.

EPE086

Cervical pre-cancer in women with HIV in the context of highly effective antiretroviral therapy

G. Liu[1], M. Shin[2], H. Kibuuka[3], J. Maswai[4,5], J. Owuoth[6,7], E. Bahemana[4,8], M. Iroezindu[4,8], A. Parikh[4,9], A. Esber[4,9], T. Crowell[4,9], M. Imbach[4,9], J. Ake[4], C. Polyak[4,9], R. Barnabas[10,11,12,13], AFRICOS Study Group

[1]University of Washington, Department of Global Health, Seattle, United States, [2]University of South California, Los Angeles, United States, [3]Makerere University Walter Reed Project, Kampala, Uganda, [4]Walter Reed Army Institute of Research, U.S. Military HIV Research Program, Silver Spring, United States, [5]U.S. Army Medical Research Directorate – Africa, Kericho, Kenya, [6]U.S. Army Medical Research Directorate – Africa, Kisumu, Kenya, [7]HJF Medical Research International, Kisumu, Kenya, [8]HJF Medical Research International, Abuja, Nigeria, [9]Henry M. Jackson Foundation for the Advancement of Military Medicine, Inc., Bethesda, United States, [10]University of Washington, Global Health, Seattle, United States, [11]University of Washington, Department of Obstetrics and Gynecology, Seattle, United States, [12]University of Washington, Department of Epidemiology, Seattle, United States, [13]Fred Hutchinson Cancer Research Center, Vaccine and Infectious Disease Division, Seattle, United States

Background: Immunodeficiency caused by HIV increases the risk of cervical cancer. More data on the impact of antiretroviral therapy (ART) on cervical carcinogenesis in African women with HIV are needed. We assessed cervical pre-cancer detection by HIV and ART status among women in the African Cohort Study (AFRICOS), which follows people with and without HIV aged ≥18 in four countries.

Methods: We analyzed data from the women's first cervical cancer screening in AFRICOS between 2013-2020. We estimated the association between HIV and cervical pre-cancer, detected by visual inspection with acetic acid or cytology, using logistic regression adjusted for age, country, travel time to clinic, number of sex partners, and condom use. To assess the association between ART and pre-cancer, we repeated the logistic regression among

women with HIV and adjusted for time since HIV diagnosis, CD4 cell count, and HIV viral load. We evaluated the mediating effect of viral load and CD4 cell count using the potential outcomes approach.

Results: In our sample of 1729 women, overall prevalence of cervical pre-cancer was 4% (Table 1). >80% of women with HIV, regardless of ART status, had CD4 count ≥200. Mean duration on ART was 3.7 years (standard deviation 3.1). Relative to women without HIV, cervical pre-cancer detection was not significantly higher among women with HIV on ART (adjusted odds ratio [aOR] 1.8, 95% confidence interval [CI] 0.8-4.5) and ART-naïve women with HIV (aOR 1.8, 95% CI 0.7-4.9).

Among women with HIV, cervical pre-cancer detection was not different by ART status (aOR 1.0, 95% CI 0.4-2.4). The aOR was unchanged after accounting for potential mediation by viral load and CD4 cell count (aOR 1.0, 95% CI 1.0-1.0).

	Women without HIV (N=271)	Women with HIV, not on ART (N=339)	Women with HIV, on ART (N=1119)	p value*
Cervical pre-cancer detected	7 (2.6%)	16 (4.7%)	47 (4.2%)	0.376
Age (SD)	36.4 (10.3)	34.5 (9.7)	38.4 (9.4)	<0.001
Number of lifetime sex partners (SD)	3.2 (6.2)	4.6 (8.4)	3.7 (4.0)	0.004
Median number of year since HIV diagnosis (IQR)		0.2 (0.0, 1.5)	4.5 (1.7, 7.6)	< 0.001
Virally suppressed		61 (18.2%)	973 (87.3%)	<0.001
CD4+ cell count of≥200		276 (81.4%)	965 (86.2%)	<0.001

Table.

Conclusions: Pre-cancer detection was uncommon and not different by HIV or ART status in AFRICOS. Our findings suggest that early ART initiation, sustained HIV care, and integrating cervical cancer prevention into HIV programs can reduce cervical cancer risk among women with HIV.

EPE087

Implementation opportunities for scaling up methadone maintenance therapy as HIV-prevention strategy in Kyrgyzstan: methadone dosing and retention in treatment over two years

R. Ivasiy[1], L. Madden[2], S. Farnum[2], S. Galvez de Leon[1], D. Bromberg[3], N. Shumskaya[4], A. Kurmanalieva[5], A. Duishenaliev[6], R. Tokubaev[6], F. Altice[1]

[1]Yale University, School of Medicine, New Haven, United States, [2]APT Foundation, New Haven, United States, [3]Yale University, School of Public Health, New Haven, United States, [4]AFEW Foundation, Bishkek, Kyrgyzstan, [5]AFEW Foundation, New Haven, United States, [6]Republican Narcology Center, Bishkek, Kyrgyzstan

Background: Methadone maintenance treatment (MMT) is the most cost-effective strategy to control HIV in countries in Central Asia, where the epidemic is concentrated among people who inject drugs (PWID).

Methods: An observational prospective cohort study design was applied to patients prescribed methadone in Kyrgyzstan between 2017 and 2021, both in community and carceral facilities. Retention in MMT was assessed at 1, 6, 12, and 24 months and was stratified by dosing levels, HIV status, and type of clinical setting using survival analysis. Predictors of treatment dropout were estimated using Cox multivariate regression models.

Results: Among 940 MMT patients, the proportion receiving low (<40mg), medium (40-85mg), and high (>85mg) dosing was 37.9%, 42.2%, and 19,9%, respectively. Increasing MMT dose was significantly (p<0.0001) correlated with retention at 1 (90%, 98%, 100%), 6 (42%, 63%, 95%), 12 (33%, 55%, 89%), and 24 (16%, 45%, 80%) months, respectively (Figure 1), with no differences between community and correctional settings.

OAT; opioid agonist treatment

Risk factors of treatment dropout at 12 months included (Table 2) low [adjusted hazard ratio (aHR)=8.0; 95% confidence limit (CL) =5.8-11.0] and medium (aHR=3.5; 95%CL=2.5-4.9) methadone dosing relative to high dosing and receiving treatment in three administrative regions (city of Osh, Chuy Region, and Jalal-Abad Region) relative to capital Bishkek.

Receiving MMT in the tuberculosis-specialized clinic in Bishkek (aHR=0.5; 95%CL=0.3-0.9) and addiction treatment specialized centers (aHR=0.6; 95%CL=0.4-0.9) was associated with higher retention at 12 months. HIV-positive individuals receive higher average MMT doses (79.5mg vs.63.1mg; p<0.0001) than HIV-negative; however, retention in MMT did not differ (aHR=0.9; 95%CL=0.7-1.1) after controlling for dosage.

Conclusions: Only one-fifth of MMT clients received optimal(>85mg) dosages; receiving lower dosages contributed most to dropout, providing an implementation opportunity for MMT scale-up in Kyrgyzstan.

EPE088

Do digital innovations improve sexual and reproductive health among youth? Results from a systematic review

A. Karellis[1,2], O. Vaikla[2], E. Woolhouse[2], R. Deli-Houssein[1,2], N. Pai[1,2]

[1]McGill University, Medicine, Montreal, Canada, [2]Research Institute of the McGill University Health Centre, Montreal, Canada

Background: Sexual and reproductive health (SRH) challenges disproportionally affect young individuals who are particularly vulnerable to engage in risky behaviours and acquire sexually-transmitted infections (STIs). Digital interventions may help improve access to SRH services, SRH-related education, thereby decreasing STI development and changing SRH attitudes/intentions. This systematic review summarizes literature regarding digital SRH interventions/innovations.

Methods: For the period June 2017-July 2021, two reviewers independently searched two electronic databases (Medline, Embase), retrieved 6,895 citations and abstracted data from 74 eligible studies which assessed SRH digital interventions/innovations among persons aged 10-30.

Results: This abstract, based on 13 publications that focused on HIV/STI prevention, testing and acquisition, included data of N=5,457 individuals. A wide range of digital strategies were assessed: web-based (n=4), text messaging (n=4), mobile application (n=3), telehealth (n=1), and a multimodal strategy (e-mail/website/video) (n=1).

A reduction of HIV/STI risk was shown. For instance, significant (p<0.05) differences between youth who underwent a digital-based intervention versus the standard of care were observed in regard to STI prevention self-efficacy and attitudes/intentions to reduce STI risk (condom usage, high-risk sexual behaviours).

Two studies which specifically evaluated PrEP usage among at-risk youth showed favourable results: the first proved that digital strategies improved individuals' ability to adhere to PrEP, and, in the second study, no cases of HIV were diagnosed, though bacterial STIs had been detected over the 180-day study period.

Two studies showed that text messaging-based strategies led to increased STI testing (intervention vs. control: 50.0% vs. 26.6%, p<0.001) or the intention to get tested [OR (95% CI)= 2.6 (1.49-4.68), p=0.001]. A third study failed to prove the impact of digital strategies on HIV/STI testing and PrEP initiation, though low sample size (n=155) likely led to statistical non-significance.

Moreover, digital innovations led to decreased STI incidence, including HIV, gonorrhoea, chlamydia and syphilis, while STI incidence among individuals who underwent routine care either remained stable or increased over time.

Conclusions: Digital interventions show tremendous promise to improve access to SRH services. Particularly during the ongoing COVID-19 pandemic, healthcare professionals are encouraged to scale up said innovations to reach youth and vulnerable populations who scarcely utilize in-person resources.

EPE089

Improved TB testing in Malawi following targeted supportive supervisions for TB LAM uptake

G. Saemisch[1], Y. Gumulira[2], D. Telela[2], E. Matupa[2], B. Wilson[3], P. Nyasulu[3], R. Nyirenda[3], J. Mpunga[4]

[1]Clinton Health Access Initiative, Boston, United States, [2]Clinton Health Access Initiative, HIV Access Program, Lilongwe, Malawi, [3]Ministry of Health, Department of HIV and AIDS, Lilongwe, Malawi, [4]Ministry of Health, National TB Control Programme, Lilongwe, Malawi

Background: Tuberculosis (TB) case finding in people living with HIV (PLHIV) has been a focus of HIV programs for years. Malawi historically depended on sputum microscopy and, more recently, GeneXpert for TB diagnosis. GeneXpert improved pulmonary TB detection, however, given that significant proportions of PLHIV with TB are

unable to produce sputum or have extra-pulmonary TB, TB detection remained a challenge. Although the Malawi Department of HIV and AIDS (DHA) introduced the TB lipoarabinomannan (LAM) Point of Care (POC) test in a bid to address these issues, uptake of the test remained low. Therefore, the DHA conducted tailored supportive supervision visits to improve TB LAM uptake.

Description: In 2018, the DHA adopted the World Health Organization recommendation that all PLHIV with CD4<200, WHO stage 3/4 or who are seriously ill, have access to TB LAM testing for TB diagnosis. By January 2021, TB LAM implementation had scaled up to 118 sites across 28 districts. Following the lifting of COVID movement restrictions, capacity building through supportive supervision visits were conducted in July 2021 utilizing a checklist/scorecard at implementation sites to identify and address uptake barriers and share TB LAM best practices with health care workers (HCWs).

Lessons learned: Malawi has seen a steady increase in the percentage of AHD patients who receive a TB LAM test since the supportive supervision visits were conducted. From January – June 2021, sites were testing AHD patients for TB at an average of 81.4%. However, following capacity building and uptake reinforcement, the average TB testing rate increased to an average of 97.5% during July – September 2021.

In addition to the scorecard, crucial components of the supervision visits include interviews with providers, stock inventory, and review of data capturing tools.

Conclusions/Next steps: Malawi was one of the first low- and middle-income countries to adopt TB LAM testing and tailored supportive supervisions have been crucial in improving TB testing. Scale up to ~300 sites is planned for 2022 to increase access to POC TB testing. National HIV and TB programmes can learn from Malawi's experience improving TB LAM uptake for PLHIV with AHD.

EPE090

Integrating mental health counseling into PrEP delivery for South African adolescent girls and young women: an implementation science approach to identifying determinants and strategies for service delivery

T. Concepcion[1], L. Mills[2], N. Khoza[2], S. Gumede[2], H. Chauke[2], S. Hosek[3], B. Weiner[1], C. Celum[1], S. Delany-Moretlwe[2], J. Velloza[1]

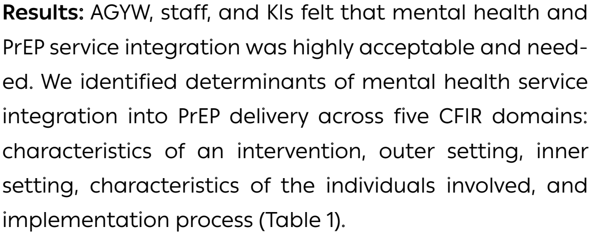
[1]University of Washington, Department of Global Health, Seattle, United States, [2]Wits Reproductive Health and HIV Institute, Johannesburg, South Africa, [3]Stroger Hospital of Cook County, Departments of Psychiatry and Infectious Diseases, Chicago, United States

Background: African adolescent girls and young women (AGYW) who may benefit from HIV pre-exposure prophylaxis (PrEP) face high levels of depression and related psychosocial issues. Depression can significantly reduce PrEP adherence, yet mental health counseling interventions are often under-resourced and have not been well-integrated into PrEP delivery. Integrated mental health and PrEP services have the potential to be efficient and effective. We sought to identify barriers and facilitators of delivering a mental health intervention for AGYW in South African PrEP clinics.

Methods: We conducted 31 in-depth interviews with AGYW using PrEP (n=9), staff at a PrEP clinic in Johannesburg (n=12), and key informants (KIs) with experience in mental health and PrEP delivery in South Africa (n=10). Interviews were informed by the Consolidated Framework for Implementation Research (CFIR) and discussed acceptability of mental health interventions in PrEP clinics and approaches for service delivery. We used a rapid qualitative analysis approach to identify themes and compare content by respondent groups. Facilitators and barriers of mental health intervention implementation were grouped into constructs defined by the CFIR. We matched determinants to implementation strategies using the Expert Recommendations for Implementing Change (ERIC).

CFIR domain	Implementation determinants	Implementation strategies
Characteristics of the intervention – *mental health counseling*	**Facilitators**: building capacity for psychosocial counseling is more appealing than medication and standard-of-care referrals **Barriers**: unethical to screen for a counseling intervention if no specialists are available for referral; could result in long clinic wait times; AGYW may be reluctant to open up	- Refined screening practices to triage AGYW - Person-centered, stepped care models tailored to AGYW needs - Warm hand-offs (ensuring connection) for all referral services - Adapt intervention to incorporate local perspectives and content relevant for AGYW - Adapt clinic flow to maximize time efficiency for AGYW
Outer setting – *urban Johannesburg, South Africa*	**Facilitators**: Clear need for mental health interventions related to depression and other mental health issues (gender-based violence, relationship issues, PrEP stigma); mental health service integration aligns with South African Department of Health goals **Barriers**: Community stigma around mental health awareness and care seeking; lack of clarity on referral options and lack of existing services	- Community outreach activities for demand-creation, PrEP, and mental health stigma reduction - Conduct group sessions with AGYW to normalize mental health issues - Inventory referral services and engage key stakeholders to identify a broad range of referral options to address mental health issues and gender-based violence
Inner setting – *Ward 21 adolescent-friendly PrEP clinic*	**Facilitators**: Strong network to support within-clinic referrals; some mental health services already provided (referrals, some screening) although without formal procedures or monitoring **Barriers**: Provider judgment and discrimination among staff; tension between wanting to provide mental health interventions but also not adding more staff work or clinic inefficiencies; lack of time, space, and funding for counselors	- Create a non-judgmental and friendly atmosphere for AGYW - Incorporate mental health screening and counseling with other youth-friendly services (e.g., PrEP counseling) to maximize efficiency - Create a rewards system for counselors with recognition for outcomes - Training, supervision, and peer support to empower counselors - Engage clinic leadership to "own" the intervention
Characteristics of individuals involved – *lay counselors*	**Facilitators**: None described **Barriers**: Lack of counselor training on mental health and counseling approaches, judgmental attitudes among providers	- Train counselors in adolescent-friendly communication skills and mental health counseling approaches - Provide a space for counselors to process difficult cases - Conduct training on patient-counselor confidentiality - Regular supervision with audit and feedback to promote counselor self-efficacy for intervention delivery
Process	**Facilitators**: External change agents (celebrities, social media influencers) have spoken out about mental health during COVID **Barriers**: None	- Engage AGYW as peer champions and social influencers, to conduct demand creation

Table 1: Summary of determinants of mental health intervention implementation and potential implementation strategies for South African PrEP clinics.



Results: AGYW, staff, and KIs felt that mental health and PrEP service integration was highly acceptable and needed. We identified determinants of mental health service integration into PrEP delivery across five CFIR domains: characteristics of an intervention, outer setting, inner setting, characteristics of the individuals involved, and implementation process (Table 1).

Interviewees described implementation strategies for mental health and PrEP service integration including demand-creation through community outreach and youth champions, intervention delivery through "person-centered" stepped-care models, and staff training to promote efficient and non-judgmental service delivery.

Conclusions: Our findings highlight the need to adapt and deliver psychosocial interventions for AGYW in South African PrEP clinics. Mental heatlh counseling and PrEP integration is acceptable and needed, although successful implementation will require adequate training, and addressing the needs of clinics and AGYW.

EPE091
Assessing the feasibility and acceptability of integrating HIV/syphilis dual-testing in antenatal care facilities in Liberia

K.L. Gray[1], E. Efronson[2], A. Konstantinova[2], R. Mondae[1], M. Nywoeh[1], S. Conteh[1], M. Tobii[1]
[1]*Ministry of Health, National AIDS and STI Control Program, Monrovia, Liberia,* [2]*Evidence Action, Washington DC, United States*

Background: In Liberia, 2.0% of pregnant women are infected with HIV and 2.7% with active syphilis. If left untreated, these infections result in adverse outcomes for both mother and fetus. While over 85% of pregnant women are tested for HIV during antenatal care (ANC) visits, only 8% are tested for syphilis.

To address this gap, the National HIV Program implemented a pilot to assess the feasibility and acceptability of switching from an HIV-only screening test to a rapid diagnostic HIV/syphilis dual-test in ANC facilities across Liberia.

Description: From March-December 2020 dual-tests were piloted amongst pregnant women in 5 facilities with different characteristics. A 2-hour on-site training was held with providers on the use of the dual-test and treatment of syphilis. At least 8 mentorship-and-supervision visits were provided at each facility. Focus group discussions (FGDs) were used to assess provider perspectives at the end of the pilot.

Lessons learned: A total of 8,908 pregnant women were screened with the dual-test. Of the 1.3%(n=112) who tested positive for syphilis, 69.6% (n=78) received treatment. Additionally, 21.2% (n=29) were co-infected with HIV and syphilis while 1.5% (n=137) were positive for HIV. In 99.7% (n=8887) of HIV tests recorded at facilities, the revised HIV-testing algorithm was followed correctly. Through FGDs, providers expressed high levels of acceptance and confidence in using the dual-test and the benefits of using a single finger-prick to obtain timely results for both HIV and syphilis. Additionally, the introduction of the dual-test had no adverse impact on providers following the updated national HIV testing algorithm.

Conclusions/Next steps: The pilot demonstrated that the introduction of the dual-test in ANC settings is feasible and readily adopted by healthcare providers and leads to increases in syphilis screening and treatment. Early mentorship and supportive supervision beginning 2-weeks following on-site training are critical to address challenges early on as well as improve quality of data recording for programmatic decision-making.

The National HIV Program recommends that the dual-test be integrated into all ANC settings to ensure that pregnant women receive comprehensive care and that mother-to-child transmission of HIV and syphilis is prevented.

EPE092
Point-of-Care integrated platform as a strategy to improve national HIV viral load testing in the Brazilian National Healthcare System

A. Alencar Cabral Morais[1], R. Santos Lima[1], M. Villares[1], Á. Bigolin[1], J. Boullosa Alonso Neto[1], G. Fernando Mendes Pereira[1]
[1]*Ministry of Health of Brazil, Department of Diseases of Chronic Condition and Sexually Transmitted Infections (DCCI), Brasilia, Brazil*

Background: Rapid access to diagnosis allows immediate HIV treatment. Brazil is a large country with different realities and the demand for HIV viral load (VL) tests is diverse. Conventional VL platforms are often closed systems, usually requiring a minimum sample demand to avoid the inputs loss, resulting in a long result releasing time and the impossibility of processing last-minute or urgent samples. These limitations impact the turnaround time for the patient and, consequently, care. Point-of-Care (POC) platforms allows rapid tests execution shortly after patient's sample receipt. Since 2014, the Ministry of Health (MoH) has been using the GeneXpert platform for Rapid Molecular Tuberculosis Test (TRM-TB). We carried out a project to evaluate the advantages of integrating the TRM-TB and HIV VL using GeneXpert POC platform.

Description: The project lasted 4 months and 16 laboratories from 10 Brazilian states were selected, based on their productivity and availability of TRM-TB equipment for sharing. The shared platform allowed prioritization for urgent HIV samples. The data from the realized exams were evaluated to determine the population served and result release time. The professional's perception was evaluated through a Google Forms questionnaire.

Lessons learned: 88% of the HIV exams were from adults (19-64 years old), 7% seniors (>65 yo), 4% infants and children (<11 yo), and 1% adolescents (12-18 yo). Among the infants and children, 51% were younger than 12 months

old. Pregnant women represented about 40% of the adults attended. The average release time droped from 7 days on the conventional VL, to 4 days on the POC VL, allowing a faster access to the result for the population above. About 81% of professionals evaluated integration positively affecting the laboratory execution flow, however, sharing GeneXpert is compromised when demand is higher than equipment capacity.

Conclusions/Next steps: POC integrated TB and HIV platform allows the prioritization of exams and could accelerate diagnosis fornewborns, children and pregnant women, contributing to the prevention of vertical transmission and to a faster access to care.

The results can support MoH to evaluate the expansion of the GeneXpert network integration in a nationwide scale-up. Cost-effectiveness must be evaluated.

EPE093

Effect of a one-time financial incentive on linkage to chronic hypertension care in Kenya and Uganda: a randomized controlled trial

M.D. Hickey[1], A. Owaraganise[2], N. Sang[3], F.J. Opel[3], E. Wafula[3], J. Ayieko[3], J. Kabami[2], G. Chamie[1], E. Kakande[2], M.L. Petersen[4], L.B. Balzer[5], M. Kamya[2,6], D.V. Havlir[1]
[1]University of California, San Francisco, United States, [2]Infectious Diseases Research Collaboration, Kampala, Uganda, [3]Kenya Medical Research Institute, Kisumu, Kenya, [4]University of California, Berkeley, United States, [5]University of Massachusetts, Amherst, United States, [6]Makerere University, Kampala, Uganda

Background: Hypertension is the largest driver of morbidity and mortality globally and can be treated with low-cost, readily available medications; however, <10% of people with hypertension in sub-Saharan Africa are diagnosed, linked to care, and have hypertension control. We hypothesized that a one-time financial incentive and phone call reminder for missed appointments would increase linkage to hypertension care following community-based screening in rural Uganda and Kenya.

Methods: In a randomized controlled trial, we conducted community-based hypertension screening and enrolled adults ≥25 years with blood pressure ≥140/90 mmHg on three measures; we excluded participants with known hypertension or hypertensive emergency (the latter immediately transported to clinical care). The intervention was transportation reimbursement upon linkage (~$5 USD) and up to three reminder phone calls for those not linking within seven days. Control participants received a clinic referral only. Hypertension care was provided via a patient-centered HIV care model with multi-disease integration (chronic HIV, hypertension, and/or diabetes care). Outcomes were linkage to hypertension care within 30 days (primary) and hypertension control <140/90 mmHg measured in all participants at 90 days (secondary). We used targeted maximum likelihood estimation to compute adjusted risk ratios (RR).

Results: We screened 1,998 participants, identifying 370 with uncontrolled hypertension and enrolling 199 (100 control, 99 intervention). Reasons for non-enrollment included prior hypertension diagnosis (n=108) and hypertensive emergency (n=32). Participants were 60% female, median age 56 (IQR 47-68), 10% HIV-positive, and 42% had baseline blood pressure ≥160/100 mmHg. Linkage to care within 30 days was 96% in intervention and 66% in control (RR 1.45, 95%CI 1.25-1.68). Hypertension control at 90 days was 51% in intervention and 41% in control (RR 1.23, 95%CI 0.92-1.66). Among persons with baseline blood pressure ≥160/100 mmHg, hypertension control was 46% in intervention and 26% in control (RR 1.78, 95%CI 0.98-3.22).

Conclusions: A one-time financial incentive and reminder call for missed visits resulted in a 30% absolute increase in linkage to hypertension care following community-based screening. Patient-centered HIV care models can be effectively leveraged to deliver chronic hypertension care; financial incentives can improve the critical step of linkage to care for people newly diagnosed with hypertension in the community.

EPE094

Availability of substance use care implementation and integration in HIV treatment clinics within the global IeDEA consortium

K. Lancaster[1], M. Remch[2], M. Stockton[3], D. Nash[4], C.W. Wester[5], A. Adedimeji[6], R. Finlayson[7], A. Freeman[8], B. Hogan[8], C. Kasozi[9], E.K. Kwobah[10], J.L. Kulzer[11], P. Lelo[12], T. Merati[13], J. Tine[14], A. Poda[15], R. Succi[16], M. Tlali[17], C. Twizere[18], P. von Groote[19], A. Parcesepe[2], IeDEA Consortium
[1]Ohio State University, Columbus, United States, [2]University of North Carolina at Chapel Hill, Chapel Hill, United States, [3]Columbia University, New York, United States, [4]City University of New York, New York, United States, [5]Vanderbilt University Medical Center, Nashville, United States, [6]Albert Einstein College of Medicine, Bronx, United States, [7]Taylor Square Private Clinic, Sydney, Australia, [8]Johns Hopkins University, Johns Hopkins Bloomberg School of Public Health, Baltimore, United States, [9]Masaka Regional Referral Hospital, Masaka City, Uganda, [10]Moi Teaching and Referral Hospital, Eldoret, Kenya, [11]University of California (UCSF), San Francisco, United States, [12]Kalembelembe Pediatric Hospital, Kinshasa, Congo, Democratic Republic of the, [13]Faculty of Medicine Udayana University & Sanglah Hospital, Bali, Indonesia, [14]Centre Hospitalier National Universitaire de Fann, Dakar, Senegal, [15]Université Polytechnique de Bobo-Dioulasso, Bobo-Dioulasso, Burkina Faso, [16]Universidade Federal de São Paulo, São Paulo, Brazil, [17]University of Cape Town, Cape Town, South Africa, [18]Centre National de Référence en Matière de VIH/SIDA au Burundi, Bujumbura, Burundi, [19]University of Bern, Bern, Switzerland

Background: Overwhelming evidence highlights the negative impact of substance use on HIV care and treatment outcomes. Yet, the extent to which care for alcohol use

disorders (AUD) and substance use disorders (SUD) (i.e., screening, management) have been integrated within routine HIV clinical settings is limited. We assessed AUD and other SUD screening and management practices within HIV treatment sites participating in the global International epidemiology Databases to Evaluate AIDS (IeDEA) consortium.

Methods: In 2020, 223 of 238 HIV treatment sites across seven geographic regions completed a survey on capacity and practices related to HIV care and SUD management. Sites provided information on the characteristics and AUD and other SUD screening and management practices.

Results: Among participating sites, 67% were in urban or primarily urban settings, 38% served only adults, and 50% served adults and children. Thirty-eight percent of sites were from lower-middle-income countries, with equal proportions from low-income and high-income countries (23% each). AUD and other SUD screening using validated instruments were reported at 32% and 12% of sites, respectively. North America had the highest proportion of sites that reported AUD screening (76%), followed by East Africa (46%). Among the sites that reported AUD screening using a validated instrument, 29% provided on-site counseling, 23% provided brief intervention, psychotherapy, or Screening, Brief Intervention and Referral to Treatment (SBIRT). While fewer sites provided treatment for SUD relative to AUD treatment, the patterns for treatment availability were similar.

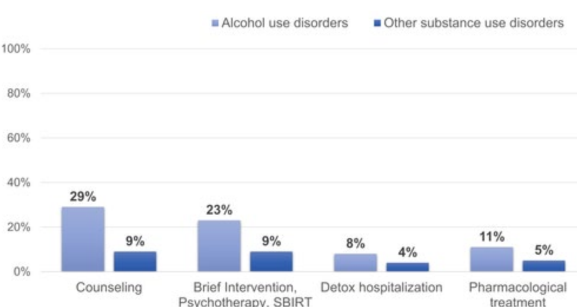


Figure 1. Availability of alcohol and other substance use management among HIV treatment sites reporting screening with validated instruments.

Conclusions: Availability of screening and management for AUD and other SUD were limited in HIV treatment settings in our consortium outside of North America, leaving a major implementation chasm for integration into ongoing HIV care.

Future research should investigate the feasibility of implementing integrated AUD and other SUD screening and management into HIV care settings, particularly in resource-constrained settings.

EPE095

Peer-led, outreach approach for upscaling of access to TB-HIV service integration in Myanmar during COVID-19 and Coup

M.T. Oo[1], M.M. Aye[2], N.N. Maw[3]

[1]Strength of Survival (Self Helped Group), Programme, Pyay, Myanmar, [2]Strength of Survival, Management, Pyay, Myanmar, [3]Phoenix Association, Implementation, Pyay, Myanmar

Background: In Myanmar, integrated TB/HIV services for people living with HIV in the rural and sub-urban areas are scarce, particularly during the time of COVID and political instabilities. With the very limited resources setting and the civil disobedience movement by public healthcare facilities after coup d e'tat, TB and HIV services has been force-stopped.

Description: During 2021, a group of local volunteer living with HIV in Pyay in partnership with "Local Action Towards TB-Free Myanmar" implemented the community outreach project for TB/HIV services to rural and hard to reach areas of the region. Project trained the peer volunteers on HIV/TB awareness raising, home based care, psychosocial counselling and outreaching activities. Peer workers delivered the field visit to the project areas and conducted PLHIV focus group discussions relating to the TB and HIV treatment difficulties. Coordinating with the National TB Program and Township Health Department, peer volunteers assisted in door to door delivery of Anti-TB medications, food support, referral for lab tests and regular follow up on adherence counselling. By means of sustainability of the intervention, the project encouraged and provided necessary assistance on development of local peer groups in each rural and sub-urban areas of the project.

Lessons learned: Effective integration of TB/HIV service could be rightly done when;

a. Local peer communities are trained, equipped with necessary skills and information to lead the program

b. The service providers and the healthcare facilities are integrated as a one comprehensive treatment package, and;

c. Multi-lateral partnerships of public and private sector for effective resource mobilisation and program implementation.

Conclusions/Next steps:

The methodology used in upscaling the access to TB/HIV integrated services in rural and hard to reach areas of Myanmar by peer PLHIV community can be useful for national and regional program development in other countries as well as internationally.

EPE096

Screening & management of hypertension among People Living with HIV (PLHIV) through 'single window approach': aexperience from ART Centers in Mumbai, India

P.V. Deshpande[1], D. Rathod[2], S. Acharya[2], P. Kannan[1], A. Harshana[1], S.Y. Koli[1], S.S. Todmal[1], S.J. Wani[1]

[1]*UW International Training and Education Centre for Health Private Limited, New Delhi, India,* [2]*Mumbai District AIDS Control Society, Mumbai, India*

Background: Non-communicable diseases (NCD) including hypertension are the leading cause of mortality both globally and in India. HIV-infected adults on ART have a higher prevalence of hypertension when compared with HIV-uninfected individuals. People Living with HIV (PLHIV) with hypertension also have a higher risk of cardiovascular events and all-cause mortality.

Though longevity in PLHIV has increased with ART, there is hardly any information on NCDs or its management among PLHIVs in India.

It was decided to launch a pilot project for integrated hypertension and ARV services through ART centers in Mumbai.

Description: A standardized Protocol for Screening and Management of Hypertension was developed through the expert committee to avoid drug-drug interactions, reduce pill burden and improve medication adherence for PLHIVs.

The training was conducted for different cadres of ART Center staff with a focus on integrating the process of screening and treatment with existing patient flow strategies and defined roles & responsibilities for staff.

Screening for all adult PLHIVs has been initiated during their routine visit at ART Center with appropriate treatment for patients diagnosed with hypertension. Referral for patients with severe hypertension and other complications has also been initiated.

Lessons learned: Routine screening for hypertension has helped in early diagnosis and treatment initiation among PLHIVs across all ART centers in the city.

To date 25758 adult PLHIV registered for care have been screened for hypertension and 3948 (15.3%) have been put on anti-hypertensive medicines through ART centers.55% were males while 45% were females. The commonest age group was between 35 to 45 years of age.

Conclusions/Next steps: NCD screening can be integrated into HIV care through standardized screening and management protocol. The early detection and management of hypertension and other NCDs among PLHIVs at ART Centres can help in reducing morbidity & mortality. This model for integrated services can be scaled up at all ART centers across the country.

EPE097

Advancing integration of cervical cancer screening and treatment in faith-based health facilities in Uganda

J. Ekong[1], R. Kamara[1], S. Orach Orochi[1], J. Muhangi[1], H. Mwesezi[1], C. Nyeko[1], J. Kalamya[2], A. G Fitzmaurice[2,2]

[1]*Uganda Episcopal Conference, Uganda Catholic Medical Bureau, Kampala, Uganda,* [2]*US Centres for Disease Control and Prevention, Division of Global HIV and TB, Kampala, Uganda*

Background: Cervical cancer is the most common cause of cancer death among African women, and the HIV epidemic intensifies this burden. Cervical cancer incidence is six-fold greater among women with HIV infection than the general population. In Uganda, a study found that uptake of screening among women living with HIV (WLHIV) was 30.3%; those who had never been screened cited lack of information (29.6%) and no time (25.5%) as the main reasons for declining screening.Uganda Episcopal Conference (UEC)—with support of Infectious Diseases Institute (IDI) in Kampala, Rakai Health Sciences Program (RHSP) in Masaka region, and the Ministry of Health (MOH)—integrated and scaled up cervical cancer screening and treatment of precancerous lesions in 20 health facilities.

Methods: A training targeting health workers from 20 health facilities was conducted using the MOH's strict selection procedure. A total of 64 health workers were selected and trained on visual inspection with acetic acid (VIA) screening and treatment of pre-cancerous lesions with thermocoagulation.

All trainees were followed up with mentorship and supervision to ensure they mastered the skills and were able to provide quality service. All facilities were supplied with equipment, supplies, and thermocoagulators; all implemented the service/intervention.

Results: During March—October 2021, 6,539 WLHIV were screened for cervical cancer using VIA, of which 103 (1.6%) were positive for precancerous lesions eligible for ablative therapy and 40 (0.6%) were referred due to suspected cancer. Of the 103, 56 (54%) were treated with thermocoagulation the same day. Challenges such as stock-out of supplies, interruption in HIV treatment, delayed supply of thermocoagulators, delayed training, and poor documentation due to lack of registers affected screening uptake initially, but these issues have been addressed.

Conclusions: Cervical cancer screening was successfully integrated into HIV programming in 20 health facilities on a large scale, indicating that screening and same-day

Oral abstracts

Poster exhibition

E-posters

Late-breaker abstracts

Author Index

treatment of cervical cancer are feasible in faith-based facilities serving WLHIV. This intervention might reduce cervical cancer mortality among WLHIV who do not know about or make time for cervical cancer screening.

EPE098

Integrating hepatitis B into HIV programs in low and middle-income countries: pilot program in Zambia

S. Fwoloshi[1,2], E. Sinkala[1,2], R. Chirwa[1], F. Kunda Mwila[1], M. Fwambo[1], L. Mulenga[1,3], D. Mulenga[1], E. Chama[1], C. Kankasa[1], M. Vinikoor[1,4]

[1]*University Teaching Hospital HIV AIDS Programme, Lusaka, Zambia,* [2]*University of Zambia School of Medicine, Lusaka, Zambia,* [3]*Ministry of Health, Lusaka, Zambia,* [4]*University of Alabama at Birmingham, Birmingham, United States*

Background: 60 million individuals in sub-Saharan Africa (SSA) are living with chronic hepatitis B virus (HBV) infection, but <5% are diagnosed and in care. Within the national ART program in Zambia, we have begun to integrate care and treatment for chronic HBV.

Description: With catalytic funding from The Hepatitis Fund, we piloted an HBV care model integrated with an HIV clinic in Lusaka, Zambia. We designated one half-day clinic session per week for people with HBV. Existing and visiting staff rotated through the HBV clinic, which was supervised by an expert clinician, to gain experience caring for patients.

Project ECHO, already used in the HIV program, was leveraged to deliver educational content and review cases. Lay and professional counselors providing rapid HIV testing were trained and equipped to provide rapid HBsAg testing. Pharmacy registers were adapted to track prescriptions of tenofovir-based therapy for HBV monoinfection; GeneXpert machines allowed for integrated HBV and HIV viral load (plus TB sputum) testing at the laboratory.

File case report forms, clinic registers, and other tracking systems were also created, building from those used with HIV-uninfected people accessing HIV pre-exposure prophylaxis. Index testing, which is widely used to find undiagnosed and out-of-care people with HIV, is also being adapted for HBV.

Lessons learned: From September 2021-January 2022, during 20 half-day HBV clinics, 224 patient visits occurred, reaching 169 people with HBV (median age, 35 years; 39.6% female sex).

People with HBV had been diagnosed and linked to the clinic after routine (77.9%; i.e., blood bank, routine medical check-ups, antenatal care, etc.) and clinically-driven (22.1%; i.e., signs and symptoms) HBsAg testing.

Among the 169, 120 (71.0%) underwent serum transaminase testing, 95 (56.2%) had HBV viral load, and 63 (37.3%) were prescribed tenofovir-based antiviral therapy based on local guidelines. Since inception, 30 mentee physicians and 10 nurses have participated, seeing an average of 10 clients (range 3-32) with HBV per mentee.

Conclusions/Next steps: We demonstrated the initial feasibility of a model of HBV-HIV care integration in a high HIV prevalence setting in SSA. Applying treatment criteria for HBV monoinfection requires consistent laboratory capacity. Lessons learned from this pilot can inform future scale-up.

EPE099

Integrated transportation modelfor uninterrupted access to TB and HIV diagnosis, treatment, and monitoring in Ukraine

O. Pavlova[1], O. Diuzheva[1], O. Pavlenko[1], A. Bogdanov[1], G. Dravniece[1], K. Gamazina[1]

[1]*PATH, Kyiv, Ukraine*

Background: In many regions of Ukraine, inefficient or nonexistent specimen transportation systems have caused delays in access TB and HIV diagnostics, treatment, and patient monitoring. The COVID-19 pandemic worsened this situation, as regions had to prioritize services to combat the COVID-19 pandemic, leaving TB and or HIV patients, particularly in remote areas, with limited access to services.

Description: To ensure regular and uninterrupted access to HIV and TB diagnosis, treatment, and monitoring, the USAID-funded Support TB Control Efforts in Ukraine Project (STBCEU) established a transportation model in project-supported regions in Ukraine. The transportation system delivers specimens for TB and HIV diagnosis and treatment monitoring, COVID-19 testing, and others, and also transports TB and ART drugs when required.

Established mainly to improve TB diagnostics, the system has adapted to work across disease areas, including HIV. The model was first introduced in Cherkaska oblast in June 2020, and now is functional in ten project-supported regions.

Lessons learned: From June 2020 through December 2021, 12,273 smear samples were delivered for TB diagnosis and 15,934 samples for treatment monitoring.

As a result, 2,117 patients were diagnosed with bacteriologically confirmed TB (17% of all bacteriologically confirmed cases in 12 regions during this period), including 655 patients with DR-TB. In addition to TB samples, the transportation system delivered 30,644 biological samples (15,936 HIV, 3,965 hepatitis B, C, and other opportunistic diseases) for diagnostics and monitoring.

The system also delivered TB and ART drugs to 1,500 clients every month. Two regions established local funding to sustain transportation system activities based on positive implementation results.

Conclusions/Next steps: The successful pilot of an integrated transportation system for biological samples and medications by STBCEU has helped maintain continuity of TB and HIV diagnosis and treatment services.

Based on these outcomes, STBCEU presented the model to national partners, and the National TB Program (NTP) plans to adopt and replicate the integrated transporta-

tion system using a Global Fund grant starting in 2022, using guidance and SOPs developed by STBCEU for country-wide implementation. The next step will be a cost-effectiveness study of the system to advocate for more sustainable funding.

EPE100
Cervical cancer screening and treatment among women living with HIV: experiences from in 4 counties in Kenya

S. Mutimba[1], M. Kitheka[2], L. Matu[3], N. Gitahi[4], D. Juma[5], W. Opudo[1], K. Lelesiit[6], C. Kerich[7], S. Labat[8], F. Ruga[9]
[1]Goldstar Kenya, Care and Treatment, Nakuru, Kenya, [2]Deloitte & Touche, Care and Treatment, Nakuru, Kenya, [3]FHI360, Care and Treatment, Nakuru, Kenya, [4]Goldstar Kenya, Care and Treatment, Nairobi, Kenya, [5]Deloitte & Touche, M&E, Nakuru, Kenya, [6]Samburu Department of Health, Reproductive Health, Maralal, Kenya, [7]Nakuru Department of Health, Reproductive Health, Nakuru, Kenya, [8]Baringo Department of Health, Reproductive Health, Kabarnet, Kenya, [9]Laikipia Department of health, Reproductive Health, Nanyuki, Kenya

Background: Cervical cancer is global killer, and is the leading cause of cancer morbidity and mortality among women in Kenya, predominantly affects HPV unvaccinated HIV positive women more than those who are HIV negative or vaccinated. Cervical cancer is preventable and curable in early stages through primary, secondary and tertiary interventions involving vaccination, early diagnosis and treatment. Although countries have started exploring strategies to address awareness, prevention, screening and immunization and research in these areas is increasing, much remains to be done.
Description: USAID Tujenge Jamii (UTJ) is a 5 year USAID funded activity co-implemented with MOH in supporting 201 sites. Implementation is pronged approach of intervention which entailed: - training and mentorship of healthcare providers on screening all eligible clients using VIA, with subsequent treatment of precancerous lesions by cryotherapy or thermal ablation.
UTJ in addition supports routine line listing of eligible WRA between 18-49years, creating awareness through Health talks, data monitoring and system strengthening. The Outcome of interest was cervical cancer screening and treatment uptake before and after intervention.
Lessons learned: Of 30428 women WLHIV line listed between October 2020 and September 2021, 62% (n=19010) had been screened for cervical cancer. Of unscreened women (n=11418), 37.5% were aware of cervical cancer screening.
Overally the positivity was at 1.9% (361) of 19010 women Screened. Of 361 women tested positive, 38% (136) were treated. Cryotherapy accounted for 83% (113) 7% (10) for thermoablation and 10% (13) had LEEP therapy. A total of 5 clients were diagnosed with invasive form of cervical cancer and referred for specialist management. 134 clients were treated for infections upon re-evaluation by reproductive health experts. Of 74 not treated 9.4% (7) were LTFU, 9.4% (7) Declined, whilst 81% (60) still on follow up.
Conclusions/Next steps: Cervical Cancer Screening among high risk targeted groups shows improved case identification and early treatment of suspected lesions.
The journey towards improved uptake of screening must incorporate intensive peer to peer mentorship, integration of services alongside service areas like CCC and streamlined reportingtools to capture service delivery, diagnosis and treatment.

EPE101
Offering Hormone Replacement Therapy (HRT) helps improve retention in HIV care and viral suppression among transgender patients in Atlanta, Georgia, USA

J. Smith[1], Q. Hatcher-Johnson[1], J. Helton[1]
[1]Positive Impact Health Centers, Atlanta, United States

Background: In the United States, transgender people continue to experience heighted vulnerability to HIV, particularly transgender women of color, with 44% of Black transgender women estimated to have HIV.
Given the unique structural inequities faced by transgender people living with HIV, programs that specifically prioritize transgender people and improve outcomes across the HIV care continuum are needed to end the HIV epidemic among this community, particularly in the southern U.S.
Programs that address stigma, socio-economic barriers, and health literacy among transgender communities combined with gender-affirming clinical care show early promise in improving HIV-related outcomes for transgender people living with HIV.
We present the design and implementation of a gender-affirming care pilot project at Positive Impact Health Centers (PIHC), an HIV/AIDS service organization located in Atlanta, Georgia, USA.
Description: We offered gender affirming care in the form of hormone replacement therapy (HRT) to transgender patients receiving HIV care in PIHC clinics.
The goal of this pilot program is to improve our understanding of how incorporating gender-affirming care in the form of HRT into the clinical care of transgender patients living with HIV impacts retention and engagement in care, and ultimately viral suppression.
Lessons learned: After starting the HRT pilot program at PIHC, viral suppression rates among enrolled transgender patients living with HIV increased from 64% to 80%. Adding gender affirming care hormonal therapy to existing wrap-around services such as housing, case management, behavioral health, transportation, can help improve viral suppression among transgender people living with HIV.

Oral abstracts

Poster exhibition

E-posters

Late-breaker abstracts

Author Index

Conclusions/Next steps: Positive Impact Health Centers recently hired a new Gender-Inclusive Program manager and TransLife Care Specialist to help expand our organization's services that prioritize the health needs of transgender people in our region.

EPE102

Impact of continuous quality improvement on Ca Cervix Screening at Naivasha Sub County, Nakuru Kenya

W. Opudo[1], M. Owino[2], S. Mutimba[3], D. Juma[4], L. Ndiba[5], E. Mbawi[6], E. Omwoe[7], D. Mutua[8]
[1]*USAID Tujenge Jamii, HIV Prevention, Care and Treatment, Nakuru, Kenya,* [2]*USAID Tujenge Jamii, Paediatric HIV Care and treatment, Nairobi, Kenya,* [3]*USAID Tujenge Jamii, HIV Prevention, Care and Treatment, Nairobi, Kenya,* [4]*USAID Tujenge Jamii, Senior Data Management, Nakuru, Kenya,* [5]*Department of Health , Nakuru County, Sub county AIDs and STI Coordinator, Nakuru, Kenya,* [6]*USAID Tujenge Jamii, Monitoring and Evaluation Associate, Nakuru, Kenya,* [7]*USAID Tujenge Jamii, Clinical Mentor, Nakuru, Kenya,* [8]*USAID Tujenge Jamii, Health Record and Information Officer, Nakuru, Kenya*

Background: Cervical cancer remains a public health concern as being the 4th common with a devastating—impact on women, especially developing countries. In Kenya, cervical cancer ranks second common killer cancer after breast cancer accounting for 13% of cancer-related mortalities in the country. About 4802 women were diagnosed with a cervical malignancy in Kenya in 2018, with 2500 annual deaths, but only 3.2% screening uptake.
The current trends to reverse the cervical malignancy adopted by the country are HPV vaccination among under 10 years and mass cervical cancer screening, especially among WRA.
Description: Naivasha Sub County Health management team in collaboration with the USAID Tujenge jamii project implemented continuous quality improvement across its 4 high volume facilities.
A RE-AIM framework and implementation approach was adopted; Reach (R)-Proportion of health facilities scaling up Cacx screening and HIV infected WRA accessing screening services, Efficacy (E)-Impact of Health care worker peer to peer mentorship towards CaCx screening scale-up among HIV WRA, Adoption (A)-Proportion of health care managers adopting to peer mentors approach to improve screening uptake, Implementation (I)-Core elements and determinants of CaCx uptake among HIV infected WRA, and Maintenance (M)-Proportion of health facilities and health care workers sustaining 80% Cacx screening coverage among HIV infected WRA 25-49 years.
Lessons learned: Comparing a one year period before roll out of RE-AIM as the baseline and during RE-AIM for the 4 high volume site, there was a significant improvement with a growth from 13% (325/ 2034) ca cervix uptake to a 90% (1838/2034) increasing 7 times by January 2022. Overally the positivity was at 2.3 %(46) of 2034 women Screened. Of 46 women tested positive, 43.5% (21) were treated. Cryotherapy accounted for 43.5%(20) and 2.2% (1) done for thermoablation and no LEEP therapy. 1 client was diagnosed with invasive form of cervical cancer and referred for specialist management. 23.9% (11/46) clients were treated for infections upon re-evaluation by reproductive health experts. Of 3 not treated 1 was LTFU and 2 Declined.
Conclusions/Next steps: A peer led on site mentorship and approach to improve service delivery and uptake of CACX screening showed adoptability and home grown innovative approaches to scaling up performance in health care programs.

EPE103

Support of HIV treatment initiation and ART adherence among needle and syringe program participants

A. Alexandrov[1]
[1]*Minsk Regional Clinical Center 'Psychiatry-Narcology', Minsk, Belarus*

Background: Expanding of HIV treatment for PLWH who use drugs with provision of NSP and OST are essentials elements of HIV response. Our purpose was enrolment of regular NSP clients in ART and support of its continuation.
Description: Minsk region with 1473000 population. In 2021 there were registered 3818 PLWH and 1314 PWUD. NSP fixed site as well as OST and drug detox centers operated in our clinic during 11 years. We provide HIV prevention (provision of sterile injecting equipment, information and education materials) and testing (rapid oral and blood tests) with referrals to HIV and drug treatment. NSP site staff (doctor, nurse, psychologist, social worker) cooperate with outreach workers from peer-based NGO, epidemiologists, infection disease doctors. In 2021 we provided services to 1705 clients and distributed 20902 syringes, 17000 needles, 11800 alcohol wipe, 6156 disinfectant tablets, 7038 male condoms.
Because of opioid overdose deaths growth (140 in 2021) site provide naloxone (460 ampules, 1100 prescriptions). For 795 clients reported as previously HIV+ tested staff contacted with infection disease doctors. Only 695 registered with HIV diagnosis. 280 registered PLWH received ART on first visit to clinic and just 195 of them have VL suppression.
As incentives for HIV diagnosing and start of ART we provide psychologist or psychiatrist consultation (465 clients), treatment of opioid withdrawal (1169), referral to OST program (155). On the last visit 415 PLWH clients received ART and 330 of them have suppressed VL. 910 PWUD who have no HIV record underwent HIV testing. 13 who tested positively received diagnose, doctor consultation and start ART with help of social worker and peer.

Lessons learned: Access to drug treatment services is one of the best motivation PLWH clients of NSP program to start ART and adhere to it. Main barriers were registration of PWUD seeking treatment, high threshold OST regulation and drug user stigma among health care specialists.

Conclusions/Next steps: We plan to include HCV testing and referral to treatment both with HCB vaccination for NSP clients as additional goals of this year project. Close work with infection disease professionals, primary health care services and peer-lead NGO would be key elements of project success.

EPE104

Engaging U.S. behavioral health clinicians in HIV prevention: Collaborating for PrEP

K. Ard[1], J. Bruno[2], C. Lambert[2], U. Uzoeghelu[2], K. Mayer[2], A. Keuroghlian[3]

[1]Massachusetts General Hospital/Harvard Medical School, Medicine/Infectious Diseases, Boston, United States, [2]The Fenway Institute, Boston, United States, [3]The Fenway Institute/Massachusetts General Hospital/Harvard Medical School, Boston, United States

Background: The role of medical clinicians in providing HIV pre-exposure prophylaxis (PrEP) is well-established, and these clinicians are often the focus of PrEP education. Engagement of behavioral health clinicians in PrEP education and programs has been less well described, despite the role of these clinicians in addressing potential barriers to PrEP uptake and adherence, including stigma, mental health conditions, and substance use disorders.

Description: In 2020, as part of a federal initiative to foster HIV prevention in U.S. federally-qualified health centers, the National LGBTQIA+ Health Education Center of The Fenway Institute in Boston, Massachusetts, delivered a 12-session virtual training program on PrEP for health center staff in high-HIV-burden locations identified in the federal government's Ending the HIV Epidemic plan.

Training topics included PrEP prescribing; integration with behavioral health and substance use disorder treatment; PrEP for adolescents, sexual and gender minority people, and people who inject drugs; and adherence. Behavioral health and medical clinicians were invited to participate. Participants completed a baseline survey about their experiences with and knowledge about PrEP.

Lessons learned: Seventeen health centers participated in the program. Forty-five participants completed the baseline survey, of which 25 (56%) were medical clinicians, 9 (20%) were behavioral health clinicians, and 11 (24%) had other roles. Of behavioral health clinicians, 13% rated their capacity to discuss PrEP as high or very high, and 38% considered their capacity to guide patients on how to discuss PrEP with medical providers as high or very high. In contrast, a majority of behavioral health clinicians ranked their ability to provide culturally competent care for sexual and gender minority people, people who inject drugs, and members of racial and ethnic majority groups as high or very high.

Qualitative data from the baseline survey indicated that behavioral health clinicians sought to learn how to incorporate discussions of sexual health and HIV prevention into their work.

Conclusions/Next steps: Behavioral health clinicians at U.S. health centers in high-HIV-burden areas are committed to HIV prevention and have unique strengths in caring for people at increased risk for HIV. PrEP education and scale-up efforts should engage behavioral health clinicians.

EPE105

Sexually transmitted infections among clients seeking both pre-exposure prophylaxis (PrEP) and non-PrEP services at key population-led and -friendly private clinics in Vietnam

H.A. Doan[1], L.K. Tran[1], T.M. Le[2], K.Q. Do[3], B.H. Nguyen[4], P.A. Nguyen[5], B.N. Vu[1], K.E. Green[1]

[1]PATH, Hanoi, Viet Nam, [2]Glink Vietnam, Ho Chi Minh City, Viet Nam, [3]Galant Clinic, Ho Chi Minh City, Viet Nam, [4]Bien Viet Clinic, Hanoi, Viet Nam, [5]My Home Clinic, Ho Chi Minh City, Viet Nam

Background: Sexually transmitted infection (STI) testing and treatment is an essential component of key population (KP) healthcare in Vietnam. HIV pre-exposure prophylaxis (PrEP) further routinizes STI screening among KP.

The USAID/PATH Healthy Markets project has supported KP-led and KP-friendly private clinics to integrate STI screening, diagnosis and treatment as part of routine care and PrEP services.

Description: PrEP users in five KP-led and KP-friendly private clinics are screened for syphilis using a rapid diagnostic test (RDT) every three months. If the RDT result is positive, a blood sample is sent to a specialized lab for confirmatory testing using a Treponema pallidum hemagglutination (TPHA) test. Nucleic acid amplification testing (NAAT) is used as gold standard for chlamydia and gonorrhea testing. Due to high costs, this is offered to PrEP users every six months.

Samples collected from oropharyngeal, anal and urethral or vaginal swaps, together with a urine sample, are pooled by specialized labs offering NAAT. Confirmatory results are sent back to PrEP providers for client counseling and treatment.

Lessons learned: From October 2020 to November 2021, 6,380 clients at KP-led and KP-friendly private clinics sought testing for STIs: 14.4% were diagnosed with either syphilis, gonorrhea or chlamydia (8.3% syphilis, 7.6% gonorrhea and 4.9% chlamydia). 90.0% of clients diagnosed with one or more STI were men who have sex with men.

Among PrEP users, syphilis and gonorrhea infection were significantly higher (12.0% and 25.5%, respectively) than among non-PrEP users (8.0% and 6.6%, respectively).

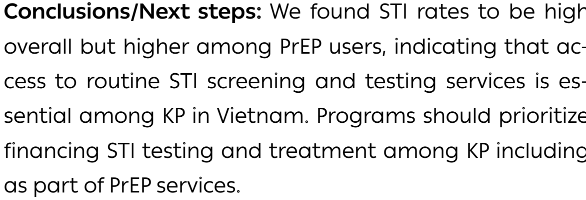
Oral abstracts

Poster exhibition

E-posters

Late-breaker abstracts

Author Index



Conclusions/Next steps: We found STI rates to be high overall but higher among PrEP users, indicating that access to routine STI screening and testing services is essential among KP in Vietnam. Programs should prioritize financing STI testing and treatment among KP including as part of PrEP services.

EPE106

Increasing syphilis testing coverage in antenatal care by 70% in Ghana: lessons from the rollout of dual HIV/syphilis rapid diagnostic tests

M. Abdulai[1], S. Ayisi Addo[1], K. Danso[1], K. Senya[2], K.K. Owusu[1], E. Wiah[1], R. Adu-Gyamfi[1], C.C. Johnson[3], M.S. Baar-Dichiara[3], A. Ashinyo[1]
[1]Ghana Health Service, National AIDS Control Program, Accra, Ghana, [2]World Health Organisation, Communicable Disease Cluster, Accra, Ghana, [3]World Health Organisation, Global HIV, Hepatitis, STI Programmes, Geneva, Switzerland

Background: WHO recommends the use of dual HIV/syphilis rapid diagnostic tests (dual tests) as the first test in antenatal care (ANC) to prevent mother-to-child transmission (MTCT). Scaling-up use of dual tests and achieving 95% syphilis testing coverage is a priority in Ghana's triple elimination strategy for HIV, syphilis and hepatitis B virus (HBV). Here we describe lessons learned from the initial implementation.

Description: In 2018, the Ghana Health Service, through the National AIDS/ STI Programme, began introducing the dual test and fully adopted the WHO guidance for using dual tests in all ANC sites in 2020. From the beginning, key stakeholders, including community groups, were engaged in planning dual test introduction and scale-up. A verification study was completed to select the correct dual test for the national algorithm. Quantification and procurement of the selected test kits was followed by training of service providers. The national rollout began in October 2020.

INDICATOR	2018	2019	2020	2021
ANC Registrants	938779	936253	980822	985457
Number Tested for HIV	867,263	869,615	861,030	924,584
Number Tested for Syphilis	496,665	562,312	686,176	894,983
HIV Testing Coverage	92%	93%	88%	94%
Syphilis Testing Coverage	53%	60%	70%	91%
% gap between number tested for HIV and Syphilis	39%	33%	18%	3%

Table.

Lessons learned: Following the initial introduction of the dual test, between 2018 and 2021, syphilis testing coverage increased from 53% to 91%. Overall, syphilis testing coverage in Ghana increased by 70% and the gap between HIV and syphilis testing coverage was virtually eliminated over this period. Healthcare workers reported dual tests were very convenient to use, and the national program found dual tests reduced overall quantification and procurement costs by at least 16%. Broad and extensive stakeholder engagement was essential for the success of the dual test rollout.

Conclusions/Next steps: Adoption of the dual HIV/syphilis rapid diagnostic test in ANC is feasible and critical in improving syphilis testing coverage. Ghana's early adoption of the dual test has accelerated progress toward national targets within the triple elimination strategy.

National programs should establish robust systems to facilitate rapid evaluation, adoption and scale-up of innovative tools such as the dual test.

EPE107

Systems analysis and improvement approach for hypertension for people living with HIV

O. Uetela[1], A.O. Mocumbi[2], J. Coutinho[3], M. Chidacua[3], A. Charama[3], L. Andela[4], R. Hossieke[5], F. Murgorgo[6], S. Pope[1], I. Ramiro[3], S. Gimbel[7]
[1]University of Washington, Department of Global Health, Seattle, United States, [2]Eduardo Mondlane University, Faculty of Medicine, Maputo, Mozambique, [3]Comité de Saúde de Moçambique, Maputo, Mozambique, [4]Beira Central Hospital, Beira, Mozambique, [5]Manica Provincial Health Directorate, Chimoio, Mozambique, [6]Chimoio Provincial Hospital, Chimoio, Mozambique, [7]University of Washington, Child, Family, and Population Health Nursing, Seattle, United States

Background: Undiagnosed and untreated hypertension (HTN) is a main driver of cardiovascular disease (CVD) in sub-Saharan Africa. As survivorship of people living with HIV (PLHIV) increases with improvements in ART access, HIV-HTN comorbidity is expanding. While HIV treatment is integrated into primary care, access to HTN services are suboptimal, resulting in uncontrolled HTN among comorbid patients.

A hybrid type III parallel cluster randomized controlled trial is underway in Mozambique to assess the effectiveness of the Systems Analysis and Improvement Approach in improving HTN care cascade outcomes (SAIA-HTN), including HTN screening, HTN management, and controlled HTN.

Description: SAIA-HTN includes 16 facilities (eight intervention, eight control) in central Mozambique, with a focus on integrating HTN services into the HIV treatment platform. Healthcare teams use cascade analysis to diagnose HTN care cascade inefficiencies for PLHIV, process mapping to identify potential workflow modifications, and continuous quality improvement (CQI) to iteratively test context-appropriate, low-cost solutions.

Facility-level work is supported by study nurses with guidance from public-sector clinical leaders. Principles of human-centered design were used to establish a system for collection and use of HTN care cascade data, including adaptation of existing patient forms and facility-level data flows.

Lessons learned: Patient forms, developed with Ministry of Health support, were introduced in 16 facilities in central Mozambique to provide data on the HTN cascade.
Sixteen CQI cycles across eight intervention facilities supported facility-led identification of inefficiencies in care delivery and iteratively tested solutions to improve care performance. Data efforts focused on defining workflows, improving data availability and quality, patient education and communication among facility staff.
The patient forms are being used to lay the groundwork to expand SAIA-HTN in real-time to an additional province in southern Mozambique, jointly led by Eduard Mondlane University, the Mozambican National Institute of Health and the Ministry of Health.
Conclusions/Next steps: Routine data systems that collect HTN care cascade data are needed to improve delivery of HTN services for PLHIV and assess if sustained improvements in HTN care cascade outcomes are achieved.
Initiating the expansion in overlap with SAIA-HTN allows for a rapid translation of this finding.

Strategies to enhance U=U communication and implementation

EPE108
LGBTQ affirming care may increase awareness and understanding of "Undetectable=Untransmittable" (U=U) among midlife and older gay and bisexual men in the US South

T. Mckay[1], E.-R. Akre[2], J. Henne[3], A. Conway[4], I. Gothelf[4], N. Kari[4]
[1]Vanderbilt University, Department of Medicine, Health, and Society, Nashville, United States, [2]Dartmouth College, Hanover, United States, [3]The Henne Group, Inc., San Francisco, United States, [4]Vanderbilt University, Nashville, United States

Background: Healthcare providers are an important point of contact for dissemination of the U=U message, however not all providers are comfortable delivering this information and patients may not disclose their sexual behavior to providers they perceive to be nonaffirming.
In this study we examine whether having an LGBTQ affirming healthcare provider increases U=U awareness, belief, and understanding among midlife and older gay and bisexual men in the US South, a region where new HIV infections are increasing and undiagnosed cases remain high.
Methods: We use data from the Vanderbilt University Social Networks Aging and Policy Study (VUSNAPS) on 676 sexual minority men aged 50 to 76 from four Southern US states--Alabama, Georgia, North Carolina, and Tennessee--collected in 2020-2021.

Results: Only one in four (25.4%) of older sexual minority men had heard of the U=U concept. U=U awareness was higher for HIV positive men (56.3%) compared to HIV negative men (17.5%). Two thirds (64.8%) of respondents identified a primary or secondary healthcare provider as LGBTQ affirming. HIV positive men were more than 7 times more likely to identify their healthcare provider as LGBTQ affirming compared with HIV negative men (OR=7.10; 95% CI=3.94-12.80.
In logistic regression analyses adjusting for respondent characteristics and geographic variation, we find that HIV negative men with an affirming care provider were more than 3 times more likely to have heard of U=U (OR=3.13; 95% CI=1.75-5.61), 1.5 times more likely to believe U=U (OR=1.53; 95% CI=1.02-2.30), and more than 2 times more likely to have ever tested for HIV (OR=2.26; 95% CI=1.38-3.72) compared to HIV negative men with a non-affirming provider. Having an LGBTQ affirming healthcare provider also improved risk perception accuracy among HIV negative men.
Among those with an LGBTQ affirming provider, 21.2% heard about U=U from their healthcare provider compared with just 8.7% among those with a nonaffirming provider.
Conclusions: Awareness of U=U among older sexual minority men in the US South is substantially lower compared with other samples of men who have sex with men. Improving access to LGBTQ affirming healthcare may improve U=U awareness, belief, and understanding, which could help to curb HIV transmission in the US South.

EPE109
Talking about treatment-as-prevention and U=U: patient needs and health worker perspectives

D. Onoya[1], I. Mokhele[1], S. Sharma[2], T. Sineke[1], R. Cele[1], P. Sigasa[1], M. Dukashe[3], L. Hansrod[4], R. Inglis[4], R. King[5], J. Bor[2,1]
[1]University of the Witwatersrand, Department of Internal Medicine, Health Economics & Epidemiology Research Office, Johannesburg, South Africa, [2]Boston University School of Public Health, Department of Global Health, Boston, United States, [3]HIV Survivors and Partners Network, Tshwane, South Africa, [4]Jive Media Africa, Pietermaritzburg, South Africa, [5]University of California, Institute for Global Health Sciences, San Francisco, United States

Background: People who are virally-suppressed cannot transmit HIV sexually. While the science of HIV treatment-as-prevention (TasP) is clear, this message has not been disseminated widely in sub-Saharan Africa, limiting its value in motivating treatment uptake, adherence, and retention HIV care.
We sought to understand the TasP communication needs of persons living with HIV (PLHIV) and barriers and facilitators to TasP communication among health care workers in South Africa.

Methods: As part of an ongoing randomized controlled trial, we conducted five focus group discussions (FGDs) with healthcare workers (N=42) including nurses and counsellors from primary healthcare clinics and counselling staff of non-governmental organisations supporting the HIV testing and treatment programs in the Gauteng and Free State Provinces of South Africa.

Additionally, three FGDs (N=27) were conducted with PLHIV recruited by snowball sampling through civil society organisations and we interviewed 27 PLHIV referred by HIV counsellors at primary healthcare clinics in Johannesburg. Interviews were conducted in May 2021, audio-recorded, transcribed verbatim, translated to English, and thematically analysed.

Results: While PLHIV participants had some knowledge about TasP, they expressed scepticism about the effectiveness of TasP. Knowledge about viral load (VL) suppression was an important validator and motivator for medication adherence. However, PLHIV expressed the need for guidance in communicating TasP, highlighting ongoing concerns around possible rejection by potential sexual partners.

Healthcare workers expressed discomfort with sharing the science of TasP due to concerns about patient non-adherence to ART and being responsible for ensuing HIV transmission. Healthcare workers worried that promoting TasP would undermine strong messaging on condom use to prevent other sexually transmitted infections. HIV counsellors expressed the need for communication tools providing simple, unambiguous, and consistent narratives for TasP and VL counselling, with visual and narrative support.

PLHIV and counsellors alike recommended a phased approach to communicating ART benefits, focusing first on attaining viral suppression and emphasizing condomless sex only after sustained viral suppression.

Conclusions: These data highlight the need for TasP communication support. Healthcare workers also need training and support to confidently and adequately communicate TasP, adapting the message according to the phases of PLHIVs' ART journey.

EPE110

Medical community attitude to U=U fact in Russia

E. Stepanova[1], E. Ignatov[1], S. Smirnov[2]

[1]University Clinic H-Clinic, Moscow, Russian Federation, [2]Social Partnership Development Fund, Moscow, Russian Federation

Background: It is widely recognized by the scientific and medical community that U=U is a very important step in the fight against stigma and discrimination of PLHIV. There are some barriers to the U=U implementation in Russia.

The study objective is to find out the attitude of infectious disease doctors to the U=U fact in Russia and identify factors, which hinder its implementation.

Hypothesis: Misunderstanding of the U=U message among infectious disease doctors can be a barrier to translate it to patients.

Methods: The study was descriptive. It was carried out in Google Forms as an online survey in September 2021. The questionnaire consisted of 10 questions with estimated length of 5 minutes.

The survey involved 122 respondents: doctors specialized in HIV from different regions of Russia. Their working experience with HIV was 1-35 years (median 7 years).

Limitations: most likely, the study involved doctors who are interested in the issue, and the results may look finer compared to the real situation.

Results: The majority of respondents (89%) are aware of the U=U fact, but only 56% translate it to their patients. 81% were able to exactly explain the U=U message, while the rest were inaccurate in its interpretation, and used the old definition assuming theminimum risk of HIV sexual transmission instead of zero risk.

An important issue is that doctors translate this principle to patients selectively. Only 38.5% inform all their patients about it.

Doctors translate the concept less often to elderly people (at 1.5 ratio) and to socially disadvantaged people (at 1.6 ratio).

The most common reasons of this fact:

- Unsure of patients to take ART correctly – 20%
- Not all patients have undetectable viral load – 20%
- Without condoms patients will not be protected from other STIs and pregnancy – 17%
- Viral load blips – 17%

Conclusions: The major part of doctors (89%) understand the U=U and can explain its essence (81%), but only 38,5% of those informed translate it to all patients.

The main reasons are not based on evidence, hence, a continuous medical education and awareness raising efforts are required to improve the situation and make practice correspond to the contemporary science.

"We are equal": increasing service uptake through strategic communications

M. Rodrigues[1], N. Hasen[2], M. Chissano[1], S. Sharma[3]

[1]Population Services International Mozambique, Maputo, Mozambique, [2]Population Services International, Washington DC, United States, [3]Ipsos, London, United Kingdom

Background: Mozambique has approximately 2.1 million PLHIV; 710,000 are men, of which only 62% are on ART. With our partner, Ipsos, PSI conducted qualitative research to identify Mozambican men's barriers to treatment. A key finding was that both men and their influencers associate ART with HIV. Men fear that being on ART would limit acceptance by peers, creating a key barrier to treatment uptake.

Methods: The "Somos Iguais" (We are equal) campaign was designed to reduce the negative associations with ART by normalizing PLHIV on treatment. From May-August 2021, 4,211 ads reached an estimated 30,496 people through TV and 16,131 through radio; over 20,000 were reached daily through social media. Key messages included "We are all the Same, the virus doesn't define us" and depicted people taking ARVs in daily settings around friends and family.

After 6 months of the campaign, a cross-sectional study was conducted reaching 2,285 people dispersed across Mozambique (60% PLHIV, 45% of whom were female and 40% non-PLHIV, 39% of whom were female) with an additional analysis of social media performance to assess the impact of the campaign on attitudes and beliefs about HIV and ART.

Results: 79% of respondents recalled messages from the campaign, with many respondents reporting preliminary steps towards behavior change as a result, including discussing HIV with someone else (54%) and seeking health services (21%). While three of the four most popular social media posts were unrelated to HIV, the fourth was a PLHIV testimonial video, illustrating similarities between the lives of PLHIV and non-PLHIV.

Analysis of social media interactions showed 82% of private messages requested information or help related to HIV; this was unrelated to whether the post contained HIV or non-HIV content. The testimonial videos by PLHIV received positive feedback, showing the power of this form of content to connect with audiences.

Conclusions: Breaking the association between HIV and ART is key to increasing men's uptake of treatment. Mass, mid and social media campaigns normalizing HIV treatment behaviors can play an effective role in changing attitudes and increasing service uptake.
